HORTUS SECOND

THIS Hortus Americanus is designed to account for all the species and botanical varieties of plants in cultivation in the continental United States and Canada in the decade ending midyear 1940, together with brief directions on uses, propagation and cultivation. The inventory is based on the catalogues of seeds, bulbs, roots, shrubs, trees and other nursery stock in the published lists of commercial dealers, on statements in current journals, exchanges between growers, continuing correspondence, contents of herbaria, extensive experience with gardens. It is a source-book and record of the plant materials currently available in North American horticulture, with addition of common names, descriptive terms and definitions, inventories of families of plants, and abundant cross-references.

The book does not attempt to include plants known only at present in institutional botanic gardens or in government test grounds. It does not recommend the plants entered within its covers or endeavor to list native plants not yet known in cultivation even though they may possess evident merit for garden use. Nor do the Editors undertake to inform correspondents where roots or seeds of given plants may be obtained. Great care has been exercised in the preparation of articles and in the assembling of advice, but no guaranty is attached and the consultant pursues his course on his own responsibility.

While the intention of Hortus Second is primarily horticultural, yet the effort to identify botanically the species of plants in cultivation is always a major problem before the Editors. Many of the entries are derived from names in lists and the plants or specimens of them are not available for study; whether a plant actually represents its name can be determined only as the work proceeds year by year. If a nomen has no botanical standing, it appears in these pages as "listed name" or otherwise, indicating that more information is needed; or no definite nativity may be assigned to it.

This volume, as the first Hortus, is intended to be useful as a handbook of ready reference, rapid aid to nomenclature and to spelling of names, help in labeling, medium of suggestions on the main or standard requirements in the cultivation of plants. It is hoped the book will contribute to the understanding and the dignity of plant-growing. The grower should be proud to be in the company of so many kinds of plants.

The first Hortus was published in December, 1930, to cover the inventories of cultivated plants in North America for the period ending with 1929. A reprint was published in 1935, with addition of a large Supplement to account for the novelties of the half decade. The present volume is Hortus Second, to include the plants in cultivation to the close of 1939 and the beginning of 1940. Hortus Second is not a reprint, but a new work set in different type and format, to bring the continuing enterprise down to date and to register the species and botanical varieties now available to the cultivator, together with the essential botanical and horticultural revisions. It includes most of the former book and also much more. The old book now becomes an historic record, and should be kept in the library as a reference.

Since the publication of Hortus the field has been newly studied for three purposes: to assemble records of the hundreds of plants introduced to cultivation in the intermediate years; to present changes in nomenclature resulting from continuous studies by many investigators; to assess the horticultural applications. In general the defini-

tions of species have been expanded only as much as may be practicable in a condensed popular work. The cultural articles have been revised or approved by specialists. Yet, at the same time, the plan of Hortus has been retained inasmuch as the public has approved it.

Effort to record the plants in actual cultivation in North America has extended over a period of more than fifty years. It began in the five volumes of Annals of Horticulture 1889 to 1893, was continued in Cyclopedia of American Horticulture 1900 to 1902, second volume (Crops) of Cyclopedia of American Agriculture 1907, Standard Cyclopedia of Horticulture 1914 to 1917, Hortus 1930, Supplement to Hortus 1935. It is now still continued in Hortus Second 1941. It is expected that new Hortuses will be issued every ten years, and perhaps Supplements in the half-decades when needed, if the public continues to find the publications useful.

From the earliest attempt to prepare authoritative inventories, hope has prevailed that at last a stabilized uninterrupted program might be established. Such program requires a permanent institution provided with literature, ample herbarium of cultivated plants, test grounds even though small, accumulated records and extensive card indices, established staff impelled by the will to keep the enterprise useful and alive.

Many persons have aided in the preparation of Hortus Second, although details in Latin names follow an Editorial policy. Some of the persons should be specially mentioned. Most of the detailed revision has been by George H. M. Lawrence, now regularly on the staff of the Bailey Hortorium of Cornell University; the article Armeria is his particular authorship. The Crassulaceæ, Ferns, Geum, Potentilla, Rheum are by Robert T. Clausen, also at the Hortorium. All the entries on genera and species of orchids have been revised and in many cases rewritten by Charles Schweinfurth of the Botanical Museums of Harvard University. The Cactaceæ have been gone over by Elzada Clover of the University of Michigan, the entries on fruit, grafting and pruning by L. H. MacDaniels, the vegetable articles by H. C. Thompson, G. E. Knott and E. V. Hardenburg, Mushrooms by A. J. Pratt, all of Cornell University, Propagation by H. T. Skinner, Phlox and Soils by E. T. Wherry, Roses by J. Horace McFarland. Other aids, in their fields, are A. J. Eames, H. H. Hume, Lewis Knudson, E. A. White. Many critical notes have been supplied by P. J. Van Melle of the Poughkeepsie, New York, Nursery Company.

The Nomenclature

It is necessary to state again that fixity or rigidity in botanical nomenclature is unattainable, either in Latin or vernacular names, although the tendency is naturally toward uniformity in practice. Species are not fixed and invariable entities. Demarcation between species and varieties is open to interpretation. Not nearly all the plants on the earth are yet discovered. Conclusions of careful investigators must be recorded. Knowledge in any science is subject always to modification and new statement, whether in physics or chemistry or biology. When knowledge and its formulas become static the science decays. There is no finality in interpretations of nature.

In a work of the present scope, covering plants from all over the world, one cannot expect to be aware at the moment of all essential changes in nomenclature, and the Editors may exercise their judgment in particular cases and await a Supplement or a subsequent Hortus before accepting changes. The acceptance herein of a generic treatment does not necessarily mean that the Editors approve of the segregation or the combination of names and categories.

Mention of changes in nomenclature (pronounced no-menclature) may alarm the gardener; yet such changes are inevitable and natural, for the subject is a living and growing department of knowledge. We may deplore changes in names and thereby we may magnify names out of due proportion. The real problem is not nomenclature but identification. If the identification of the species is accurate, the names follow as a matter of course and every one of them has a meaning and adds to the interest and richness of intelligent gardening even though the changes may be troublesome in commerce. Changes in names need not lead to confusion if one really knows the plants and is interested in the essential elements of plant knowledge.

Names of genera and of species are spelled as they were made originally except for a few changes in genera adopted by international authority and in the endings of certain epithets or specific names. This accounts for the name pensylvanica of early authors, and pennsylvanica at a later time when the title of the State had become stabilized. It explains also why certain plants named for China may be chinensis and others sinensis, sinica, cathayensis; these names are not in conflict and are not in-advertencies: they are adopted as they stand. Similar cases are virginica, virginiana, virginiensis; salicina (Salix-like), saligna, salicis; caroliniana, carolinensis; marilandica, marylandica, mariana; ohioensis, ohionis. Terminations of personal names in the genitive, both masculine and feminine, have been unified on the basis of the International Rules in accord with an authoritative published proposal, and following the practice in the Standard Cyclopedia of Horticulture.

The designation var. (variety) is inserted before Latin names subordinate to a species. It represents plants not sufficiently separate or permanent to be accounted the rank of natural species. In trade catalogues the names are likely to be run continuously as a trinomial, but var. is understood to belong between the second and third Latin word. In horticultural writing one does not attempt to draw fine distinctions between variations, as to whether they are subspecies, varieties or forme. Commercial growers like the Latin names because they are for the most part familiar, have definite application, and are easy to pronounce and remember; such names are superba, grandiflora, nana, pumila, compacta, atropurpurea, speciosa, pyramidalis, gigantea, hybrida; botanical rank of the plants may not appear to be important, yet the distinguishing of varieties as distinct from species constitutes one of the prime personal satisfactions in horticulture.

The word variety is often used in a very different meaning, not to designate a taxonomic practice but in the sense of "kinds," as when one speaks of the many varieties of maples or oaks or orchids when one really means the many species. It is confusion of ideas to speak of varieties and species as equivalent or interchangeable words.

Vernacular names of plants fall into three categories. 1. Names that by usage have become common and are part of the language. The most significant of these names in English are chosen for Hortus Second. 2. Titles of groups or species proposed as the result of taxonomic study and therefore based on biological or systematic reasons. These may be admitted. 3. Invented English names, in a series, provide an alternative nomenclature but they may not become common or popular and may remain for commercial or professional use; they presuppose that the user recognizes the species to which they belong and therefore is familiar with the Latin names by which the vernaculars may be identified.

Identification

Some of the responsibility in preserving a record of plants in cultivation in a given epoch rests with the growers themselves. If they introduce or grow novelties, the fact may well be transmitted to the Editor of the Hortuses. This statement applies particularly to species (the word species is both plural and singular) and marked botanical varieties rather than to vernacularly named and more or less transitory horticultural varieties or garden forms which cannot be covered in a work of this character. Frequently the grower wishes identification of a novelty, a service the Editor is glad to render if the applicant sends material that represents the plant. Only rarely can a plant be identified by a non-botanical description in correspondence.

A leaf or a flower or a little sprig is not sufficient for identification, among the million and more plants now described. The identifier needs a specimen. This specimen should be large enough to reveal what the plant is like, and it should show the essential parts,—foliage, flower-cluster, fruits or pods when possible. The sender should state the general stature or size of the plant, whether herb, shrub, tree, or vine, and disclose as much of its source or origin as may be known; also color of flowers.

The identifier makes an herbarium specimen of the material, for record and as a check on identification. It is mounted on standard herbarium paper, when pressed and dried; this paper measures 11½ x 16½ inches, and these dimensions indicate the limits of size of the material to be sent for identification.

If the distance is not too great, the fresh material may be sent in a box by mail as a florist ships cut-flowers. Otherwise, the specimen is sent flat tied tightly between paper and cardboards. It will be partially dry and preserved when it reaches destination, and the recipient completes the process of drying and pressing. It will be better if the sender is practiced in making herbarium specimens and sends the material ready prepared.

At all events, do not pack the material in cotton or in any kind of preservative or powder. Do not roll the plants. Keep them flat and tight. Be sure the material is dry when despatched, unless perfectly whole fresh sprays, like cut-flowers, are sent by mail and then preferably with special delivery postage. Always be careful to attach a label or number to each specimen; the parcel should bear name and address of the sender.

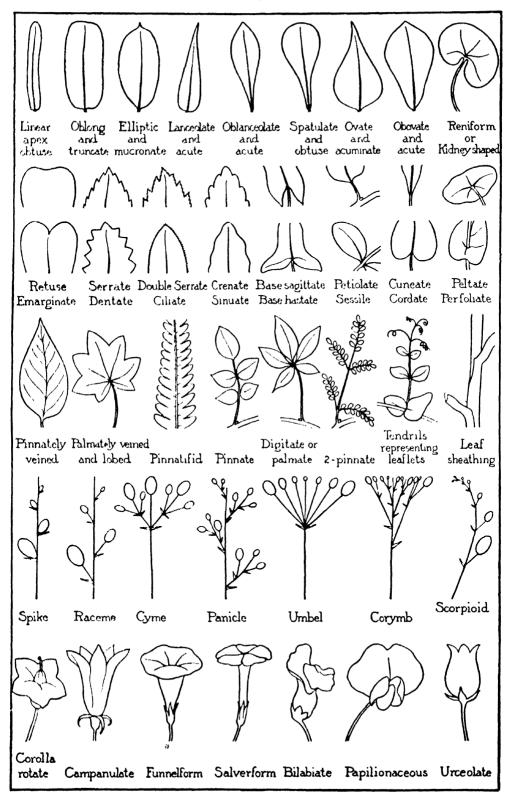

Ithaca, N. Y. October 1, 1940 L. H. BAILEY ETHEL ZOE BAILEY Abbreviations and elisions are necessary to the great condensation required in a work of this character. Aside from the usual abbreviations for countries, states and provinces, those employed in this volume are as follows:

annaı	nnual	lfia.	leaflets
bienbi	iennial	bs	leaves
caps ca	apsule	mis	mountains
cent	entral	N	North, northern: N. N. Amer.,
	ultivated, cultivation		Northern North America; N. S.
diam di			Amer., Northern South Amer-
	ast, eastern: E. U. S., Eastern		ica; N. Eu., Northern Europe.
		nat	naturalized
			perennial
<i>ft</i> flo			South, Southern; S. S. Amer.,
fld flo	owered		Southern South America; S.
fls flo			Calif., Southern California; S.
fr. fr			W. U. S., Southwestern United
<i>frs.</i> fr			States.
ft. fo		segm., segms	segment, segments
			stem, stems
<i>in</i> in			subtropical
inft in			
intro in		trop	
isl., isls is		var	variety (of a species)
<i>lf</i> le	eaf ´	W	West
<i>lft</i> le	unflet.		

Statements on stature or measurement of plants and their parts are intended to indicate the upper and lower limits of size or at least of height. This is the customary practice in descriptive botany. Thus, "to 5 ft." suggests the plant may attain that height as a characteristic of the species, whatever may be the usual or average height in a garden.

HORTUS SECOND

A CONCISE DICTIONARY OF GARDENING AND GENERAL HORTICULTURE

ABACÁ: Musa textilis. ABAMA: see Nartherium. ABELE: Populus alba.

ABÈLIA. Caprifoliacex. Attractive shrubs with persistent or deciduous simple opposite lvs. and numerous small white or pink tubular fls. in axillary or terminal cymes with persistent large purplish sepals, blooming in summer; native in Asia and Mex.

Abelias thrive in a well-drained soil, enriched with leaf-Abenas unive in a well-drained soil, enriched with lear-mold, and in a sunny preferably protected situation. A. floribunda is sometimes grown in the greenhouse. Propa-gated by greenwood cuttings rooted under glass in the sum-mer, or by cuttings of ripe wood in autumn; seed is rarely employed. A. grandiflora and A. Engleriana are hardy North, and other species less hardy.

chinensis (A. rupestris). Deciduous shrub to 6 ft.: lvs. ovate, to 1 ½ in. long: fls. in dense terminal panicles, white, tunnelform, ½ in. long, fragrant; sepals 5. China.—Plants grown under this name may be A. grandifora.

Englerians. Deciduous shrub to 6 ft.: lvs. ovate to ovallanceolate, to 1½ in. long: fls. in few-fld. axillary clusters, rosy-purple or rosy-pink, funnelform, ¾ in. long; sepals 2.

floribunda. Mexican A. Evergreen shrub to 6 ft.: lvs. ovate, to 1½ in. long: fls. pendulous, solitary or in 2-3-fld. clusters, earmine-purple, tubular, 1½ in. long; sepals 5. Mex.

Gaucheri. Listed as a hybrid having bright lavender pink fis. with orange throat, slightly larger than those of A. grandiflora.

Graebneriana. Deciduous shrub to 10 ft.: lvs. ovate or narrowly so, to 2½ in. long, acuminate: fls. solitary or few on short side branchlets or axillary, pink, yellow inside. China.

grandiflora. Glossy A. Hybrid between A. chinensis and A. uniflora: half-evergreen shrub to 6 ft.: lvs. ovate, to 1½ in. long, shining: fls. in loose terminal panicles, white flushed pink, bell-shaped, ¾ in. long; sepals 2-5.—The common kind in cult; often grown as A. chinensis. Var. Sherwoodii is listed as dwarf form to 3 ft. tall, with somewhat smaller lvs. and fls.

longitùba: probably A. Schumannii.

rupéstris: A. chinensis, but the plant in the trade is usually A. grandiflora.

Schumannii. Deciduous slender shrub to 5 ft. or more: vs. ovate to elliptic, to about 1 in. long, mucronate but otherwise nearly obtuse; fis. several on short side growths, pink, corolla slender at base. China.

triflòra. Deciduous shrub to 12 ft.: lvs. lanceolate or ovate-lanceolate, to 3 in. long: fis. in terminal clusters 2 in. across, rosy-white, salverform, 1/2 in. long; sepals 5.

unifibra. Interesting as one of the parents of A. grandi-flora: evergreen, to 6 ft.: lvs. ovate, acuminate, shining above, to 1 in. long: fls. pinkish-white, orange in throat, 1 in. long; sepals 2. China.

ABELIOPHÝLLUM. Oleaceæ. One deciduous shrub of recent introduction, native in Korea, allied to Fontanesia. A. distichum. To 3 ft.: lvs. opposite, ovate, to 2 in. long, entire, pubescent: fis. white, ¼ in. across, in short racemes in May: fr. nearly orbicular, 1 in. across, winged on all

ABELMOSCHUS: see Hibiscus. ABERIA: see Dovyalis.

ABIES. Fir. Pinacex. Large evergreen trees 30 ft. and more in height and of pyramidal

habit and continuous axis or trunk, having flat linear lvs. which are usually shiny above and with 2 white bands below, and erect cones with deciduous scales; native in the north temp. zone and hardy in cult. from the central regions north. Distinguished from the spruces (Picea) by the flat lvs. whitish beneath, erect cones with deciduous scales. Although distinct to those who know them, the firs are difficult to separate by brief descriptions. For cult. see Conifers.

ajanénsis: Picea jezoensis.

ajanensis: Picca jezoensis.

álba (A. pectinata. A. Picca). Silver F. Lvs. to 1½ in. long, rounded and notched at apex: cones cylindric, to 5½ in. long, green turning reddish-brown. Cent. and S. Eu.; hardy in northeastern states, but likely to lose its lower branches there and to become thin. Var. columnar; head columnar; var. compácta, dwarf and compact; var. equitrojáni, lvs. more pointed, cones oblong-cylindric; var. péndula, branches drooping; var. pyramidális, head columnar; var. tortuðas, dwarf and compact with shining lvs. and crowded branches.

amábilis. Cascade F. Lvs. about 1 in. long, notched or truncate at apex: cones oblong, to 6 in. long, purple. B. C. to Ore.; hardy in S. New England.

haborénsis: A numidica.

balsamea. Balsam F. Lvs. to 1 in. long, rounded or slightly notched at apex: cones oblong, to 2½ in. long, violet-purple. Lab. to W. Va. and Ia. Var. hudsonia, a dwarf form; var. marcocárpa, lvs. and cones longer; var. nana is listed as a dwarf form; var. phanerólepis, bracts of cone exserted.

Beissneriana: A. Ernestii.

Bòrisii-règis. Lvs. about 1 in. long, acute or sometimes notched at apex: cones cylindric, to 6 in. long. Balkan

Bornmuellerians. Lvs. 1½ in. long, rounded or notched at apex: cones cylindric, to 5 in. long. Asia Minor.

brachyph vila: A. homolepis.

canadénsis: Tsuga canadensis. caroliniana: Tsuga caroliniana.

cephalónica (A. Regins-Amalis). GREEK F. Lvs. to 1 in. long, sharp-pointed: cones cylindric, to 7 in. long, brownish. Greece; hardy in S. New England. Var. Apóllinis has thicker and broader less pointed lvs. chensiénsis

chensiensis. Lvs. to 1½ in long, usually rounded and notched at apex; cones ovoid-oblong, to 4 in long, green turning red-brown. Cent. China; can be grown in S. New England.

cilicica. Lvs. about 1 in. long, slightly notched at apex: cones cylindric, to 9 in. long, reddish-brown. Asia Minor, Syria; hardy in climates like S. New England and N. Y.

cóncolor. Whithe F. Lvs. to 2 in. long, rounded or acute at apex: conce cylindric, to 5 in. long, greenish or purplish. Colo. to Mex.; hardy N. Var. argéntea, lvs. silvery-white; var. aftee, lvs. golden-yellow when young; var. brevifòlia, lvs. short and thick; var. cónica, dwarf pyramidal form; var. globòsa, habit globose; var. Lowiana, lvs. longer, notched at apex, Ore. to Calif.; var. violacea, lvs. bluish-white; var. Wattèzii, lvs. pale yellowish becomme gilven-white ing silvery-white.

Delavayi: plants in cult. under this name are referable

Douglasii: Pseudotsuga taxifolia.

Ernestii (A. Beissneriana). Lvs. to 11/4 in. long, flat above with pale bands beneath: cones peduncled. W. China: probably hardy in north central states.

Fábri (A. Delavayi of hort.). Lvs. to 1 in. long, notched at apex, margins revolute: cones cylindric to oblong, to 3 in. long, violet-black. W. China; hardy in such climates as S. New England.

Fargèsii. Lvs. to 1 in. long, notched at apex: cones ovoid-oblong, to 3 in. long, purple or red-brown. Cent. China; hardy S. New England but suffers in severe winters.

Faxoniana. Lvs. to 1 in. long, rounded or notched at apex, margins slightly revolute: cones ovoid-oblong, to 3 in. long, violet-purple. W. China; probably hardy in N. Y. and S. New England.

firms. Mom F. Lvs. to 1½ in. long, rounded and notched at apex, bands beneath inconspicuous: cones cylindric, to 5 in. long, yellowish-green. Japan; hardy in north central states and S. New England.

Forrestii. Lvs. to 1½ in long, rounded or notched at apex: cones cylindric, to 4 in long, violet-purple. W. China; somewhat tender N. E.

Fraseri (Picea hudsonia). Southern Balsam F. Lvs. to 1 in. long, rounded and notched at apex: cones oblong or ovoid, to 2½ in. long, purple. Alleghany Mts.; hardy N. Var. horizontalis is listed as a dwarf spreading form.

Gordoniana: A. grandis.

grandis (A. Gordoniana). GIANT F. Lvs. to 2½ in. long, rounded and notched at apex: cones cylindric, to 4 in. long, bright green. Vancouver Isl. to Calif. and Mont.; to be grown in central states; in S. New England remains

holophfila. NEEDLE F. Lvs. to 1½ in. long, rounded or acute at apex, spiny when young, bands beneath inconspicuous: cones cylindric, to 6 in. long, green becoming light brown. Manchuria, Korea; hardy N. Y. and New England.

homólepis (A. brachyphylla. A. Tschonoskiana). Nikko F. Lvs. about 1 in. long, rounded and slightly notched at apex: cones cylindric, 4 in. long, purple. Japan; hardy in northern states. Var. Scótties, Dwarf Nikko F., is a branch-sport; var. Tomòmi, less branched, lvs. shorter; var. umbellata, young cones green.

insignis. Hybrid between A. Pinsapo and A. Nordmanniana. Named vars. are Beissneriana, Kentiana, Mastersiana, and speciosa.

koreana. Lvs. to ¾ in. long, rounded and notched at apex, pointed when young, margins revolute: cones cylindric, to 3 in. long, violet-purple. Korea; hardy N. Y. and New England.

lasiocarpa (Picea bifolia). ALPINE F. Lvs. to 1½ in. long, rounded or acute at apex, pale bluish-green: cones oblong-cylindric, to 4 in. long, purple. Alaska to New Mex. Var. arizônica (A. arizonica), Cork F., bark thick and corky; var. compacta, dwarf and compact.

magnifica. Red F. Lvs. 4-sided, to 1½ in. long, rounded at apex: cones cylindric-oblong, to 9 in. long, purplishviolet. Ore to Calif.; hardy in parts of E. but needs shelter N. Var. argéntea, lvs. bluish-white; var. glaûca, Azvræ F., lvs. glaucous; var. shasténsis, bracts of cone exserted.

Marièsii. Lvs. to ¾ in. long, rounded or notched at apex: cones ovoid to oblong, to 3½ in. long, dark purple. Japan; hardy N. Y. and New England.

nephrolepis. Very similar to A. sibirica but with shorter lvs. and smaller cones. Siberia, China; hardy in sheltered positions N. E.

nóbilis. Noble F. Lvs. to 1½ in. long, rounded at apex, entire or slightly notched: cones cylindric-oblong, to 10 in. long, green becoming purplish-brown. Wash. to N. Calif; not hardy throughout S. New England, and grows slowly. Var. glaûca has glaucous lvs.; hardy.

Nordmanniana. Lvs. to 1½ in. long, rounded and notched at apex: cones cylindric, to 6 in. long, reddish-brown. Caucasus, Asia Minor, Greece; hardy and useful in northern states. Var. aûrea, lvs. yellow; var. tortifòlia, some of lvs. twisted. some of lvs. twisted.

numidica (A. baborensis). Algerian F. I.vs. to ¾ in. long, rounded and slightly notched at apex: cones cylindric, to 7 in. long, purple. N. Afr.; grows in S. New England in sheltered places.

obovata: Picea obovata.

Omórika: Picea Omorika.

pectinata: A. alba.

Picea: A. alba.

Pindrow. Lvs. to 21/3 in. long, acute and notched at apex, bands beneath inconspicuous: cones cylindric, to 51/4 in. long, deep purple. Himalayas; hardy in central

Pinsapo. Spanish F. Lvs. to ¾ in. long, acute, thick and stiff, bands beneath inconspicuous: cones cylindric, to 5 in. long, purplish-brown. Spain; hardy in central states, also S. New England in sheltered positions. Var. argéntea, lvs. silvery-white; var. glauca, lvs. glaucous; var. péndula, branche desconing. branches drooping.

recurvata. Lvs. to 1½ in. long, acute or sharp-pointed, bands beneath inconspicuous: cones oblong-ovoid, to 4 in. long, violet-purple becoming brownish. W. China; hardy in S. New England.

Reginse-Amalia: A. cephalonica.

religioss. Lvs. to 11/2 in. long, scute at apex: cones cylindric-oblong, to 6 in. long, violet-blue. Mex.

rubra: Picea rubens.

sachalinensis. Saghalin F. Lvs. to 1½ in. long, entire or slightly notched and rounded at apex: cones cylindric, to 3 in. long, greenish-purple. N. Japan, Saghalin; very hardy. Var. nemorensis (A. Wilsonii) has smaller cones.

siblrica. Lvs. to 1½ in. long, rounded at apex, entire or notched: cones cylindric, to 3 in. long, bluish. N. Russia to Turkestan and Manchuria.—Sometimes suffers in hot

spectábilis (A. Webbiana). HIMALATAN F. Lvs. te 2½ in. long, rounded or notched at apex: cones cylindric, to 7 in. long, violet-purple. Himalayas; hardy in central-southern regions. Var. brevitôlia has shorter lvs.

squamata. FLAKY F. Bark flaky: lvs. to 1 in. long, obtuse: cones oblong-ovoid, to 2½ in. long, violet. W. China.

sutchuenénsis. Similar to A. Fargesii but differing in the shorter lvs. with yellow petioles. W. China.

taxifòlia: Pseudotsuga taxifolia.

Tschonoskiana: A. homolepis.

Veitchii. Lvs. to 1 in. long, notched at apex: cones cylindric, to 2½ in. long, bluish-purple. Japan; very hardy. Var. nikkoénsis, cones smaller; var. olivacea, young cones

venústa. Bristlecone F. Lvs. to 21/2 in. long, stiff, spiny-pointed: cones ovoid, bristly, to 4 in. long, purplish-

Vilmorinii. Hybrid between A. cephalonica and A. Pinsapo.

Webbiana: A. spectabilis.

Wilsonii: A. sachalinensis var. nemorensis.

ABRÒNIA. SAND-VERBENA. Nyctaginaceæ. Trailing or low annuals or perennials, with fragrant red, yellow, or white verbena-like fis. borne in a peduncled showy head subtended by bracts; native in W. N. Amer., a few of minor importance for borders and flower-gardens in sunny exposures.

Abronias are treated as annuals. For early summer bloom seeds may be started indoors, but they are usually sown directly in the open ground; in mild climates seeds may be sown in the fall. Remove the husk before planting; the seeds are often slow in germinating.

álba. Prostrate per.: fis. white. S. Calif. Var. platy-phýlla has broader wavy lvs.

arenaria: A. latifolia.

fragrans. Erect per. to 10 in.: lvs. usually ovate, pale below: fis. white, to 1 in. long, night-blossoming. B. C. to N. Mex.

grandifiòra: A. umbellata var.

latifòlia (A. arenaria). Yellow S. Per., prostrate: fis. lemon-yellow. Sea-coast Calif. to B. C.

marítima. Prostrate per.: fis. dark red. Sea-coast S. Calif.

pogonántha. Trailing per., glandular-villous: fis. pale lavender or purple. Mohave Desert.

umbellata. Pink S. The commonly cult. species: per, prostrate: fis. rose-purple. Sea-coast Calif. to B. C. Var. grandiflora has larger fis. Var. rosea has paler fis.

villosa. Similar to A. umbellata but with glandular-villous pubescence. Calif., Ariz., Utah,

ABROPHÝLLUM. Saxifragaceæ. One Australian shrub or small tree sometimes planted in S. Calif. A. ornans. Lvs. alternate, ovatelanceolate, to 9 in. long: fls. small, yellowish or greenish, in forking clusters shorter than lvs., the sepals and petals deciduous: fr. a berry 1/2 in.

ABRUS. Leguminosæ. Slender more or less woody vines with pinnate lvs. of many small lfts., small papilionaceous fls. in axillary racemes, and short pods; native in trop. regions and sometimes grown under glass N. for ornament and the interesting seeds.

Propagated by seeds which germinate more quickly if scaked, or by cuttings of firm shoots in sand under glass.

precatorius. ROBART-PEA. Twining to 10 ft.: fis. red to purple, rarely white: pods oblong, to 1½ in. long, with shining scarlet seeds black at base, used in bead-work and for rosaries. Tropics.

pulchéllus. Twining to 20 ft.: fls. pale purple: pods linear, to 2 in, long. Trop. Afr. to Malaya.

ARSINTHIUM: Artemisia Absinthium.

ABUMON: Agapanthus.

ABÙTILON. FLOWERING MAPLE. Malvaceæ. Herbs and shrubs with alternate often lobed lys. and bright red, yellow, white or striped mostly drooping fls.: distributed in warm climates.

Abutilons are used as house plants and for bedding out and A. megapotamicum makes an attractive basket-plant. They should be given the same cultivation as geraniums. Propagated by seeds and cuttings. Plants from seed sown in the open may be taken up in the fall and half of the new growth removed, for bloom in winter and spring. Some varieties are treated as annuals even if shrubby. Following are woody plants except A. Theophrastis.

Avicénne: A. Theophrastii.

Coolidgel: hort. name for pink-fld. form, probably of the A. hybridum group.

hfbridum. Cultigens: lvs. slightly 3-lobed or unlobed, spotted: fls. of various colors. Most of the garden forms belong here as they cannot be referred to the pure species.

indicum. Shrubby per. to 5 ft.: lvs. entire or toothed, to 4 in. across, white-tomentose: fis. yellow, 1 in. across, Tropics.

insigne. Lvs. not lobed, wavy-toothed, to 4 in. long: fis. to 2½ in. across, white or rose with dark veins. Colombia

máximum: hort. name.

megapotámicum (A. verillarium). Habit drooping: lvs. not lobed, wavy-toothed, to 3 in. long, often arrow-shaped: fis. with yellow petals and red calyx, to 2 in. long, with exserted stamens, fuchsia-like. S. Amer.

mollissimum. To 10 ft.: lvs. ovate, to 6 in. or more long, pubescent: fis. yellow, about ½ in. long. S. Amer.

pictum. Lvs. 3-lobed, toothed, middle lobe broadest at base, green or variegated: fis. orange or yellow veined crimson, 1½ in. long. S. Brazil to Argentina.—Often passes as A. striatum.

pleniflorum. Differs from A. pictum in the green lvs. and double fls. Of garden origin.

Savítzii: one of the A. hybridum group.

speciosum: listed as a dwarf free-flowering plant with large bright orange fls.

striatum. Lvs. 5-7-lobed, the middle lobe narrowed at base: fls. orange veined with dark crimson, to 1 ½ in. long. Guatemala.—Not common in cult. Var. Thompsonii has lvs. variegated with yellow.

Theophrástii (A. Avicennæ). Ann. herb to 5 ft.: lvs. nearly entire or toothed, pubescent, to 1 ft. across: fis. yellow, to ¾ in across. S. Asia; nat. in N. Amer.

Thompsonii: A. striatum var.

variegatum: hort. name, perhaps for a form of A. striatum

vexillàrium: A. megapotamicum.

vitifolium. Lvs. 3-7-lobed, to 5 in. across, tomentose beneath: fis. light blue, to 3½ in. across. Chile.

Leguminosæ. Shrubs and trees mostly of the tropics or warm temp. regions, particularly Australia, with bipinnate lys. or the lvs. reduced to leaf-like petioles or phyllodia and resembling a simple If., small usually yellow fls. in stalked heads or spikes, mostly in early spring, stamens free (not united at base as in Albizzia), and fr. a pod, ovate to linear, or moniliform (like a string of beads).

Acaias are grown extensively out-of-doors in warmer United States, particularly in California. They do not stand temperatures below 18-20° F. as a rule. They grow very quickly but are short-lived. In the tropics some species are grown as forage crops, for medicine, gums, soap, fibers, and other purposes. Acacias are often grown under glass for spring bloom, but are not usually well adapted to forcing as they do not thrive in temperatures above 40-50°. They need plenty of water and sunshine, and should be pruned after blooming and set out-of-doors for the summer.

Propagation is by seeds under glass or sown in the open. Germination is hastened by softening the hard seed-coats, either by placing the seed in hot ashes and leaving until

cool, or by soaking in hot water which is allowed to cool for 12-48 hours. Propagated also by cuttings of half-ripened wood with a heel.

abyssinica. Sts. villous: phyllodia linear, usually 20-30, ciliate-puberulous: fis. yellow, on very short peduncles. Ethiopia.

accola. Glabrous shrub to 8 ft.: phyllodia linear, 3-5 in. long, 1-nerved: fl-heads several in racemes that are 114-2 in. long: pods to 4 in. long and 14 in. broad, flat, with waxy lustre. Australia.

acinàcea. Much branched shrub: phyllodia oblong, about ½ in. long: fl.-heads ½ in. or less across, usually in pairs: pods linear, curved. S. Australia.

acuminata. Tree to 40 ft.: phyllodia long-linear, to 10 in. long and ½ in. broad, with fine parallel nerves: fis. in sessile spikes that are 1 ft. or less long; pods linear, less than ¼ in. broad, somewhat contracted between seeds. W. Australia.

adúnca: A. crassiuscula.

ailta. Shrub to 6 ft.: phyllodia decurrent along the st., forming wings to ½ in. across: fl.-heads ¼ in. across, solitary or in pairs. W. Australia. Var. platfptera (A. platsptera) has narrower phyllodia.

anetra. MULGA. Shrub or tree: phyllodia narrow-linear, to 3 in. long: fis. in spikes to 3/4 in. long: pods to 1/5 in. long. Australia, where it is used as fodder for cattle in times of drought.

arábica: A. nilotica.

armata (A. paradoxa). Kangaroo-Thorn. Shrub to 10 ft., with spines 1/2 in. long: phyllodia half-ovate, to 1 in. long: fi-heads 1/2 in. across, solitary: pods to 2 in. long. Australia. Var. péndula has larger phyllodia and more straggling habit.

aspera. Shrub to 4 ft.: phyllodia oblong-linear, to 1½ in. long: fl.-heads solitary or in pairs: pods to 2 in. long, contracted between seeds. Victoria, New S. Wales.

auriculæfórmis. Small tree: phyllodia oblong-falcate, to 8 in. long: fl.-heads in short racemose spikes: pods much twisted. Albany Isl., Queensland.

Baileyana. Shrub or small tree: lvs. bipinnate, the lfts. to ½ in. long, glaucous: fl.-heads about ½ in. across, in racemes to 3 in. or nore long: pods to 4 in. long, glaucous. New S. Wales. Var. purpures, listed name for a form with purple-tinged foliage.

Bancroftiana: probably a Casalpinia.

Bétchel. Shrub to 12 ft.: phyllodia linear, 3 in. long: fi.-heads globular, small, in racemes 3 in. or less long: pods 4 in. long, nearly woody. New S. Wales.

binervata. Shrub or tree to 40 ft.: phyllodia falcate to lanceolate, to 4 in. long: fi.-heads in short racemes: pods to 5 in. long. New S. Wales, Queensland.

brachybotrya. Tall shrub: phyllodia obovate, to 1 in. or more long: fl.-heads in short recemes or solitary; pods linear. S. Australia.

buxifòlia. Shrub, branches angled: phyllodia oblong-lanceolate and oblique, mostly 1 in. or less long, thickish, veins not prominent: fl.-heads globular, small: pods flat, ¾ in. or less broad. New S. Wales.

calamifòlia. Broom Wattle. Tall shrub: phyllodia narrow-linear, to 4 in. long: fi-heads almost ¼ in. across, in short racemes or rarely solitary: pods to 6 in. long, con-stricted between seeds. S. Australia.

Catechu. Tree: lvs. bipinnate, the lfts. ¼ in. long: fis. in spikes to 5 in. long: pods to 3 in. long. E. Indies, Himalayas.—Yields black catechu.

Cavenia. Espino Cavan. Shrub to 20 ft. with stout spines, and good for hedges: lvs. bipinnate: fl.-heads clustered. Chile.

confusa. Tree to 50 ft., with terete branchlets: phyllodia narrow-lanceolate, to 5 in. or more long, rather obtuse, about 5-nerved: fl.-heads axillary and solitary: pods 3 in. or more long, somewhat inflated, more or less constricted. Philippines, Formosa.

constricts (Acaciopsis constricts). Shrub to 10 ft. or more, spiny: lvs. bipinnste, lfts. to 1/2 in long: fis. bright yellow, fragrant, in globose heads: pods to 5 in long, constricted between the seeds. Tex., Ariz., Mex.

cornigers. Bullhorn A. Shrub or small tree with large infinited spines resembling the horns of an ox, often twisted: lys. bipinnate, the lfts. ¼ in. long; fls. in dense spikes to 1½ in. long; pods to 2½ in. long, beaked. Mex.

crassifiscula (A. adunca). Shrub, mostly with sharp-angled branches: phyllodia linear or some of them narrow-lanceolate, to 2 in. long, 1-nerved, thickish: fi.-heads small and dense, in racemes that are shorter than the phyllodia: pods linear, mostly less than ½ in. broad, thick and coriaceous, contracted between seeds. Queensland to Tasmania.

cultriformis. Kniff A. Tall shrub: phyllodia ovate, to 1 in. long, gray and glaucous: fi.-heads about $\frac{1}{2}$ in. across,

in long racemes forming a terminal panicle: pods to 3 in. long glaucous. New S. Wales, Queensland.

cuneàta. Tall shrub: phyllodia oblong, to 1 in. long: fl.-heads solitary, on stalks about as long as phyllodia: pods to 3 in. long, curved. W. Australia.

cyanophfila. Blue-leaf Wattle. Stoloniferous shrub to 18 ft.: phyllodia linear-oblong, 6-12 in. long: fl.-heads ¼ in. or more across, in short racemes: pods about 5 in. long, contracted between seeds. W. Australia.

cyclops. Shrub to 10 ft.: phyllodia narrow-oblong, to 3½ in. long: fl.-heads solitary or in short racemes, July-Dec.: pods to 2½ in. long, curved. W. Australia.

dealbata: A. decurrens var.

decipiens. Shrub to 12 ft.: phyllodia triangular, to ¾ in. long: fl.-heads solitary or in pairs: pods to 2 in. long, much curved. W. Australia.

decora. Shrub, with angled branchlets: phyllodia lanceolate or linear, to 2 in. long, 1-nerved: fl.-heads globular, in racemes exceeding the phyllodia: pods flat, about ½ in. broad, little if at all contracted between seeds. Queensland, New S. Wales.

decurrens. Green Wattle. Tree: lvs. bipinnate, the lfts. to !\(\frac{1}{5}\) in. long: fl.-heads !\(\frac{1}{4}\) in. across, in racemes: pods to 4 in. long. Australia. Var. dealbata (A. dealbata). SILVER WATTLE. To 50 ft.: lvs. silvery-gray. Var. mollis: (A. mollissima). Black Wattle. To 50 ft.: lvs. tomentose, yellowish when young. Var. normalis. Glabrous or young parts tomentose.

dentifera. Tall shrub: phyllodia narrow-linear, to 8 in. long: fl.-heads solitary or in pairs: pods to 3 in. long. W. Australia.

Dietrichiana. Phyllodia linear, to 3 in. and more long: fl.-heads about ½ in. across, solitary: pods 2½ in. long, contracted between seeds. Queensland.

diffùsa. Shrub to 6 ft.: phyllodia linear, about ¾ in. long, stiff: fl.-heads usually in pairs: pods to 4 in. long. S. Australia, Tasmania.

discolor. Shrub or small tree: lvs. bipinnate, the lfts. 14 in. long, pale beneath: fl.-heads in racemes: pods to 3 in. long. S. Australia, Tasmania.

dodonæifòlia. Tall shrub: phyllodia lanceolate, to 4 in. long: fl.-heads solitary or in pairs: pods long and flat. S. Australia.

doratóxylon. Shrub or small tree: phyllodia to 8 in. long and 1/4 in. across: fl.-heads in dense spikes to 1 in. long: pods to 4 in. long. Australia.

Drúmmondii. Shrub or small tree: lvs. bipinnate, the lfts. ¼ in. long: fl-heads in dense drooping spikes to 1½ in. long: pods to 1 in. long. W. Australia.

in. long: pods to 1 in. long. W. Australia.

ebúrnea. Shrub with stipular spines to 2 in. long: lvs. bipinnate, the lfts. to 1/8 in. long: fi-heads 1/4 in. or less across, solitary: pods to 6 in. long. Arabia to India and Ceylon.

elata. Tree to 60 ft.: lvs. bipinnate, the lfts. to 2 in. long: ft.-heads in racemes to 6 in. long, Sept.-Dec.: pods to 6 in. long. New S. Wales.

elongata. Tall shrub: phyllodia narrow-linear, to 4 in. long: fi-heads solitary or in pairs: pods to 2½ in. long. S. Australia.

exténsa. Shrub to 5 ft.: phyllodia linear, to 4 in. and more long, resembling branchlets: fi-heads solitary or in short racemes: pods to 4 in. long, contracted between seeds. W. Australia.

falcata. Shrub or small tree; phyllodia lanceolate-falcate, to 6 in. or more long; fl.-heads in short racemes; pods to 3 in. long. Queensland, New S. Wales.

Farnesians (Vachellia Farnesiana). POPINAC. OPO-PANAX. CASSIE. HUISACHE. SWEET A. Thorny much branched shrub to 10 ft.: lvs. bipinnate, the lfts. to ½ in. long: fi-heads ½-1½ in. across, very fragrant, in small clusters: pods to 3 in. long. Tex., Mex., Asia, Afr., Australia; original nativity uncertain.

filicioides: see A. hirta.

fimbriata: a form of A. linifolia var. prominens.

floribúnda: A. longifolia var.

Giráffæ. Camet-Thorn. Tree to 40 ft. with long stout spines: lvs. bipinnate: ft.-heads in clusters: pods oval, indehiscent. S. Afr.

glaucescens. Tree to 60 ft.: phyllodia lanceolate or falcate, to 6 in. long, gray-pubescent: fis. in spikes to 2 in. long: pods twisted or coiled. Queensland, New S. Wales.

grándis: A. pulchella var.

Gréggii (Senegalia Greggii). Texas Mimosa. Shrub or sometimes tree to 20 ft.: lvs. bipinnate: fls. pale yellow, in spikes to 2½ in. long, in summer: pods to 4 in. long, twisted. Tex. to Mex.

gummifers. Tree to 30 ft., with stipular spines: lvs. bipinnate: fi-heads in spikes: pods white-tomentose, contracted between seeds. Afr.

hakioldes. Small tree or shrub: phyllodia linear-spatulate, to 5 in. long and ½ in. wide, usually obtuse, 1-nerved: racemes of about 20 fls., small and head-like. Australia.

harpophfila. Tall tree: phyllodia falcate-lanceolate, to 8 in. long, pale or glaucous: fl.-heads in clusters or short racemes: pods to 6 in. long, slightly contracted between seeds. Queensland.

hastulata. Shrub to 3 ft.: phyllodia crowded, hastate-lanceolate, to 1/2 in. long, spiny-pointed: fl.-heads 1/8 in. or less across, solitary: pods to 2 in. long, curved. W. Australia.

heterophfila. Shrub to 5 ft.: phyllodia linear, often with bipinnate lvs. on adult branches: fl.-heads in racemes. Mascarene Isls.

hirta (Acaciella hirta). To 3 ft., herbaceous: lvs. bipinnate into 24-30 pairs of linear lits.: pods oblong, 2 in. long. Mo. to Tex., Fla.—Probably the plant cult. as A. filicioides belongs here.

hispidíssima: A. pulchella var.

holosericea. Shrub or tree to 20 ft., covered with white silky pubescence: phyllodia oval-oblong, to 6 m. long: fl.-heads in spikes to 2 in. long: pods twisted. N. Australia.

homalophfila. Small tree: phyllodia lanceolate to linear, to 3 in. long: fi-heads in pairs or clusters: pods linear, slightly curved. Australia.

horrida. Karroo-Thorn. Shrub or small tree: phyllodia oblong-linear, obtuse to subacute, to ½ in. long, sharp ivory-white stipular spines to 3 in. long; fls. in capitate clusters with peduncles bracteate at middle: pods linear, flat, to 4 in. long, glabrous, curved. S. Afr.

impléxa. Tree to 50 ft.: phyllodia lanceolate-falcate, to 6 in. or more long: fl.-heads in short racemes: pods narrow-linear, much twisted, contracted between seeds. Australia.

Jonesii. Shrub to 3 ft., very slender, branchlets hairy: lvs. bipinnate, with 5 or 6 pairs of pinnules that bear many lfts. $\frac{1}{2}$ in. or less long, nearly or quite linear: ft.-heads racemose: pods compressed and narrow, to 3 in. long. New S. Wales.

Julibrissin: Albizzia Julibrissin.

juncifòlia (A. pinifolia). Tall shrub: phyllodia linear, to 6 in. or more long: fl.-heads solitary or in pairs: pods to 4 in. long. Australia.

juniperina. PRICKLY WATTLE. Shrub to 12 ft.: phyllodia linear, to 34 in. long: ft.-heads solitary: pods to 2 in. long, contracted between seeds. Australia, Tasmania.

Kòa. Koa. Tree to 60 ft.: phyllodia falcate, to 5 in. long: fl.-heads usually in short racemes: pods to 6 in. long and 1 in. wide. Hawaiian Isls.

latifòlia. Phyllodia to 6 in. long and 2 in. across, glaucous: fl.-heads in loose spikes to 2 in. long: pods to 4 in. long. N. Australia.

Lébbek: Albizzia Lebbek.

lepròsa. Shrub or small tree: phyllodia linear-lanceolate, to 3 in. long: fl.-heads in pairs or clusters: pods falcate. Victoria, New S. Wales.

leptôclada. Shrub: lvs. bipinnate, the lfts. $\frac{1}{12}$ in. or less long: fl.-heads small, in racemes. Queensland.

ligulata: the plant grown under this name is probably A. salicina.

linearis. Shrub: phyllodia narrow-linear, to 6 in. or more long: fl.-heads in loose spikes to 2 in. long: pods to 4 in. long. Australia.

lineata. Shrub: phyllodia linear, to ¾ in. long: fl.-heads solitary: pods curved or twisted. Australia.

linifòlia. Tall shrub: phyllodia linear, to 1½ in. long: fl.-heads in short racemes: pods to 4 in. long. Queensland, New S. Wales. Var. próminens (A. prominens) has broader phyllodia and pods.

phyllodia and poes.

longifòlia. Synney Golden Wattle. Shrub or small tree: phyllodia oblong-lanceolate, to 6 in. long: fil-heads in loose spikes to 2½ in. long: pods to 5 in. long. Australia. Var. fioribunda (A. floribunda). Foliage at ends of branches: fis. whitish-yellow. Var. mucronata (A. mucronata). Phyllodia very narrow. Var. Sophoræ (A. Sophoræ). Phyllodia to 3 in. long and 1 in. wide, very obtuse.

lophántha: Albizzia lophantha.

lunăta. Shrub: phyllodia oblong-falcate, to 1 in. long: fi.-heads in racemes longer than phyllodia: pods glaucous. Australia.

macracantha. Shrub or tree to 20 ft., with spines to 2 in. long: lvs. bipinnate, the lfts. 1/4 in. long: fl.-heads to 1/4 in. across, solitary or clustered: pods to 5 in. long. Mex., S. Amer.

macracantholdes (Poponax macracantholdes). Shrub or tree to 40 ft. or more, with bipinnate lvs. and numerous narrow lfts. about ¼ in. long, and fis. in small yellow globular peduncled heads: pods 3 in. or more long and about ¼ in. broad, flat: spines mostly 1¼ in. or less long

and essentially terete. W. Indies, Venezuela.—This is the plant commonly known erroneously as A. macracantha, but that species has flattened ridged spines 2½ in. or more long and larger broader pods.

macradènia. Shrub to 12 ft.: phyllodia lanceolate-falcate, to 6 in. and more long: fl.-heads in short racemes: pods to 4 in. long. Queensland.

Màidenii. Shrub or tree to 50 ft.: phyllodia lanceolate-falcate, to 6 in. long: fl.-heads in spikes 1 in, long: pods much twisted. Australia.

Meissneri. Tall shrub: phyllodia obovate-oblong, to in. long: fl.-heads solitary: pods long and narrow. W. Australia.

melanóxylon. Blackwood A. Large tree: phyllodia oblanceolate, to 4 in. long and 1 in. wide, often with bipinnate lvs. also on young shoots: fl.-heads cream, ¼ in. across, in short racemes: pods to 5 in. long, twisted. Australia.

mollissima: A. decurrens var. mollis.

mucronata: A. longifolia var.

myrtifòlia. Tall shrub: phyllodia obovate to linear, to 2 in. and more long: fi.-heads in short racemes: pods to 3 in. long, curved. Australia.

Nèmu: Albizzia Julibrissin

neriifòlia. Bald A. Shrub or small tree: phyllodia linear-lanceolate, to 5 in. long: fi.-heads to ½ in. across, in short racemes: pods to 6 in. long. Australia.

nigricans. Shrub to 6 ft.: lvs. bipinnate, the lfts. to 1/2 in. long: fl.-heads solitary: pods to 1/2 in. long. W. Australia.

arabica. A. scorpioides). TREE. Tree with stipular spines: Ivs. bipinnate, the lits. to ½ in. long: fl-heads in pairs or clusters: pods to 6 in. long, moniliform. N. Afr., Eu.—The gum arabic of commerce is obtained from A. Senegal, not known to be cult.

Drooping much branched shrub: obovate or orbicular, to 1/2 in. long: fi-heads solitary or in pairs: pods to 2 in. long, twisted. S. Australia.

obtusata. Tall shrub: phyllodia oblong-linear, to 3 in. long, stiff: fl.-heads in short racemes. New S. Wales.

Oswaldii. Shrub to 10 ft.: phyllodia falcate-lanceolate to linear, to 2 in. long, stiff: fl.-heads solitary or in clusters: pods curved or twisted. Australia.

Oxycédrus. Stiff shrub: phyllodia linear-lanceolate, to 1 in. long: fl.-heads in dense spikes 1 in. long: pods to 3 in. long, Australia.

paradóxa: A. armata.

pendula. Weeping Myall. Small tree with drooping branchlets: phyllodia linear-lanceolate, to 3 in. long, stiff, gray: fi.-heads in pairs or clusters: pods to 3 in. long, the sutures narrowly winged. Queensland, New S. Wales.

penninérvis. Tree to 40 ft. or more: phyllodia lanceolatefalcate, to 4 in. long or more: fl.-heads in short loose racemes: pods to 5 in. long. Australia. Var. falcifórmis. Shrub with longer and more falcate phyllodia.

pentadènia. Tall shrub, with usually 4-angled branch-lets: lvs. bipinnate, the 2-5 pairs of pinnules bearing many lfts. ¼ in. or less long: fl-heads globular, clustered: pods flat, 1½ in. or less long, the valves elastic. W. Australia.

pinifòlia: A. juncifolia.

pinnata: A. tamarindifolia.

pinnatifòlia: listed name. platyphýlla of lists is probably A. alata.

platyptera: A. alata var.

podalyriæfðlia. Pearl A. Tall glaucous pubescent shrub: phyllodia ovate or oblong, to 1½ in. long: fl.-heads in long racemes: pods to 3 in. long. Queensland.

polybótrya. Small tree with subterete branches; phyllodia oblong, to 1/3 in. long, obtuse, hairy beneath; fis. in many-headed paniculate racemes. Australia.

pravissima. Screwfod A. Tree to 20 ft., with drooping branchlets: phyllodia ovate, to 1 in. long: fi.-heads less than ½ in. across, in racemes longer than phyllodia: pods to 3 in. long, much twisted. Victoria.

próminens: A. linifolia var.

pruinòsa. Small tree: lvs. bipinnate, the lfts. to ¼ in. ng: fl.-heads in racemes: pods to 3 in. long. New S. long: i

pubescens. HAIRY WATTLE. Shrub with drooping branchlets: lvs. bipinnate, the lfts. to 1/4 in. long: fl.-heads in racemes longer than lvs.: pods flat. New S. Wales.

pulchélla. Spiny shrub: lvs. bipinnate, the lfts. to ¼ in. long: fl.-heads solitary: pods to 2 in. long. W. Australia. Var. grándis (A. grandis) is glabrous with larger lfts. Var. hispidissima (A. hispidissima) is hairy with narrow lfts.

pycnantha. Golden or Broad-Leaved Wattle. Small tree: phyllodia to 6 in. long and 1½ in. wide or sometimes

4 in. wide on seedlings: fl.-heads 14 in. or more across, fragrant, in many-fld. racemes: pods to 5 in. long. S. Australia.

retindes. Shrub or small tree: phyllodia linear-lance-olate, to 5 in. long: fi-heads in short branched racemes: pods to 8 in. long. S. Australia. Vars. floribunda and gracultima are listed.

Riceana. Shrub or small tree: phyllodia linear, to 1½ in long, scattered: fl.-heads in loose spikes to 2 in long; pods to 3 in long, curved, contracted between seeds. Tasmania.

rùbida. Glabrous shrub, branches angular: phyllodia lanceolate, to 3 in. long, acute, 1-nerved: fis. in 10-12-headed racemes. New S. Wales.

salicina. Shrub or small tree with drooping branches: phyllodia oblong-linear, to 5 in. long: fl.-heads in short racemes or solitary: pods to 3 in. long. Australia. Var. Wayse. Shrub to 8 ft.

saligna. Shrub or small tree: phyllodia lanceolate, to 8 in. and more long: fl.-heads ½ in. across, in racemes: pods to 5 in. long, contracted between seeds. W. Australia.

scorpioldes: A. nilotica.

Sénegal. Tree to 30 ft.: lvs. bipinnate: fls. white, in axillary spikes. Trop. Afr.

Sentis. Tree to 40 ft.: lvs. lanceolate-oblong to linear. to 2 in. long: fl.-heads solitary or in pairs: pods to 3 in. long. Australia.

siculifórmis. Tall shrub: phyllodia linear or linear-lanceolate, to 134 in. long, stiff: fl-heads solitary: poda to 1 in. long. S. Australia, Tasmania.

Sideróxylon: listed name.

Sophoræ: A. longifolia var.

spectabilis. Branches glaucescent: phyllodia obovate-oblong, to ½ in. long, obtuse, fleshy, obscurely 2-3-nerved: fls. in many-headed racemes: pods to 4 in. long, glabrous.

stenophfila. Tree: phyllodia linear, to 1 ft. long: fl.heads mostly in short racemes: pods to 8 in. long, moniliform. Australia.

stenoptera. Stiff low shrub or bush: phyllodia running into long opposite wings, the upper or free part lanceolate or narrower: fl.-heads on very short peduncles: pods falcate, acuminate. W. Australia.

suaveclens. Shrub to 6 ft.: phyllodia linear, to 6 in. long: fl-heads in racemes: pods to $1\frac{1}{2}$ in. long, glaucous. Australia, Tasmania.

subulata. Shrub to 10 ft.: phyllodia narrow-linear, to 6 in. long: fl.-heads in racemes. New S. Wales.

Sûma (Senegalia Suma). Small tree: lvs. bipinnate, the lfts. to 1/4 in. long: fl.-heads nearly white, in spikes to 4 in. long: pods to 4 in. long. India, Ceylon.

tamarindifòlia (A. pinnata. Senegalia tamarindifolia). Shrub, prickly, often vine-like: phyllodia 10-20 pairs, linear-oblong, to % in. long, glands often present between the pinne, stipules large, ovate: fls. in panicled heads: pods 3-5 in. long, mostly glabrescent. Trop. Amer.

tenuifolia (Senegalia tenuifolia). Shrub with drooping branchlets: phyllodia linear-subulate, to 1 in. long: fi-heads solitary: pods to 3 in. long. Victoria.

undulifòlia. Shrub or low bush, sometimes becoming large: phyllodia ovate to nearly orbicular, to 1 in. or less long, 1-nerved, undulate: fl.-heads globular, on slender peduncles: pods flat, to ¾ in. broad. Queensland, New S. peaum Wales.

verticillata. Star or Whorl-leaved A. Shrub or small tree: phyllodia linear-subulate, to ¾ in. long, in whorls: fl.-heads in spikes 1 in. long: pods to 3 in. long. Victoria, Tasmania.

vestita. Branches hispid, terete: phyllodia falcate-elliptic, to ½ in. long, aristate, base obliquely unequal, 1-nerved, usually hispidulous, margins undulate: heads in small lax racemes to 1½ in. long. New S. Wales.

viscídula. Shrub to 15 ft.: phyllodia narrow-linear, to 3 in. long: fl.-heads mostly in pairs: pods to 2 in. long. New S. Wales.

ACACIA, BLACK: Robinia Pseudo Acaci Robinia Pseudo Acacia. Rose: Robinia hispida. Pseudo Acacia.

ACACIELLA: see Acacia hirta.

ACACIOPSIS: see Acacia constricta.

ACÆNA. Rosaceæ. More or less evergreen trailing perennials used in mild countries as ground-cover, and sometimes N. with protection, with pinnate lvs., inconspicuous fls. in terminal heads or spikes, and fr. a bristly achene; native in the southern hemisphere, also Calif. Propagated by seeds, division and cuttings. Useful in rock-gardens, and some of them more or less

argéntea. Sts. creeping: lvs. silvery, of 3-4 lfts.: fls. in globose spikes. Chile.

Buchánanii. Sts. prostrate and rooting: lvs. to ¾ in. long, of 11-13 lfts., whitish-green: fls. in small sessile heads, with yellowish spines. New Zeal.

cèsia glauca: listed name

cylindrostachya. Sts. prostrate: lvs. of 10-11 lfts. silky beneath: fis. in cylindrical spikes. Peru.

glabra. Sts. creeping: lvs. to 11/4 in. long, of 7-11 lfts., pale or glaucous beneath; fis. in brownish-green globose heads to 34 in. across. New Zeal.

glatica: listed name.

Hieronymii. Similar to A. pinnatifida from which it differs in the achenes bristly only at the apex. Argentina. inérmis: A. microphylla var.

microphylla. New Zealand Bur. Sts. prostrate: lvs. to 2 in. long, with 7-13 lts.: fis. in globose stalked heads to 3/4 in. across, with purplish-red spines. New Zeal. Var. inérmis has longer lvs. and spineless frs.

myriophfila. Sts. ascending: lvs. with 7-9 deeply cut lfts. silky beneath: fls. in interrupted spikes. Chile.

nòve-zelándise. Sts. creeping and rooting: lvs. to 3 in. long, with 11-13 lfts.: fis. in globose stalked heads to 11/4 in. across, with purplish-red spines. New Zeal.

ovalifòlia. Similar to A. microphylla but with larger lvs.

ovina. Sts. ascending to 2 ft.: Ifts. to 3/4 in. long, crenate or pinnately cut: fis. purple, in long interrupted spikes. Australia.

pinnatifida. Sts. erect, to 6 in.: lvs. of 3-5 pairs of 3-5-arted lfts., the segms, linear; fls. in cylindrical spikes,

Sanguis orbe. Sts. creeping and rooting: lvs. to 3 in. long, of 7-11 lfts., pale beneath: fls. in globose stalked heads to 1/4 in. across. Australia, New Zeal.

serices. Sts. creeping: lvs. of 3-5 pairs of obovate cuttoothed lits., silky beneath: fis. in crowded cylindrical spikes. Patagonia.

ACALYPHA. Euphorbiacex. Herbs, or the cult. species monecious or direcious shrubs with attractive foliage and small inconspicuous fls. often assembled in bracted, showy, axillary or terminal spikes or racemes. The species are many, in temp. and trop. regions of both hemispheres, some of them weedy annuals. Ours are conservatory ornamentals, employed also for bedding out far S. and for hedges and lawn specimens. The cult. is simple.

Propagated by cuttings taken from outdoor bedded plants in the fall; from plants lifted in the fall and cut back; and in summer from stock kept from the previous season; the last is the best method as outlings with a heel may be obtained which give excellent plants for use in the conservatory in fall and winter.

Godsefflana. Profuse shrub, bushy and dense; lvs. mostly green with cream-colored margin, variable in form, lance-ovate to variously shredded; fl-clusters shorter than lvs., greenish-yellow. New Guinea, but probably a state of A. Wilkestana. The heterophylla form with ragged lvs. sometimes reduced to shreds may occur on the same plant

Hamiltoniana: probably a form of A. Godseffiana is

heterophylla: A. Godseffiana var.

htspida (A. Sanderi). Chenille Plant. Redhot Cat-tail. Diccious shrub to 15 ft.: lys. green, broad-ovate, to 8 in. long: pistillate spikes drooping, dense, to 1½ ft. long and 1 in. wide, red or purple. E. Indice. Var. alba has creamy-white fls. and ramosa has compound spikes.

illústris: A. Wilkesiana.

Macafeana: A. Wilkesiana var. macrophýlla: A. Wilkesiana var.

marginata: A. Wilkesiana var.

Miltoniana. Described as differing from A. Godseffiana in larger size and more finely cut lvs.

musaica: A. Wilkesiana var. obovata: A. Wilkesiana var. ramòsa: A. hispida var. Sánderi: A. hispida.

tricolor: A. Wilkesiana.

triumphans: A. Wilkesiana var.

Wilkesians (A. Wilkesians va. Moncecious shrub to 15 ft.; Ivs. profuse, elliptic or ovate, 5-8 in. long, serrate, bronsy-green mottled with copper, red or purplish: spikes slender, 8 in. long and ½ in. wide, reddish. S. Sea Isls. There are many vars. in the trade: Macateana, Ivs. red marked crimson and bronze; macrophylla, lvs. russet-brown; marginata, lvs. with crimson or other margins; musaica (mosaica), lvs. green with orange and red markings; obowata, lvs. becoming bronzy-green with respect to the property of the pro and red markings; obovata, ivs. becoming bronsy-green with rosy-pink margins; triümphans, ivs. spotted crimson, green and brown. In its many color strains this plant is much planted in S. Fla. and the American tropics, less in S. Calif.

ACÁMPE. Orchidacex. Strong epiphytes with thick two-ranked lvs. and small fis. mostly in short lateral racemes, the lip with a short spur. Require trop. conditions; for cult. see Orchids.

multiflora. To 24 in. high: lvs. to about 1 ft. long and 2 in. wide: racemes or panicles almost as long as lvs.; sepals and petals yellow spotted with red-brown; lip whitish transversely lined with dark red. Mar.—Sept. China.

papilloss. To about 10 in. high: lvs. to about 4 in. long and ½ in. wide: racemes about ½ in. long, densely few-fld.; sepals and petals yellow spotted with brown; lip white transversely barred with purple. Nov.-Dec., Aug. Himalayas, Burma.

ACANTHÀCEÆ. ACANTHUS FAMILY. About 180 genera, mostly herbs widely distributed, largely in trop. countries, sometimes spinebearing: lvs. opposite, simple: fls. bisexual, irregular; calyx 4-5-parted; corolla gamopetalous, 5-lobed or 2-lipped; stamens 2 or 4; ovary 2celled with slender style: fr. a dry caps. Plants in many genera are grown for ornament in greenhouses and the open, both for showy fls. and for colored striking foliage, as Acanthus, Adhatoda, Anisacanthus, Aphelandra, Asystasia, Barleria, Beloperone, Crossandra, Dyschoriste, Eranthemum, Fittonia, Graptophyllum, Hemigraphis, Jacobinia, Justicia, Mackaya, Odontonema, Pachystachys, Peristrophe, Pseuderanthemum. Ruellia, Sanchezia, Schaueria, Stenandrium, Strobilanthes, Thunbergia, Whitfieldia.

ACANTHOCALÝCIUM, Cactaceæ. S. American genus allied to Echinopsis, resembling it in general habit but differing in having perianthtube and ovary covered with woolly recurved and pungently-tipped scales, and outer segms. with acuminate or mucronate chartaceous tips.

formdsum: Echinopsis formosa.

spiniflorum (Lobivia and Echinopsis spiniflora. Echinocactus spiniflorus). Globose to cylindrical, to 2 ft. tall and 6 in. diam.; ribs 17-22, notched, areoles about ¼ in. apart and whitish; spines straight, centrals 1-3, radials 10-20, reddish-brown to yellow becoming whitish, to ¾ in. long: fls. pink, funnelform, to 1¾ in. long. Argentina.

thionanthum (Lobivia and Echinopsis thionantha). Usually solitary, globose to subcylindric, to 5 in. tall and about 4 in. diam.; ribs 13-15, somewhat wavy, low, tubercles not distinct; spines to ½ in. long, radials 8-11, awishaped, grayish, central 1: fis. yellow, to 1½ in. long. Argentina.

violaceum (Echinopsis violacea). Globose to cylindrical, to 8 in. tall and 5 in. diam.; ribs about 15, to ½ in. high, notched; spines straight, centrals 3-4, to 1½ in. long, yellow tipped brown, radials 10-12, to 1½ in. long, yellow: fls. pale violet, to 3½ in. long, narrowly funnelform. Argentina.

ACANTHOCÈREUS. Cactacex. jointed mostly strongly 3-angled clambering or trailing cacti, usually several ft. long, the areoles with soft wool and several stiff spines: fls. white or greenish, funnelform, solitary, nocturnal: coasts of Fla. and Tex. to S. Amer. See Cacti.

hondurénsis: probably Selenicereus hondurensis. horrfbilis (A. horridus). Plant stout, with wider more deeply crenate joints than A. pentagonus; radial spines 1-6, to ½ in. long, very stout; centrals 1-2, to 3 in. long: fis. to 8 in. long. Guatemala.

hórridus: A. horribilis.

pentagonus (Cereus pentagonus. C. bazaniensis). To 20 ft., sometimes rooting at tips; spines several, to 2 in. long: fis. 6-8 in. long. Fla. and Tex., south.—Sometimes employed as a greenhouse plant and in the open in its native regions.

tetragonus: see Cereus tetragonus.

ACANTHOLIMON. PRICKLY-THRIFT. Plumbaginaceæ. Dwarf tufted hardy perennials with evergreen sharp-pointed linear rigid lvs. and fls. rose or white in tight heads, spikes or racemes; native S. E. Eu. to Asia.

The prickly-thrifts are slow-growing plants for rock-gardens and sandy places, needing sun and warmth. Prop-agated by cuttings in late summer and wintered under protection in a coldframe; also by layering.

armenum. To 6 in.: lvs. glauoous, flat to somewhat 3-sided: fls. white veined rose-pink, in dense 12-15-fld. spikes. Armenia.

glumaceum. To 6 in.: fis. small, rose, in dense one-sided racemes. July-Sept. Armenia.

gramineum. Densely tufted, to 8 in.: lvs. silvery-glaucous: fls. bright rose-pink, in elongated ascending or arching spikes. Turkestan.

lepturoides. To 3 in.: lvs. glaucous: fls. whitish, in loose racemes. Caucasus.

venústum. To 8 in.: lvs. glaucous: fis. rose or purple, in loose racemes. July-Sept. Asia Minor.

ACANTHÓPANAX. Araliaceæ. shrubs and trees, usually prickly, with alternate palmately lobed or compound lvs., small greenish fls. in umbels, and little blackish berries; grown for ornament and the following mostly hardy N.

Propagated by seeds sown at once or stratified, by root-cuttings over heat, or softwood cuttings from forced plants.

japonicus: the plant grown under this name is Aralia elaia; the true Acanthopanax japonicus is not known to be in cult.

lasifgyne. To 20 ft.: lfts. 3, glabrous, obovate to oblong, to 2 in. or more, acute, sometimes serrate above middle: fls. in umbels. China.

pentaphýllus: A. Sieboldianus.

ricinifòlius: Kalopanax pictus.

senticosus. Shrub to 15 ft.: sts. with slender prickles: Ifts. 5, occasionally 3, to 5 in. long, doubly serrate, stalked, veins pubescent when young: fls. in long-pedunoled umbels. N. China.

septémiobus: Kalopanax pictus.

sessiliflorus. To 12 ft.: lvs. of mostly 3-toothed lfts. to 7 in. long: fis. dull purplish, in globular heads. Manchuria,

Sieboldianus (A. pentaphyllus. Aralia pentaphylla). To 10 ft, with arching branches: lvs. of 5-7 toothed lfts. to 214 in. long: fls. greenish-white. Japan.—A good hardy shrub. Var. variegatus has lvs. edged with white.

spindsus. Differs from A. Sieboldianus in the thinner lvs. and 2 nearly distinct styles rather than 5 styles united almost to top. Japan.—Hort. material is usually A. Sieboldianus.

trifoliatus. Climbing shrub to 20 ft.: sts. with few hooked spines: Ifts. usually 3, ovate to lanceolate, to 3 in. long, serrulate, light green beneath: fls. slender pedicelled, umbels in terminal whorls. China.

ACANTHOPHŒNIX. Palmacex. feather-leaf palms of the Mascarene Isls. (beyond Madagascar) apparently not in cult. in N. Amer. unless in test plantations. Lf.-sheaths spine-bearing: they produce a single closely ringed spineless trunk to 50 or 60 ft. or more and hanging clusters at base of crown-shaft beneath the lvs.: fr. about ½ in. long, globose or oblong, hard, black. Probably these palms have been confused with Linoma (Dictyosperma) by cultivators.

ACANTHOPHYLLUM. Caryophyllaceæ. Stiff herbs, apparently not in cult., the plants grown as A. pungens (A. spinosum) being Dianthus Noeanus.

ACANTHORRHÌZA. Palmacez. A few American small woods fan-palms that bear root-spines along the single trunk but otherwise with the general look of Thrinax or Coccothrinax. Fl.-clusters among the lvs., somewhat branching, fis. hermaphrodite: fr. small, globular or pyriform: lvs. usually glaucous. Not in cult. within our territory unless under test. The genus has been combined recently with Cryosophila. which see

ACANTHOSABAL CÆSPITOSA: Paurotis Wrightii.

ACANTHUS. BEARS-BREECH. Acanthaces. Per. herbs or small shrubs with mostly basal broad toothed or pinnatifid lys., showy fls. dull white to rose or purple in long erect spikes; native in the Medit. region, Asia and Afr., only a few employed as ornamentals.

Heavy winter protection is needed in the North. 'They do best in rich well-drained soil. Propagated by seeds or by division in early autumn or spring. The bold leaves of acanthus have suggested important decorative features in art.

latifolius: A. mollis var.

lusitanicus: A. mollis var. latifolius.

móllis. To 2 ft.: lvs. not spiny, to 2 ft. long and half as broad, cordate at base, sinuately-lobed: fis. rose, lilao, or whitish, in spikes 1½ ft. long. S. Eu. Var. latifolius (A. latifolius, A. lusitanicus) is larger-lyd., more hardy, 3 ft. tall.

montanus. To 3 ft.: lvs. 1 ft. long, pinnatifid, spiny: fis. rose-tinted, in a terminal spike to 10 in. long. W. Afr. sorbsus: listed as an Abyssinian species with large

clusters of pink fls.: not known botanically. spinòsus. To 3 ft.: lvs. pinnatifid, the lobes toothed or cut. spiny; fis. purplish, in dense spikes. S. Eu., Asia

ACAULESCENT: stemless, or apparently stemless; sometimes the stem is subterranean or protrudes only slightly and is not noticeable; a descriptive term.

ACAULON: Aistocaulon.

ACER. MAPLE. Aceraceæ. Mostly deciduous trees with opposite usually palmately lobed or sometimes compound lvs., commonly unisexual fls., and fr. of 2 samaras long-winged on one side; native in north temp. zone.

Maples are used extensively for lawn, park and street planting; many are valuable timber trees. Most of the species are hardy in the northern states. They are strong and free-growing subjects. Ordinary soil is satisfactory for and free-growing subjects. Ordinary soil is satisfactory for the maples. Propagated by seed sown soon after maturity or stratified and sown in spring; rare species and varieties may be budded in summer on species of the same group. Some shrubby species are propagated by layers or half-ripened greenwood cuttings, or by cuttings in early spring from plants forced in greenhouses. Fancy maples may be winter-grafted by the veneer method on seedlings of the same or related species.

argûtum. To 25 ft.: lvs. 5-7-lobed, to 3 in. across, pale beneath: fis. in racemes to 2 in. long. Japan.

auratum: A. Negundo var.

barbinerve. To 25 ft.: lvs. 5-lobed, pubescent beneath, at least on veins, margins coarsely doubly-serrate: fis. yellowish-green, in racemes to 2 in long: nutlet of fr. about 14 in long. Manchuria.

Buergerianum (A. trifidum). TRIDENT M. Small tree: lys. 3-lobed, to 3 in. across, pale beneath: fis. in panicles. China, Japan.

Cámpbellii. To 50 ft.: lvs. 5-7-lobed, to 5 in. scross: fis. in cymes to 6 in. long. Himalayas.

campéstre. HEDGE M. To 50 ft. or more, the branches slightly corky: lvs. 3-5-lobed, to 4 in. across: fis. in erect corymbs. Eu. W. Asia. Some hort. vars. are: fibovarieghtum, lvs. with large white blotches; austriacum, lvs. 5-lobed; hebecarpum, fr. pubescent; pulveruléntum, lvs. speckled with white; taûricum, lvs. 5-lobed, pubescent beneath.

capilipes. To 30 ft.: lvs. 3-lobed, to 5 in. long: fis. in drooping racemes to 4 in. long. Japan.

cappadócicum (A. lætum). Coliseum M. To 50 ft.: lvs. 5-7-lobed, to 514 in. across: fs. in corymbs. W. Asia. Var. aŭreum, lvs. red and golden-yellow. Var. rübrum (A. colchicum var. rubrum. A. lætum var. horticola), lvs. when

18

oung blood-red. Var. sinicum, smaller, lvs. 5-lobed. China. Var. tricaudatum, lvs. 3-lobed. Var. tricolor, lvs. when young blood-red sprinkled with rosy-pink.

carpinifolium. Hornbeam M. To 30 ft.: lvs. ovate-oblong, to 5 in. long, pinnately veined, toothed: fis. in short racemes. Japan.

catalpifòlium. To 60 ft.: lvs. ovate, to 8 in. long, undivided or 3-lobed: fls. in loose corymbs. China; not hardy N.

caudatum. Large tree: lvs. 7-lobed, to 5½ in. across: fis. in erect spikes 6 in. long. Himalayas. Var. multiser-ratum. To 30 ft.: lvs. glabrous beneath. China. Var. ukurunduénse. Small tree: lvs. pubescent beneath. Japan,

circinàtum. Vine M. Small round-headed tree to 40 ft.: lvs. 7-9-lobed, to 5 in. across: fis. in drooping corymbs, the sepals purple: fr. red. B. C. to Calif.

cissifolium (Negundo cissifolium). To 30 ft.: lvs. of 3 lfts. to 3 in. long. toothed: fls. in racemes to 4 in. long. Japan.

crategifòlium. Hawthorn M. To 30 ft.: lvs. oblong-ovate, to 3 in. long, often with 2 or 4 lobes near the base, pinnate-veined, bluish-green: fls. in erect racemes 2 in. long. Japan.

créticum: A. orientale.

dasycárpum: A. saccharinum.

Davidii. To 50 ft., with shining striped branchlets: lvs. ovate, to 6 in. long, not lobed, pinnate-veined, in young plants lvs. often lobed at base: fls. in drooping racemes to 3½ in. long; fr. 1-1½ in. long. China.

diabólicum. To 30 ft.: lvs. 5-lobed, to 6 in. across: fls. yellow, staminate in clusters, pistillate in racemes. Japan. Var. purpuráscens. Fls. purple: lvs. red when young:

fr. purplish.

Diéckii (A. platanoides var. integrilobum). Hybrid between A. platanoides and A. Lobelii, with lobes of lys. entire.

disséctum: A. palmatum var.

Douglasii: A. glabrum var.

Drummondii: A. rubrum var.

filicifolium: listed name of a plant which may be A. japonicum var. aconitifolium.

floridanum (Saccharodendron floridanum). To 50 ft., the bark white: lvs. 3-5-lobed, 214 m. across, glaucous beneath: fls. in corymbs. Va. to Fla. and Tex.

Ginnala (A. tataricum var. aidzuense). Amur M. Graceful shrub or tree to 20 ft.: lvs. 3-lobed, to 3 in. long, terminal lobe long, shining above, pale beneath: fls. fragrant, in panicles. Manchuria, China, Japan. Var. Semenovii. Shrub: lvs. deeply 3- or 5-lobed. Turkestan.

glàbrum. Rocky Mr. M. Shrub or tree to 25 ft.; lvs. 3-5-lobed or 3-parted, to 5 in. across, shining above, pale beneath: fls. in corymbs: fr. often rose-colored. Mont. to Calif. Var. Douglasii (A. Douglasii) has 3-lobed lvs. and frs. slightly larger than the type. Alaska to Ore. and Wyo. Var. rhodocarpum has bright red frs. Var. tripartitum (var. trisectum) has lvs. usually 3-parted.

grandidentatum. To 40 ft., with dark brown scalv bark: lvs. 3-5-lobed, to 3 in. across, pubescent beneath: fis. in corymbs: fr. often rose-colored. Wyo. to N. Mex.

griseum. Paperbark M. To 25 ft., with cinnamonbrown flaky bark: lvs. of 3 coarsely toothed lfts. to 2½ in. long, pubescent beneath: fls. in cymes. China.

Heldreichii. Balkan M. Medium-sized tree: lvs. 5-lobed, to 5 in. across, middle lobe divided nearly to base, shining above, glaucous beneath: fls. in erect panicles.

Hénryi. To 30 ft.: lvs of 3 elliptic remotely toothed lfts. to 4 in. long: fis. in drooping racemes. China.

Hérsii. Closely related to A. Davidii, from which it differs in its 3-lobed ovate lvs., and fr. slightly less than 1 in. long. N. China.

Hobkeri. To 50 ft.: lvs. oblong-ovate, to 5½ in. long, cothed, caudate-acuminate: fls. in racemes to 4½ in. long. Himalayas; not hardy N.

hyrcanum (A. Opalus var. hyrcanum. A. tauricum). To 30 ft.: lvs. deeply 5-lobed, to 4 in. across, petioles red: fls. in drooping corymbs. S. E. Eu.

insigne: A. velutinum var. glabrescens.

ftalum: A. Opalus.

japonicum. Fullmoon M. Small tree or shrub: lvs. 7-11-lobed, to 5½ in. across: fls. purple, in nodding corymbs. Japan. Var. acreum, lvs. yellow. Var. macrophyllum, lvs. larger. Var. acontifolium (vars. Parsonsii, filicifolium and laciniatum). Fernleaf M. Lvs. divided nearly to base into 9-11 prints the out segme into 9-11 pinnately cut segms.

lètum: A. cappadocicum.

laxiflorum. To 50 ft.: lvs. oblong-ovate, to 4 in. long sharp-toothed with 2 or 4 short lobes near base: fts. in drooping racemes. China; not hardy N. Var. longflobum, lvs. 5-lobed.

leucodérme (Saccharodendron leucoderme). CHALK M. To 25 ft., rarely 40 ft., with light gray or grayish-brown bark: lvs. 3-5-lobed, to 3 in. across, pubescent beneath: fts. in corymbs. N. C. to Ga. and La.

16ngipes. To 30 ft.: lvs. 3-5-lobed, to 6½ in. across, the lobes entire, sometimes lvs. undivided: fis. in corymbs 4 in. across. China.

macrophfilum. Oregon M. To 100 ft.: lvs. 3-5-lobed or divided, to 1 ft. across, shining above: fls. fragrant, in drooping or spreading racemes to 5 in. long. Alaska to

mandshuricum. Shrub or tree to 30 ft.: lvs. of 3 oblong toothed lfts. to 4 in. long, glaucous beneath, petioles slender, red: fls. in cymes. Manchuria, Korea.

micránthum. Shrubby tree to 20 ft.: lvs. 5-7-lobed, to 3 in. across, lobes long-acuminate, doubly serrate, glabrous: fls. in racemes to 3 in. long: nutlet of fr. to ¾ in. long. Japan.

Miyabei. To 40 ft., bark of branches corky: lvs. 5-lobed, to 6 in. across, pubescent beneath: fis. in corymbs. Japan.

Mono (A. pictum). PAINTED M. To 60 ft.: lvs. 5-7-lobed, to 6 in. across, the triangular lobes entire; ffs. in corymbs 2½ in. across. Japan. Vars. šlob-maculātum and marmorātum have lvs. spotted white. Var. parviflorum, lvs. cordate at base. China, Koren.—The name A. pictum was originally misapplied by Thunberg to Kalopanax.

monspessulanum. Montpeller M. Shrub or tree to 25 ft.: ivs. 3-lobed, to 3 in. across, shining above, nearly evergreen: fls. in drooping corymbs. S. Eu, W. Asia.—Thrives in dry situations. Var. ibéricum, ivs. larger, inner lobes slightly 3-lobed.

lobes slightly 3-lobed.

Negúndo (Negundo fraxinifolium. N. aceroides Rulac Negundo). Box-Elder. To 70 ft.: lvs. of 3-5 ovate to oblong lits. to 4 in. long, rarely 7-9: fts. before lvs. Ont. to Fla. and Tex. Var argénteo-variegàtum is variegatum; auratum (var. californicum auraum), lvs. yellow; aireo-marginàtum, lvs. edged with yellow; aireo-rariegàtum, lvs. spotted with yellow; californicum (Negundo californicum, vigorous form with bloomy branchlets; var. variegàtum (var. argenteo-variegatum), lvs. with white margins; violàceum branchlets purolish or violet. lits. usually 5-7. ceum, branchlets purplish or violet, lfts. usually 5-7.

neopolitanum: A. Opalus var. tomentosum

nigrum (A. saccharum var. nigrum. Saccharodendron nigrum). BLACK M. To 120 ft., with black deeply furrowed bark: lvs. 3-lobed, to 5½ in. across, pubescent on veins beneath and often on petioles: fls. in corymbs. Que. to Ky. and Mo.

nikoénse. To 40 ft., branchlets pubescent: lvs. of 3 ovate to oblong slightly toothed lifts. to 5 in. long, pubescent beneath: fis in nodding cymes. Japan, China.

oblongum. To 50 ft., partially evergreen: lvs. oblong, to 5 in. long, entire or sometimes 3-lobed, glaucous beneath: fls in short panicles. Himalayas, China. Var. concolor, lvs. green beneath.

obtusatum: A. Opalus var.

Oliveriànum. To 30 ft.: lvs. 5-lobed, to 4 in. across, lobes long-acuminate, shining beneath: fls. in panicles. China.

Öpalus (A. italum. A. opulifolium). To 30 ft.: lvs. 5-lobed, the lobes short and broad, to 4 in. across: fls. in corymbs. S. Eu. Var. obtusātum (A. obtusātum), lvs. 5 in. across, pubescent beneath. Var. tomentōsum (A. neopolitanum), lvs. to 6½ in. across, tomentose beneath. Italy.

opulifòlium: A. Opalus.

orientale (A. creticum). To 15 ft. or more, half-ever-green: lvs. ovate or 3-lobed, to 2 in. long, leathery: fls. in corymbs. Medit. region.

palmātum (A. polymorphum). Japanese M. Shrub or tree to 25 ft.: lvs. deeply 5-9-lobed or divided, to 4 in. across, lobes acuminate: fis. purple, in corymbs. Japan, Korea. There are many hort. vars. as follows: aconitiolium, lobes divided to base and coarsely serrate; arginteum, lvs. marked with silver; atrolineāre, lvs. dark red, divided nearly to base; atropurpireum (var. nigrum), lvs. deep purple; aîreum, lvs. yellow; bícolor, lvs. purple and red; críspum, margins of lvs. rolled in; disséctum (var. nultifidum, var. decompositum, A. polymorphum var. nultifidum, var. decompositum, A. polymorphum var. nultifidum, var. decompositum, lvs. filicifòlium, lvs. laciniate; Fredericii-Guilélmii, lvs. finely cut, spotted with pink and white; heptálobum (var. septemlobum), lvs. usually 7-lobed; Héssei, lvs. dark purple; linearflobum, lvs. divided nearly to base into linear lobes; multifidum is var. dessectum; Nicholsonii; nigrum is atropurpureum; ornātum, lvs. pinnately cut, deep red; reticulātum, lvs. greenish-yellow with dark green veins and margins; ribesifòlium, lvs. divided to base into jagged-edged lobes; rōseo-marginātum, lvs. deeply cut, narrowly

edged with pink; rubéllum, a form of multifidum with young lvs. red; rhbrum, lvs. large, deep red when young; sanguineum, lvs. purplish-red; septémiobum is var. heptalobum; sessilifòlium, lvs. deeply cut, very short-stalked; sinuatum; Thánbergii, lobes coarsely toothed or cut; tricolor, lvs. spotted with red, pink and white; versícolor, lvs. green with large white spots.

pensylvánicum (A. strutum). Moosewood. Striped M. To 40 ft., bark greenish striped with white: lvs. 3-lobed at apex, to 7 in. long: fls. in drooping racemes to 6 in. long. Que. to Ga.

pictum: A. Mono.

pictum: A. Mono.
platanoides. Norway M. To 100 ft.: lvs. 5-lobed, to
7 in. across, shining above: fls. in erect corymbs. Eu., W.
Asia. Some of the hort. vars. are: albo-marginatum, lvs.
margined with white, perhaps not distinct from var.
Drummondii of European collections; aureo-marginatum,
lvs. margined with yellow; Clárkei, a selected strain of
albo-marginutum: columnare, habit columnar; cucullatum,
lvs. with short crimped lobes; globosum, with dense globose
head; laciniatum, habit columnar, lvs. with irregular clawlike lobes; Lorbérgii, lvs. divided nearly to base, hight green;
palmatifidum (var. dissectum), lvs. divided nearly to base,
dark green; ribrum (var. Reitenbachii), lvs. greenish-red
turning to dark red; Schwédleri, lvs. bright red when young;
Stóllii, lvs. with 3 entire lobes, purple when unfolding;
variegatum (var. albo-variegatum), lvs. spotted with white.
polymórohum: A. valmatum.

polymórphum: A. palmatum.

polymórphum: A. palmatum.

Pseudo-Plátanus. Sycamore M. To 100 ft.: lvs. 5-lobed, to 6 in. across: fls. in drooping panicles to 5 in. long. Eu., W. Asia. Some hort vars. are: atropurpureum is var. purpureum; bícolor, lvs. spotted yellow turning white; erythrocárpum, lvs. shining, fr. red; flavo-variegatum, lvs. variegated with yellow; Handjéryi, lvs. purplish beneath; Léopoldii, young lvs. rosy-pink variegated with yellowishpink; nervôsum, of pyramidal habit, lvs. yellow between veins; purpureum (var. purpurascens, var. atropurpureum), lvs. purple beneath; quadrícolor, lvs. spotted white, pink when young; rùbrum, perhaps not distinct from var. purpureum; tomentôsum (var. villosum), lvs. pubescent beneath; trícolor, young lvs. purplish spotted with yellow; variegātum (var. albo-variegatum), lvs. variegated with white; Wôrleei, lvs. deep yellow, petiole reddish.

pseùdo-Sieboldiànum. Differs from A. Sveboldianum

pseudo-Sieboldianum. Differs from A. Sieboldianum in lys. 9-11-lobed, the lobes doubly serrate: fis. purple, on glabrous peduncles. E. Asia.

on glabrous peduncies. E. Asia.

rùbrum (Rufacer rubrum). Red, Scarlet, or Swamp M.
To 120 ft.: Ivs. 3-5-lobed, to 4 in. long, shining above, glaucous beneath: fls. red or scarlet, before Ivs. Newf. to Fla. and Tex. Valuable as a street and park tree. Var. columnare, of columnar habit; Drümmondii (A. Drümmondii), Ivs. 5-lobed, pubescent beneath, Ind. to La.; globsum, of compact habit; magnificum, Ivs. scarlet in fall, veined green; tomentòsum, Ivs. 5-lobed, pubescent beneath; trilobum (var. trudens), Ivs. 3-lobed near apex, pubescent beneath.

rufinerve. To 40 ft, young branches glaucous: lvs. 3-lobed, to 5 in. long: fls. in erect racemes. Japan. Var. albo-limbatum, lvs. with margin of white spots.

saccharinum (A. dasyonrpum. Argentacer saccharinum).

Silver or White M. To 120 ft.: lvs. deeply 5-lobed, to 6 in. across, silver-white beneath. Que. to Fla. and Okla. Carden vars. are: sibo-variegatum, lvs. spotted white or pink; aŭreum, lvs. variegated yellow; crispum, lvs. cut and crimped; heteroph/flum, lvs. with deep unequal lobes; laciniatum (var. Wierl), Wiers Weeping M. branches drooping, lvs. deeply divided into cut lobes; lutéscens, lvs. yellow; pyramidale, of pyramidal habit; Skínneri, listed as a cut-leaf form with pendulous branches; tripartitum, lvs. divided nearly to base into 3 lobes; Wièri is var. lacinatum.

sáccharum (Saccharodendron barbatum). Sugar or Rock M. To 120 ft.: lvs. 3-5-lobed, to 6 in. across, light green beneath: fls. in corymbs. Que. to Fla. and Tex. Var. monumentăle, Sentra M., of columnar habit. Var. Rügelii, lvs. usually with 3 entire lobes.

Shirasawanum. Related to A. palmatum but Ivs. usually 11-lobed, cordate, fis. yellowish-white. Japan.

Sieboldianum. Shrub or small tree: lvs. 7-9-lobed, to 3 in. across, lobes acuminate, serrate: fls. yellowish, in nodding corymbs, on pubescent peduncles. Japan. microphfilum has lvs. about 2 in. across.

Spaèthii: form of A. Pseudo-Platanus with lvs. purple beneath and splashed with silver above.

spicatum. MOUNTAIN M. Shrub or tree rarely 30 ft.: lvs. 3- or.glightly 5-lobed, to 5 in. long, pubescent beneath: fts. in erect spikes to 5 in. long: fr. bright red in summer. E. N. Amer. Var. laciniatum, lvs. deeply lobed and cut.

striatum: A. pensylvanicum.

tatáricum. Shrub or tree to 20 ft.: lvs. ovate, to 4 in. long, pinnate-veined, toothed: fls. in erect panicles: fr. bright red in summer. S. E. Eu., W. Asia.

tauricum: A. hyrcanum.

tetrámerum. To 30 ft.: lvs. ovate, to 3 in. long, usually 3-nerved at base, toothed, sometimes slightly lobed: fis. in racemes. China. Var. lobulatum, lvs. slightly lobed. Var. tiliifòlium, lvs. cordate, pubescent beneath.

Trautvétteri. To 50 ft.: lvs. deeply 5-lobed, to 6 in. across, shining above, glaucous beneath: fls. in erect panicles. Caucasus.

trifidum: A. Buergerianum.

truncătum. To 25 ft.: lvs. deeply 5-lobed, 4 in. across, lobes entire or middle one sometimes 3-lobed, acuminate: fls. in erect corymbs to 3 in. across. China.

Tschonóskii. To 20 ft.: lvs. 5-7-lobed, to 4 in. across: fls. in racemes. Japan.

fis. in racemes. Japan.

velùtinum (A. insigne var. velutinum). Persian M. To
50 ft.: Ivs. 5-lobed, to 7 in. across, pubescent beneath: fis.
in erect panicles 4 in. across. Caucasus, N. Persia. Var.
glabréscens (A. insigne) has Ivs. glabrous and glaucous
beneath with individuals intermediate between this and
the pubescent-Ivd. forms often more common than the
extremes. Var. Van Volxémii has Ivs. to 1 ft. across and fis.
in dense subglobose corymbs. A form related to var.
glabrescens is Wôlfii which differs only in Ivs. purplish-red
beneath and the plant listed in trade as A. insigne var.
atropurpureum probably belongs here.

ACERACEÆ. MAPLE FAMILY. Two genera, Acer and Dipteronia, of trees and shrubs. The plants bear opposite prevailingly simple lvs., polygamous or directions fls. having 4-5 sepals and petals, rarely apetalous, 4-10 stamens, superior 2-celled ovary, and fr. of 2 samaras.

ACERÁNTHUS. Berberidacex.Hardy herbaceous perennials from Asia, with fls. in loose racemes; useful in the rock-garden or other semi-shady positions. Cult. as for Epimedium.

diphýllus (Epimedium diphyllum). Maplewort. To 5 in.: lvs. in 2's, obliquely cordate-ovate: fls. white, small. May-June. Japan. Var. rôseus has pink fls.

ACERÀTES. Asclepiadaceæ. N. American per. herbs differing from Asclepias in the hoods of the crown (in the fl.) being crestless or with an obscure crest-like keel; fls. greenish.

pūmila. Probably Asclepias verticillata var. pumila, a tufted plant to 10 in. with crowded needle-like lvs. to 2 in. long, small greenish-white fls in umbels and milkweed-like pods to 3 in. long. Ia. to New Mex.

ACHANIA: Malvaviscus.

ACHENE (akene): a dry indehiscent one-seeded peri-carp or fruit, as the "seeds" on the surface of the strawherry.

ACHILLEA. YARROW. Compositæ. Hardy herbaceous perennials bearing clustered small white, yellow or pink heads and often finely cut foliage: heads rayed; pappus none. Native in north temp. zone.

Yarrows are grown in borders and the smaller species in rock-gardens, and bloom in spring and summer, often lasting until autumn. They are of easy culture. Propagated by division and rarely by cuttings. Seeds should give blooming plants the second year.

abrotanifòlia: a confused name applied correctly to certain dissected-lyd. members of the genera Tanacetum and Chrysanthemum.

abrotanoides. Erect, to 15 in., more or less hairy: lvs. bipinnate, green: heads corymbed, white, rays 8-9, about as long as involucre. S. E. Eu.—Differs from A. atrata in involucral bracts having pale margins.

ageratifòlia. To 8 in., tufted, silvery-pubescent: lvs. pinnatifid: fls. white. Greece. Var. Aizoón (Anthemis Aizoon) has lvs. entire or merely toothed.

Agératum. Sweet Y. To 1½ ft.: lvs. oblong, obtuse, to 1 in., rarely to 2 in., long, toothed: fis. yellow, in compact corymbs to 1½ in. across. Eu.

Aizoón: A. ageratifolia var.

argentea. SILVERY Y. Less than 1 ft. high: lvs. 3-parted or pinnatifid, silvery-silky-pubescent: fls. white. Dalmatia.—Some of the material cult. under this name is A. Clavennæ.

atrata. Per., spreading, to 10 in.: lvs. linear-oblong, to 1 in. long, acutely and somewhat coarsely pinnatisect, segms. glabrous, nucronate: fls. white, in compact infl. to 1 in. across, rays 7-12, margins of involucral bracts dark brown or blackish. Cent. Eu.—A. Clusiana differs in its more finely

divided lvs. and smaller heads and is probably not specifically distinct from A. atrata.

aurea: cult. form of A. tomentosa.

canéscens: A. Fragsii var.

cartilagines. To 2 ft.: lvs. oblong- or elliptic-lanceolate, to 2 in. long, finely serrate, densely glandular-punctate: fis. white, in loose infl. to 3 in. across, ray-fis. 8-12. Eu. Resembles A. Ptarmica, differing in its broader punctate

chrysócoma. Low villous per. with very finely pinna-tisect lvs. whose segms. are linear-setaceous and crowded terminal corymbs of yellow-rayed heads. Mts. of Mace-

cinèrea: A. Fraasii var. canescens.

Clavennes. To 1 ft., tufted, silvery-pubescent: lvs. pinnatifid: fis. white, rays 6-20, in compact heads to ¾ in. across. Eu.—Entire lvd. forms are known.

Clusians: see A. atrata.

clvpeolata. White-tomentose: clypeolata. White-tomentose: lvs. linear-lanceolate, pinnatisect, segms. not deeply incised and usually entire or only toothed: fis. yellow, in deuse clusters. Greece.

Eupatdrium: A. filipendulina.

filipendulina (A. Eupatorium). FERNLEAF Y. To 5 ft., stout: lvs. 1-2-pinnately parted: fls. yellow, heads small in rounded clusters 2½-4 in. across. Orient.

Frasil. To 16 in., simple, closely silky-tomentose: radical lvs. bipinnate, narrow: fls. white, heads \(\frac{3}{4} \) in. across, short-stalked in corymbs. Greece. Var. canescens (A. cinerea) is gray-canescent throughout and has larger heads.

Fronmuelleri. Hybrid between A. abrotanoides and A.

Grisebachii: listed name.

Hérba-ròta. To 8 in., aromatic when handled: lvs. oblong to lanceolate, glandular-punctate, finely serrate, numerous on st., those of sterile rosettes obtuse: fis. white, large for size of plant, in loose clusters. Mts., S. Eu.

holosericea. To 1½ ft., silky-pubescent: lvs. pinnatifid: fls. yellow, rays 4-5, about ½ as long as involucre. Greece.

impatiens (A. nitida). To 3 ft., glabrous: lvs. lanceolate, pinnatifid, glabrous or nearly so: fis. white, rays 7-9, equalling or exceeding involucre. Siberia, E. Eu. rays 7-9.

Kélwayi: A. Millefolium var.

lanulosa. Similar to A. Millefolium from which it differs in its more woolly sts. and lvs. and in the infl. convex, not flat-topped. Que. to Yukon, south to Okla., Calif. and

Lèwisii. Hybrid between A. tomentosa and A. argentea, to 6 in. high having gray woolly pinnatisect lvs. and pale yellow fla.

ligustica. Marjoram-scented Y. Hairy and glandular, to 30 in., very leafy: lvs. ovate, pinnatifid, lower st.-lvs. with only 3-5 lateral segms: fis. white, in compound corymbs. Eu., W. Asia.—Differs from A. Millefolium in its coarser If.-segms. and in having the central If.-axis somewhat toothed.

macedónica: poorly understood plant from Eu., of questionable identity; plants so listed are probably referable to other species here accounted for.

mágna. To 3 ft.: lvs. 1-3-pinnately parted: fis. usually pink, the involucral bracts edged dark brown. Eu.—By some authors referred to A. ligustica.

Millefolium. Common Y. Millfoll. To 3 ft.: lvs. 1-2-pinnately parted: fis. white, but with pink in var. ròsea. Eurasia, N. Amer. Var. Kélwayi (A. Kelwayi) is listed as having magenta-red fis. Var. ràbra has dark pink fis.

mongólica: A. sibirica.

moschata. To 6 in., tufted, sts. simple and erect: lvs. glabrous, pectinate-pinnately parted, the segms. obtuse and nearly or quite entire, glandular-punctate beneath: fls. white, heads about 1/2 in. across. Eu.

nana. To 6 in., sts. ascending, woolly: lvs. pinnatifid: fis. white, rays 5-8, about ½ as long as involucre. S. Eu.—Probably not in cult., much of the material so listed being A. Millefolium.

Neilreichii: A. nobilis.

nitida: A. impatiens.

nóbilis (A. Neilreichii). To 1½ or 2 ft., white-hairy or nearly glabrous: lvs. 2-pinnate, segms. ovate, toothed: fis. dirty white, rays 3-7, less than half as long as involucre.

odorata. To 1 ft., st. little branched, woolly: lvs. 2-pinnate, segms. ovate-oblong, entire: fls. white. S. Eu.

Ptármica (A. salicifolia). Snememort. To 2 ft.: lvs. linear-lanceolate, glabrous, finely serrate, apex attenuate: fis. white, heads to ½ in. across. Eurasia, N. Amer. The var. Pearl, double, is common. Boule de Neige, Perry White and Globe are planted.

pyrenàica. To 2 ft., sts. glabrous or nearly so: lvs. lanceolate, acute, to 3 in. long, serrate, punctate, often pubescent, apex nearly obtuse, not attenuate: fis. white, heads to ½ in. across, rays 10-15. France, Spain. ròsea: A. Millefolium var.

rupéstris. To 8 in., tufted: lvs. linear-spatulate, to in. long, entire: fls. white, usually 5-6-rayed, heads to in. across. S. Italy.—Allied to A. Herba-rota, differing in lvs. of sterile rosettes acute.

salicifòlia: A. Ptarmica.

santolinoides. To 1 ft., sts. short-woolly matted, much branched: lvs. pinnatisect, about ½ in. long, the segms. less than ½ in. long, densely short-woolly: fis. white, in short-rayed heads about ½ in. across. Spain.

sérbica. To 10 in., finely pubescent: radical lvs. clustered, narrow, entire or minutely toothed; st.-lvs. 1½ in. or less long, broad-based, toothed: heads stalked, white, rays large. Balkan region.—Grown often as A. ageratifolia and perhaps only a variant of it.

serices. Botanically a synonym of A. coarctata, but plants so listed may be A. Millefolium.

setacea. To 3 ft., pubescent: lvs. 2-pinnatifid, the segms, filiform and often slightly prickly: fis. white or yellowish, in dense corymbs. Eu.

sibfrica (A. mongolica). To 3 ft.: lvs. lanceolate, toothed or pinnatifid: fis. white, rays 6-8, usually shorter than involuces. Eu., N. Asia.

stricta. Robust, erect, woolly above: lvs. bi- or tri-pinnate: heads white. Balkan region.

tomentosa. Woolly Y. To 1 ft., woolly, mat-forming: lvs. 1-2-pinnatifid: fls. yellow, few-rayed. Eu., Orient, N. Amer. Vars. álba, aurea and nana are listed.

Tournefortii. To 1½ ft.: lvs. pinnatifid, segms. coarsely dentate and obtuse: fis. pale yellow. Greece.

umbellata. To 5 in., densely woolly: lvs. pinnatifid, segms. oblong, obtuse, entire or toothed: fis. white, large-rayed. Greece.
Wilczeklana. To 1 ft., gray-pubescent: radical lvs.

Wilczekiana. To 1 ft., gray-pubescent: radical lvs. oblanceolate and obtuse, double-serrate, 3 in. long; st.-lvs. short, oblong, serrate: heads several in corymb, large, rays white. N. Italy.—Described as a hybrid between A. Herba-rota var. ambigua and A. nana.

ACHIMENES. Gesneriacex. Per. mostly branching herbs, 1-2 ft., with thickened, scaly Per. mostly or tuberous roots, grown under glass and some-times planted out for the showy somewhat gloxinia-like fls. borne in the axils of the lys., in reds, violet and white, spring and summer; native in trop. Amer. Most of the garden kinds are hybrids or variations from the original species.

After blooming the plants are dried off, the dry tubers being potted and started again in late winter or early spring. Propagated by offsets or division of the rhizomes, sometimes by cuttings.

grandiflora. Lvs. ovate, toothed, reddish beneath: fis. large, red-purple, often more than 1 in axil. Mex.

Haageana: A. longiflora.

longiflora (A. Haageana). TRUMPET A. Lvs. oval or ovate-oblong, toothed, pale beneath: fis. long-tubed, limb violet-blue, 1 in an axil. Guatemala.—There is a white var. magnifica: hort. form with violet-blue fls.

patens. To 1½ ft.: lvs. ovate-pointed, unequal, serrate, hispid: fis. violet-blue, the tube shorter than limb. Mex.

Swainsonii: hort, form with mauve fls. spotted blue and throat white.

ACHLYS. Berberidaceæ. Per. herbs of 2 species in W. N. Amer. and Japan: lvs. of 3 lfts., long-stalked: fls. minute, without petals, borne in dense spikes on leafless scapes.

triphylla. Deer-Foot. To 1 ft.: Ifts. fan-shaped, to 6 in. across, wavy-toothed: spikes 1 in. long. Woods, B. C. to Calif.—Sometimes planted in rock-gardens and similar places.

ACHRAS (Calocarpum). Sapotacex. Evergreen trees grown in trop. Amer. for their edible fr.: lvs. simple, thick, clustered near ends of branchlets: fls. white, gamopetalous, in clusters of 6-12 in the lf.-axils.

Sapotes are grown in the tropics and will not endure frost. They thrive in clay or clay loam soils. Propagated by seeds from which the husk should be removed before planting. The seeds should be only slightly covered and transferred into pots when 6 or 8 inches high.

Sapòta: Sapota Achras.

Zapòta (Lucuma mammosa). Sapote. Marmalade-Plum. To 65 ft.: lvs. obovate, to 16 in. long: fis. ½ in. across: fr. to 6 in. long, russet-brown, flesh reddish, with 1 shining brown seed. Cent. Amer. but widely distributed in trop. Amer.

ACHYRÁNTHES. Amaranthaceæ. A large group of trop. herbs or subshrubs not known to be in cult. in this country. The materials listed in the trade under this genus belong to Alternanthera or Iresine.

acuminata: Iresine Lindenii.

aurea: Alternanthera Bettzickiana var. Bésteri: Alternanthera Bettzickiana var. Bettzickiana: Alternanthera Bettzickiana Blardii: Alternanthera Bettzickiana var.

brilliantissima: Alternanthera Bettzickiana var.

Émersonii: Iresine Lindenii.

Gibsonii: Alternanthera Bettzickiana var.

Hérbstii: Iresine Herbstii. Lindenii: Iresine Lindenii. Verschafféltii: Iresine Herbstii. ACHYRODES: Lamarckia.

ACIDANTHÈRA. Iridaceæ. Tender summerblooming cormous plants somewhat intermediate in appearance between Gladiolus and Ixia: species about 18, in Afr.

Propagation is commonly by means of the abundant spawn or cormels that form about the old corm. Treat as for gladiolus.

bicolor. To 18 in.: fis. long-tubed, drooping, creamywhite with very dark center, 1,2-2 in. across. Trop. Afr. Mùrieliæ: Gladiolus Murieliæ.

ACINÈTA. Orchidaceæ. Strong epiphytes with large pseudobulbs, plaited lvs., and fis. in pendulous racemes on lateral leafless scapes, the lip 3-lobed. Require hothouse temperatures: for cult. see Orchids.

Bárkeri. Pseudobulbs to 6 in. long, bearing 2-4 lvs. up to 26 in. long and 3 in. wide: fls. golden-yellow, the lip spotted with red, about 1½ in. long, in racemes to 18 in. long. Sept.-Nov. Mex., Guatemala.

Húmboldtii: A. superba.

supérba (A. Humbolditi). Pseudobulbs to over 4 in. long, bearing 3 lvs. to 16 in. long and 2¾ in. wide: fls. reddish-brown spotted with red within, lip yellow or browned spotted with purple, about 3 in. across, in racemes to 16 in. long. Venezuela, Colombia, Ecuador.

ACIPHYLLA. *Umbelliferæ*. A genus of about 30 species of erect and usually spinescent glabrous perennials with thick pinnate lvs. and small fis. in compound spiny-bracted umbels: plants usually diocious. They are grown in the rock-garden or border.

Colensoi. To 5 ft.: basal lvs. numerous, 1-2-pinnate, to 2½ ft. long, lfts. to 15 in. long and ½ in. wide terminating in long stout spine: fls. white, in narrowly cylindrical panicle, staminate infl. much more lax than pistillate.

Monròi. To 14 in.: basal lvs. 1-2-pinnate, to 9 in. long, oblong-lanceolate, lfts. to 1½ in. long and ½ in. wide, usually 4-8 pairs, pungent but not spine-tipped: fis. in sompound umbels forming an open panicle. New Zeal.

similis. To 15 in.: lvs. of 4-10 pairs of narrowly linear lits. to 3 in. long, apex with short pungent point: fis. white, in compound umbels on stout peduncles. New Zeal.

ACKAMA. Cunoniaceæ. Small trees native in New Zeal., Australia and New Guinea, with opposite pinnate lvs., small unisexual fis. in compound panicles, and fr. a small leathery caps.; one species sometimes grown in S. Calif.

rosæfòlia. To 40 ft.: lvs. of 3-8 pairs of oblong toothed lfts. to 3 in. long. New Zeal.

ACŒLORRAPHE: Paurotis.

ACOKANTHERA (Toxicophlæa). A pocynaceæ. Shrubs or small trees, containing strong poisons, sometimes grown under glass and in the open in warm countries for the showy white or pinkish fragrant fis.; native in Afr. Propagated usually by cuttings in early spring.

Acmitum

spectabilis. WINTER-SWEET. Shrub 8-10 ft. or more with long narrow lvs. and clustered slender fis. nearly or about 1 in. long. S. Afr.

venenata. Bushmans-Poison. Lvs. broad and relatively short: fis. smaller. S. Afr.

ACOMASTYLIS: Geum.

ACONITE: Aconitum, Winter: Eranthia

ACONÌTUM. ACONITE. MONKSHOOD. Ranunculaceæ. Herbaceous perennials, usually branched, sometimes semi-climbing, with tuberous or thickened roots, delphinium-like foliage. showy hooded fls. in blue, white and sometimes yellow in late summer and autumn; they contain violent poisons; native in north temp, zone.

Aconitums require a rich soil; partial shade is better than full sun as the flowers last longer. They should not be moved until absolutely necessary. They are useful in rear borders and as specimen clumps. Propagated by seed or division of the roots, seeds giving flowers second and third years. The tall slender kinds of the Fischeri group may need staking. The cultivated monkshoods are not clearly differentiated. The hood or helmet is formed of one of the sepals, in which the two upper petals are contained; the other three petals are minute or may be absent.

acuminatum: A. paniculatum.

acutum: A. Napellus.

Anthora (A. pyrenaicum). Pyrenees M. To 2 ft.: segms. of lvs. linear: fls. pale yellow, the rounded helmet produced into short beak. S. Eu. Var. aureum is deeper yellow.

aureum: A. Anthora var.

autumnèle. To 5 ft.: lvs. pedately 5-lobed: fls. blue, lilac or whitish, the helmet closed. N. China.—It is not certain whether the plants cult. under this name really belong here.

Bakeri. To 2 ft.: lvs. cut into 5-7 deeply divided lobes: fls. dark blue, in a spike-like infl. Colo.

barbatum: A. lycoctonum.

Bárkeri: catalogue name, probably for A. Bakeri.

bicolor: probably a form of A. Fischeri.

californicum: A. columbianum.

Cammarum (A. exaltatum). To 4 ft.: lvs. with bluntish lobes: fis. purple, in loose few-fid. panicles, the hood closed. Hungary.

chinense. To 6 ft.: lvs. cut into 3 toothed or divided lobes: fls. bright blue, the helmet semi-circular. China.

columbianum (A. californicum). To 3 ft.: lvs. cut into 5 toothed or divided lobes: fis. blue or rarely white, the helmet strongly beaked and higher than broad. B. C. to Calif. and New Mex.—Very close to A. Fischeri and by some authorities not kept distinct.

cordatum: confused name.

delphinifòlium. To 1 ft., rarely to 2½ ft.: lvs. 5-lobed, segms. linear: fis. blue, few, rounded helmet produced into a very short beak. Alta. to Alaska.—By some considered a var. of A. Napellus.

exaltatum: A. Cammarum.

terox. Erect to 6 ft.: Ivs. ovate-orbiculate, palmately 5-lobed, segms. ovate-cuneate and incised: fls. pale dirty blue, helmet with short sharp beak, in terminal dense racemes. Himalayas.

Fischeri (A. sinense). To 6 ft.: lvs. cut into 3 lobed or notched divisions: fis. blue or white, the helmet about as broad as long and produced into spur-like visor. Asia.—Many garden names are associated with this group which seems to be highly variable.

Howellii. To 3 ft., sts. weak: lvs. laciniately cut, bearing bulblets in the axils: fis. pale blue. Ore., N. Calif.

japônicum. To 4 ft.: lvs. 2-3-divided, shining dark green: fis. deep blue or violet tinged red, the conical helmet with abruptly pointed beak. Japan.

longiligulatum: listed name.

ltridum. Erect to 3 ft., sts. simple, few-lvd.: lvs. palmately 5-lobed below the middle, to 3 in. across, segms. 3-divided, coarsely crenate: fis. dull red, helmet with long straight beak, racemes to 1 ft. long. E. Himalayas.

lutéscens. To 21/2 ft.: lvs. cut into toothed lobes: fis. pale yellow. New Mex. to Mont. and Ida.

lycóctonum (A. septentrionale. A. vulparia. A. barbatum). WOLFBBANE. To 6 ft.: lvs. cut into 3-9 broad toothed or lobed divisions: fls. yellow or cream, the comical helmet constricted below the summit. Eu., Siberia.

moldávicum: a synonym or form of A. lycoctonum.

monavicum: a synonym or form of A. lycoctonum.

Napéllus (A. tauricum. A. Willdenowit. A. acutum. A. strictum). To 4 ft.: lvs. 2-3-divided into linear segms: fls. blue, the helmet much broader than high and with beak-like visor. Eu. Very poisonous. Var. álbum has white fls. and var. bícolor blue and white. Var. cárneum, fls. flesh-color. Var. pyramidàle, fls. blue late blossoning, but may not differ from type. Var. rôseum, with pink fls., is listed. Var. præcox is advertised, also Spárksii or Sparks var. with dark blue fls.

orientale. To 4-5 ft., with broad panicle: lvs. palmatifid, cylindrical. Caucasus.

paniculatum (A. acuminatum). To 3 ft.: lvs. cut into 3-7 toothed or divided lobes: fls. blue, the helmet swollen on one side and beaked Eu.

præcox: A. Napellus var. pyramidàle: A. Napellus var. pyrenaicum: A. Anthora.

rostratum: A. varregatum.

septentrionale: A. lucoctonum. sinénse: A. Frscherr.

Snárksii: A. Napellus var.

Stoerkianum. The plant in the trade under this name is probably a form of A Prochers.

strictum: A. Napetlus.

tauricum: A Napellus.

thyraicum. To 2 ft., the sts. thickly leaved: lvs. cut into 7 toothed or cut lobes: fls. dark blue. Carpathians.

uncinatum. To 5 ft., partially climbing: lvs. cut into 3-5 toothed or divided lobes: fls. blue, the helmet about as broad as long and decurved beak. Pa. to Ga. and Wis.

variegatum (A. rostratum). Erect to 6 ft., but usually to waregatum (A. rostratum). Freet to 6 R., bit usually to 315 ft; ivs pulmately 3-lobed, segms, coarsely serrate to heriniate, lower lvs long-petioled, upper ones sessile; fls. blue to violet or white, in loose panicles, helmet bent forward, higher than broad and without prominent beak. Eu.

Vilmorinianum. Climbing: lvs. deeply cut into 3 lobed or toothed divisions: fls deep blue. China.

volubile. The plant in cult, under this name is probably A. uncinatum.

vulpăria: A. lycoctonum.

Willdendwii: A. Napellus,

Wilsonii: a form or variety of A. Fischeri with violet fls.

ÁCORUS. Aracex. Herbs inhabiting marshy places, having long slender parallel-veined grass-like Ivs., and fls. on a greenish spadix which appears to be borne laterally on the scape due to the leaf-like spathe; sometimes planted in bog-gardens; hardy. Propagated by division.

Cálamus. Sweet Flag. To 6 ft: lvs. to ³4 in. wide: spudix to 4 in long. Northern hemisphere. Var. variegatus has lvs. striped yellow.

gramineus. To 1 ft: lvs grass-like: spadix to 2 in. long. Asia. Var. pusillus is a dwarf form. Var. variegatus has lvs. striped white.

japónicus variegatus: A. Calamus var. variegatus.

ACROCLINIUM: Helipterum roseum

ACROCÒMIA. GRU-GRU. Palmaceæ. Monaccious feather-palms, mostly armed, more than 20 kinds in trop. Amer., some of which are planted in Fla., Gulf Coast and S. Calif.: trunk mostly tall, cylindric or swollen: lvs. pinnate, with narrow mostly drooping or curving pinnæ: spadices among the lvs., branched and drooping, with 2 stiff-hairy or prickly spathes; staminate fls. on upper part of branches; stamens 6: fr. rather large, usually 1 in. or more diam., the endocarp or inner shell with 3 pores near middle; outer part ripening into an eggshell-like nearly or quite smooth covering, the mesocarp between the shell and nut soft and usually edible and yielding oil but drying into a tough fibrous mass. See Palm.

Two groups or classes characterize the gru-grus. 1. One

group holds the petioles on the trunk for several years, the leaf-stalk breaking indway, the persistent bases or "boots" bearing spines; when the petiole-bases finally fall by decay the trunk is nearly or quite unarmed, and is marked by deep rut-like scars; often the bases are as hard as stone. To this group belong A. sclerocarpa, A. mexicana, A. mintera. 2. The other group, most frequently seen under cultivation in the United States, is known by deciduous petioles, the entire leaf usually falling intact, and shallow rings alternating with circles of spines mark the bole; some or nearly all the spines may fall eventually by weathering. weathering.

weathering.

The spathe in Acrocomia is double. The small outer spathe or valve usually falls early and is not observed if the ground is kept clean under the tree. The main inner spathe persists after the fruit is fallen, hanging as a long shell inside which is the spadix or flower-bearing part.

The trees have important uses in their native regions for food, oil, building materials and the making of liquors. tor tood, oil, building materials and the making of liquois. What species of Acrocomia may be in cultivation in the United States is not yet well known, but the following are to be expected. In Spanish-speaking West Indies the Acrocomias are known as corozo and corojo, but botanically that name should be reserved for the genus Corozo.

aculeata. Tall, to 50 ft., bole stout and cylindric or slightly thickened toward top, very spmy, petioles deciduous, pinne glabrous, main ones 1-1½ in. broad, more or less glossy above, green or at least not glaucous-blue underneath, rachis bearing spines: main spathe 3 ft. or more long, broad, densely brown-felted and bearing a few scattered spines: fr. depressed-globose to oblate, 1½ in. or more diam. Martinique; glou-glou or gru-gru.

or more diam. Martinique; glou-glou or gru-gru.

armentàlis (A. crispa). Tall, to 40 or 50 ft, bole slender
and conspicuously spindle-shaped at maturity, spines disappearing by weathering, petioles deciduous: pinnæ
glabrous, 1 in. or less broad, shining green on upper surface
and gray or bluish but not glaucous underneath, rachis
often nearly or quite unarmed: main spathe 3-5 ft. long
and very narrow, tomentose and scantily or not at all
spiny: fr. small and very smooth, globose to depressedglobose, 1 in or a trifle more diam. Cuba, where it is the
common cotojo.—The specific name is transferred from
Gastroca os armentalis of Morales, 1865.

crispa: A. armentalis.

fusifórmis. Trunk rather slender, to 40 ft. or so, gradutustorms. Trunk rather slender, to 40 ft. or so, gradually swollen or fusiform in upper part, spiny, petioles deciduous: pinne glabrous, about \(^{9}\)\(_{1}\) in, or less broad, glossy above, grayish underneath, rachis spiny: main spathe often 5 or 6 ft. long, broad and heavy, browntomentose and mostly spincless unless along edges of dehiseence: fr depressed-globose, about \(^{12}\)\(_{2}\) in. diam. Jamaica, where it is known as the mackaw-tree

mèdia. Stout tree to 40 ft. or more, bole cylindrical or media. Stout tree to 40 it. or more, bole cylindrical or practically so, very spiny, petioles deciduous: pinnæ narrow, about $\frac{3}{4}$ in. or less broad at middle, glabrous and more or less glossy above, glaucous-blue and finely pubescent underneath, rachis spiny: main spathe 3-5 it. long, broad, brown-tomentose and nearly free of spines: fr. depressed-globose, $1\frac{1}{2}$ in. diam. Puerto Rico, where known as corozo.

mexicana. Usually a low tree, trunk covered with petiole-bases or boots: pn_nue rather broad, 1 nn. or more at middle, nearly-pubescent labove, glaucous-blue and hairy-pubescent underneath, rachis bearing many long white-based spines: spathe 3-4 ft. long, broad, brown-tomentose and sometimes with a few spines: fr. depressed-globose, large, 1½ in. diam. S. Mex., where known as coyol.

large, 1/2 in. diam. S. Mex., where known as coyol. sclerocárpa. Tree to 30 ft. tall, bole covered with persistent petiole-bases at least until maturity: pinnæ narrow, glabrous above, gray or glaucous and finely pubescent underneath, rachis and petiole tomentose and bearing brownish spines: main spathe 2-3 ft. long, outside covered with short spines: fr. depressed, almost oblate, about 1½ in diam. Brazil; species confused, and still in doubt. doubt.

Totài. Slender tall tree, said to reach 80 ft. in its native regions, bole nearly or quite cylindric, spiny but becoming bare by weathering, petioles deciduous: pinne very narrow, mostly \$\frac{3}{2}\$ in. or less broad, glabrous and green on both surfaces: main spathe very slender, 4 ft. long and about 3 in. diam at middle after dehiscence, brownwoolly, spineless: fr. small, smooth and polished, about 1 in. diam, not depressed. N. Argentina, Paraguay, E. Bolivia, where it is known as totai by certain aborigines; apparently little planted within our territory, the trees so named being probably \$A\$. aculeata and others.

named being probably A. acuteau and otners.

vinifera. Tree to 40 ft., bole slender and long holding
the boots, usually cylindric but often turnid at middle,
petiole-bases persistent: pinne very narrow, about ½ in.
or less broad, sparsely hairy underneath: fr. depressed,
mostly more than 1½ in. diam: supposed to differ from
A. mexicana in main spathe very long narrow and cylindric,
the rachille or branchlets of spadix more or less appressed.
Nicaragua to Panama; known as corozo and coyal and
palma de vino. palma de vino.

ACRÒDON. Dwarf succulents Aizoaceæ. allied to Mesembryanthemum, with 3-cornered lys, having 1 or 2 small teeth on keel near apex: stigmas and fr.-cells 5.

bellidiflorus (M. bellidiflorum). Plant to 3 in.: lvs. to 3 in. long and 1/4-1/4 in. wide, recurved-spreading, glaucous: fls. solitary, petals white with a pink stripe, to 13/4 in. across; stigmas plumose.

ACRONÝCHIA. Rutacex. Trees or shrubs with mostly simple lvs. (of 1 lft.) and white or yellowish polygamous fls. in panicles or cymes; native from trop. Asia to Pacific Isls., one planted in S. Calif.

Baûeri. Tree: lvs. opposite, ovate or obovate, to 4 in. long: fis. very small, pubescent outside: fr. ½ in. diam. Australia.

ACROPERA LODDIGESII: Gongora galeata.

ACRÓSTICHUM. Polypodiacex. Coarse swamp ferns with stout erect rootstocks, often forming massive tussocks; fronds tall, thick leathery and 1-pinnate with the pinnae entire or obscurely toothed; sporangia borne in a dense mass over the entire under surface of the fertile pinnæ; native in the tropics.

aureum. Fronds erect, 3-9 ft. high, with only the upper pinnse fertile. Old and New World tropics.

crinitum: Elaphoglossum crinitum.

daneæfðlium (A. ercelsum). Fronds subcrect, 5-13 ft. high, with all or most of the pinnæ fertile. New World tropics.

excélsum: A. danexfolium.

ACTEA. BANEBERRY. Соновн. Ranunculacex. Herbaceous perennials with compound lys., small white fls. in showy terminal clusters in spring, and attractive shiny berries in summer and autumn.

They are useful in the rockery, the wild-garden or the border. They also do well in woods or in other shady places. Propagated by seed sown in late fall or in spring; rootdivision in spring is the best method.

ālba: the American plant long known by this name is now treated as A. pachypoda; the true A. alba of Philip Miller and based on European material is considered synonymous with the older A. spicala.

arguta (A. spicuta var arguta). Similar to A. rubra but with smaller nearly spherical berries. Alaska to Calif. and New Mex.

Cimicífuga: Cimicífuga fatida.

japónica: Cimicifuga japonica.

pachypoda (A. alba of American authors). White B. To 1½ ft: lvs. glabrous beneath except for few haus on veins: fl.-pediecls stout, to ½ in. long: berries white, or red in var. rubrocarpa. S. E. Canada to Ga., La. and Okla.

rûbra. Red B. To 2 ft.: lvs. usually with scattered hairs over lower surface: fi-pedicels slender, to % in. long; bernes crimson-red, rarely white in var. neglécta. Lab. to N. J. west to S. D. and Neb.

spicata. Herb-Christopher. Black B. To 2 ft.: fls. white or bluish: berries purplish-black. Eu., Japan.

ACTINÈA (Actinella. Tetraneuris). positæ. American herbs with narrow alternate resinous-dotted lvs. and solitary yellow heads of ray- and disk-fls.; pappus of scales; related to Helenium.

acaùlis. Similar to A, simplex but foliage silvery-silky. N. D. to New Mex.

fastigiàta (T. stenophylla). Per. to 4 in.: lvs. basal, narrow linear-oblanceolate, to 1½ in. long, glabrous: heads about 1 in. across, rays light yellow. Kans. to Tex.

grandiflora (Rydbergia grandiflora). Per. to 1 ft.: lvs. 1-2-pinnatifid into linear segms.: heads 2 in. and more across, the yellow rays to 3/4 in. long. Mts., Mont. to Naw May.

herbacea. Per. to 8 in.: lvs. basal, linear-spatulate, to 3 in. long, hairy: heads 2 in. across. Ont. to Ill.

linearifòlia (T. linearifolia). Ann. or bien. to 15 in., branched: basal lvs. spatulate, st.-lvs. narrowly linear, to 1½ in. long: heads to ¾ in. across, many, on slender peduncles. Kans. to La., west to New Mex.

simplex. Per. to 10 in.: lvs. basal, linear-spatulate, to 3 in. long, becoming glabrous: heads to 1% in. across, rays golden-yellow veined orange. S. D. to Colo.

stenoph vila: A. fastraiata.

ACTINELLA: Actinea.

ACTINÍDIA. Dilleniacex. Shrubby twining vines grown for their attractive foliage and A. chinensis also for the edible berries: lvs. alternate, long-stalked: fls. in axillary clusters or sometimes solitary, cup-shaped, usually white: native in Asia. The species here listed are hardy N. with the exception of A. chinensis and perhaps A corriacea

Actinidias grow equally well in sunny and half-shady locations. Propagated by seeds, sown in spring; also by cuttings of half-ripened wood in summer or of hard wood under glass; or even by layers. They are good vines for trellises and arbors.

argūta (A. volubilis). Bower A. Tara-Vine. Lvs. to 6 in. long: fls. white, brownish at base, 34 in. across, anthers dark purple: fr. greenish-yellow, sweet. Japan, Korea, Manchuria.

chinénsis. Yangtao. Lvs. to 5 in. long. white-tomentose beneath: fls. white turning yellow, to 2 in. across: fr. with gooseberry-like flavor. China.

coriàcea. Lvs. oblong, to 4 in. long, glabrous: fls. reddish, small: fr spotted. China.

Kolomíkta. Lvs. often variegated with white or pink, to 5 in. long: fls. white, $\frac{3}{4}$ in. across, solitary: fr. yellow or greenish. Japan, Manchuria, China.

lanceolâta. Shrub, branches somewhat pendent: lvs. lanceolate, to 3 in long, acuminate, white-tomentose beneath, maigins with mucronate serrations: fls. greenish, 3-6 in axillary cymes. China.

polfgama. Silver-Vine. Lvs to 6 in. long, usually variegated with white or yellowish: fis. white, ¾ in. across, solitary: fr. yellow, bitter. Japan, Korea, Manchuria, China.

purpùrea. Lvs. oblong or elliptic, to 4 in. or more long, dentate, glabrous underneath unless on midrib: fls. about ½ in. across: fr. purple, to 1 in. long, sweet. China.

volùbilis: A. arauta.

ACTINOLEPIS CORONARIA: Baeria aristata.

ACTINÓMERIS. Composita. Tall sunflowerlike branching native perennials, adapted to wild-garden, hardy border or amongst shrubbery. The plants resemble Helianthus and Verbesina, differing from the former in the flat or winged achenes and from the latter in having neutral ray-fls. rather than pistillate ones. Cult. as for Helianthus, propagated by seed or division.

alternifòlia (A. squarrosa). To 8 ft.: Ivs. lanceolate-oblong, to 10 in. long, acummate, serrate, base somewhat cuneate: fls. yellow, usually 1-2 in. across, heads many in corymbs, ray-fls. irregular, 2-10. E. N. Amer.

squarròsa: A. alternifolia.

ACTINOPHLŒUS. CLUSTER PALMS. Palmacex. A few neat unarmed monocious small spineless feather-palms of New Guinea and neighboring islands, distinguished from Ptycho-sperma (with which it has been united) by the homogeneous rather than ruminate albumen in the seed which is also very deeply sulcate, lvs. often irregularly pinnate and the segms. or pinnæ long or elongate, and the clustered or multiple trunks. See Palm.

hőspitus: A. Macarthuri var.

höspitus: A. Macarthuri var.

Macarthuri (Ptychosperma and Kentia Macarthuri).

Handsome palm with few or several slender ringed green trunks to 10 ft. and more high and graceful spreading and curved bright green rather soft foliage that is commonly transversely mottled: lvs. 2-3 ft. long, lighter colored underneath; pinnæ to 40 or more, 6-12 in long, with prominent secondary ribs, truncate and erose or jagged and fingered at apex, upper ones opposite: infl. below the lvs. short but branched: fr. ½-½ in. long, cartridge-shaped, wrinkled and furrowed in drying.—Does well in S. Fla. in partial shade; a good palm as a tub specimen under glass. Var höspitus. Differs from A. Macarthuri in its much narrower lateral lits. which are usually under

 $1\frac{1}{2}$ in. broad and their sides more nearly parallel, without much transverse mottling.—Planted in S. Fla.

Nicolai (Romanovia Nicolai). Much like A. Macarthuri but young lvs. and spathe purple or purple-red: pinnæ sometimes but not commonly more than 2 in. broad, midrib very prominent.—Planted in Cuba; to be expected in S. Fla.

Sanderianus (Kentia Sanderiana). Ornamental plant with many strongly ringed sts., to 10 ft. or so: lvs. 2-3 ft., gracefully spreading or arching on the mature plant; pinnae more slender and narrow than in A. Macarthur, the lower ones very narrow and long-acuminate, others oblique and erose or the narrow terminal ones truncate or barely so: fr. much as in the above.—An attractive delicate pot-plant; probably not now in cult. in N. Amer. outside testing places.

ACTINÓSTROBUS. Cupressaceæ. One species allied to Callitris but differing in having numerous scale-like bracts at base of cone. A. pyramidàlis (Callitris Actinostrobus). Shrub, densely branched: lvs. scale-like or sometimes needle-like: cones of 6 scales, 3/5 in. across. W. Australia.

ACTINÒTUS. Umbelliferæ. A small genus of Australian herbs, one grown for cutting. A. Helianthi. Flannel-Flower. Erect per. to 2 ft., woolly-tomentose: lvs. 2-3-pinnate, segms. linear-oblong: fls. minute, apetalous, forming dense head-like umbels subtended by radiating involucre to 4 in. across composed of 10-18 white-woolly petal-like bracts.—Not hardy N., but may be treated as an annual.

ACUAN: Desmanthus.

ACUTE: sharp; ending in a point.

ADA. Orchidaceæ. Two epiphytic orchids of which one is sometimes grown in a cool greenhouse. A. aurantiaca. Pseudobulbs to 4 in. long, bearing 1-3 lvs. to 9 in. long and ½ in. wide: fls. orange- or cinnabar-red, 1½ in. long, with narrow sepals and petals and much shorter 2-keeled lip, in arching 5-13-fld. racemes about as long as lvs. Nov.-May. Colombia.

ADAM-AND-EVE: Aplectrum.
ADAMS-NEEDLE: Yucca filamentosa.

ADANSÒNIA. Bombacacex. Big trees of Afr. and Australia with digitately compound lvs., large solitary pendulous fis. and woody frs.; planted as a shade tree in the tropics. The bark yields fiber and the fr. is said to be edible, known as "monkeys-bread."

digitate. BAOBAB. MONKEY-BREAD TREE. To 60 ft., developing a relatively short soft trunk to 30 ft. in diam. and a spread of branches of 30 ft.: lfts. to 5 in. long: fis. white, 6 in. across, often in advance of lvs., on long stalks, the petals soon rolling back exposing the purplish stamens: fr. to 1 ft. long, densely tomentose. Trop. Afr., where it has many uses.

ADDERS-TONGUE: Erythronium.
ADELIA: Forestiera.

ADELOCARYUM. Boraginaceæ. Per. or bien. herbs with alternate simple lvs. and bell-shaped fis. in terminal cymes; rarely grown in the flower-garden in warm countries. Differs from Cynoglossum in surface of nutlet concave and not flat or convex.

collectinum (Cynoglossum and Paracaryum calestinum). To 5 ft., somewhat hairy: lvs. broadly ovate, to 1 ft. long, upper ones becoming smaller: fls. blue, 1/4 in. diam., in branched racemes or cymes, nearly sessile. India.—The plant cult. under this name is likely to be Cynoglossum Wallichu.

ADENANTHÈRA. BEAD-TREE. Leguminosæ. Trees, allied to Mimosa, with compound lvs., long slender racemes of small yellow or white fls., and fr. a narrow pod with bright colored seeds; native in Old World tropics. One species

grown for the ornamental seeds, under glass or in the open far S. Propagated by seeds which have been soaked in hot water.

pavonina. Red Sandalwood Tree. Peacock Flower-Fence. Lits. about 13, oblong or ovate, to 1½ in. long: flow white and yellow, in racemes to 6 in. or more long: pods to 9 in. long, after dehiscing much coiled; seeds red, lensshaped, "Circassian seeds," sometimes used as beads. Trop. Asia and Afr.

ADENOCALÝMNA. Bignoniaceæ. S. American climbing shrubs with 2 lfts. and a terminal tendril, or 3 lfts., showy funnelform fls. in racemes or panicles, and long woody frs.; grown under glass or in the open only in warm regions, but little planted in U.S. Propagated by cuttings.

alliaceum (Bignonia alliacea). Lvs. of 2 oblong lfts. to 6 in. long: fts. whitish, 2 in. long, onion-scented, in 5-8-fld. racemes. Guiana.

ADENOCÁRPUS. Leguminosæ. Low shrubs with small alternate lvs. of 3 lfts., yellow papilionaceous fls. in terminal racemes, and fr. a flat pod; native in S. Eu., Afr. and Asia Minor. Grown under glass or in the open in the S. Propagated by seeds, by cuttings of green wood, and by layers.

foliosus. Branches and lvs. pubescent, densely crowded: fix abundant in many-fid. racemes; calyx pubescent. Canary Isls.

viscòsus. Evergreen: branches pubescent: Ifts. linearoblong: calyx glandular. Teneriffe.

ADENÓPHORA. LADYBELL. Campanulaceæ. Erect per. herbs with fleshy roots and fls. usually in shades of violet, much confused with Campanula, from which they differ in the presence of a tubular or cup-like disk surrounding the base of the style underneath the expanded filaments of the stamens. There is little in the external appearance of the plants to distinguish them from regular bellflowers. In the dried pressed fl. the disk can often be distinguished through a lens when the blossom is held to the light. Mostly montane; native in Siberia, China and Japan and a few of them in Eu. Summer bloomers in cult. Many of the plants grown as Adenophora are Campanula rapunculoides or related species.

Ladybells are handled the same as campanulas; propagated by seeds or by cuttings in spring. Roots should be disturbed as little as possible. Some of the species are useful in rock-gardens.

Bulleyana. Sts. puberulent, to 3 ft. or so tall, branched at top: lvs. on st. oblong-ovate to lanceolate, serrate, to 3 in. long: fts. close together on upper part of branches, sometimes 3 together, dark lavender, about 1 in. long. W. China.

chinénsis: A. sinensis. communis: A. lilifolia.

confusa (A. Farreri). Erect and stiff to 3 ft., slightly pilose to glabrous: st.-lvs. many, sessile or nearly so, rhomboid-ovate to lance-ovate, irregularly denticulate or crenate: fis. deep blue, nearly 1 in. long and lobed 1/2 to base, in a slightly branched panicle; style somewhat exserted. China.

cordata: plants seen in cult. under this name were Campanula Grossekii.

denticulata: A. tricuspidata. Plants grown under the name A. denticulata are likely to be Campanulas.

diplodonta. To 3 ft. tall, pubescent: Ivs. on st. ovate, narrowed at base, doubly or unequally serrate, to 3 in. or more long, hirsute underneath: fls. in racemes or panicles, sometimes twin, narrowly bell-shaped, nearly 1 in. long, lilac to white, style long-exserted, calyx-lobes very narrow. Yunnan, W. China.—A. Bulleyana may be grown under this name.

Fárreri: A. confusa.

Lamfrckii. Glabrous, to 2 ft.: lvs. on st. ovate-lanceolate, 2 in. long, sharply serrate, paler on under surface, ciliate on margins: fls. many in long racemes, bluish, ½ in. long and broad. Altai region, Siberia.

latifòlia. Sts. strict and simple, 1 ft. or more, glabrous, with remotely scattered foliage: lvs. on st. verticillate,

ovate-oblong, 2 in. long, serrate, glabrous except margin perhaps ciliate: fls. 2-3 on a peduncle or sometimes single, bluish, 34 in. or less long. Siberia.—Plants grown under this name are likely to be Campanulas.

lilifòlia (A. suaveolens. A. communis. A. lulıfıora erroneously). Sts. thick, to 4 ft. or so tall, from a thick fusiform root, glabrous: root-lvs. round-ovate and cordate, lvs. on st. ovate-lanceolate and coarsely serrate, to 3 in. long, glabrous or nearly so: fls. sweet-scented, paniculate, corolla about ½ in. long, blush or whitsh-blue. Cent. Eu., Siberia.—The specific name is commonly spelled luluflora but not so by Linnæus in Campanula. In gardens confused with Campanulas.

marsupiiflora. Slender, erect, 2-3 ft., branched: lvs. mostly on lower part of sts, linear to lance-linear, long-pointed, entire or nearly so, 2-3 in. long: fls. narrow-bell-shaped, on slender pedicels, bluish, style long-exserted. Siberia—Plants in cult. under this name may be Campanulus

megalántha. Sts. glabrous, to 2 ft.: lvs. on st. very narrow at base, obovate or obovate-elliptic, to 4 in. long, coarsely serrate, hairy on upper surface and setulose on nerves underneath: fls. racemose, large, nearly 2 in. long, deep rich bluish, style not exserted. W. China. Var. álba, white-fld., is listed.

niepénsis: listed name.

nikoénsis. Small, scarrely 1 ft. high, glabrous: lvs. on st. lanceolate, sessile, alternate, glaucous underneath, about 1 m. long: fls. few in simple spikes, bluish, about ¾ in. long, style included. Japan.

ornāta. Sts. 2-4 ft., puberulent or glabrous: lvs. on st. sessile, obovate to elongated-obovate, strongly serrate, to 2½ in. long, pubescent or glabrous: fls paniculate or racemose, 1 in. long, deep bluish, style included. W. China.

palústris. Sts 2-3 ft, glabrous, densely leafy: lvs. on st. thick, sessile, shining, oblong or orbicular-ovate, crenate-dentate: fls. in spike-like racemes, broadly bell-shaped, bluish, about ¾ in. across, style little if at all exserted.

polymórpha. To 3 ft., sts. branched, at least midway: lvs. on st. narrow-ovate to broad-lanceolate, sharp-pointed and strongly toothed, sessile and narrowed to base: fis. violet to purple, broad-bell-shaped, 1 in. across. Russia to Japan, in several forms or vars.

Potanini. Sts. weak or nearly scandent at base but becoming erect, to 3 ft and more, from a thick root, piloso: lvs. on st. ovate-lanceolate to lanceolate, to 2 in. long, strongly few-toothed to nearly entire, hairy: fls. in simple panieles, broad-bell-shaped, about ¾ in. long and somewhat broader, violet, style exserted. W. China.—Plants cult. under this name need verification.

remotifiòra. Sts. glabrous, erect 2-3 ft.: lvs. on st. petioled, cordate-ovate or narrower, acuminate, serrate or dentate: fls. loosely racemose or paniculate, violet, narrowly bell-shaped, style exserted. Japan.

sinénsis (A. chinensis). Sts. erect, 1 ft. and more, glabrous or pubescent: lvs. on st. sessile, ovate-lanceolate, to 2 in long, sharply serrate, glabrous on both surfaces but paler in color underneath: fts. racemose or paniculate, trumpet-shaped, about 2 in long, style exserted. China.

stricta. Plant of strict habit, whitish-hairy on upper sts. and lvs, the latter sessile and elliptic-ovate or obovate, 2-3 in. long, short-pointed or nearly obtuse, serrate: fis. in dense spikes, violet, pubescent on outside, bell-shaped, style little if at all exserted. Japan.

stylosa. Sts. simple, about 1 ft. tall, glabrous: lvs. on st obovate to ovate and acuminate, 1½ in. long, serrate, or the lower ones sinuate, glabrous: fls. in long lax racemes, corolla less than ½ in. long, blush, style equalling corolla or sometimes exserted. Siberia.—Plants seen in cult. have been Campanulas.

suavèolens: A. lilifolia.

Takèdai. Very slender, weak, less than 2 ft., glabrous: lvs. on st. few, thin, puberulent near margins on upper surface, glabrous underneath, linear, serrulate, ¾ in. or less long: fls. about 1 in. long, bell-shaped, violet-blue, style scarcely exserted. Japan.

Tashirdi. Low, glabrous, 2-10 in. tall, sts. often slender: lvs. on st. few, subsessile or petiolate, elliptic, ovate or obovate-oblong, coarsely serrate, about ¾ in. or less long: fls. few or solitary, ¾ in. or less long. violet-blue, style exserted. Japan.

tricuspidata (A. denticulata). Sts. simple, about 1 ft. tall, glabrous, leafy: lvs. on st. ovate-lanceolate, 1½ in. or less long, somewhat hairy on margins: fls. in long lax racemes, bell-shaped, bluish, less than ½ in. long and broad, style not exserted. China.

verticillata. Tall and slender, 2-3 ft., nearly or quite simple, sts. glabrous: lvs. on st. 3-6 at each insertion, ovatelanceolate, to 2 in. and more long, dentate: fls. usually few or several at a node, sometimes on slender branchlets, small

and narrow, about 1/2 in. long, style exserted. Siberia, China, Japan.—Variable; plants grown under this name may be Campanulas. It is an open grower, with fis. small for size of plant.

ADENOROPHIM. Jatropha.

ADENÓSTOMA. CHAMISO. Rosaceæ. Evergreen shrubs with small needle-shaped and heath-like lvs., white fls. in terminal panicles, stamens 10–15 in 2's or 3's, pistil single, style not exserted, and fr. an achene.

Planted somewhat in their native or similar regions. They need a sunny position and well-drained soil. Propagated by greenwood cuttings or by seed in the spring.

fasciculatum. To 10 ft.: lvs. about 1/4 in. long: panicles to 4 in. long. May-June. S. Calif., Lower Calif.—Herbage somewhat resinous and sweet-smelling.

ADHÁTODA. Acanthaceæ. Trop. shrubs with opposite entire lvs., tubular 2-lipped fls. in terminal spikes, and capsular frs.; cult. as for Jacobinia, in mild climates.

Vásica. To 8 ft. or more: lvs. oval, to 8 in. long, pubescent: fls. white striped with red, to ½ in. across, in spikes to 3 in. long. India to Ceylon.

ADIÁNTUM. MAIDENHAIR-FERN. Polypodiaceæ. Dainty shade-loving ferns with shiny black or purplish stipes and thin delicate fronds or If.-blades either simple or divided into fanshaped segms.; sori borne at edges of fronds; mostly of trop. Amer., in many species, a few in temp. N. Amer. and 1 native as far north as Que. and Alaska.

The greenhouse species require a temperature of 60-65°, a fairly moist atmosphere, and should be protected from full exposure to sun; soil of good loam and leaf-mold. The native species may be grown in the open in places like their native habitat, protected from wind and roots covered in winter.

acutum: a form or derivative of A. tenerum.

&mulum: A. cuneatum.

affine (A. Cunninghamit). Fronds to 15 in. long and 9 in. wide, 2-pinnate, segms. to 1 in. long, the stipes black and shining New Zeal.

Bárdii: a form of A. cuncutum with fronds to 2 ft. long. Baûsei: hort. form of A. tenerum.

béllum. Bermuda M. Fronds tufted, bipinnate, to 11/2 ft. long, the segms. to 3/4 in. long. Bermuda.

Capfilus-Véneris (A. Ferguson). Southern M. Venus-Hair. Slender, erect, spreading, to 1½ ft. high: fronds 2-3-pinnate, segms to 1 in across, very variable. Temp. and trop. Amer., warmer parts of Old World. Var. daphnites has simpler fronds.

cardiochlænum: A. polyphyllum.

caudatum. Trailing M. Fronds to 1 ft. long, 1-pinnate, segms. to 34 in. long, stipes short, brownish, hairy, rooting at apex. Old World tropics.

concinnum. Fronds 2-3-pinnate, to 1½ ft. long and 9 in. broad, on stout black stipes. Mex. to Brazil. Var. latum is stiff and upright with much larger fronds.

Croweanum: A. cuneatum var.

cuneatum (A. xmulum). Delta M. Fronds 3-4-pinnate, to 15 in. long and 9 in. wide, segme. to 15 in. across. Brazil. There are many forms as var. Charlottiæ; var. Croweanum (A. Croweanum), large, vigorous, hardy; var. gracillimum (A. gracillimum), fronds finely divided; var. gradidiceps, Tassel. M., tassel-like growths at ends of fronds; var. variegatum has white-striped segms. Vars. defléxum and dissectum are also listed.

Cúnninghamii: A. affine.

curvatum. Fronds forked, the main divisions again once or twice forked, on shining stipes. Brazil.

decòrum. Rather stiff, erect, stipes stout, brown-black: fronds 10 in. long, half or more as broad, dull green. Peru.

diáphanum. Fronds to 6 in. long, simply pinnate or usually 2-pinnate at base, segms. to ½ in. long. Asia to New Zeal.

élegans: hort, form of A, decorum,

excisum. Fronds to 1 ft. long and 4 in. wide, 2-3-pinnate, segms. with lobed margins. Chile. Var. multifidum has more finely cut fronds.

farleyénse: A. tenerum var.

Férgusonii: A. Capillus-Veneris.

formosum. Australian M. Fronds to 2 ft. long and two-thirds as broad, usually 3-pinnate, segms. to 1/4 in. long, stipes rough. Australia.

fragrantissimum; hort. form of A. cuneatum.

gloridsa Lémkesii: an improved form of A. tenerum var. farleyense, with larger fronds tinted pink when young.

gracillimum: A. cuneatum var.

hispidulum. Fronds forked at base, 2-3-pinnate, segms. to $\frac{2}{3}$ in. long, rachis hairy and rough. Old World tropics.

hýbridum: a hort name of doubtful status; has been referred to A. cuneatum.

Lathomin: hort, form of A, tenerum.

LeGrándii: a form of A. cuneatum var. gracellemum.

lunulatum. Walking M. Fronds 1 ft. long, rooting at apex, simply pinnate, on shiny black stipes. Tropics.

macroph'ilum. Fronds 1 ft. long, simply pinnate, segms. to 2 in. long. Trop Amer.

magnificum: form of A. tenerum.

Moòrei. Fronds to 15 in. long, 2-3-pinnate, segms. to ½ in long, deeply lobed. Peru

mundulum: a form of A. cuneatum.

O'Brienii: A. cuncatum form.

pedàtum. American M. Hardy: fronds forked, nearly orbicular, to $1\frac{1}{2}$ ft. across, segms oblong, stipes purphsh. Woods, N. Amer.

peruviànum. Fronds 1 ft. long, simply pinnate, segms. to 2 in long Peru.

polyphfilum (A. cardiochlænum). Fronds 2-3-pinnate, segms. to 1 in long, the stipes smooth and polished. S.

princeps: hort form of A. tenerum.

rhodoph flum: hort, form of A. tenerum.

Sánctæ-Catharinæ: a form of A. trapeziforme with deeper lubes.

scitum: a form of A. tenerum.

Siebréchtii. Supposed to be a cross between A. decorum and A. Williamsii.

and A. Williamsii.

ténerum. Brittle M. Fan M. Erect, to 3 ft.: fronds
3-pinnate, segms 34 in across, deeply notched, on stout
shining brown-black stipes. Trop. Amer. Var. farleyénse
(A farleyense) Farley or Barrados M. Fronds to 3 ft.
long and 2 ft. wide, infertile, drooping, delicate green sometimes rose-tinted, segms deeply cut. The race of farleyense
known as Gloriosa produces indusia and is said to be fertile.

trapezitôrme. Fronds to 1½ ft or more long, 2-pinnate, segms, trapezoidal, to ¾ in, across. Trop. Amer.

versaillénse: hort form of A. cuneatum.

Victòriæ: hort. form of A. tenerum.

Wágneri: hort form of A. decorum.

Weigándii: a form of A, decorum with larger less cuneate segms

Westlevanum: a hort, name of doubtful status.

Williamsii. Fronds triangular, nearly 1 ft. long, segms, nearly semicircular, 3-4-lobed. Peru.

Wrightii: probably a form of A. cuneatum.

ADICEA: Pilea.
ADIPERA: Cassia.
ADLAY: see Coix.

ADLÙMIA. Fumariacex. One attractive bien, vine native in E. N. Amer, and sometimes planted for ornament. It thrives in a cool damp place protected from sun and wind, as in a thicket. Propagated by seeds in spring, and often spontaneous thereafter. A. fungôsa (A. cirrhosa).CLIMBING FUMITORY. MOUNTAIN ALLEGHENY-VINE. Lvs. FRINGE 3-pinnate, fern-like, the petioles holding st. to the support: fls. white or purplish, dicentra-like, ½ in. or more long, in drooping axillary panicles: fr. an oblong caps.

ADONÍDIA. Palmacex. One attractive moncecious unarmed ringed feather-palm of the Philippines where it is cult., now planted in S. Fla.: spadices borne below the lf.-sheaths, at top of trunk, short-peduncled, branched; fls. in 3's, a pistillate between 2 staminate; stamens

numerous: fr. drupe-like with thin pulp, ellipticovoid, upwards of 1 in. long, bright red and showy, in clusters; seed 1, with ruminate albumen. A. Mérrillii (Normanbya Merrillii). MANILA PALM. Rather slender single trunk, 15-20 ft.: lvs. 6 ft. or so long, strongly arching; pinnæ many and closely placed, 24-30 in. long and to 2 in. broad, bifid at apex, 1-ribbed and prominently nerved at margins.

ADÒNIS. PHEASANTS-EYE. Ranunculaceæ. Hardy herbaceous perennials and annuals with alternate finely dissected lvs. and solitary terminal red or yellow fls.; native in temp. Eu. and Asia.

Asia.

A few are grown in the border and rock-garden and sometimes in the front rows of margins, the annuals in flower-gardens. Cultivation simple as any soil is satisfactory and either sunny situations or purtial shade. Both the annuals and perennals may be propagated by seed sown in the spring or fall; root-division in the spring may be used for perennals.

æstivalis. Summer A Ann. to 1½ ft: fls. crimson, to 1½ in across June-July. Cent. Eu. Var. citrina, fls. citron-yellow.

aléppica. Ann. to 1 ft.: fls. red, to 2 in. across. Syria. amurénsis. Per. to 1½ ft.: fls. golden-yellow, varying to white and pink, 2 in. across. Mar. Manchuria, Japan. Sometimes double.

finua (A. autumnalis). Autumn A. Flos A. Ann. to ft.: fis deep red with darker center, about ¾ in. aeross. June-Sept. Cent Eu. to W. Asia.

autumnàlis: A. annua.

chrysocyathus. Per. to 114 ft.: fls golden-yellow, to 214 in. across June-July Himalayas—Differs from A pyrenaica in the numerous and much smaller achenes of the fr.

flámmea. Ann. to $1\frac{1}{2}$ ft.: fls. bright scarlet, sometimes with black spot at base, to $1\frac{1}{4}$ in. across May–July. Eu., W. Asia.

pyrenàica. Per. to 1 ft.: fls. yellow, smaller than A. vernalis June-July. Pyrenees—Differs from A. vernalis in the lower lvs. not being reduced to scales.

vernàlis. Spring A. Per. to 1½ ft: fls yellow, to 3 in. across, early spring. Eu. A white form, álba, and a double-fld, var. are in cult.

ADOPOGON: Krigia.

ADÓXA. Adoxacex. One little per. herb with tuberous roots, native in N. N. Amer., N. Eu. and N. Asia and sometimes grown in the rockgarden. A. Moschatéllina. Musk-Root. To 6 in.: lvs. ternately compound into ovate 3-parted segms.: fls. green, small, in heads to ½ in. across, above the foliage: fr. a small green drupe.

ADOXÀCEÆ. MOSCHATEL FAMILY. Only one genus, Adoxa, of one species: fls. gamopetalous, with wheel-shaped 4-6-lobed corolla, 8-12 stamens, and 3-5-celled ovary.

ADROMÍSCHUS. Crassulacew. Succulent herbs distinguished from Cotyledon by the small tubular erect fls. in spike-like racemes terminating the stout bracted st.; S. Africa.

caryophyllaceus: botanical status uncertain.

clavatus: hort. name.

clavifolius. Per to 6 in., with short sts. having aerial roots: Iva ovate-lanceolate or spatulate, to 1½ in. long and ½ in. thick, indistinctly spotted: fls. greenish tipped with red, ½ in. long.

Cooperi (Cotyledon Cooperi). A little plant to 12 in., scarcely caulescent: lvs. 5-6 near base, spatulate, 2 in. long, spotted: fls. 6-10, red and greenish, tubular, about % in. long.

cristatus. Per. to 10 in., with stout st. densely beset with short aerial roots: lvs and sts pubescent; lvs wedge-shaped, undulate-dentate at apex, petiolate, to 1 in. long: fis. 1/2 in. long.

hemisphéricus. Per. to 14 in, with short leafy st: lvs. orbicular or obovate, flat above, convex on back, 1-2 in. long, 1-1½ in. wide.

maculatus. Per. with flat suborbicular lvs., gray-green heavily blotched with dark red-purple.

rhombifòlius. Per, with flat grav-green scalv lys., 2-31/4 in. long, 112-2 in. wide.

chomboideus: bort name

ADVENTITIOUS: foreign; said of a plant introduced but not yet naturalized or established; applied also to buds and shoots that arise otherwise than in the normal order

ÆCHMÈA (Hoplophytum). Bromeliacex. Epiphytic herbs from S. Amer. with stiff lvs. in a basal rosette and yellow or red fls. borne in spikes, panicles or racemes with often colored bracts; grown for ornament in the greenhouse. For cult, see Bromelia.

Bárleei. To 31½ ft.: lvs. to 3 ft. long, sword-shaped, pale green, marginal spines to ½ in. long: fls. pale yellow, subtended by red bracts to 3 in. long. Brazil. calyculata. To 1 ft.: lvs. to 1 ft., margins denticulate, rounded tip cuspidate: fls. bright yellow, in globose heads.

S. Amer.

discolor: Æ. fulgens var. or Æ. miniata var.

distans: Hohenbergia distans.

fasciàta (Billbergia rhodocyanea). Lvs. to 2 ft. long, toothed, lined and marbled with white on back: fls. pink, with pale red bract-lvs, in globose heads. Brazil.

fülgens. Lvs to 16 m. long and 3 m wide, with small teeth; fis red tipped with blue, in panicles branched below and simple above. Brazil. Var. discolor has lvs. brownish or violet-red beneath.

Mariæ-Reginæ. Lvs to 3 ft. long and 4 in. wide, pricklymargined fis red tipped with violet, in dense spikes to 1 ft. or more long, the bract-lvs. brilliant crimson. Costa Rica.

miniata. Lvs. with many close-set teeth: fls red with blue petals, in branched panieles much longer than lvs. Brazil. Var. discolor has lvs. purphsh or brownish on back.

Ortgièsii. Lvs to 1 ft. long and 34 in. wide, prickly-margined: fls red with straw-colored bracts, borne on short spikes Brazil.

polystachya. Lys to 2 ft. long and 1½ in wide, prickly-margined, fls violet with prominent bracts, in erect panieles.

speciòsa minùta is a listed name of unknown botanical standing

Thibautiàna: hort, name,

tinctoria. Plant with ensiform lys. strongly recurved, upper two-thirds of margin with coarse blackish spinular teeth to ½ in long, lower third entire: fis. many in erect infl, small and yellow in more or less dense heads, subtended by red or green floral bracts on a densely white-weekly entire Bracilly entire the coarse. woolly scape. Brazil

Veitchii. To 1 ft.: lvs. serrate, spotted: fls. pale green-ish-yellow, subtended by larger bright red serrate bracts. S Amer

viminalis: listed name of unknown botanical standing. Weilbächii. To 1 ft: lvs. short: fls. blue and red on a red-stemmed scape. S. Amer.

ÆGLE. Rutacer. Only one species, the BAEL FRUIT of India, Æ. Marmelos. Small tree with lvs. of 3 ovate lfts. and greenishyellow frs. 4-6 in. across, having a very hard shell and fragrant mucilaginous edible pulp. The pulp is used in making drinks and also has medicinal value. Propagated by seeds and suited to any good soil; may be grown in the warmer citrus regions, but little planted in the U. S. A. sepiaria is Poncirus trifoliata.

ÆGLÓPSIS. Rutacex. One species, Æ. Chevalièri, in swamps near the sea in trop. W. Afr., grown experimentally in this country as a possible stock for Citrus: spiny tree or large shrub with simple persistent lvs., small fls. in clusters and bearing 10 stamens, and globose or somewhat pear-shaped usually 6-celled whitish frs. ½-34 in. diam. with a fragrant pulp or mucilage.

ÆGOPÒDIUM. Umbelliferæ. Coarse per. herbs with creeping rootstocks, biternate lvs.,

yellow or white little fls. in compound umbels; 2 species in Eu. and Asia. The variegated form 2 species in Ed. and Asia. The variegated form is commonly planted for edgings and mats in shady places. Propagated by division.

Podagrària. Goutweed. Bishops-Weed. To 14 in 4 fls. white. June. Eu.; nat. in N. Amer. Var. variegàtum has lvs. margined with white.

ÆÒNIUM. Crassulacex. Succulent plants of Madeira and the Canary Isls. ordinarily referred to Sempervivum (which see) but by recent writers kept distinct. The group is marked by technical characters, such as calvx with 6-12 teeth or lobes, carpels partially sunk in calyx-tube; scales various. These plants are adapted to outdoor cult. in Calif., and are interesting under glass.

arboreum. Tender, to 3 ft.: rosettes terminal, 6 in, and more across, the oblanceolate or spatulate lvs. cliate on margins: fls. golden-yellow, about 34 in. across, numerous in terminal thyrse. Morocco.—Cult. in S. Calif. and known sometimes as Sedum or Crassula purpurascens because of color of foliage in autumn. Var. fòliis purpùreis, lys dark purple.

balsamiferum. To 3 ft., shrubby, with balsamic odor: rosettes terminal, loose, lvs. spatulate, chate: fls. yellow, in dense infl. to 4 in. long.

Burchardii. Subshrub to 1 ft. or more, with rich brown shining branches: lvs. in loose rosette or scattered, obovatespatulate, thickened down center: fis. buff with red line down middle, ½ in. across.

cæspitòsum (Æ. floribundum. Sempervivum hybridum). Tender plant to 6 in., woody: lvs. oblong-lnear, cihate, hned with brown: fls. yellow, in a forking corymb.

canariénse (Æ. gigantrum). Evergreen subshrub grown under glass and in the open in Calif, to 1½ ft. or more in bloom: lvs. in a large flattened or bowl-like tosette, large, obovate to spoon-shaped, with velvety appearance: fls. many in clusters, white or yellowish; petals 7-9, very narrow

Castello-Paivise. Shrub to 1 ft. or more: lvs in loose rosettes, spatulate, glaucous, limp and soft: fls. pinkish-white, in loose infl. to 8 in. long.

ciliatum. To 3 ft, shrubby, branches rough with tubercles: lvs. in loose rosettes, spatulate, margins red, shining: fls. greenish-white or pinkish, the infl. to 1 ft. long.

Cooperi: listed name.

cruentum: A. spathulatum var.

cuneatum. St fleshy and woody, plant glabrous, to 1½ ft: lvs rigid, long-cuneate, light green, mucronate, short-chate: fls. yellow.

decorum. Much branched shrublet: lvs. thick, lanceolate, attenuate at base and sessile, acuminate-pointed, shining green and rose-tinted; fls. corymbose; petals white with

domésticum: Aichruson domesticum.

floribúndum: A. cæspitosum.

gigánticum: A. canariense.

glutinòsum. Very sticky per to'2 ft., often decumbent: lvs. broad-spatulate, ciliate: fis. golden-yellow, ½ in. across, the infl. to 1 ft. long. Madeira.

Goochiæ. Much branched clammy shrub to 6 in. with woody tortuous branches: rosettes loose, the lvs limp, rhomboid-obovate: fls pink, 1/2 in. across, in loose infl. 2 in. across.

Haworthii. St. or trunk woody and much branched at base, to 1 ft. or more, the branches short: lvs. thick, ovateacute, glaucous and chiate: fis. pale yellow flushed rose, 40-50 in a terminal panicle.

hierrénse. Unbranched subshrub to 4 ft, dying after flowering: rosettes terminal, Ivs. spatulate, glaucous, margins red and ciliate: fls. pink to white, $\frac{1}{2}$ in. across, in large infl. to 2 ft. long.

holochrysum. St. woody and fleshy, with spreading branches: Ivs. rosulate, glabrous, broad-spatulate, narrow to base, chiate, purplish-keeled: fls. orange, in dense thyrse.

Lindleyi. To 1 ft., much branched, shrubby, with tortuous branches: lvs. obovate-spatulate, very fleshy and sticky-pubescent: fls. yellow, the infl. to 3 in. across.

Manriqueorum. Per. to 6 ft., woody, with tortuous branches: rosettes terminal, to 8 in. across, the lvs. spatulate, shining, cliate: fls. bright yellow, the infl. glandularpubescent, to 8 in. long.

nobile. To 2 ft, dying after flowering: lvs. semi-circular, to 1 ft. long, very thick, pale yellowidingreen; fis. dark red, in a dense flat infl. to 2 ft. across.

percárneum. Subshrub to 4 ft.: rosettes terminal, loose, the lvs. cuneate-spatulate, fleshy, margins red and ciliate, purple in sun: fls. pink, the infl. 10 in. long and broad.

pseudo-tabulæfórme. Hybrid, probably with A. tabu-læforme as one parent, but nearly stemless and rosette very flat: fls. golden.

sedifolium. Shrub to 1 ft., very twiggy, the branches tortuous: lvs. obovate, ½ in. long, shining and sticky, marked with red. fls. bright yellow, in small clusters.

spathulatum (Æ. strepscludum Æ. Tourneforti). Tender shrubby plant, with stout sts. 1 ft. or more high: rosettes with lvs marked with red-brown: fts. yellow, in large many-fid. panicles. Var. cruéntum (A. cruentum, Semperwium pulchellum), sts. and lvs. red when grown in exposure.

strepsicladum; A. spathulatum.

tabulæfórme. Evergreen subshrub to 1 ft. or more, grown under glass and in Calif. in the open: lvs. in flat rosettes at ends of branches, oblong-spatulate, chate: fls. pale yellow; petals 10-12, narrow.

tabularis: hotonical status uncertain

Tournef ortii: A. spathulatum

undulatum (Sempervivum Doramæ). Robust, woody, 11/2 ft.: lvs. spatulate-ovate, narrowed at base, mucronate, undulate, cliate, sometimes reddish: fis. yellow.

urbicum. Unbranched shrub to 5 ft. dving after flowering: rosettes terminal, lvs long-spatulate, margins red and ciliate: fis. greenish-white or pinkish, ¾ in. across, in pyramidal infl. to 2½ ft. long.

AERÁNGIS. Orchidacex. Very short-stemmed epiphytes with mostly white fls. in long manyfld. racemes, the lip with long slender spur. See Orchids for cult.

modésta (Angræcum modestum and Sanderianum). Lvs. to 6 in. long: fls. snow-white, about 1½ in. across, the spur to 3 in. long, in pendulous racemes. Apr.-May. Mada-

AËRÎDES. Orchidacex. Epiphytes with thick two-ranked lvs. sheathing at base and fls. in lateral pendulous racemes, the 2 lateral sepals attached to base of column, the dorsal sepals and petals similar, the lip 3-lobed and produced into a hollow usually upturned spur. Cult. in the hothouse; see Orchids.

affine: A. multiflorum.

crassifòlium. Lvs. to 8 in. long and 2 in. wide: fls. rosepurple, $1\frac{1}{2}$ in. long, the spur greenish at tip, in racemes longer than lvs. May-June. Burma.

crispum. Lvs. to 10 in. long, lorate, retuse: fls. large, many in drooping racemes; sepals and petals white tinged rose, lp 3-lobed, middle lobe fringed, white at base and deep rose-purple on terminal half. E. Indies. Var. Lindleyanum has large branching spikes of white and purplishpink fls.

expánsum: A. falcatum.

falcatum (A. Lurpentse. A erpansum). Similar to A. crassifolium but with amethyst-red lip and white sepals and petals spotted with purple. May-June. Burma Var. Houlletianum (A. Houlletianum) has whiter lip and yellowish-brown sepals and petals. Var Leoniæ (A Leoniæ) has larger fis. with white lip spotted and edged with dark red.

Fièldingii. Lys. to 10 in, long and 1% in, wide: fls. white dotted and suffused with rose, 1½ in. across, the spur white, in racemes longer than lvs. May-June. India.

Houlletianum: A. falcatum var.

Larpéntæ: A. falcatum.

Lawrencese. Lvs. to 1 ft. long and 2 in. wide: fls. 11/2 in. across, sepals and petals white tipped with amethyst-purple, the lip white with purple central lobe and green spur, in racemes as long as lvs June-Aug. Philippines Var. Sanderianum has creamy-white sepals and petals tipped with magenta, and yellow-magenta and creamy-white lip.

Lednise: A. falcatum var.

multiflorum (A. affine. A. roseum). Lvs. to 9 in. long and \$4 in. wide: fls. 1 in. across, the sepals and petals white spotted and tipped with purple, the lip light purple deeper in middle, in racemes longer than lvs. July-Sept. Himalays to Cochin-China.

odoratum (A. suavissimum). Lvs. to 8 in. long and 2 in. wide: fls. fragrant, to ! in. long, the petals and sepals white with purple spot at tip, the lip white spotted with red and the middle lobe rose, in racemes often longer than lvs. July-Sept. India to China, Philippines. Var. album has white fls. Var. majus (A. virens) has larger spikes of fls. than type.

quinquevulnerum. Differs from the last only in having the middle lobe of the lip toothed on the edges. Philippines.

rdseum: A. multiflorum.

Sanderianum: A. Lawrencez var.

suavissimum. A odoratum

vandárum. Lvs. to 8 in. long, cylindrical: fls. 2 in. long, white and somewhat transparent, in 1-3-fld. racemes shorter than the lvs. Feb.-Mar. Himalayas.

virens: A. odoratum var. maius

AËRIDOVÁNDA. Orchidacex. A group of bigeneric hybrids between Aërides and Vanda. A. Múndayi (A. vandarum $\times V$, teres) has white fls. tinged with lilac. Cult. as for Aërides.

ÆRVA. Amaranthaceæ. Herbs or subshrubs of trop. Asia and Afr.: lvs. alternate or opposite: fls. very small, often polygamous, in spikes. One is grown as a border plant in warm regions.

sanguinea: A. scandens var.

scándens. More or less climbing subshrub but may be trimmed as a tall edging subject: lvs. ovate to lanceolate, to 4 m. long: spikes to 1 m. long, white-woolly, shining. Asia, Afr. Var. sanguínea (Æ. sanguínea) has dark red lvs.

ÆSCHYNANTHUS: Trichosporum.

ÆSCULUS. Horse-Chestnut. BUCKEYE. Hippocastanaceæ. Large deciduous shrubs or trees cult. for their showy clusters of red, white or yellow fls. mostly in May and June, for the large digitately compound lys., and for the large often spiny frs.

Horse-chestnuts are mostly hardy north except Californian and Himalayan species. Propagated by seed sown in the autumn or stratified, by side-grafting, by budding on common species and the shrubby kinds also by layers. E. parviflora may also be propagated by root-cuttings.

arguta. Texas B. Shrub to 7 ft.: lfts. 7-9, lanceolate or broader, to 5 in. long, bluntly serrate, becoming glabrous: fls. yellowish-green. E. Tex.

austrina: A. discolor var. mollis.

Bridtii: Æ carnea var.

Búshii. Hybrid between Æ. discolor and Æ. glabra: tree to 30 ft.; fls. pink and yellow. Ark, Miss.

californica. Tree to 40 ft: lfts. 5-7, stalked: fls. white or pale rose, in panicles to 8 in. long. Calif.
cárnea (£. rubicunda). Red H. Hybrid between £. Hippocastanum and £ Pava: tree to 40 ft: lfts_usually 5, nearly sesule fis flesh-color to scarlet, in panicles to 8 in. long Var Briotii, fis scarlet. Var. plantierensis, Damask H., fls. whitish tinged pink, fading to pink. Var. péndula, branches drooping.

chinénsis. Tree to 60 ft. lfts. 5-7: fls. white, 1/2 in. or less long. China.

discolor. Woolly B. Shrub or tree to 30 ft.: lfts. 5, short-stalked, white-tomentose beneath: fis yellow and red, in panicles to 8 in. long. Ga. to Tex. Var. móllis (£. austrina), fis. bright scallet. Var. flavéscens, fis. yellow. Var. Koèhnei, low, fis. red and yellow.—Some of the cult. material of this species is £. neglecta var. tomentosa.

flava: E. octandra.

georgiàna: Æ. neglecta var.

glàbra (Æ. ohioensis). Onto B. Tree to 30 ft.: lfts. 5, short-stalked: fls. greenish-yellow, in panicles to 6 in. long. Pa. to Ala. and Neb. Var. leucodérmis. Bark smooth, nearly white. Mo, Ark. Var. Sárgentii (var. Buckleyi). Shrub: lfts. 6-7. Ohio to Miss.

Hárbisonii: Æ. mutabilis var.

Hippocastanum. Common H. Tree to 100 ft.: lfts. 5-7, Hippocastanum. Common H. Tree to 100 ft.: lits. 5-7, sessile: fis white blotched with red and yellow, in panieles to 1 ft. long. Balkan Peninsula. Some of the vars. are: alba, fis. pure white; Baumannii, fis. white, double; Hénkelii, fifs cut-lobed; incisa, lits. deeply toothed or lobed; laciniata, lits. deeply cut; lûteo-variegata, lvs. variegated with yellow; Memmingeri, lvs. marked with white; pûmila, dwarf; pyramidâlis, habit pyramidal; Schirnhoferi, fis. yellowish-red, double; umbraculifera, head round.

hùmilis: Æ. Pavia var.

h\$brida (Æ. Lyonii). Hybrid between Æ. octandra and Æ. Pava: tree: lfts. 5, short-stalked: fls. red and yellow, in panicles to 6 in. long.

indica. Tree to 60 ft.: lfts. 5-9, short-stalked: fis. white, upper petals yellow blotched, lower tinged rose, in panicles to 15 in. long. Himalayas.

lùtea: Æ. octandra.

Lonii: Æ. hybrida.

macrostachya: Æ. parviflora.

marylandica. Hybrid between E. glabra and E. octandra. Michauxii: E. neglecta var. tomentosa.

mutábilis. Hybrid between A. discolor var. mollis and A. neglecta var. georgiana, having panicles 4-6 in. long of yellow and red fls. Var. Hárbisonii (Æ. Harbisonii) has bright red fls. in panicles 6-8 in. long.

neglécta. Tree to 60 ft.: lfts. 5, nearly sessile: fls. pale yellow veined red, in panicles to 6 in. long. N. C. Var. georgiana (Æ. georgiana), shrub to 6 ft. with broader panicles of bright yellow or red fls. or a mixture of the two colors. Fla. and Ala. Var. tomentòsa (Æ. Michauxii of cult.), has lvs. tomentose to villous beneath and bright red fls. S. C.

octándra (Æ. flava. Æ. lutea). Yellow B. Sweet B. Tree to 90 ft.: líts. 5, short-stalked: fls. yellow, in panicles to 6 in. long. Pa. to Ga. and Ill.

ohioénsis: Æ. alabra.

parviflora (Æ. macrostachya). BOTTLEBRUSH B. DWARF H. Shrub to 12 ft.: lfts. 5-7, nearly sessile: fis. white, in panicles to 1 ft. long. S. C. to Fla. and Ala.

Pavia (Pavia Michauxii. E. and P. rubra). Rep B. Shrub or small tree to 20 ft.: lfts. 5, short-stalked: fls. dark red or purplish, in panicles to 7 in. long. Va. to Fla. and La. Vars. atrosanguínea, fls. dark red; humilis (var nana, E. humilis), low, often prostrate; sublaciniàta, lfts. deeply toothed.

plantierensis: Æ. carnea var.

rubicúnda: Æ. carnea.

rubra: Æ. Pavia.

sinénsis: Æ. turbinata.

spléndens. Shrub to 12 ft.: lfts. 5, densely pubescent beneath: fis. bright red, in panieles to 8 in. long. Ala. to La. turbinata (£. sinensis). Japanese H. Tree to 30 ft.: lfts. 5-7, sessile: fis. yellowish-white with red spot, in panieles to 10 in. long. Japan.

Wilsonii. Tree to 80 ft: lfts. 5-7, stalked: fls. white spotted yellow, in panicles to 1 ft. long. China.

woerlitzénsis. Tree: fls. red, in panicles to 5 in. long. Garden origin. Var. Ellwangeri (Æ. Pavia var. Whitleys), fls. darker.

ÆTHEOPAPPUS: Centaurea pulcherrima.

ÆTHIONÈMA. STONE-CRESS. Cruciferæ. Dwarf herbs and subshrubs allied to Iberis, mostly with small narrow lvs. and pink, llac, purplish or rose-colored, sometimes white, fls. in terminal racemes: pod or silicle short and broad, mostly winged. About 50 species of the Medit. region, a few of them grown in the border or rock-garden, blooming mostly in May and June. They may be used also as cut-fls.; one species sometimes cult. is an ann. flower-garden subject, with broad lvs.

If grown in a light sandy soil in dry sunny locations, they will not need replanting or renewal for many years in regions where hardy, as in southern New England or southward. The perennial types are propagated by cuttings in summer or by seeds in the spring, and by division; the annuals and biennials only by seeds.

 ${\bf alpinum:}$ listed as a plant to 5 in. with glaucous lvs. and pink fis.

amoenum. Similar to \mathcal{A} . pulchellum but with longer lvs. and much larger pale pink fis. Armenia.

armènum. Per., 3-4 in.: lvs. linear, short, acute: fis. minute: pod to ½ in. long, each cell 1-seeded. Armenia.

Buxbaimii (*E. cappadoccum*). Short-season ann., 3-6 in., with oblong lvs. to 1 in. long and minute hlac fls., grown for its erect racemes of large thin winged overlapping pods. S. E. Eu. and S. W. Asia.

cappadócicum: Æ. Buxbaumii.

coridifolium (Iberis jucunda). Lebanon S. Per., 4-10 in.: lvs. crowded, nearly linear, 1 in. or less long: fis. light or rosy-lilao, in short dense racemes: pod with style shorter than narrow sinus. Chalky summits of Mt. Lebanon and Taurus.—See Æ. pulchellum.

créticum (£. ovalifolium). Per., dwarf: lvs. ovate to oblong, very obtuse, glaucous: fls. minute, pale rose, in capitate racemes: pod with style shorter than the narrow sinus. S. Eu.—By some authorities considered to represent a variant of £. saratile from which it differs in the lower lvs. ovate-spatulate to orbicular and the petals scarcely twice as long as sepals.

diastròphis. I er. to 6 in., little branched: lvs. oblonglinear: fis. small, rosy-lulac: pod dentate. Asia Minor.

glaucum: probably A. grandiflorum var.

grandiflorum. Persian S. Per., 1½ ft., with simple branches: lvs. oblong-linear, to 1½ in. long: fls. pink or rose, ¼ in. across, in slender racemes, petals about four times as long as sepals: pod notched at top, each of its 2 cells 1-seeded. Persia. Var. glaûcum has lvs. blue-green.

iberídeum. Tuíted low per.: lvs. crowded and very narrow: fis. large, showy, white, in short racemes: pod ovate-obcordate, to 1/2 in. long, 2-seeded. E. Medit. region, Asia Minor.

jucunda: E. coridifolium.

Kôtschyi: listed name for a very dwarf plant with rosypink fls.

oppositifòlium. Tufted per to 8 in.: lvs. orbicular, opposite, somewhat fleshy, glabrous: fls. rose, about ½ in. across, petals obovate: pod ½ in. long and ¼ in. wide. Greece.

ovalifolium: A. creticum.

persicum: listed name for a foot-high plant with deep rose fis.: probably referable to E. where deep nor E. saratile.

pulchellum. Per with branched sts.: lvs. linear-oblong, obtuse: fls. rosy-pink, in heads or racemes: pod dentate, to ½ in. long, stigma sessile. Asia Minor.—Cult. plants passing as Æ. coruh/olum may belong here.

purpureum: advertised as a trailer with rose-purple fls. pyrenaicum. Per. to 16 in.: lvs. oval, obtuse, leathery: fls. pink, small, raceme elongating in fr.: pod usually only 1-seeded. Pyrenees.—By some considered only a variant of £. saxathe.

of *E. saxatue*.

saxátile. Per. to 1 ft., simple or branched: lvs. many, oval to linear-lanceolate, usually acute: fis. small, pink, in a close but elongating raceme, petals usually shightly more than twice as long as sepals: pod oblong, to nearly ½ in. long, notched, each cell normally 2-seeded. S. Eu., Algeria Var. grácile (Æ. Thomasianum) differs in having a longer style in fr.

schistòsum. Per., sts. many, 2 in. or more high, erect and simple: lvs. narrow-linear, somewhat acute: fls. large, rosecolor: pod orbicular or broader than long, 1-seeded, in imbricated raceme. Asia Minor.

stylòsum. Per to 1 ft. or less: lvs. large, ovate-lanceolate, to $\frac{5}{8}$ m. long: fls. rosy-pink, in a head: style of fr. longer than sinus. Lehanon.

Thomasianum: Æ saxatile var. gracile.

trinérvium (Iberidella trinervia). Per., woody: lvs. oblong to nearly linear, stiff, more or less 3-nerved, the upper ones somewhat clasping: fis. large, white. Persia.

warleyénse. Said to be a hybrid: compact but spreading, 3-6 in. high: fis. brilliant rose-pink or rose-carmine or one form paler: foliage steel-blue.

AGALINIS: Gerardia.

AGAPÁNTHUS (Abumon). Liliaceæ. African herbs with tuberous rootstocks, one popular as a tub plant or big subject in pots, and out-of-doors in warm regions. It does well in large tubs and will bloom for several years without rehandling if given liquid manure; will also force satisfactorily. Propagated by division of roots or rarely by seeds.

africanus (A. umbellatus). African-Lily. Lily-of-the-Nile. To 3 ft.: lvs. basal, linear-lanceolate: fls. funnelshaped, bright blue, to 2 in. long, 12-30 in terminal umbels. Hort. vars. are álbidus with white fls., Mooreanus with dark blue fls., more hardy than most other forms, nanus, dwarf and compact, and variegatus with striped lvs.

orientalis. Distinguished from A. africanus by its broader softer reflexing lvs., longer peduncle and pedicel with the umbel comprised of 40-100 fls.

péndulus. To 1½ ft.: lvs. deciduous, linear, to 15 in, long and 1½ in. wide: fts. dark purple outside, paler within, to 1½ in. long, tube longer than lobes, on pedicels to 2 in. long, segms. scarcely spreading.

AGARITA: Mahonia trifoliolata.

AGÁSTACHE (Lophanthus). Labiatæ. Per. N. American tall herbs with 4-angled sts., toothed lvs., 2-lipped purplish, blue or yellowish fls. in terminal spikes; sometimes grown in the border. The word has four syllables.

cana: Brittonastrum canum.

nepetoides. To 5 ft.: lvs. ovate to ovate-oblong, to 6 in. long: fis. greenish-yellow, 1/2 in. long, in dense spikes to 1/2 ft. long. Que. to Ga. and Ark.

urticifòlia. To 3 ft.: lvs. cordate, to 4 m. long, coarsely toothed: fls rose to violet, about \S_3 in. long, in very dense spikes 1–4 m. long, calyx-lobes lanceolate, acumnate, rosetinged. Mont. to B. Č. south to Colo. and Calif.

AGATHÆA CŒLESTIS: Felicia amelloides.

AGATHIS. Dammar-Pine. Araucariaceæ. Tall evergreen trees of about 20 species, not all understood, with broad entire leathery lvs., cylindrical staminate cones, and ovoid or globose pistillate cones; native from the Philippines to Australia and New Zeal. Determination of immature and non-flowering trees is often difficult: the adult foliage of all species varies; juvenile lvs. differ from adult lvs. in form and arrangement and are always larger; different species have closely similar juvenile foliage. For cult. see Confers. They can be grown out-of-doors only in the warmer parts of the country, as in Fla. and Calif.

áiba (A. orientalis) Lvs. mostly opposite, broadly lanceolate to ovate, petiolate, 2½-5 in. long; stammate cones 2-3 in. long, ¾-1 in. diam., stalked, supra-axillary; ovulate cones subglobose, about 4 in. diam. Malaya.

australis. Kauri-Pine. Juvenile lvs. opposite, linearoblong, somewhat falcate, bronze-green, often spotted and
reddish, to 2½ in long; adult lvs. subopposite, oval to
broadly oblong, sessile, ½-1½ in. long, ½-½ in. broad,
blint: staminate cones ¾-1½ in. long, ½-¾ in. diam.,
stalked, axillary; ovulate cones subglobose, 2-3 in. diam.
New Zeal.—One of the outstanding trees of the world in
size, beauty, and timber value. Rarely cult. because the
young tree has sparse yellowish foliage and poor habit;
plants so named are usually A. robusta.

Brownii: an ambiguous name based on a juvenile plant of unknown identity; material so listed may be $A.\ alba$, $A.\ robusta$ or other species.

orientàlis: A alba.

robústa. Queensland Kauri. Juvenile lvs. mostly opposite, oblong-elliptic to ovate, to 4 in. long, subsessile; adult lvs. narrow-elliptic, 2-4 in. long: stanunate cones 2-4 in. long, ½-½ in. diam., sessile, axiliary; ovutate cones ovoid or subglobose, 4-5 in. long, 3½-4½ in. diam. Australia—The most frequently cult. species.

AGATHÓSMA (Hartogia). Rutacex. S. African shrubs with small lvs., small white, red or lilac fls. mostly in terminal umbels or heads and fr. of 2-4 carpels; grown for ornament in warm regions, sometimes in pots under glass. For cult. see Diosma.

Ventenatiana. To 1 ft. or more, much branched: lvs. overlapping, ovate-lanceolate, 1/2 in. long: fis. lilac, purple or white, in umbels.

villòsa (Diosma purpurea). To 1 ft.: lvs. overlapping, lunceolate, 1/4 in. long: fls. light purple, in dense terminal heads

AGÀTI. Leguminosx. One tree native in trop. Asia but nat. in W. Indies and S. Fla. A. grandiflòra (Sesbania grandiflora). To 40 ft.: lvs. pinnate, of 10-30 pairs of lfts. to 2 in. long: fls. papilionaccous, red or white, to 4 in. long: pods linear, flat, to 2 ft. long. An ornamental tree for warm regions, with striking fls. and pods.

AGÀVE. Amaryllidaceæ. Important economic and decorative plants with usually stiff spiny and often succulent long lvs. in rosettes or basal, fls. in spikes or panicles on long upright scapes or sts. produced in some types every year and in others at long intervals, in some cases the plants even dying after blooming; native in arid and semi-arid warm regions of western hemisphere. Many species are found in collections of succulents or of economic plants, some are grown as ornamentals in warm sections; in Mex. they furnish food, drink, fiber, razor strops and soap. A americana is in common cult. as a porch and tub plant, but most of the species are known in

hort. only to fanciers and in large or botanica.' collections. The name has three syllables.

Agaves need a soil mostly of loam and sand, good drainage and firm potting. Most species can be propagated by seeds, but often the flowers must be artificially handpollinated in order to secure them; some kinds are progagated by the suckers around the old plants or by underground stems; others by stem buds and a few by the bulbels which are found in the flower-clusters.

affinis. Plant stemless or nearly so: lvs. to 20 in. long and 2 in. across, glaucous, spine to 2 in. long, light brown to white, grooved toward base, prickles to ¾ in. long and 2 in. apart, nearly straight; fis. in short branched paniculate infl. Lower Calif.

álbicans. St. very short: lvs. to 1 ft. long and 4 in. wide: infl. about 3 ft.; fls. reddish-green, 1½ in. long. Mex.? Var. mèdio-pícta is a milk-white striped-lvd. form.

altíssima: A americana.

americana (A. altssima. A. spectabilis). Century Plant. Trunkless: lvs. to 6 ft. long and 8 in. wide, gray, smooth, in rosettes fls. yellowish-green, 3½ in. long, in a bracted scape or stalk to 40 ft. tall, produced when plant is ten years or more old; suckers are usually produced at base as the plant dies. Trop. Amer. Var. marginata has yellowish-white or deep yellow margins. Var. mèdio-picta has yellow stripe along center of lvs. Var. striata, lvs. lined with yellow or white. Var. variegata, lvs. dark green and yellow, twisted.

angustifòlia (A. Jacquiniana. A. ixthoides. A. mupara. A. Wughtu. A. cantula). Trunk to 1½ ft: lvs. to 2 ft. long and 3 m. wide, gray-green; infl. to 8 ft. high; fis. greenish, 2 m. long. Cent. Amer.? Var. marginàta (variegata) has lvs. margined with white.

antillarum. Trunkless: lvs. about 3 ft. long and 3 in. wide, bright green; infl. 15 ft.; fls. deep orange, 2 in. long.

applanata. Trunkless: lvs. to 4 ft. long and 4 in. wide, gray-green: infl. to 30 ft.; fls. yellow, 3 in. long. Mex.

atrovirens. Pulque A. Trunkless; lvs to 6 ft long and 1 ft. wide, dark green; infl. to 30 ft; fls. greenish-yellow, 4 in. long. S. Mex.—The drink pulque is derived principally from this species.

attenuata (A. glaucescens). Trunk to 5 ft, sometimes prostrate; lvs. unarmed, to 2½ ft. long and 10 in. wide; infl spike-like, to 10 ft.; fls. greenish-yellow, 2 in. long. Mex—Occasionally bulbels are produced.

Bérgeri. Plant a stemless rosette to about 31½ ft. high and 5 ft. across: lvs. to 3 ft. long and 3¼ in. across at middle, linear-lanceolate, tipped with black spine to 1 in. long, margins with black strongly recurved spines nearly ¼ in long: infl. to nearly 12 ft. high. Mex.?

brachýstachys: Manfreda brachystachys.

Bråndegeei. Lvs. to 2 ft. long and 4 in. across, grayish yellow-green, spine to 2 in. long, recurved, glossy redbrown, brown prickles ½ in. long or less and to ¾ in. apart: fls yellow, to 1¾ in. long. Lower Calif.

cæruléscens: A. lophantha var.

cantùla: A. angustifolia.

carchariodónta. Trunkfess; lvs. to 1 ft. or more long and 3½ in. wide, prickly! infl. a spike to 12 ft. high; ffs. greenish or brownish. Habitat unknown.

cerulata. Lvs. to 14 in. long and 1½ in. across, deeply concave, gray-brown, spine to 1½ in. long and almost straight, brown prickles about ½ in. long and to 1 in. apart: fis. yellow, 1½ in. long, on slender paniculate infl. to 14 ft. high. Lower Calif.

chiapénsis: A. polyacantha.

 ${\it chrysac\'{a}ntha}$: listed name of unknown botanical standing.

connochètodon. Stemless, cespitose: lvs. to 1 ft. long and 2½ in across, oblanceolate, grayish-red spine to 2 in. long, reddish-brown, prickles to ½ in. long and ¾ in. apart, terminal prickles upcurved, basal ones down-curved; fls. on branched infl. to 10 ft. high. Lower Calif.

Considerántii: A. Victoriæ-Reginæ.

datylio. Trunkless: lvs. to 4 ft. long and 1½ in. wide, yellow- or gray-green, with purplish or blackish spine and shining chestnut teeth. Lower Calif.

decipiens (A. spiralis). Trunk to 8 ft.: lvs. to 4 ft. long and 4 m wide, prickly: infl. a panicle, to 20 ft.; fls. greenish-yellow, 3 in. long. S. Fla.

desérti. Trunkless lvs. in dense rosettes, 1 ft. long and 2 in. wide, gray-green, with triangular prickles: infl. a panicle, 6 ft. high; fis. yellow, 1½ in. long. Colo. Desert, Calif.

Eichlamii. Trunkless: lvs. in rosettes, the edges with brown spines. Guatemala.

élegans: A. potatorum.

Ferdinándi-Règis. Trunkless: lvs. triangular to lanceolateovate, about 5 in. long, sharp pointed, deeply concave above, both sides with converging white lines, terminal spine about % in. long, black. Mex.

fêrox. Trunkless: lvs. to 4 ft. long and 1 ft. wide, fleshy: infl. to 30 ft.; fls. yellow, 3½ in. long. Mex.

filifera. Trunkless: lvs. in dense rosette, to 1½ in. broad and 1 or 2 ft. long, entire, spine-tipped, margins with filaments: fls. maroon-purple, 2 in. or more long including the long stamens, the scape to 15 ft. (shorter under glass). Mex. Var. compacta (A. perplexans), very compact, with lvs. 4 in. long.

fourcroydes (A. Ixtls. A. longifolia. A. minima. A. rigida). Henequen. Trunk to 6 ft.: lvs. to 7½ ft. long and 4 in. wide, grayish-green: infl. to 20 ft.; fls. greenish, to 3 in. across, ill-smelling. Yucatan.—Furnishes fiber.

Franceschiana. Trunk very short: lvs. to 3 ft. long and 4 m. wide, dark or blue-green: infl. to 15 ft.; fls. green, 21/6 in. long, ill-smelling. Mex.?

Franzosinii. Trunkless: lvs. to 8 ft. long and 1 ft. wide, whitish-green: infl. to 40 ft.; fls. yellowish, 3½ in. long. Mex.?

Ghiesbréchtii (A. Ghiesbreyhtii). Trunkless: lvs. to 2½ ft. long and 4 in. wide, sometimes striped; infl. to 9 ft.; fis. greenish or brownish, 2 in. long. Mex.

glaucéscens: A. attenuata.

Hártmanii. Similar to A. purviflora but with sickle-sheed Ivs., grooved spine, and finer marginal threads. Mex. New Mex.

heteracántha. Nearly trunkless: lvs to 2½ ft. long and 2½ n. wide, slightly striped: infl. to 15 ft. Mex.—Similar to A. lophantha, differing in lvs. somewhat wavy and prickles closer together, median band usually prominent. Material in the trade very likely to be A. lophantha var. Poselperi.

hórrida: A. noli-tangere.

Houlletiana or Houllettii: A. sisalana.

huachucénsis. Lvs. to 1 ft. long and 7 in. across, erect-spreading, reddish to gray spine to 1 in. long, prickles to 14 in. long and ½ in. apart, mostly reflexed: fls. yellow, to 3 in long, on infl. to 18 ft. high. Ariz.

hýstrix: A. stricta.

imperialis: trade name for a glaucous-lvd. form.

ingens. Nearly trunkless: lvs. to 6 ft. long and 14 in. wide, dark green or grayish-green: infl to 30 ft; fls. yellowish-green, 31½ in. long. Mex. Var. picta, lvs. yellow-maruned.

İxtli: A. fourcroydes.

ixtlioides: A. angustifolia.

Jacquiniana: A. angustrfolia.

Kerchovei. Trunkless or short-trunked: lvs. to 1½ ft. long and 2½ in. wide, gray-green, triangular, fibrous: infl. to 18 ft; fls. 1½ in. long. Mex.

làvis: A. sısalana.

latifòlia: A. potatorum.

Lecheguilla: A. lophantha var. Poselgeri.

longifòlia; A. fourcroydes.

lophántha. CRESTED A. Short-trunked: lvs. to 3 ft. long and 3 in. wide, green, glossy, striped beneath: infl. spikelike, to 15 ft.; fls. greenish-yellow, 1½ in. long. Mex. Var. cæruléscens (A. cærulescens) is a glancous form without stripes. Var. Posélgeri (A. Lecheguilla) has smaller lvs. with a pale central band, bluish-green and striped beneath. Var. univittata, lvs. with prominent pale band above.

lùrida (A. mexicana). Trunkless or nearly so: lvs. to 3 ft. long and 6 in. wide, with small teeth, glaucous: infl. a panicle, to 20 ft.; fls. greenish, 3 in. long. Mex.

macrántha. Trunkless: lvs. long and narrow, 5½ in. wide: infl. to 5 ft.; fls. yellowish, 3 in. long. Mex.

maculòsa: Manfreda maculosa.

margaritæ. Stemless, cespitose: lvs to 10 in. long and 4 in. across, obovate-oblanceolate, dull green with transverse bands, chestnut-gray spine to 1 in. long, prickles to 14 in long and 34 in long and 35, in apart, mostly downcurved on lower half and upcurved above: fls. light yellow, to 2 in. long, in paniculate infl. to 14 ft. high. Santa Margarita Isls., Lower Calif.

marginata: forms of A. americana and A. angustifolia.

marmorata (A. Todaror). Trunkless: lvs. to 6 ft. long and 1 ft. wide, very rough, gray and green-banded: infl. 10 ft. high; fls. golden, 1½ in. long. Mex.

mesotillo. Similar to A. lophantha var. Poselgeri with broader lvs. and heavier prickles. Mex.

mexicana: A. lurida.

micracantha. Trunkless: lvs. to 1½ ft. long and 5 in. wide, bright green, paler beneath: infl. about 10 ft.; fis. brownish-green, 1½ in. long. Mex.?

minima: A. fourcroydes.

miradorénsis. DWARF CENTURY PLANT. Trunkless: lvs. to 3 ft. long and 5 in. wide: infl. to 9 ft.; fls. greenish, 2 in. long, fetid. Mex.

mitis. Trunk very short: lvs. to 15 in. long and 4 in. wide, with small teeth: infl. 6 ft. high; fls. brown, 2 in. long, in racemes. Mex.

mitræfórmis. Nearly trunkless: lvs. to 2½ ft. long and 1 ft. wide, zoned with gray and with chestnut-tipped prickles: infl. to 20 ft.; fls. 2½ in. long. S. Mex.

neglécta. Blue Century Plant. Trunkless: lvs. to 3 ft. long and 6 in. wide, gray: infl. to 40 ft.; fls. yellowishgreen, 2 in. long, fetid. Fla.

Nélsonii. Lvs. to 1 ft. long and 3 in. wide, glaucous, with blackish spine and brown or whitish teeth. Lower Calif.

Nickelsii. Differs from A. Victoriæ-Reginæ in more open rosettes of fewer lys.

noll-tangere (A. horrida). Lvs. to $1\frac{1}{2}$ ft. long and 3 in. wide, the margins toothed: infl. to 8 ft.; fis. green, $1\frac{1}{2}$ in. long, in spikes. Mex.

oblongata. Stemless: lvs. to 2 ft. long and 4 in. wide, gray-green with chestnut teeth: infl. to 4 ft.; fis. 1½ in. long. Perhaps Mex.

Orcuttiana. Cespitose plant with reclining st. to 10 ft. long: lvs. to 1 ft. long and 4 in. across, flexuous gray spine to 1 in. long, prickles to 3½ in. long and 3½ in. apart, usually curved or hooked; fls. to 3 in. long, in paniculate infl. Lower Calif.

Pálmeri. Lvs. to 30 in. long and 4 in. across, lanceolate, ascending, terminal spine long, open-grooved and slender, marginal spines hooked: fls. yellow, to 2½ in. long. Ariz. and New Mex.

Párryi. Trunkless: lvs. to 1 ft. long and 4 in. wide, glaucous, prickly-margined: infl. to 16 ft.; fls. creamy-yellow, 2½ in. long, in panicles. Ariz., New Mex., Mex.

parviflora. Small: lvs. 4 in. long and 14 in. wide: infl. to 5 ft.; fls. greenish-white, 14 in. long, S. Åriz.

perpléxans: A. filifera var. compacta.

picta. Similar to A. americana but with darker green lvs. to 10 ft. long with marginal yellow band. Trop. Amer.

polyacántha (A. chiapensis). Nearly trunkless: lvs. to 3 ft. long and 6 in. wide: infl. to 15 ft.; fls. 2 in. long. Mex.

potatòrum (A. elegans. A. latifolia A. pulchra). Trunkless: lvs. to 1 ft. long and 4 in. wide; infl. 12 ft.; fls. yellowish-green, 2½ in. long. Mex.

púlchra: A. potatorum.

τigida: A. fourcroydes.

Roezliana. Lvs. to 16 in. long and 4 in. across, ovate-lanceolate, rigid, with broad pale-green stripe above, terminal spine grooved, margin with rather large teeth. S. Mex. Var. Gilbeyi a dwarf form of var. Inghamii which has broader and uniformly colored lvs.

Rosedna. Stemless, somewhat cespitose: lvs. to 20 in. long and 6 in. across, stiffly ascending, purplish to gray spine to 234 in. long and twisted-wavy, brown prickles to 1 in long and 1½ in. apart, broadly triangular and somewhat recurved: fls. to 2 in long, in narrowly paniculate infl. to 10 ft. high. Lower Calif.

Salmiàna. Trunkless: rosettes very large, lvs to 7 ft. long and 1½ ft. wide, prickly-margined: infl. 30 ft.; fls. yellow, in panicles. Mex.

scabra (A. Wislizenii). Trunkless: lvs. to 10 m. long and 6 in. wide, gray, prickly-margined: infl. 12 ft.; fts. yellow, 2½ in. long. Mex.

schidigera. Trunkless: lvs. to 1½ ft. long and ½ in. wide, with marginal threads: infl. 10 ft.; fls. 2 in. long, in racemes. Mex.

Schôttii. Lvs. to 12 in. long and ¼ in. wide, linear-triangular, spine scarcely grooved, toothless or with minute prickles at base, margin shreddy: fls. yellow, to 1½ in. long. S. Ariz.

Sebastiana. Nearly trunkless: lvs. to 1 ft. long and 4 in. wide, gray-green: infl. 6 ft.; fls. yellow, 3½ in. long. Lower Calif.

Shawii. Nearly trunkless: lvs. 1½ ft. long and 5 in. wide, prickly-margined: infl. to 10 ft. high; fis. greenish-yellow, 3½ in. long, in panicles. Calif.

sisala: A. sisalana.

sisalàna (A. Houlletiana or Houllettii. A. lævis. A. sisala). Sisal Hemp. Trunk to 3 ft.: lvs. to 5 ft. long and 4 in. wide, green or grayish: infl. to 20 ft.; fis. greenish, 2½ in. long, ill-smelling. Habitat unknown.

spectábilis: A. americana.

spiralis: A. decipiens.

striata. Trunkless: lvs. 1½ ft. long and 1 in. or more wide, gray striped with dark green: infl. to 12 ft.; fls. greenish, in spikes. Mex.

stricta (A. hystrix. Bonapartea, Littæa and Yucca hystrix). Неравнов А. Trunkless: Ivs. to 14 in. long and ¼ in. wide, often pale or purphsh: infl. to 12 ft.; fls. 1¼ in. long. Mex. Var. glatca has glaucous Ivs.

tequilana. Tequila A. Trunkless: lvs. to 3 ft. long and 3 in. wide, gray-green: infl. 20 ft.; fls. 2½ in. long. Mex.

Todardi: A. marmorata,

Toumeyana. Trunkless: Ivs. to 4 in. long and ½ in. wide, ascending and recurved or lax, terminal spine brown, to ½ in. long, margins translucently denticulate below middle: fis. about ½ in. long. S. Anz.

utahensis. Trunkless: lvs. to 1 ft. long and 1 in. wide, glaucous, with white teeth: infl. 5 ft. or more; fls. yellow, 1 in. long, in clusters. Utah, Calif, Ariz. Var. nevadénsis has wavy terminal spine and is listed as a dwarf form.

variegata: Manfreda variegata.

Verschafféltii. Nearly trunkless: lvs. to 7 in. long and 3 in. wide, with twisted light brown spine and long rusty teeth on fleshy prominences: fls. about 2 in. long Mex.

Victòriæ-Reginæ (A. Considerantii). Trunkless: lvs. to 6 in. long and 2 in. wide, dark green with gray margin: nff. 12 ft.; fis. greenish, 1½ in. long. Mex.

virginica: Manfreda virginica.

vivipara: A. angustifolia.

Wêberi. Trunkless: lvs. to 2½ ft. long and 8 in. wide, margins entire: infl. a panicle. Mex.

Weingártii. Trunkless: lvs. variable, apple-green. Guatemala.

Wightii: A. angustifolia.

Wislizènii: A. scabra.

xylonacántha. Trunkless or nearly so: lvs. to 3 ft. long and 2 m wide, dark striped beneath, with horny prickly margins: infl. to 7 ft.; fts. 1½ in. long, in spike-like racemes.

Zapûpe. Trunkless: lvs. to 6½ ft. long and 4 in. wide, with red-brown spine and small teeth. Mex.

AGDÉSTIS. Phytolaccaccæ. One woody or herbaceous vine from a very large gray tuberous root, grown out-of-doors in S. U. S. and thriving in rich soil. Propagated by offsets. A. clematidea. Climbing to 50 ft.: lvs. alternate, cordate-ovate, to 3 in. or more across: fls. white, star-shaped, to ½ in. across, without petals, in panicled racemes. Mex. Guatemala.

AGÉRATUM. Compositæ. Herbaceous annuals with tassel-like clustered heads, usually blue or white, and mostly opposite lvs.: florets all tubular; pappus of scales. Ageratums require the usual cult. for annuals; the dwarfer kinds are excellent for edgings.

cœlestinum: A. corumbosum.

conspicuum: Eupatorium glechonophyllum.

conyzoides. To 2 ft.: lvs. ovate, toothed, blunt or rounded at base: fls blue or white, in heads to ½ in across, all summer; involuctal bracts oblong, slightly hairy. Tronics.

corymbosum (A. calestinum). To 1½ ft.: lvs. lanceolate, often broadly so, to 3½ in. long, somewhat villous beneath, margin entire or serrate, tapering at base: fls blue, in heads to ½ in. across, involucial bracts linear-lanceolate, chate. Mex.

Fraseri: see Eupatorium rugosum.

Houstonianum (A. mericanum). Differs from A. conyzoides in lvs. usually heart-shaped at base, blue fis in larger heads, and involueral bracts linear-lanceolate and densely hairy. Mex. Listed vars. include álbum, cærùleum, nanum and pùmilium.

Lasseauxii: Eupatorium Lasseauxii.

mexicanum: A. Houstonianum.

purpuráscens: hort. name.

Wilsonii: a catalogue name for a form with clear blue fis. in large clusters.

AGLAONÈMA. Araceæ. Trop. Asian and African rhizomatous or stoloniferous herbs with oblong or oblong-lanceolate lvs. having thick midribs and sheathed petioles, and unisexual fls. borne on a spadix subtended by a spathe.

Glasshouse subjects grown for the attractive often varie-

gated foliage; succeed in fibrous foam with rotted manure, sand and charcoal added. Propagated by division and cuttings.

commutatum. To 2 ft.: lvs. to 6 in. long and 2 in. across, deep green marked on veins with pale green. Malaya.

costatum. Sts. short, branching at base: Ivs. to 8 in. long and 4 in. across, variously spotted with white. Malaya. modéstum. Sts. to 18 in.: Ivs. to 18 in. long and 5 in. across, ovate-acuminate, 4-5 lateral ascending veins. Philippines.

nitidum: A. oblongifolium.

oblongifolium (A. mitdum). Sts. to 3 ft. or more: lvs. to 20 in. long, with long petioles, to 3½ in. across, elongate-elliptical, apex cuspidate, 7-8 lateral ascending veins: spathe to 3 in. long, yellowish-green. Malaya.

pictum (A. versicolor). Sts. to 10 ft. long: lvs. to 6 in. long and 2 in. across, clouded or spotted with white. Malaya. Var tricolor, lf-blade marked with golden-yellow and yellowish-green spots.

Robelínii. Very robust: lvs. to 10 in. long and 5 in. wide, obscurely marked with pale green. Malaya.

siamense. Sts. to 1½ ft. long: lvs. to 10 in. long and broad, the petioles about 6 in. long. Siam,

simplex. Erect to 3 ft., rooting below: lvs. lance-oblong or somewhat broader, acuminate, to 12 m. long at maturity, green: spathe greenish or whitish inside, to 2 in. long. Borneo, Celebes—Grown in water as "Chinese evergreen," thriving in poorly lighted places, infrequently blooming.

sinensis: listed name of uncertain botanical standing.

versicolor: A. pictum.

AGNIRÍCTUS. Aizoaceæ. A Mesembryanthemum segregate with lvs. having encrusted warts; formerly included in Stomatium but differing in calyx characters.

agninus (M and Stomatum agninum). Sts very short and branched: lvs oblong, to 2 in. long and ½ in. broad, canescent, wrinkled, dotted and with pustule at base, entire or toothed: fis. solitary, yellow, 1 in. across, with many linear petals.

AGÒNIS. Myrtacex. Australian shrubs or trees with alternate simple lvs., fls. in dense sessile heads, and fr. a leathery caps.; grown for ornament in S. Calif. For cult. see Leptospermum.

flexuosa (Leptospermum flexuosum). To 40 ft.: lvs. willow-like, to 6 in. long: fls. white, the axillary heads ½ in. across; stamens usually 20. W. Australia.

linearifòlia. To 12 ft. or more: lvs. linear or linearlanceolate, to 1 in. long: fls. white, in small axillary heads; stamens 10. W. Australia.

marginata. Tall shrub: lvs. obovate-oblong, to 1 in. long: fls. white, in terminal or axillary heads; stamens 10. W. Australia.

AGÓSERIS. Compositæ. Ann. and per. herbs related to Crepis with lvs. in a basal tuft and yellow fls. in large heads terminating scapes; pappus of bristles.

cuspidata (Nothocalais cuspidata). Per. to 1 ft.: lvs. linear-lanceolate, wavy-margined: fts. Apr.-June. Wis. Colo.

glauca. Per. to 15 in.: lvs. linear-oblanceolate, to 8 in. long, usually entire, rarely pinnatifid, glaucous: fis. light yellow becoming pinkish. June-Aug. Colo. to Wash. and Man.

major. Ann. to 1½ ft.: lvs. often pinnatifid: fls. deep yellow. Apr.-May. Calif.

AGRIMÒNIA. AGRIMONY. Rosaceæ. Per. ereet herbs mostly of the north temp. zone, with alternate pinnate lvs., small yellow fls. in racemes, and fr. a bristly burr; sometimes grown in shady or rear places for interest but not particularly ornamental; also medicinal. There are several N. American species, but apparently not planted. Propagated by root-division in spring and by seeds.

Eupatòria. To 3 ft.: lfts. oblong-ovate, gray-hairy beneath: fr. obconical, bristles slightly spreading. Eu.

odorata. To 3 ft.: lits. lanceolate, sharply serrate, finely pubescent: fr. nearly hemispherical, bristles nearly at right angles to side of fr. Eu., W. Asia, N. Afr.

pildsa. To 5 ft.: lfts. with stiff hairs on veins beneath: bristles of fr. incurved. Eu.

AGRIMONY: Agrimonia. Hemp: Eupatorium cannabinum.

AGRITO: Mahonia trifoliolata.

AGROPYRON. Gramineæ. Mostly per. grasses, usually of Eurasian origin and grown here primarily for forage purposes. The spikelets are several-fld., solitary and are arranged flatwise at each joint of an unbranched rachis. Quack-grass or Dog-grass (A. repens), a common weed in E. U. S., belongs to this genus and may be distinguished from the species below by the presence of creeping rhizomes.

cristatum. Crested Wheat-Grass. Per., erect culms to 3½ ft., usually without creeping rhizomes: spikelets much compressed, closely imbricated on spike to 2½ in. long. Eurasia.—Adapted for hay and pasture uses in the northern Great Plains, spreading by reseeding.

pauciflorum (A. tenerum). SLENDER W. Per. to 3½ ft., without creeping rhizomes, glabrous: lvs. flat, to ½ in. wide: spikelets remote to imbricate on spike to 10 in. long. Lab. to Alaska south to W. Va., Calif. and N. W. Mex.—Of poor forage value.

ténerum: A. pauciflorum.

AGROSTÉMMA. CORN COCKLE. Caryophyllaceæ. As now defined, a genus of 2 species of ann. or bien. herbs, Eu. and Asia, one of them a showy weed and sometimes known as a cult. plant, A. Githàgo (Lychnis Githago. L. segitalis). Grayish erect branching silky-hairy plant to 3 ft., with long-linear erect lvs.: fls. purplish-red and more or less spotted, 1 in. or more across, petals obcordate and exceeded by the very long leaf-like calyx-lobes (which are deciduous in fr.). Common in wheat-fields. See Lychnis.

AGRÓSTIS. Bent-Grass. Graminex. Tufted annuals and perennials of small or medium size and many narrow lvs., the small spikelets borne in open diffuse panicles; of world-wide distribution and furnishing familiar hay, pasture, and lawn grasses as well as flower-garden subjects. See Grasses.

álba. Redtop. Fiorin. Per. to 3½ ft., erect or base slightly decumbent, vigorous creeping rhizomes: lvs. flat, to 8 in. long and ½ in. wide: panicles to 1 ft long, green or reddish, open with ascending branches. Eu; nat. in N. Amer.—Used for pastures and lawns. Distinguished from A. stolonyera by its stronger and usually erect culms. Often confused with A. palustris from which it differs in its open panicle and absence of stolons.

canina. Brown Bent. Velvet Bent. Per. to 2 ft.: lvs. to 2 in. long and $\frac{1}{12}$ in. wide: panicles to 7 in. long, branches very slender. Newf. to Alaska, Pa. and Tenn.—Used for lawns.

capillàris: a confused name whose botanical identity is not clearly understood. Var. astoriàna is a hort name for a form of A. tenus.

hiemalis (A. laxiflora). HAIR-GRASS. SILK-GRASS. Per. to 2 ft.: lvs. to 5 in. long and ½ in. wide: panicles often purplish, to 2 ft. long, branches hair-like and bearing spikelets only toward tips N. Amer.—Ornamental.

laxifidra: A. hiemalis.

marítima: A. palustris.

nebulòsa. CLOUD-GRASS. Ann. to 1 ft.: lvs. short and very narrow: panicles to 6 in. long, with many very fine branches bearing spikelets near tips. Spain.—Ornamental.

palústris (A. maritima. A. stolonifera var. compacta). CREEPING BENT. Creeping per. to 1½ ft., sts. often decumbent and stoloniferous: Ivs. to 3½ in. long and ½ in. wide, rough: panicles dense, to 4 in. long, branches erect. Shores Eu., E. N. Amer.—Used in lawns. Hort. forms are known in trade as Cocoos bent and Washington or Metropolitan bent; the former are propagated by seed and the latter by stolons.

pulchélla: Aira capillaris var. pulchella.

retrofracta. Ann. to 2 ft.: lvs. to 8 in. long and 1/8 in. wide, rough above: panicles to 1 ft. long, branches hair-like and bearing prominently awned spikelets toward tips. New Zeal., Australia, Hawaii; intro. into U. S.—Ornamental

stolonsfera. To 1½ ft., culms decumbent at base and ascending, often rooting along decumbent portion but true rhizomes wanting: lvs. to 6 in. long and less than ½ in. wide: panicles to 6 in. long, more or less open with the branches bearing spikelets from near the base. Newf. to Alaska, N. J. and Ore.; Eu.—The identity of plants in the trade under this name is much confused. Several varieties of it are listed, among them; var. major is probably A. alba; vars. compacta and maritima are referable to A. robustria.

ténuis (A. vulgaris). Colonial Bent. Rhode Island Bent. Similar to A. alba but smaller and with shorter redder panicles; may further be distinguished from A. alba by its ligule being one-half as long or less. Eu.; nat. in N. Amer.—Used for pasture and lawn Creeping forms are known as Astoria and Colonial bent, and certain non-creeping ones as New Zealand and Prince Edward Island bent.

vulgàris: A. tenuis.

AICHRYSON. Crassulacex. Succulents of the Canary Isls., intermediate between Sedum and Sempervivum (see the latter), with cup-shaped calyx 5–12-lobed, scales ciliate, carpels partially immersed in calyx-tube.

dichétomum. Ann. or bien.: sts. erect and forked, hairy: lvs. oboyate or spatulate: fls. yellow, in loose corymbs, petals 8 or 9.

domésticum (Sempervivum tortuosum of DeCandolle) is an old garden hybrid; erect slightly shrubby free-flowering somewhat hairy plant: lvs. spatulate, to 1 in. long; fls. yellow.

tortuòsum. Dense downy subshrub, 1-6 in. high: lvs. obovate-spatulate, very fleshy, ½ in. long, ¼ in. broad, ¼-¼ in. thick: fls. golden-yellow, in small corymbs.

villòsum. Ann. to 4 in. and more, sticky-hairy: lvs. spatulate, to 34 in. long: fis golden-yellow, 14 in. across, in loose corymbs, petals 6-9. Madeira, Azores.

Allánthus (Pongelion). Simarubaceæ. Large deciduous trees of Asia and N. Australia, one planted widely as a street and yard tree as it is smoke-resistant and free from insects: lvs. pinnately compound, ill-scented when bruised: fls. small, green, in large terminal panicles, polygamous: fr. a samara with the seed in the middle.

The ailanthus grows on any upland soil and tends to spread as seedlings; propagated by seed sown soon after ripening and by root-cuttings.

ripening and by root-cuttings.

altíssima (A. glandulosa. A. japonica). Tree-orHeaven. To 60 ft. or more, rapid growing: lvs. of 13-25
líts. to 5 in. long, glabrous beneath, with large glandbearing or callous teeth at base: fr. 1½ in long China;
nat. in E. N. Amer.—Only the fertile-fid. types should be
planted as the staminate fis. exhale a sweetish or to some
persons a disagreeable odor Var. erythrocárpa (A. rubra),
fr. bright red Var. pendulifòlia, lvs. large and drooping.
Var. sutchuenénsis, petioles purphsh, frs. larger.

glandulòsa: A. altıssima.

imberbiflòra. To 100 ft.: lvs of 15-20 glabrous lfts. to 3 in. long: fr. 2 in. long. Australia.

japónica: A. altıssima.

rùbra: A. altissima var. erythrocarpa.

Vilmoriniana. To 50 ft.: lvs. of 17-35 lfts. to 6 in. long, pubescent beneath: fr. 2 m. long. China.

AÍPHANES. Palmaceæ. A few trop. American more or less cespitose or soboliferous pinnate-lvd. monœcious palms of low to medium height, one of which is frequently planted in our warmest parts: lf.-sheaths, petioles and rachis, and sometimes the pinnæ themselves, bearing sharp dark spines: pinnæ often cuneate or broad, apex erose or variously jagged: spacides long, among the foliage, mostly only once-branched: fr. size of cherry, globose or obovoid, l-seeded. The generic name may be pronounced in four syllables: a-ff-an-ees.

caryotæfòlia (Martinezia caryotæfolia). Trunk solitary, to 30 ft. and more, 4-6 in. thick, ringed and with long black spines: lvs. 3-6 ft. and more long; pinnæ 6-14 in. long, most of them 3-6 in. broad and suddenly expanded near apex and narrower below, the end obscurely somewhat 3-lobed and variously toothed; spathe to 18 in. long, spiny toward the base: fr. about ½ in. long, yellow. S. Amer.

AÌRA. Graminex. Small mostly ann. grasses of the Medit. region, with narrow lvs. and spikelets borne in loose panicles; one species is planted for ornament and use in dry bouquets. See Grasses.

cærùlea: Molinia cærulea.

capillaris (Aspris capillaris). Ann. to 1½ ft: lvs. hair-like: panicles with many spreading thread-like branches. Var. pulchélla (Aspris pulchella, Agrostis pulchella) has awned florets.

flexudsa; Deschampsia flexuosa. pulchélla: A. capillaris var. AIR-PLANT: Kalanchoë mnnata.

AISTOCAULON. Aizoacex. A segregate from the genus Mesembryanthemum, one species from S. Afr. A. rosulatum (M. rosulatum. Nananthus rosulatus. Acaulon rosulatum). Roots long and fleshy: lvs. 6-8, spatulate, to 1½ in. long and 1 in. wide near tip, rough with many whitish wart-like dots: fls. yellow with red line in center of petals; stamens vellow with white anthers, 11/2 in. across.

AIZOACEÆ. CARPET-WEED FAMILY. Widely distributed low mostly succulent herbs or subshrubs, of about 20 formerly listed genera but now of much greater number with the segregations from Mesembryanthemum, with regular bisexual fls. having many or no petals, 4-5-parted calyx, 4-5 or many stamens, superior or inferior 2- or more-celled ovary, and fr. a caps. The plantbody is sometimes reduced to nearly or quite globular proportions, particularly in the dry and desert regions of S. Afr. Known to hort. in the plants of the Mesembryanthemum group grown for ornament and fancy, and in the New Zealand spinach grown as a pot-herb: Acrodon, Agnirictus, Aistocaulon, Aptenia, Argyroderma, Aridaria, Astridia, Bergeranthus, Bijlia, Carpanthea, Carpobrotus, Carruanthus, Cephalophylthea, Carpobrotus, Carruantius, Cephaiophyslum, Cerochlamys, Chasmatophyllum, Cheiridopsis, Concesia, Conophyllum, Conophytum, Corpuscularia, Cryophytum, Cylindrophyllum, Dactylopsis, Delosperma, Didymaotus, Dinteranthus, Diplosoma, Disphyma, Dorotheanthus, Dracophilus, Drosanthemum, Eberlanzia, Ebracteola, Echinus, Erepsia, Faucaria, Fenestraria, Gibbaeum, Glottiphyllum, Hereroa, Herreanthus, Hymenocyclus, Juttadinteria, Lampranthus, Lapidaria, Lithops, Machairophyllum, Mesembryanthemum, Meyerophytum, Mit-rophyllum, Monilaria, Nananthus, Odontophorus, Oophytum, Ophthalmophyllum, Oscularia, Peersia, Pleiospilos, Prenia, Psammophora, Psilo-caulon, Rabiea, Rhinephyllum, Rhombophyllum, Ruschia, Sceletium, Schwantesia, Semmanthe, Sphalmanthus, Stomatium, Tetragonia, Titanopsis, Trichodiadema, Vanheerdia.

AJŪGA. BUGLE-WEED. Labiata. Herbaceous annuals and perennials, grown in the rock-garden and the border, with numerous blue, white, or rose fls. in whorls in terminal spikes in early summer. Propagated by seeds and division; of simple cult.

alpina: A. genevensis.

Brockbankii: probably A. reptans var. Brockbankii, although referred by some to A. genevensis.

chia. Per to 1 ft, somewhat stoloniferous, sts villous above: Ivs. entire and linear-lanceolate to palmately 3-fid. with linear-spatulate segms to 1 in. long: fis. yellow, purple, or yellow with purple stripes, about 34 in. long. E. Eu.

genevénsis (A. alpina, A. rugosa), Per. 8-14 in., erect, not stoloniferous: lvs oblong or obovate, toothed: fis. blue. Eu., Orient. Var. álba, fls. white. Var. ròsea, fls. rose-pink. Var. variegàta is listed.

metállica var. crispa: hort, name for a form to 5 in, high with curled metallic glossy blue fls. in a pyramidal spike.

purpurea: hort. name, probably for form of A. metallica var. crisma: also a form of A. replans.

rèpens: A. reptans.

réptans (A. repens), CARPET B. Per 3-12 in., st. more réptans (A. 1epens). CARPET B. Per 3-12 in., st. more or less prostrate: lvs oblong or obovate, entire or wavy: fls white or in some vars, blue or purplish. Eu. Var. álba, fls. white Var atropurpurea has blue fls. and bronze lvs. Var. Brôckbankii, fls. blue. Var. multicolor, tohage spotted and variegated with yellow, brown and red. Var. purpurea is listed as having fls. purple. Var. rûbra, lvs. dark purple. Var. variegāta, lvs. splashed and edged creamyvellow

rugdsa: A. genevensis.

Tóttenhamii: a garden form about 6 in, high, with bronze foliage and purplish fls.

variegata: A. reptans var.

AKÈBIA. Lardizabalaceæ. Hardy twining shrubs with half-evergreen digitately com-Hardy twining pound lys., odd purplish unisexual fls. in axillary racemes in spring, and fr. a purple berry; 2 species from China and Japan.

Akebias are neat vines where heavy shade is not needed; they are also used in cool greenhouses for covering walls and pillars. They need sun and well-drained soil Propagated by seeds, by hardwood and greenwood cuttings, and by root-division.

lobàta: A. trifoliata.

quinata. FIVE-LEAF A. Lits. 5, entire: fis. fragrant. China, Japan, Korea,

trifoliàta (A lobata). Three-leaf A. Lits 3, coarsely toothed or entire Japan, China. Var. austrâlis has leathery entire lits. China. Var. clematifòlia has thin entire lits. Japan.

AKEE: Blighia sapida.

ALBÍZZIA. Leguminosæ. Small trees or shrubs with deciduous bipinnate lvs., fls. more or less plume-like or tassel-like due to exserted stamens, in heads or spikes, white, yellow, pink, blooming in summer, and pods strap-shaped and flat without partitions; native in trop. and subtrop. Asia, Afr. and Australia, and 1 in Mex. Cult. as for Acacia. A. Julibrissin may be grown as far north as Washington and hardy races much farther, and the others only in S. Fla. and S. Calif.

Julibrissin (Acaca Julibrissin. A. and Mimosa Nemu). SILK-TREE Tree 30-40 ft.: Ifts. ½ in. long: fts pink, in heads crowded on the upper ends of branches; pods to 6 in. long Persia to Japan. Var. rôsea, smaller bright pink fls., hardier.

Kalkòra. Differs from A. Lebbek primarily in lits. oblong, fis. yellowish-white with pink stamens and pod to 6 in long on a long stalk. India.—Intro. in test grounds but not in general cult.

Lébbek (Acacia Lebbel.). Lebber-Tree Siris-Tree. Womans-Tongue-Tree Tree to 50 ft.: lfts to $1\frac{1}{2}$ in long: fls greenish-yellow, in axillary heads: pods to 1 ft. long on pedicels 2-3 in. long. Trop. Asia, N. Australia; nat. in W. Indies.

lebbekoides. Tree to 50 ft.: lvs. of 8-12 pinnæ, lfts. 50-60, oblong, to $\frac{1}{3}$ in. long, obtuse: heads small, few-fld., numerous, corolla narrowly tubular: pods 6-8 in. long, -12-seeded. Burma.

lophántha (Acacia lophantha). Plume A. Shrub or tree to 20 ft.: lfts. 1/3 in. long: fls. yellow, in spikes 2 in. long: pods 3 in. long. Australia.

procèra. Tall tree: lfts. to 1 in. long: fls. greenish-white, in heads: pods to 7 in. long. Trop. Asia, Australia.

ALBÜCA. Liliacex. Bulbous herbs of the Scilla tribe with flat basal lys. and large yellow or white fls. in racemes; the two following from S. Afr. have been intro. in Calif.

major. To 3 ft.: lvs. to 1½ ft. long: fis. pale yellow with broad green band, 1 in long.

minor. To 1½ ft: lvs 1 ft. long: fis. pale yellow with broad green band, ¾ in. long.

ALCEA: Althæa Hohenackeri.

ALCHEMÍLLA. LADYS-MANTLE. Rosaceæ. Ann. or per. herbs with palmately-lobed or divided lvs., small greenish or yellowish fls. in corymbs, and fr. an achene; native in the north temp. zone and sometimes cult. Some of the species make good mats or low clumps of attractive foliage; fis. not showy. Propagated by seeds or division.

alpina. Per. to 8 in.: lvs. divided into 5-7 oblong lfts. toothed at tip and shining silvery-hairy beneath. Mts. of Eu.

arvénsis: see A. microcarpa.

chirophylla. Per. to 8 in.: lvs. divided into 5-7 oblong-obovate lits. toothed at tip, silky-hairy on both sides. Eu. micans. A form of A. vulgaris, very dark green turning red in autumn. Eu.

microcarpa. Ann. to 6 in.: lvs. deeply 3-parted into cut segms, pubescent, about ¼ in. long. Eu; nat. in E N. Amer.—Long confused with A. arvensis, from which it differs in its smaller lys and fls.

praténsis. Tall per.: lvs. orbicular, with 5-9 shallow-toothed lobes, pubescent beneath. Eu.; nat. in N. Amer.—By some considered a form of A. vulgaris.

pub
éscens. Per. to 8 in.: lvs. with 7–11 shallow coarsely too
thed lobes, sılky-harry. Eu.

sylvéstris. A form of A. vulgaris, bluish-green turning red-brown in autumn. Eu.

vulgàris. Per. to 1½ ft.: lvs. orbicular, to 6 in. across, with 7-9 shallow toothed lobes, grayish-pubescent. Eu.

ALCICORNIUM: Platycerium.

ALDER: Alnus. Black-: Ilex verticullata. White-: Clethra.

ALÉCTRYON. Sapindacex. Evergreen trees with alternate pinnate lys., bisexual or unisexual fls. in many-fld. panicles, without petals, and fr. a leathery caps.; variable; grown in S.

excélsum. Titoki. To 60 ft.: lvs. of 4-6 pairs of ovate-lanceolate nearly entire lfts to 4 in. long: panieles to 1 ft. long: caps. ½ in long. New Zeal.

subcinèreum. Sмоотн Rambutan. Tree to 30 ft.: lfts. oblong-elliptic to lanceolate, 3-5 in. long, glabrous, usually 2-6: fls. in loose panicles: fr. subsessile, lobes globose, to 1/2 in. across. Australia.

ALETRIS. STAR-GRASS. Liliaceæ. fibrous-rooted herbs with a basal cluster of narrow or grass-like lvs. and small white or vellow fls. in erect spikes or spike-like racemes terminating a slender scape.

Star-grass does well in moist sunny positions; useful for colonizing. Propagated by seed or division.

aurea. Yellow Colic-Root. To 2½ ft.: lvs. pale yellows,-prece, to 3 in. long: fls. yellow, oblong, erect: fr. an ovoid caps. nearly as long as perianth. June-Aug. S. E. U. S.

cordata: listed name of unknown botanical status.

farinòsa. To 3 ft.: lvs. pale yellowish-green, to 6 in. long: fls. white, elongate bell-shaped, erect: fr. an ovoid caps. usually shorter than perianth. May-July. Me. to Fla. and Ark.

ALEURITES. Euphorbiacex. Trees native in the eastern tropics, with milky juice, large alternate simple often lobed lvs., monoccious fls. in terminal panieled cymes, and rather large æsculus-like frs.; grown far S. for shade and for the seeds which yield valuable oil. The generic name is pronounced in four syllables

Propagated by seed sown where plants are to stand or seedlings transplanted when about 1 foot high. Also propagated by hardwood cuttings. Trees begin to bear nuts in three to six years.

cordata. Japan Wood-Oil-Tree. To 30 ft.: lvs broadly ovate-cordate, 3-5-lobed or toothed: fls. ¾ in. long, ovary 3-4-celled: fr, warty. S. E. Asia.

Fórdii. China Wood-Oil. or Tung-Oil-Tree To 25 ft: lvs. ovate, sometimes 3-lobed, to 5 in long: fis reddish-white, ovary 3-5-celled: fr. 2-3 in. across, smooth. Cent Asia

moluccàna. CANDLENUT. CANDLE-BERRY-TREE. NISH-TREE. To 60 ft.: lvs. ovate, often with 3-5 triangular lobes, to 8 in. long: fis. white, ovary 2-celled: fr. 2 in. or more across. Malaya: nat. in tropics.

ALFALFA: Medicago.

ALFILARIA: Erodium cicutarium.

ALGERITA: Mahonia trifoliolata.

WATER-PLANTAIN. Aquatic mostly per. herbs with erect or floating basal lvs. and fls. in panieles, having 3 white or rose-tinged petals; a widely distributed genus. Sometimes grown about ponds and in bogs for the foliage and many small white fls. Propagated by division or seeds.

Plantago-aquática. Lvs. oblong to ovate: fls. to ½ in. across, in whorls on panicles to 3 ft. high. Northern hemisphere; in N. Amer. as far north as Mass. and Minn.

subcordatum: the common N. American plant, by some authors considered to be distinct from the Old World A. Plantago-aquatica.

WATER-PLANTAIN FAMILY. ALISMÀCEÆ. About 13 genera in swamps and streams around the world. Herbs with basal long-stalked lys., regular bisexual or unisexual fls. borne in whorls on racemes or panieles, having 3 sepals, 3 deciduous petals, 6 or more stamens, many 1-celled ovaries becoming achenes in fr. Alisma and Sagittaria are grown in outdoor ponds and bogs. Lophotocarpus is grown in pools in Calif.

ALKANET: Anchusa.

ALKEKENGI: Physalis Alkekengii.

ALLAMÁNDA. Apocynaccæ. Trop. shrubs. erect or clambering climbers, grown in conservatories and in the open far S., with opposite or whorled lvs. and large funnel-shaped yellow or purplish showy fls., essential organs deep in the tube, and fr. a large prickly caps., which is not to be expected under glass.

The cultivation of Allamandas is simple, but they need two feeding during the whole growing season. The plants The cultivation of Allamandas is simple, but they need extra feeding during the whole growing season. The plants should be kept nearly dry after growth ceases in late autumn till February or March; they should then be cut back and started in a moist position; all repotting should be done before the new growth is 6 inches long. Propagated from old and new wood cuttings. In warm countries they thrive profusely on walls and fences.

cathártica. COMMON A. Tall climbing: lvs. usually in 4's, obovute, to 6 in. long fls. golden-yellow, to 3 in. across. Brazil Vars. are: grandiflòra, fls. to 4½ in. across; Héndersonii (A. Hendersonii), lvs. leathery, fls. to 5 in across; nóbilis (A. nobilis), fls. to 5 in. across, with magnolia-like fragrance; Schóttii (A. Schotti), fls. with durk striped throat; Williamsii, fls. with reddish-brown throat.

grandiflòra: A. cathartica var.

Héndersonii: A. cathartica var.

neriifòlia. Oleander A. Half climbing or erect shrub to 3 ft.: lvs. in whorls of 2-5, oval or oblong, to 5 in. long: fls. golden-yellow, 1½ in. across, swollen at base. Brazil.

nóbilis: A. cathartica var.

purpurea: hort. name. Schöttii: A. cathartica var.

violacea. Slender climber: lvs. usually in 4's, oval, to 6 in. long: fis. reddish-purple, 2½ in. across. Brazil.—Thrives best if grafted on A. cathartica var. Hendersonu or

Williamsii: A. cathartica var.

ALLEGHENY-VINE: Adlumia fungosa.

ALLIÒNIA (Oxybaphus). Umbreila-wort. Nyctaginaceæ. Mostly American herbs with opposite lvs. and fls. in terminal panicles or solitary in the axils, without petals and subtended by involueres; occasionally transplanted

nyctaginea. Per. to 3 ft.: lvs. broad-ovate to oblong, to 4 in long: fis. red, longer than involuce, in panicles. Ill. to Colo. and Tex. ALLIUM. Liliaceæ. Bulbous herbs with mostly strong odor, narrow basal lvs. and sometimes a few cauline lvs. and small fls. borne in umbels or heads subtended by bracts and terminating slender scapes; perianth-segms. 6; ovary 3-celled. In some species the lvs. are terete and fistular (hollow), and in others broad and flat. The roots are sometimes more rhizomatous than strictly bulbous. A large genus native mostly in the northern hemisphere and the species still much confused in cult.

Several species are grown for food and others for ornament, the latter mostly for colonizing or in wild-gardens and recently very popular in the rock-garden. The flower-garden alliums require no special treatment and bloom in spring and summer; A. neapolt'anum is useful for cut-flowers when grown in boxes or beds under glass. Propagated by seeds sown in early spring, by offsets and bulbels in autumn or spring. Most of the species are hardy North. See C'hive, Garlic, Leek, Onion.

acuminātum. To 1 ft., bulbs with membranous reticulated coats: lvs. ½ in. wide, shorter than scape: fls. deep rose-purple; segms. about length of pedirels; stamens shorter than segms B. C. to Ida. and Calif. Var. cuspidatum has more slender scapes and cuspidate segms.

acutángulum: A. angulosum.

álbidum: A. denudatum.

albopilosum. To 3 ft, bulbs with membranous coats; lvs to 134 in wide, white-hairy beneath; fls blac, in umbels 8 in across; pedicels 2-3 times longer than segms.; stamens shorter than segms. Persia to Asia Minor.

albo-purpureum: listed name.

álbum: not in cult., the plants so grown being A tuberosum.

alleghaniénse. To 2 ft., bulbs with membranous coats: lvs narrow-linear, shorter than scape: fls purple, in nodding umbels; pedicels filhform, many times longer than segms.; stamens exserted. Va. to Tenn. and Ga.

altaicum; A. fistulosum.

ammophilum. Often united with A. angulosum but lower, with smaller lvs. and golden-yellow fls. Eu.

Ampelôprasum. Differs from A. Porrum in the bulbs breaking up into numerous bulbels, and in the exserted rather than included style. Medit. region —Material grown as A. Ampeloprasum is likely to be A. Porrum.

ampléctens. To 134 ft., bulbs with membranous reticulated coats: lvs. filiform, shorter than scape: fls. white, in head-like umbels 1 in. across; pedicels nearly twice length of segms.; stamens about equalling segms. Wash. to Calif.

angulosum (A. acutangulum). To 2 ft, bulbs with membranous coats; lvs to 14 in wide, shorter than scape; fls. Islac or purple, rarely white; pedicels 2-3 times longer than segms; stamens included. Eu. to Siberia.

angustóprasum: listed name; plants so grown have been A. Schænoprasum.

ascalónicum. Shallor. To 1½ ft., clustered bulbs with membranous coats: lvs. terete and hollow, awl-shaped, shorter than scape: fls. white or violet, in globose umbels, rarely produced; pedicels longer than segms; stamens included Probably a cultigen.—Plants so advertised have turned out to be A. pulchellum.

Aschersonianum. To 1½ ft, bulbs with membranous fringed coats: Ivs to ½ in wide, shorter than scape: fls. pink, in dense umbels; pedicels 3-4 times longer than segms; stamens slightly exserted. Asia Minor to Egypt.—Plants grown under this name have proved to be A. carmatum.

atrorubens. To 5 in., bulbs with membranous coats: If. solitary, terete: fis. reddish-purple; pedicels equalling segms.; stamens included. Nev., Calif.

azureum; A. cæruleum.

Beesianum. To 1½ ft, clustered bulbs having fibrous coats: lvs to ½ in. wide, shorter than scape: fis. deep blue edged with white, in nodding umbels; pedicels equalling segms; stamens included. China.

Bidwelliæ: A. campanulatum.

biscéptrum. To 8 in., bulbs with membranous reticulated coats: lvs. ½ in. wide, about length of scape: fls. rose to whitish; pedicels 2-3 times longer than segms.; stamens included. Cahf., Utah.

Bolánderi. To 8 in., bulbs with membranous reticulated coats: lvs 1/2 in wide, shorter than scape: fls. rose to white; pedicels slightly longer than segms.; stamens included. Ore, Calif. Var. stenánthum (A. stenanthum) is taller, fls. nearly white.

brevistylum. To 2 ft., bulbs with fibrous coats: lvs. to

 $\frac{1}{2}$ in, wide, shorter than scape: fls. deep rose, in loose umbels; pedicels twice as long as segms.; stamens included. Mont. to Colo.

Brèweri. To 3 in., bulbs with membranous coats: lvs. 1/4 in. wide, much longer than winged scape: fls. rose-purple, in dense umbels; pedicels equalling segms.; stamens included. Calif.

bulgáricum: plants cult. under this name are probably A. sphærocephalum.

Búrbankii: listed name; probably referable to A. Schænovrasum.

carrileum (A. azureum). To 4 ft., bulbs with membranous coats: lvs. linear, 3-angled, shorter than scape: fis. deep blue, in dense globose umbels to 2 in. across; pedicels much longer than segms; stamens included or only slightly exserted. Siberia, Turkestan.

campanulatum (A. Bidwelliæ). To 1 ft., bulbs with membranous reticulated coats: lvs. 1/8 in. wide, shorter than scape: fis. pink, in many-fid. umbels; pedicels twice length of segms.; stamens included. Calif.

canadense. WILD GARLIC. To 2 ft, bulbs with fibrous reticulated coats: lvs. 5 m. wide, shorter than scape: fls. pink or white, often replaced by bulblets; pedicels much longer than segms.; stamens included. N. B. to Tex.

carinatum. To 2 ft, bulbs with membranous coats: lvs. 1/6 in. across, borne half way up st.: umbels bearing bulbels, subtended by 2 very long unequal bracts; fls. few, violet to rose; pedicels much longer than segms.; stamens exserted Eu; escaped in N. J. and Pa.—Material cult. as A. carinatum may be A. pulchellum.

Cèpa. Onion (which see). To 4 ft., large bulbs with membranous coats: lvs cylindrical and hollow, much shorter than hollow swollen scape: fls. lalac to white, in large umbels; pedicels many times longer than segms; stamens exserted. W. Asia. Var. solaninum (var. multiphenus), Potaro and Multiplier Onion, propagates by natural divisions of the bulb. Var. viviparum (var. bulbelliferum), Top Onion, is propagated by bulbels borne in the umbels.

cérnum (A. recurvatum). To 2 ft., clustered bulbs with membranous coats: lvs. 1/6 in. wide, shorter than scape: fls. rose or white (var. álbum), in many-fld nodding umbels; pedicels much longer than segms.; stamens exserted. N. Amer.

ciliatum: A. subhirsutum.

cinèreum: indefinite name botanically; plants so cult. are A. cernuum.

controvérsum: A. pyrenaicum.

crenulatum (A. vancquiverense). To 3 in, bulbs with membranous coats: lvs to ¼ in wide, longer than scapes which have winged crenate margins; fls. deep rose-purple; pedicels about equalling segms.; stamens included. B. C., Wash.

crispum: A. peninsulare var.

cuspidatum: A. acuminatum var.

cyaneum (A. Purdomu). To 10 in , clustered bulbs with fibrous coats: Ivs linear or filiform, ½5 in wide, longer than scape: fls. blue, in slightly nodding umbels; pedicels about length of segms.; stamens nuch exserted, blue. China.

Cfrillii. Allied to A. nigrum but a smaller plant with narrower lvs. and perianth-segms. and fleshy stamens. Italy to Asia Minor.

darwasicum. To 1 ft., bulbs with membranous coats: lvs. to ½ in. wide, as long as or longer than scape: fls. white, in many-fld. umbels; pedicels about length of segms.; stamens included. Bokkara.—Apparently not in cult., plants so labelled being other species.

denudatum (A. albidum). To 1 ft, bulbs with membranous coats: lvs. semi-terete, ½s in. wide, half as long as scape: fls. white or pale yellow; pedicels much longer than segms.; stamens about length of segms. Siberia to China.

desertícola: A. Geyeri.

dichlamfdeum. Similar to A. peninsulare but with broader obtuse perianth-segms. Calif., near coast.

Douglasii. To 10 in., bulbs with membranous coats: lvs. to ½ in. wide, much shorter than scape: fls. rose, in many-fld. umbels; pedicels twice as long as segms.; stamens included. Wash, Ida.

falcifolium. To 4 in., bulbs with membranous coats: lvs. ¼ in. wide, falcate, much longer than scape: fls. deep rose, with very narrow segms.; pedicels about length of segms.; stamens included. Ore, Calif.

fállax: A. senescens.

Farreri. To 1 ft., bulbs with fibrous coats: lvs. narrow-linear, about length of scape: fls. reddish-purple, campanulate, in loose umbels; pedicels equalling segms.; stamens included. Ckina.

fibrillum. To 4 in., bulbs with membranous reticulated coats: lvs. 1/2 in. wide, as long as scape: fis. white or pink,

in loose umbels; pedicels equalling segms.; stamens included. Ida., Ore.

fibrosum: A. rubrum: the true species is not in cult.

fimbriatum. To d in, bulbs with membranous coats: If, solitary, A in. wide, longer than scape: fis. rose-purple, in loose umbels; pedicels twice as long as segms.; stamens included. S. Calif.

fistulosum (A. altaicum). Welsh or Spanish Onion. To 1½ ft., clustered bulbs with membranous coats: Ivs. hollow and cylindrical, about length of hollow swollen scape: fls. white, in head-like umbels; pedicels equalling segms.; stamens exserted. Asia.

flavéscens: confused name; perhaps A. flavum is meant.

flavum. To 2 ft., bulbs with membranous coats: lvs. linear, terete, as long as scape: fts. yellow, in loose umbels subtended by 2 very long bracts; pedicels 2-3 times as long as segms.; stamens exserted. S. Eu. to W. Asia. Vars. major and minor are listed.

frigidum. To 6 in , bulbs with membranous coats: Ivs. semi-terete, borne on st., about length of scape: fis. whitish veined with rose, in loose umbels subtended by 2 long bracts; pedicels equalling segms.; stamens included. Greece.

galanthum. To 1½ ft., clustered bulbs with membranous coats: Ivs. few, hollow and terete, shorter than swollen scape: fls. whitish, m many-fld umbels; pedicels twice as long as segms.; stamens included. Siberna.—Some of the material grown under this name belongs to A. fistulosum.

Geyeri (A. deserticola). To 14 in., bulbs with fibrous coats; Ivs. † in. wide, shorter than scape: fls. rose, with broad segms.; pedicels twice as long as segms.; stamens included. B. C. to Ore. and Wyo.

needed. B. C. to Ore. and wyo.
gigantèum. To 4 ft., bulbs with membranous coats:
lvs. 2 m. wide and 1½ ft. long, glaucous: fls. bright hlac,
in dense globose umblels 4 in across; pedreels many times
longer than fls.; stamens exserted. Cent. Asia.

glaucum: A. senescens var.

globosum. To 2 ft., clustered bulbs with membranous coats: lvs terete, filiform, shorter than scape: fls. rose with deeper midrib, in globose umbels; pedicels much longer than segms; stamens exserted. Caucasus.

hæmatochiton. To 16 in., clustered bulbs with membranous coats: lvs. to ½ in. wide, somewhat shorter than scape: fis. purple or rose with darker midrib; pedicels twice as long as segms.; stamens included. S. Calif., N. Mex.

Hélleri: A. Nuttallii.

Hûteri: listed name.

hyślinum. To 1 ft., bulbs with membranous reticulated coats: lvs. ½ in. wide, somewhat shorter than scape: fls. white or pinkish, becoming translucent; pedicels 3 times longer than segms.; stamens included. Calif.

hymemorrhizum. To 3 ft., bulbs with membranous coats: lvs. to ¼ in. wide, shorter than scape; fls. rose, in globose umbels; pedicels longer than segms.; stamens exserted. W. Asia.

insubricum: A. narcissiflorum.

japónicum: A. Thunbergii.

kansuénse. Distinguished from A. cyaneum by its wider linear lvs., larger tubular-campanulate fis., and included stamens. W. China, Tibet.

karataviénse. To 10 in , with membranous bulbs: lvs. 2, to 5 in. across, longer than scape: fls. whitish with purple midrib, in globose umbels 3 in. across; pedicels 3 times as long as segms.; stamens slightly exserted. Turkestan.

 $\bar{\mathbf{K}}$ òchii: name of no botanical standing; plants so labelled have been A. fistulosum.

lacunosum. To 1 ft., bulbs with membranous reticulated coats: lvs. about length of scape: fls pink, in loose umbels; pedicels twice length of segms.; stamens about equalling segms. Calif.

Ledebourianum. To 2 ft., bulbs with membranous coats: lvs. terete and hollow, shorter than scape: fls. rose, shining, in many-fld. umbels; pedicels 2-3 times longer than segms.; stamens included. Siberia.

Lémmonii. To 6 in., bulbs with membranous reticulated coats: lvs. 1/4 in. wide, about length of scape: fls. pink, in loose many-fld. umbels; pedicels about equalling segms.; stamens length of segms. Calif.

libani. To 5 in, bulbs with membranous coats: lvs. to 1/2 in. wide, glaucous, longer than scape: fls. white, in many-fld. umbels; pedicels twice length of segms.; stamens included. Asla Minor.—Apparently not in cult., plants so named belonging to other species.

lineare. To 1½ ft., bulbs with fibrous reticulated coats: lvs. to ½ in. wide, shorter than scape: fls. rose-purple, in many-fld. umbels; pedicels 4 times longer than segms.; stamens exserted. Russia, Siberia.

macranthum. To 2 ft., bulbs with membranous coats:

lvs. 1/6 in. wide, shorter than scape: fls. deep purple, nodding, in loose umbels; pedicels much longer than segms.; stamens included. Himalayas.

Mairei (A. yunnanense). To 16 in., clustered bulbs with fibrous coats: lvs. filiform, terete, shorter than scape: fis. whitish or rose, campanulate, in loose umbels; pedicels longer than segms.; stamens included. China.

margaritaceum. To 3 ft., bulbs with fibrous coats: Ivs. filiform, semi-terete, shorter than scape: fls. whitish with green midrib, in dense globose umbels; pedicels 2-3 times as long as segms.; stamens exserted. S. E. Eu., Asia Minor.

maritimum: Mulla maritima.

Moly. To 1½ ft., clustered bulbs with membranous coats: lvs. to 1 in. wide, about length of scape: fls. bright yellow, star-like, in many-fld. umbels to 3 in. across; pedicels longer than segms.; stamens included. S. Eu. Var. lûteum is listed.

monadélphum. To 1½ ft., clustered bulbs with slightly fibrous coats: lvs. linear, hollow, longer than hollow scape: fls. rose-purple, in many-fld. umbels; pedicels about length of segms.; stamens included. Siberia, Turkestan.

montanum: A. senescens.

moschatum. To 1 ft., bulbs with fibrous reticulated coats: lvs. terete, filiform, shorter than scape: fts. rose to whitish, in few-fld. umbels; pedicels longer than segms.; stamens included. S. Eu., W. Asia.

mutábile. To 2 ft., bulbs with fibrous reticulated coats: lvs ½6 in. wide, shorter than scape: fls. pink or white, in many-fld. umbels; pedicels longer than segms.; stamens included. N. C. to Fla. and Tex.

nanhoénse: listed name.

narcissifiorum (A. pedemontanum. A. insubricum). To 1 ft, bulbs with fibrous reticulated coats: Ivs. ½ in. wide, shorter than scape: fls. rose, large, in few-fld. nodding umbels; pedicels shorter than segms.; stamens included.

neapolitanum. To 1 ft., bulbs with membranous coats: lvs. to 1 in. wide, shorter than scape: fls. white, becoming papery, large, in few-fld. umbels to 3 in. across; pedicels 2-3 times longer than segms.; stamens included. S. Eu. Var. grandiflorum is listed.

Nèvii. To 10 in, bulbs with membranous reticulated coats: lvs. 1/4 in. wide, shorter than scape: fis pink, in loose umbels; pedicels about equalling segms.; stamens length of segms. Wash, Ore., Ida.

nigrum (A. speciosum). To 2 ft., bulbs with membranous coats: lvs. to ¾ in. wide, shorter than scape: fls. violet or whitish, in dense umbels which sometimes bear bulbels; pedicels twice as long as lanceolate segms. which become reflexed; stamens included. S. Eu., W. Asia, N. Afr.

nutans. To 2½ ft., bulbs with membranous coats: lvs. to ½ in. wide, shorter than scape: fls. white or pinkish, in many-fld. globose umbels; pedicels twice length of segms.; stamens exserted. Siberia.

Núttallii (A. Heller). To 8 in., bulbs with fibrous reticulated coats: lvs. ¼ in. wide, shorter than scape: fls. rose or white, in loose umbels; pedicels twice length of segms.; stamens included. S. D. to Tex. and Ariz.

obliquum. To 3 ft., bulbs with membranous coats: lvs. to 1 in. wide, shorter than scape: fls. yellow, in many-fld. globose umbels; pedicels twice length of segms.; stamens exserted. Siberia.

oddrum: A. ramosum; see also A. tuberosum.

oleraceum. To 2 ft., bulbs with membranous coats lvs. ½ in. wide, shorter than scapes. fls. rose, whitish or greenish, often replaced by bulbels, in loose umbels; pedicels twice length of segms.; stamens equalling segms. Eu.

oreophilum. To 4 in., bulbs with membranous coats: lvs. to ½ in. wide, glaucous, longer than scape. fls. purple, in many-fld. umbels; pedicels longer than segms.; stamens included. Caucasus.

Ostrowskianum. By some regarded as a var. of A. oreophilum, differing in the maroon-colored fis. Turkestan.

páilens: a confused name botanically, probably referable to A. panuculatum.

paniculatum. To 2 ft., bulbs with membranous coats: lvs. $\frac{1}{2}$ in. wide, shorter than scape: fls. white or rose, in loose umbels subtended by 2 very long bracts; pedicels longer than segms.; stamens equalling segms. Medit. region.

parvum. To 2 in., bulbs with membranous coats: lvs. in. wide, longer than scape: fls. rose-purple with darker midrib; pedicels equalling segms.; stamens included. Nev., Calif.

pedemontanum: A. narcissiflorum.

peltatum: listed name,

peninsulare. To 1 ft., bulbs with membranous reticulated coats: lvs. $\frac{1}{10}$ in. wide, about length of scape: fls. rose-purple, in loose umbels; pedicels twice as long as segms.;

stamens included. Calif., Lower Calif. Var. crispum (A. crispum) has inner segms. of fl. undulate or crisped.

Pikeanum. Distinguished from A. Geyers by the darker red-purple fis, and small reflexed bracts. Colo.

platycaile. To 6 in., bulbs with membranous coats; lvs. to \$\(\frac{1}{2} \) in. wide, longer than flattened scape: fls. rose, in dense umbels; pedicels about length of segms.; stamens equalling segms. Calif.

Pérrum. Leek. To 3 ft., bulbs with membranous coats: lvs. to 2 in. wide, as long as scape: fls. pinkish, in dense umbels subtended by a very long deciduous bract; pedicels much longer than segms.; stamens exserted. Cultigen.

prairiénsis: listed name.

Przewiskianum. To 10 in., clustered bulbs with fibrous reticulated conts. lvs. filiform, longer than scape: fls. rose-purple, in many-fld. umbels; pedicels 2-3 times longer than segms.; stainens exserted. China.

pulchéllum. To 2 ft., bulbs with membranous coats: lvs. ½5 m. wide, equalling scape: fls. violet or rose, nodding, in loose umbels subtended by 2 very long bracts; pedicels longer than segms.; stamens exserted. S. Eu., W. Asia.

Púrdomii: A. cyaneum.

Purdyi. To 1 ft., bulbs with membranous faintly reticulated coats: If. 1, shotter than scape: fls. pink with darker midrib, in many-fld. umbels; pedicels about twice as long as segme.; stamens included. Calif.

pyrenâlcum (A. controversum). To 3 ft., bulbs globose: lvs. lanceolate-linear, borne to middle of st.: fls. white with green midrib, in many-fld, globose umbels subtended by I long bract; stamens included. Pyrenecs.

rambsum (A. odorum, A. umbellatum, A. tatarıcum). To 20 m., clustered bulbs with fibrous reticulated coats: lvs. to ½ m. wide, hollow, shorter than scape: fls. white with reddish midirb, fragiant, in many-fid, umbels; pedicels 2-4 times as long as segms.; stamens included. Siberia.

recurvatum: A. cernuum.

reticulatum: A. textile.

Rosenbachianum. To 2 ft., bulbs with membranous coats lvs. to 34 m. wide, shorter than scape: fis. purple, in large globose umbels; pedicels much longer than segms.; stamens equalling segms. Turkestan. Var. album is listed.

ròseum. To 1½ ft., bulls with membranous coats, the outer regularly pitted: lvs. to ½ m. wide, shorter than scape fls. rose, in loose umbels to 3 m. across which often bear bullbels; pedicels 2–3 times us long as segms; stamens included. S. Eu, N. Afr. Var. grandiflòrum is listed.

rotúndum. To 3 ft., bulbs with membranous coats: lvs. 15 in. wide, about equalling scape. fls. puiple varying to whitish, in globose heads 1 in. across; pedicels much longer than segms.; stamens included. Eu., N. Afr., W. Asia.

ribrum (A. fibrosum. A. Rydbergui). To 1 ft., bulbs with fibrous reticulated conts; lvs. to ½ in. wide, shorter than scape: fls. mostly replaced by reddish bulbels; pedicels about length of segms.; stamens included. Rocky Mts.

Rødbergii: A. rubrum.

sativum. Garlic. To 2 ft., bulbs of several parts in a membranous coat: Ivs. to 1 in. wide, shorter than scape: fls. pinkish, partly replaced by bulbels, in small umbels subtended by a very long bract; pedicels longer than segms.; stamens included. Eu.

scaposum. To 1 ft., bulbs with membranous reticulated coats: lvs. terete, linear, shorter than scape; fls. white with red midrib, in loose umbels; pedicels 2-3 times longer than segms.; stamens about length of segms. Tex. to Mex.

Schenoprasum. Chive. To 2 ft., tufted, clustered bulbs with membranous coats. Ivs. terete and hollow, equalling or exceeding scape: fls. rose-purple, in many-fld. umbels; pedicels shorter than segms.; stamens included. Eu., Asia. Var. sibfricum (A. sibricum) differs chiefly in Ivs. being shorter than scapes. Sibetia, N. N. Amer.—Plants grown in the garden under many names turn out to be chives, as darwasicum, frigidum, Ledebourianum, libani.

Schübertii. To 2½ ft., bulbs with membranous coats: lvs. to 1 m. wide, longer than hollow scape, fls. pink or violet with darker midrib, in large globose umbels; pedicels much longer than segms., those of sterile fls. to 9 m. long; stamens included. Asia Minor.—Apparently not in cult., plants so named belonging to other species.

Scorodóprasum. Rocambole. Giant Garlic. To 3 ft., bulbs with membianous coats: lvs. ½ in. or more wide, borne below middle of st.: flx. deep purple, often replaced by bulbels, in large umbels; pedicels twice length of segms.; stamens included. Eu., Asia Minor.

senéscens (A. montanum. A. fallar). To 2 ft., bulbs with membranous coats, lvs. 13 m. wide, shorter than scape: fls. hlac, in many-fld umbels; pedicels longer than segms; stamens exserted. Eu., W. Asia. Var. glaucum has more narrowly campanulate fls. in denser umbels.—Common in cult. and grown under many names.

serratum. To 1 ft., bulbs with membranous reticulated

coats: lvs. 17 in. wide, shorter than scape: fls. rose, in dense umbels; pedicels about length of segms.; stamens included.

sibíricum: A. Schænoprasum var.

sikkiménse. To 6 in., bulbs with outer coats having parallel fibers: fls. purplish-blue, in dense umbels; pedicels shorter than segms.; stamens included. Sikkim,

speciosum: A. nigrum.

spherocephalum. To 3 ft., bulbs with membranous coats: lvs. \(\)_3 in wide, semi-terete, borne to about middle of st., shorter than scape: fls. reddish-purple, in dense globose umbels; pedicels of inner fls. much longer than segms.; stamens exserted. Eu., W. Asia, N. Afr.

stellatum. To 1½ ft., bulbs with membranous coats: lvs. † in. wide, shorter than scape: fls. rose, in many-fld. umbels; pedceels 2-3 times longer than segms.; stamens exserted. Ill. to Neb. and Kans.

Stellerianum. To 1 ft., clustered bulbs with membranous coats. Ivs. ½ m. wide, semi-terete, shorter than scapes; fts. pink, in loose umbels; pedicels 3 times longer than segms.; stamens equalling segms. Siberia.

stenánthum: A. Bolanderi var.

striatum: Nothoscordum bivalve.

strictum. To 1½ ft., bulbs with fibrous reticulated coats: lvs. to ½ in. wide, about length of scape. fls. purple or rose, in dense globose umbels; pedicels equalling segms.; stamens exserted. Eu., W. Asia.

subangulàtum. To 1 ft., bulbs with fibrous reticulated coats. lvs. filliorm, shorter than scape. fls. rose-purple, in many-fld. umbels; pedicels equalling segms.; stamens included. Cent. Asia.

subhirsùtum (A. cil·atum). To 20 in., bulbs with membranous coats: lvs. to ½ in. wide, equalling scape: fis, white with lavender midrib, fragrant, in loose umbels; pedicels much longer than segms.; stamens included. Medit. region.

tangùticum. To 16 in., bulbs with membranous coats; lvs. to ½ in. wide, shorter than scape: fls. blush-lilac with darker midrib, in dense umbels; pedicels twice or more as long as seguis,; stamens exserted. W. China.

tatáricum: A. 1amosum.

téxtile (A. retculatum). To 1 ft., bulbs with fibrous coats, lvs. \(^1_6\) in wide, shorter than scape: fis. white or pale pmk, in many-fid. umbels; pedicels twice length of segms.; stamens included. Sask, to Ariz.

Thúnbergii (A. japonicum). To 2 ft., bulbs with membranous coats: Ivs. 16 in. wide, about as long as scape: fts. purple, fragrant, in loose umbels; pedicels about length of segms.; stamens exserted. Japan.

tibéticum. Differs from A. sikkimense in smaller less campanulate deep blue fis. Tibet.—Doubtfully in cult., plants grown under this name belonging to other species.

tricoccum. WILD LEEK. To 1 ft., bulbs with fibrous reticulated coats, lvs. to 2 in. wide, withering before flowering fls. white; pedicels 2-3 times longer than segms.; stamens included. N. B. to Minn, and N. C.

triquètrum. To 1½ ft., bulbs with membranous coats: lvs. to ¼ m. wide, about equalling scape. fls. white, large, in loose umbels; pedicels about length of segms.; stamens included. Medit. region.

tuberòsum. Differs from A. ramosum in lvs. not being hollow, fls. expanded instead of funnel-shaped, segms, somewhat reflexed with greenish inconspicuous midrib, flowering season later July-Sept. Asia.—Some of the material grown as A. odorum belongs here.

umbellatum: A. ramosum.

unifolium. To 1½ ft, bulbs produced from lateral bulblets, with membranous reticulated coats: lvs. to ½ m. wide, shorter than scape: fls. bright rose, in many-fld. umbels, pedicels twice length of segms.; stamens included. Calif., Lower Calif.

urceolatum. To 2 ft., bulbs with membranous coats: lvs. terete, hollow, shorter than scape. fls. pale blue or whitish, m many-fld. umbels; pediecls much longer than segms.; stamens equalling segms. Turkestan.

válidum. To 2 ft., bulbs with membranous reticulated coats; lvs. to $^3\xi$ m. wide, about equalling scape; fls. rose or nearly white, in many-fid. umbels; pedicels about length of segms.; stamens exserted. Wash., Calif., Nev.

vancouverénse: A. crenulatum.

victoriàlis. To 2 ft., bulbs with fibrous reticulated coats: lvs. to 3 in. wide, shorter than scape, fls. white or yellowish, in many-fld. umbels to $1\frac{1}{2}$ in. across; pedicels longer than segms.; stamens exserted. S. Eu., Asia.

Villarsii: name of no botanical standing.

viviparum. To 3 ft., bulbs with membranous coats: lvs. linear, shorter than scarce fis. blue, often replaced by bulbels; pedicels much longer than segms.; stamens equalling segms. Siberia, Turkestan.

Wallichiànum. To $1\frac{1}{2}$ ft., clustered bulbs with membranous coats: lvs. to $\frac{3}{2}$ in. wide, longer than scape: fls. purple, in loose umbels to 3 in. across; pedicels much longer than segms.; stamens included. Himalayas.

Winklerianum. To 1½ ft, bulbs with membranous coats: lvs. ½ in, wide, shorter than scape: fls. whitish veined with green, in many-fld. umbels; pedicels shorter than segms.; stamens included. Turkestan.

vunnanénse: A. Marrei.

zebdanénse. To 2 ft., bulbs with membranous coats: lvs. ½ in. wide, shorter than scape: fls. white, in loose umbels; pedicels about equalling segms.; stamens included, Asia Minor.

ALLOPHYTON. Scrophulariacex. Three somewhat woody small per herbs of Mex. and Guatemala: lvs. simple, crowded, opposite, tapering to a sessile or clasping base: fls. bell-shaped, purple and spotted, in close long-peduncled clusters; lobes of corolla shorter than tube. A. mexicanum (Tetranema mexicanum, Penstemon mexicanus) is sometimes grown under glass for its attractive bloom: lvs. near the ground at the top of a very short st., oblong-obovate, to 6 in. long, nearly entire, glaucous underneath: fls. nearly ½ in. long, many in a cluster on peduncles to 8 in. long.

ALLOPLÉCTUS (Crantzia). Gesneriaccæ. Trop. shrubs with opposite lvs., fls. clustered or solitary in the axils having straight or curved tube and 5-lobed limb, and fr. a berry; grown in the greenhouse.

Schlimii. Lvs. ovate or ovate-oblong, to 4 in. long, toothed, violet or purple beneath: fis. yellow and red, 1 in. long, urn-shaped, the calyx red. Trop. S. Amer.

ALLOSURUS: Pellæa rotundifolia.

ALLSPICE: Pimenta officinalis. Carolina: Calycanthus florulus.

ALMOND. Two kinds of plants are known as almonds. The one grown in orchards as a fruittree is Prunus Amygdalus, native probably in western Asia. It is grown for the "nut," which is the kernel in the pit or stone. The fruit is a hard dryish drupe, the flesh more or less splitting at maturity and disclosing the stone; the thin flesh is inedible. The bitter almond is employed in certain manufacture. The sweet almond, in which the kernel is edible, is the kind grown pomologically; it may be either soft-shell or hard-shell, the former including most of the commercial kinds. The almond tree is much like the peach and the culture is in general the same. Although nearly as hardy as the peach, it blooms earlier and is more subject to damage from spring frosts. Commercially the almond is little grown in North America outside California. Propagation of named varieties is by budding on seedlings grown from either the soft-shell or hard-shell kinds.

Other almonds are grown for the ornamental bloom. There are showy and double-flowered forms of the common almond, Prunus Amygdalus. The usual "flowering almonds," however, are little bushes of other species, prized for the spring bloom, single and double, in pink, blush, rose and white. Two species are common, Prunus triloba and P. glandulosa, and P. japonica is sometimes seen. The true dwarf almond is P. tenella, not much grown: flowers single, pink or white. These various small ornamental almonds are commonly grown on plum stock, and the grower should be diligent to keep down the sprouts from the plum root.

ALMOND, EARTH-: Cyperus esculentus. Indian: Ferminalia Catappa. Tropical-: Terminalia Catappa.

ALNIPHÝLLUM. Styracacex. Small genus of W. Asiatic trees and shrubs allied to Halesia, but differing in having indehiscent fr. with few non-winged seeds; one species is cult.

Fortunei. Shrub or small tree to 30 ft., branches brownish-tomentose when young becoming glabrous and striated with age. Ivs. broadly ovate to obovate, to 5 in. long, alternate, petioled, somewhat toothed toward acute or obtuse apex: fts white, to 1 in. long, in 15-16-fld. panicles or racemes. China.

ÁLNUS. ALDER. Betulaceæ. Deciduous monoccious trees and shrubs with alternate toothed lvs., staminate fls. in long catkins and the pistillate in short eatkins becoming woody cones with 5-lobed scales; native in the northern hemisphere and the Andes of S. Amer. The bloom is not showy but interesting because it appears in advance of foliage in many species.

Alders are best adapted to moist soils and cool or cold climates. Propagated by seeds dried in the autumn and sown in spring under a light covering; also by cuttings, suckers, and rarer kinds by grafting on potted seedling stocks under glass.

Alnobétula: A. viridis,

barbata: A. glutinosa var.

califórnica: A. rhombifolia.

communis: A. glutinosa.

cordàta (A. thliacea. A. cordifolia). ITALIAN A. Tree to 75 ft.: lvs. broad-ovate, to 4 in. long, heart-shaped at base: cones 1-3. Italy, Corsica.

cordifòlia: A. cordata.

crispa (A. Mitchelliana). American Green A. Shrub to 10 ft: lvs. ovate, to 3 in long, rounded at base, aromatic when young: cones 3-6. Lab. to N. C. Vur. móllis has young lvs. and branchlets pubescent beneath; lvs. to 3½ in. long.

firma. Shrub or tree to 10 ft.: lvs. ovate-oblong, to 5 in. long, rounded at base. Japan. Var. hirtella grows to

30 it.

fruticosa. Tree to 40 ft.: lvs. ovate, to 4½ in. long, lobed or somewhat so, with 5-10 pairs of vens, glabrous beneath: pistiliate catkins terminal: winter buds not stalked. N. E. Asia.

Asia.
glutinosa (A. rotundifolia. A. vulgaris. A. communis).
BLACK A. Tree to 80 ft. the young growth very sticky:
lvs. oval or nearly orbicular, to 4 in. long, broad at base:
cones 3-5 Eu., N. Afr., Asia; somewhat escaped in E. N.
Amer. Several vars. are in cult., as: aurea with yellow lvs.;
barbata (A. barbata), lvs. pubescent beneath; denticulata,
lvs. finely toothed; imperialis, lvs. small, deeply lobed into
linear lobes; incisa (var. oxyacunthfolia), lvs. small, deeply
lobed into broad lobes; laciniata, lvs. regularly lobed to
about middle; pyramidalis (var. pyramidalis Birkana), of
narrow pyramidal habit; quercifòlia, lvs. with deep irregular
lobes; rubrinérvia, lvs. shining dark green with red veins
and petioles; sorbifòlia, lvs. small, with broad deep lobes.

hirsuta. Manchurian A. Tree to 60 ft.: 19ts broad-ovate, to 6 in long, rounded at base, glaucous and reddish-pubescent below: cones 3-4. N. E. Asia, N. Japan. Var. sibirica, 19ts densely pubescent beneath on midrib only and sparingly so on veins.

hýbrida: hybrid between A. glutinosa and A. incana. imperiàlis: A. glutinosa var.

incana. Speckled A. Shrub or tree to 60 ft.: lvs. ovate, to 4 in. long, rounded at base, glaucous or grayish-green beneath: cones 4-8. Eu., Asia, N. Amer. Var. acuminata (var. lacunuta) has lvs. lobed about half way. Var. monstrosa has much flattened branches. Var. péndula, branches drooping. Var. pinatifida has small deeply lobed lvs.

incisa: A. glutinosa var.

japónica. Tree to 80 ft.: lvs. narrow-elliptic, to 5 in. long, wedge-shaped at base, light green beneath: cones 2-6. N. E. Asia, Japan.

latifòlia: A. rugosa.

macrophýlla: A. subcordata.

marítima. Seaside A. Shrub or tree to 30 ft.: lvs. oblong, to 4 in. long, wedge-shaped at base, glossy above, light green beneath: cones 2-4. Del., Md., Okla., on banks of streams and ponds.

Mitchelliana: A. crispa.

móllis: A. crispa var.

multinérvis: A. pendula.

nepalénsis. Tree: lvs. elliptic-lanceolate, to 7 in. long: cones in lateral panicles. Himalayas.

oregana: A. rubra.

péndula (A. multinervis. A. firma var. multinervis). Shrub or tree to 30 ft.: lvs. oblong-lanceolate, to 5 in. long: cones in nodding racemes. Japan.

pubescens: probably A. hybrida.

purpurea: probably a form of A. alutinosa.

rhombifòlia (A. californica). White A. To 100 ft. or more: lvs. ovate to nearly orbicular, to 4 in. long, tapering at base. Wash. to Calif.

rotundifòlia: A. glutinosa.

rùbra (A. oregana). Rep A. Tree to 70 ft.: lvs. ovate, to 5 in. long, truncate at base, grayish-green or glaucous beneath: cones 6-8. Alaska to Ida. and Calif.

rugòsa (A. serrulata. A. latifolia). Hazel or Smooth A. Shrub or tree to 25 ft.: lvs. elliptic or obovate, to 4 in. long, wedge-shaped at base: cones 4-10. Me. to Fla. and Tex.

serrulate: A rugosa

sinuata (A. sitchensis). Shrub or tree to 50 ft.: lvs. ovate, to 4½ in. long, bright green, rounded or cuneate at base, lobed or nearly so, with 5-10 pairs of veins, serrate, usually glabrous but may be somewhat pubescent beneath along midrib: pistillate catkins terminal on slender pedicels to 3½ in. long. Alaska to N. Calif.—This species is closely related to A. fruticoss, and the two are not considered distinct entities by some authors.

sitchénsis: A. sinuata.

subcordata (A. macrophylla). Tree to 50 ft.: lvs. ovate or oblong-ovate, to 6 in. long, rounded at base, light green and pubescent on veins beneath: cones 1-4. Caucasus, Persia.

tenuifòlia. Mountain A. Tree to 30 ft.: lvs. ovate or ovate-oblong, to 4 in. long, mostly rounded at base, usually yellowish-green. B. C. to Lower Calif. and New Mex.

tiliàcea: A. cordata.

viridis (A. Alnobetula). EUROPEAN GREEN A. Shrub to 6 ft: lvs. ovate, to 2½ in. long, broad at base, pale green beneath: cones in racemes. Mts. of Eu.

vulgăris: A. glutinosa.

ALOCASIA. Araceæ. Trop. Asian herbs with thick short sts., mostly large arrow- or heart-shaped lvs. which are always peltate when young, sheathed petioles, and unisexual fls. borne on a spadix which is shorter than the spathe; grown in greenhouses for the ornamental often variegated foliage.

In the growing season plants should be given an abundance of water, protected from direct sunlight, and a night temperature of 70°; the latter should never fall below 60° even in winter. Propagated by suckers or cuttings of the roots placed in pots and plunged in sand over bottom heat; also by seed sown in pots and kept in a temperature of about 75°.

arboréscens: listed name of unknown botanical stand-

ing.

argyræa. Lvs. to 1½ ft. long, dark green with silvery sheen, the basal lobes ovate. Trop. Asia.

cuprea. Lvs. to 1½ ft. long and 1 ft. across, purple beneath, above dark metallic shining green, the basal lobes ovate: spathes purple and green. Malaya.

illústris: Colocasia antiquorum.

indica (Colocasa odorata). To 6 ft.: lvs. to 15 in. long and 6 in. wide, green, arrow-shaped, margins slightly wavy, the basal lobes ovate: spathes yellowish-green or purplish inside. Malaya. Var. metallica (A. plumbea) has deep purple lvs. and petioles with a metallic sheen. Var. variegata has lvs. and petioles lined or mottled with grayish-white.

Korthálsii (A. Thibautiana). St. short: lvs. to 14 in. long and 6 in. wide, olive-green above veined with white and purple beneath: spathes pale green. Malaya.

Lowii. St. short: Ivs. to 1½ ft. long and 6 in. wide, olive-green above with pale nerves, dark purple beneath, the basal lobes oblong-triangular; petioles rose-color: spathes whitish-green. Malaya. Var. Veltchii (A. Veitchii) has Ivs. broadly margined with white and white nerves. Java.

macrorhiza. To 15 ft. or more high: lvs. 2 ft. or more long, green, arrow-shaped, the margins wavy: spathes glaucous-green or yellowish. Malaya. Var. variegāta has lvs. blotched and mottled with white.

megarrhiza: hort. name; perhaps A. macrorhiza.

metállica: A. indica var.

mortenfontanensis. Hybrid between A. Sanderiana and A. Lowii with green lvs. margined and veined with white and purple beneath.

odora. St. to 21/2 ft.: lvs. to 3 ft. long and 21/2 ft. wide,

arrow-shaped, the margins wavy: spathes glaucous-green or vellowish. Asia.

plúmbea: A. indica var. metallica.

porphyroneira (A. princeps). Nearly stemless: lvs. pale green with purplish veins, arrow-shaped, the margins wavy, basal lobes triangular; petioles spotted white and yellow; spathes pale yellow. Malsya.—Another A. porphyroneura is a form of Caladium picturatum.

princeps: A. porphyroneura.

Rodigasiàna. Hybrid between A. regina and A. Korthalsii with grayish-green lvs. purple beneath and with paler veins

Sanderiana. Lvs. 1½ ft. long and 6 in. wide, shining metallic green above veined with white or pale yellow, purplish beneath, arrow-shaped, the margins deeply sinuate-lobed, basal lobes narrowly triangular; petioles striped with brown: spathes green. Philippines.

Sèdenii. Hybrid between A. cuprea and A. Lowii, having lvs. purple beneath and veined white above.

Thibautiana: A. Korthalsii.

Van Houtteana. Hybrid of uncertain parentage, having deep green shining lvs. margined with white.

Veltchii: A. Lown var.

violacea: probably Colocasia antiquorum.

Watsoniana. Lvs. to 2 ft. long and 14 in. wide, green above and purplish beneath margined with white, the basal lobes ovate. Malaya.

zebrina. St. short: lvs. 1½ ft. long, green, arrow-shaped, margins slightly wavy, the basal lobes oblong-triangular; petioles banded with green and white: spathes green and white. Philippines.

ALOE. Liliaceæ. Per. succulent herbs with stiff spiny-toothed lvs. and showy red or yellow fls. in mostly elevated racemes or spikes on a stout scape-like st.; sometimes grown in the greenhouse or out-of-doors in the S. for their unusual stiff and fleshy aspect. Not to be confused with agaves which are American but aloes are from the Old World, mostly Afr. As a Latin generic name, Aloe has three syllables; as a vernacular or "common" name it has two syllables.

Aloes are well-known pot subjects and are likely to be conspicuous about public buildings and parks in countries not subject to killing frost. They commonly thrive in the same pot for some years when not grown for bloom. Propagated by suckers; sometimes by cuttings of new growths and by seeds when available.

abyssinica. Stemless: loose rosette of about 25 swordshaped lvs., usually 2½-3 ft. long, ascending, slightly recurved, to 6 in. wide at base, marginal teeth fleshy, ½ in. long and about 1 in. apart: fls. yellow to red, about 1½ in. long, on erect branched racemes to 3 ft. high. Ethiopia.

affinis. Stemless: lvs. to 10 in. long and 3 in. wide, with horny teeth: fls. 1½ in. long, in many-fld. cylindrical racemes to 10 in. high. S. Afr.

africana. St. to 20 ft. below dense rosette of lys.: lys. sword-shaped, 1½-2 ft. long and 2½-3 in. broad near base, very glaucous, margins with brown prickles: fts. bright yellow tipped with green, much recurved, 1½ in. long, in dense racemes about 1 ft. long. S. Afr.

arbòrea: A. arborescens.

arboréscens (A. arborea). To 15 ft.: lvs. to 2 ft. long and 2 in. wide, at top of trunk: fis. red, 1½ in. long, in dense racemes S. Afr. Var. frutéscens is a shrubby form with glaucous lvs. Var. natalénsis, lvs. glaucous, fis. 1½ in. long, in conical racemes. Var. pachythfrsa, lvs. bluish, fis. 2 in. long, in ovate-cylindrical racemes.

aristata (A. longiaristata). Stemless: lvs. to 4 in. long and ½ in. wide, with whip-like apical thread and white marginal teeth, white-warty on back: fis. reddish-yellow, 1½ in. long, infl. to 1½ ft. S. Afr.

attenuata: Haworthia attenuata.

ausana: name of a plant reported to be similar to A. variegata.

Bainesii. Tree to 60 ft. with st. diam. to 5 ft. and leafy head diam. to 20 ft.: lvs. sword-shaped, 2-3 ft. long in young plants, shorter in mature plants, margins with scattered small prickles: fls. campanulate, salmon-pink fading into whitish, tipped with green, 1½ in. long, in dense racemes 3-4 in. long. S. Afr.

Barbertonise. Stemless or nearly so: rosette of 20-23 lvs. 12-15 in. long, lanceolate, erect-spreading, greenishred above with distinct white spots in irregular transverse bands, margins armed with stout brown spines: fis. red,

to 1½ in. long, cylindrical, inflated at base, in a 5-7-branched raceme to 3 ft. tall. S. Afr.

Bedinghaùsii. A hybrid with triangular lys. to 2 in. long and % in across.

Beguinii. Lys. in dense rosettes, to 3 in, long and 1 in.

brevifolia. St. a few in. high below dense rosette: lvs to 3 in. long and 1 in. wide, glaucous, with white horny teeth: fls. pale red, 1½ in. long, in dense racemes to 9 in. high. S. Afr.

Brunnthaleri. Botanical standing not determined: listed as probably hybrid of unknown parentage and said to be a large plant with bright red fis.

cæsia. To 12 ft.: lvs. to 1½ ft. long and 3 in. wide, very glaucous, with reddish teeth: fis. bright red, 1½ in. long, in dense racemes to 1½ ft. high. S. Afr.

Camerònii. Shrubby plant to 8½ ft. with st. branched: sword-shaped lys. to 12 in. long and 1 in. wide, flat on top, convex beneath, bright green frequently reddish, margins coarsely and remotely dentate: fls. to 2 in. long, in dense racemes 6 in. long on erect scapes 12 in. tall. Cent. Afr.

candelabrum. To 20 ft.: lvs. to 2 ft. long and 3 in. wide: fis. red, 1½ in. long, in racemes borne in a candelabrum-like branching panicle to 2 ft. high. S. Afr.

chinénsis: A. vera var.

ciliaris. St. weak and decumbent, with more or less climbing habit, bearing linear-lanceolate lvs. to 6 in. long and 1½ in. wide, and bright red fis. with greenish tips about 1½ in. long, in stalked racemes about 8 in. high. S. Afr.—Rather frequent in greenhouses and in S. Calif.

commutata. Stemless: lvs. to 6 in. long and 2 in. wide, spotted, with red teeth: fls. pale red, 1½ in. long, in loose racemes to 6 in. high, in a branching infl S. Afr.?

confusa. St. slender, much branched, decumbent: lvs. spreading, linear-lanceolate, apex recurved, to 10 in. long and 34 in. wide: fls. tubular, reddish-orange, ½ in. long, in lax racemes 4-6 in. long. E. Afr.

Codperi: A. Johnstonni.

Davyana. Stemless: Ivs. in dense rosettes, triangular-lanceolate, spotted above, glaucous beneath, with red teeth: fls. pale pink, yellow inside, 1½ in. long, in pyramidal racemes to 8 in. high. Transvaal.

dichotoma. Tree with much branched trunk 20-30 ft. high, 3-4 ft. diam.: lvs. lanceolate, 6-8 in. long, 1½ in. wide near base, very glaucous, unspotted, margins with small white teeth; fls. bright yellow, about 1 in. long, in lax raceines 2-4 in. long. S. Afr.

dístans. St. procumbent, to 9 in. long; lvs. to 4 in. long and 2 in. wide, glaucous, yellow-spined: fis. red tipped with green, 1 3/4 in. long, in infl. to 1 1/2 ft. high. S. Afr.

Dyeri. St. short, unbranched: Ivs. in dense rosette, sword-shaped, to 20 in. long, 4-5 in. wide near base, white-margined, marginal spines nearly ½ in. long, incurved and about ¾ in. apart: fls. red, yellow within tube, to 1¼ in. long, in lax racemes to 1½ in. long. Transvaal.

echinata: A. humilis var.

Eru. St. 1½ ft. high: lvs. to 2½ ft. long and 3 in. wide, usually spotted, very fleshy, with red teeth: fls. yellow or orange, to 1½ in. long, in racemes to 6 in. high. E. Afr. Var. cornuta is listed. Var. maculata has smaller spotted lvs.

fèrox. To 9 ft.: lvs. to 2½ ft. long and 6 in. wide, purplish at margins with yellow-brown teeth: fls. greenish-yellow, 1½ in. long, in infl. to 4 ft. high. S. Afr.

frutéscens: A. arborescens var.

globuligémma. Stemless: lvs. in dense rosette, to 1½ ft. long and 3½ in. wide, toothed, glaucous: fls. sulfur-yellow tinged red at base with brown or black stamens, 1 in. long, in panicles. S. Afr.

grandidentata. St. short: lvs. to 1½ ft. long and 3 in. wide, striped and spotted, with large distant teeth: fls. rose, to 1½ in. long, in loose racemes to 7 in. high, in a branching infl. S. Afr.

Greenii. St. short, unbranched: rosette of 12-15 lanc olate lvs. 15-18 in. long, 2½-3 in. wide, bright green with irregular wavy bands of confluent oblong whitish spots ½-3 in. across, margins with small brown prickles: fis. pale red, to 1¼ in. long, in panicles. S. Afr.

Hanburiana: A. striata var. rhodocincta.

Héleniæ. Tree, with st. to 14 ft. tall crowned with rosette of linear-lanceolate lvs. 1½-3½ ft. long, concave above, margins with flat triangular teeth: fis. green at base, red at apex, tall. Madagascar. red at apex, to 1 in. long, on erect scapes to 21/2 ft.

hereroensis. Stemless or nearly so: lvs. in dense rosette, triangular-lanceolate, 10-12 in. long, to 8 in. wide at base, margins with fleshy horn-like teeth about ½ in. long; fis. yellowish-orange, tubular, about 1 in. long, clustered at end of erect corymbs 2½ ft. tall. S. W. Afr.

heteracantha. St. short: lvs. to 1 ft. long and 2½ in. wide, margins entire or with few teeth: fis. red, in dense head-like racemes to 4 in. high. Nativity uncertain.

nead-like racemes to 4 in. high. Nativity uncertain.

humilis. Tufted: lvs. to 4 in. long and ½ in. wide, with white marginal teeth, tuberculate: fls. red tipped with green, 1½ in. long, in racemes to 1½ ft. high. S. Afr. Var. echinata. Lvs. thinner and more concave than in the type. Var. incúrva. Plant larger, the lvs. broader near base than type: lvs. glaucous-green, with an acuminate incurved tip: perianth tubular not inflated.

incurvata: listed name of unknown botanical standing. probably A. humilis var. incurva.

Ióhnstonii (A. Cooperi). Stemless or nearly so: rosette of 8-12 linear lys., white-spotted, margins minutely spined: fls. dull red, small, cylindrical, on simple scapes. S. Afr.

Júttise. Cespitose plant of 2-8 rosettes each with about 25 lanceolate lvs. to 12 in. long, glaucous, with a few white spots on each side: fis. bright orange-yellow to orange-red tipped with green, 1½ in. long, cylindrical, on scapes to 3 ft. S. W. Afr.

Krapohliana. Stemless, basal rosette to 4 in. across and as high: Ivs. linear-oblong, to 3 in. long, acuminate, tuberculed on reverse side with spines on upper side, marginal teeth ½ in. apart, minute: scapes to 10 in. high; fls. orangered, tipped yellow and green, to 1½ in. long. Little Namaqualand, Afr.

latifòlia. St. to 2 ft.: lvs. to 1 ft. long and 3½ in. wide, spotted white, with brown horny teeth: fls. reddish-yellow, to 1½ in. long, in racemes to 5 in. high. S. Afr.

lineata. St. to 2 ft.: lvs. 1 ft. long and 2 in. wide, glaucous, with green vertical lines and reddish-brown horny prickles: fts. bright red tipped green, in dense racemes 6 in. high. S. Afr.

longiaristàta: A. aristata.

longistyla. Stemless: lvs. in dense rosettes, to 6 in. long and 1 in. wide, with horny tip and prickles: fls. salmon-red, 2 in. long, in dense racemes to 5 in. long, the style exserted. S. Afr.

macrocárpa. Stemless, to 2 ft.: lvs. in a basal tuft, to 14 in. long and 2 in. wide, l.ned and mottled in cross bands: fls. pale red, 1 in. long, in racemes to 6 in. high. Trop. Afr.

macroclada. Tree: lvs. to 4 in. across, with brown teeth: fls. 34 in. long, in dense racemes in a candelabrum-like infl. to 10 ft. high. Madagascar.

Márlothii. Tree-like, with simple stout st.: lvs. to 2½ ft. long and 7 in. wide, very spiny: fls red, 1½ in. long, in one-sided horizontal racemes in a branching infl. S. Afr.

microuonta. Lvs. lanceolate, to 15 in. long and 3 in. wide, strongly recurved, apex acute, margins yellow with short brownish triangular spines about ½ in. apart: fis. red, in lax racemes to 1 ft. long on peduncles to 15 in. long. Ethiopia. microdónta. Lvs. lanceolate, to 15 in, long and 3 in.

microstigma. St. short: lvs. to 1 ft. long and 1½ in. wide, glaucous, spotted white, with small brown teeth: fls. greenish-yellow, in dense racemes to 20 m. high. S. Afr.

mitrifórmis. St. 3-4 ft., procumbent: lvs. to 6 in. long and 3 in. wide, with pale horny teeth: fis. bright red, 2 in. long, in dense corymbose racemes 6 in. high and broad. S. Afr.

nóbilis. St. prostrate: lvs. to 6 in. long and 2 in. wide, with white marginal teeth: fls. red, 1½ in. long, infl. 2 ft. S. Afr.

obscura (A. picta). Short-stemmed: lvs. to 8 in. long and 3 in. wide, lined and spotted with pale green, with spiny cartilaginous margins: fls. red, 1½ in. long, in infl. to 3 ft. high. S. Afr.

parvibracteata. Stemless: lvs. to 1 ft. long and 3 in. wide, spotted and striped, with small teeth: fls deep red, 1 in. long, in many-fld. loose racemes to 8 in. high. E. Afr.

parvispina. Tree: lvs. ovate-lanceolate, 10-12 in. long and 3½ in. wide at base, margins irregularly toothed with one small tooth usually between two larger ones; fis. rarely exceeding 34 in. length, on an erect branched infl. S. Afr.

Páxii. Stemless or nearly so: dense rosette of 12-18 oblong-lanceolate lvs. to 2-3 in. long, acuminate, margins of fleshy teeth: fls. yellow suffused with pink, to 1½ in. long, in panicles to 3 ft. S. Afr.—Reported to be a hybrid (A. striata × A. commutata).

Péglers. Stemless or nearly so: lvs. to 6 in. long and 1% in. wide, with distant brown teeth: fis pale pink, 1 in. long, in dense racemes about 1 ft. high. Transvaal.

penthaménsis: listed name of plant in trade.

percrássa. Stemless or nearly so: dense rosette of 30-40 elongate-triangular lvs., narrowly attenuate at apex, somewhat recurved, to 2 ft. long and 8 in. wide, upper surface deeply concave, glaucous, margins with short fleshy teeth: fls. pale red, to 1½ in. long, in elongate cylindrical racemes. S. Afr.

Pérryi. Small plant on stalk about 10 in. high terminated

by rosette of 12-20 lanceolate lvs. 10-12 in, long and 2by rosecte of 12-20 lanceolate 1vs. 10-12 in. long and 2-2½ in. wide at base, acuminate and deeply concave, glau-cous, obscurely lined, frequently reddish, margins with abundant sharp brown spines: fls. red, 1 in. long, in racemes on branched or simple scapes to 2 ft. S. Afr.

Pienaari. Stemless or nearly so; rosette of 35-60 sword-Plenaari. Stepless or nearly so: rosette of 30-00 sworushaped Ivs., erect, recurved, reddish-green to bluish, to 3 ft. long, margins armed with small brown spines: fls. scarlet tipped with green, changing to eitron-yellow, to 1½ in. long, in 2-3 much branched panieles to 4 ft. tall. Transvaal, S. Afr.

Pilnari: listed name, probably A. Pienaari.

plicatilis. To 10 ft., much branched: lvs. to 16 in. long and 1½ in. wide, glaucous, margins horny: fls. red, to 2 in. long, in loose racemes to 1 ft. high. S. Afr.

preciosa: listed name of unknown botanical standing.

pretoriensis. St. to 3 ft.: lvs. to 2 ft. long and 3 in. wide, with red horny teeth: fls. red, in racemes 1½ ft. long, in a branching infl. to 10 ft. high. Pretoria.

Robertii. Stemless or nearly so: lvs. to 21/2 ft. long and 8 in. wide, with brown teeth: fls. yellow, in a much branched infl. Perhaps a hybrid.

robústa: listed name of unknown botanical standing.

rubrolatea. Trunk 10-12 ft, covered with defixed dry lvs. and crowned by rosette of lvs. to 2 ft. long and 4 in. wide: fls. red, 1½ in. long, in racemes 1 ft. long in a branched infl. Trop. Afr.

runcinata. Plant cospitose on short st. with rosette of 15-30 linear-lanceolate lvs. 15-18 in. long, to 3 in. wide at base, broadly concave on top, green to purplish, margins with stout recurved spines at irregular intervals: fis. bright red, 112 in. long, on strongly branched scapes to 4 ft. high. S. Afr.

Sálm-Dyckiàna. To 6 ft., branching: lvs. tufted, to 2½ long and 3½ in. wide, vellowish-margined; fls. light red. 11/2 in. long, in panicled racemes to 3 ft. high. S. Afr.

saponària (A. umbellata). Densely tufted, stemless, to 2½ ft.: lvs. 8 in. long and 2½ in. wide, blotched with pale green: fls red, to 1¾ in. long, in dense many-fld. heads. S. Afr. Var. variegàta is listed.

Schimperi. Stemless or nearly so: lvs. broadly linear-lanceolate, flat, fleshy, glaucous, margin with red minute spines: fls. bright red, 1½ in. long, in short dense racemes on scapes to 3½ ft. tall. Ethiopia.—Probably a hybrid.

Schlechteri. Stemless or nearly so: dense rosette of 30-40 ovate-lanceolate lys about 15 in. long, glaucous, papillate, margins with short blunt reddish-brown spines: fls. red, to 1½ in. long, in dense racemes 10 in. long. S. Afr.

soccotrina: A. succotrina.

speciosa. Two plants are known by this name: one a hybrid with a very short branched st. and bright red fis.; the other a tree form growing to a height of 25 ft. with pink fls on scapes to 33% ft. long.

spinosissima. Hybrid with lvs to 1 ft. long and 2 in. wide, purple fls. in dense cylindrical racemes to 1 ft. high.

sparia. Stemless or nearly so: rosette of 10-12 lance-late lvs 12-15 in. long, to 2½ m. wide, bright green suffused with dull purple, margins with short brown spines: fls. pale red, to 1½ in. long, on slender 2-3-branched scapes to nearly 4 ft. high. Probably of hybrid origin.

Straussii. Stemless: lvs. to 8 in. long and 2½ in. wide, spotted: fls yellow, 1½ in. long, in short loose racemes on stalks 1½ ft. high. E. Afr.

striata. Nearly stemless, to 3 ft.: lvs. 20 in, long and 6 in. wide, with entire white cartilaginous margins: fls. red or yellowish, 1¼ in. long, in panieled umbels. S. Afr. Var. rhodocíncta (A. Hanburiana) has lvs. blotched with white.

striátula. Similar to A, ciliaris but with longer lvs., reddish to yellow or orange fis, having long-protruding stamens. S. Afr.

succotrina (A. soccotrina). To 4 ft., branching: lvs. 20 in. long and 2 in. wide, with white marginal prickles: fls. light red, $1\frac{1}{4}$ in. long, in racemes. S. Afr.

supralevis. Unbranched, to 6 ft: lvs. to 2½ ft. long and 6 in. wide, spiny below and with red-brown marginal spines: fls. reddish-yellow, to 1 in. or more long, in racemes about 1 ft. long in a branching infl. S. Afr.

ténuior. St. often branched: lvs. to 6 in. long and ½ in. wide, glaucous, minutely toothed: fls. yellow, ½ in. long, in racemes to 1 ft. high. S. Afr.

Thráskii. St. to 8½ ft. lvs. sword-shaped, to 3½ ft. long and about 6 in. wide at base, leathery and slightly fleshy, glaucous, deeply concave on top, marginal teeth small and brown: fs. red, to 1 in. long, in dense cylindrical racemes on erect slender branched peduncles. Rhodesia.

Thórncroftii. Stemless or with very short st.: rosette of 25-30 broadly lanceolate lvs to 12 in. long, erect, spreading, dark green, margins with pale brown teeth: fls. rose-

red, to 2 in. long, cylindrical on erect scapes to 5 ft. tall. Transvaal. S. Afr.

umbellata: A. saponaria.

variegata. St. to 9 in.: lvs. densely imbricated, to 5 in. long and 1 in. wide, with white spotted bands and minute teeth: fls. red, to 1½ in. long, the loose racemes on stalks to 1 ft. high. S. Afr.

vèra. True A. Barbados A. To 3 ft.: lvs. thick, to 2 ft. long, in a basal rosette: fls. yellow, nodding, in dense racemes terminating the scapes. Medit. region. Var. chinénsis is a smaller plant, with red-tinged fis. India.

virens. Strongly cespitose: Nvs. narrowly lanceolate, ascending from rosette, about 8 in. long and 1 in. wide at base, margins with fieshy deltoid teeth: fis. to 1½ in. long, in short racemes on tall slender scapes to 2 ft. S. Afr.

Wickensii. Stemless or nearly so: rosette of 40-50 lvs. to 2½ ft. long, sword-shaped, pale green, incurved, flat on top, margins armed with small sharp black spines: fls. morocco-red turning greenish-yellow to bright lemonyellow, cylindrical, to 1½ in. long, in short conical racemes on slightly branched panieles to 5 ft. tall. S. Afr.

zebrina. Stemless or nearly so: rosette of 15-25 linear-lanceolate lvs. about 6-12 in. long and 2-3 in. wide, often purplish, blotched with whitish, edged with large red-or brown-tipped teeth, spine brown: fls. dull red, to 1½ in. long, in 12-15 in. racemes on a much branched scape 3½-4½ ft. tall. S. W. Afr.

ALOINOPSIS: Nananthus.

ALONSÒA. Mask-Flower. Scrophulariaceæ. Herbs and small shrubs grown as annuals in the garden, or indoors for the attractive winter bloom: fls. red, 2-lipped, in terminal racemes, the corolla with very short tube, turned upside down by the twisting of the st.: lvs. opposite or in whorls of 3: native in trop. Amer.

Propagated from seed, and by cuttings for winter plants. They are all of simple cultural requirements in warm open exposures.

acutifòlia (A. myrtifolia). Bushy, to 3 ft.: lvs. broad-lanceolate, sharp-toothed; fls. cinnabar-red, upper lip 3-4 times longer than calyx. Peru. Var. cándida (A. albifora), fls. white.

albiflòra: A. acutifolia var. candida.

caulialata. To 1 ft. or more, with 4-angled sts.: lvs. ovate or ovate-lanceolate, toothed: fls. scarlet, upper lip twice as long as calyx. Peru.

compácta: A. Warscewiczii.

grandiflora: A. Warscewiczii.

incisifolia. To 2 ft.: lvs. oval or ovate-lanceolate, deeply cut-toothed: fls. scarlet, purple-black in throat, upper lp 2-4 times longer than calyx. Peru.

linearis (A. hmflora). Bushy, much branched, to 1½ ft.: lvs. linear, fine-toothed or entire: fls. numerous, scarlet. Peru. Var. grácilis (A. pumila), smaller and graceful.

linifldra: A. linearis.

linifòlia. To 1½ ft.: lvs. linear, entire: fls. scarlet, large.

meridionalis (A. Mutisii). Similar to A. caultalata but with uniformly dull orange fis. about 1/4 in. long. Colombia. Mutisii: A. meridionalis.

myrtifòlia: A. acutifolia.

pùmila: A. linearis var. gracilis.

Warscewiczii (A. compacta, A. grandiflora), Very bushy, to 3 ft.: lvs. ovate-lanceolate, toothed: fis. cinnabaror scarlet-red, upper lip 4-5 times longer than calyx. Peru.

ALOPECURUS. Gramineæ. Ann. and per. grasses resembling timothy and grown in meadows, the spikelets crowded into dense narrow spikes; native mostly in the north temp. zone. Sec Grasses.

praténsis. Meadow Foxtall. Per. to 3 ft.: lvs. to 6 in. long and 14 in. wide, rough: spikes to 3 in. long, above the foliage, florets awned. Eu.; nat. in E. N. Amer.—Grown in meadows: lower grass than timothy, with shorter spikes and many awns.

ALOYSIA: Lippia.

ALPHITÒNIA. Rhamnacex.Probably a single species, a tall tree with alternate lvs., fls. 1/4 in. or less across, in forking cymes, and fr. a dry drupe-like body the outer part of which often falls and leaves the 2 or 3 seeds standing on the torus. A. excélsa. Lvs. ovate to lanceolate, to 6 in. long, entire, leathery, white-tomentose beneath. Australia. Occasionally planted in S. Calif. for ornament.

ALPINES. The word alpine denotes narrowly pertaining to the Alps, but usage allows its application to any very high mountain regions. Alpine plants are particularly those that grow above the tree-line, but in common writing and speech the term is too frequently employed for mountain plants in general, and alpine-gardening is likely to mean only rock-gardening. The real alpine-gardening attempts to make an approximate imitation of alpine conditions; it is possible in cool places, with good supply of cold water, and soils something like those of alpine places. The selection of plants requires experience and the handling of them demands skill. The growing season is short. True alpine-gardening is little attempted in North America outside mountainous regions.

ALPÍNIA. Zingiberacex. Per. herbs with leafy sts. and often showy fls. in terminal spikes or panicles, having 1 petal-like staminode or lip.

Grown for ornamental foliage and habit in the tropics and subtropics or in a moist greenhouse with a temperature of 60°. They require abundant watering. Propagated by division in spring; the plants make large clumps. Some of the kinds have striped leaves. See Zingiberaceæ.

calcaràta. To 5 ft.: lvs. to 1 ft. long and 2 in. wide: fls. greenish-white, the lip variegated with red and yellow, in dense panicles to 4 in. long. India.

formosana. Lvs. to 16 in. long and 3 in. wide: fls. with crinkled lip 1 in long, in panicles to 6 in. long. Formosa.

mùtica. To 6 ft.: lvs. to 16 in. long and 1½ in. wide: fls. white, the lip yellow marked with red, in panicles to 7 in. long. Malay Peninsula—The material cult. under this name may not be this species.

nùtans: A. speciosa.

Sánderæ (A. vittata). Lvs. to 8 in. long and 1 in. wide, striped and marked with clear white. Botanical position uncertain; plant sterile; frequent in cult.

speciosa (A. nutans. Renealma nutans. Languas speciosa). Shell-Flower. To 12 ft.: lvs. to 2 ft. long and 5 in. wide: fis. white tinged with purple, the lip crinkled and yellow variegated with red and brown, fragrant, in pubescent racemes which become nodding. E. Asia.—Commonly planted in warm regions.

tricolor. Like A. Sanderæ except that the lf.-markings are yellowish-white.

vitellina (Amomum vitellinum). To 3 ft.: lvs. to 16 in. long and 3 in. wide: fls. yellow, the lip crisped and marked with red, in panicles to 3½ in. long. Malacca.

vittata: A. Sanderæ.

ALSEUÓSMIA. Caprifoliaceæ. New Zealand evergreen shrubs with alternate lvs., tubular or funnelform fragrant fls. solitary or clustered in the axils, and crimson berries; one species may be planted in S. Calif.

macrophylla. To 8 ft., glabrous: lvs. obovate to linearoblong, to 7 in. long: fls. crimson, to 1½ in. long: berries ½ in. long.

ALSINE: see Arenaria and Stellaria.

ALSINOPSIS: Arenaria.

ALSÓPHILA. TREE-FERN. Cyatheaceæ. Treeferns with large finely divided lvs. light green in color, the stipes covered with scales, spiny or smooth, with naked sori on back of segms.; mostly tropical. See Ferns.

austràlis. To 20 ft., trunk straight bearing a spreading head of 2-3-pinnate lvs. to 12 ft. long; segms. to 6 in. long and 1 in. wide. Australia.—Rather common under glass.

dealbata: A. glauca; sometimes Cyathea dealbata.

glauca (A. dealbata). Very tall, prickly: lvs. glaucous beneath, segms. to 5 in. long and 1 in. wide. Trop. Asia.

ALSTÒNIA. Apocynacex. Trees or shrubs with mostly whorled lvs., salver-shaped fls. in corymbose cymes, and fr. of 2 linear follicles; native Malava to Pacific Isls.

scholàris. Devil-Tree. Pali-Mara. To 60 ft. and more: lvs. narrow-oblong to oblanceolate, verticillate, to 8 in. long, with many parallel side-veins: fts. pubescent, white, in thyrses: pods very long and slender. India.

venenata. To 8 ft. or more, glabrous: lvs. oblong-lanceolate, to 8 in. long: fls. white, 1 in. across: frs. to 5 in. long. India.

ALSTREMÈRIA. Amaryllidaceæ. S. American herbs with thick fibrous roots, leafy sts., and showy red, yellow or purple fls. in terminal umbels, the perjanth-segms, distinct.

Alstræmerias are probably not hardy in the North except A. aurantiaca, but may be planted out in spring, lifted after blooming, and stored over winter. They should be set in shady positions in rich moist soil. Also may be grown as pot-plants in the greenhouse but should be lifted and shaken out annually. Propagated by division of roots and by seeds.

aurantiaca (A. aurea). To 3 ft.: lvs. lanceolate, to 4 in. long: fis. bright yellow spotted with brown, 1½ in. long. Chile.—Several color forms are listed, as flava, lutea, rubra.

aùrea: A. aurantiaca.

brasiliensis. To 4 ft.: lvs. oblong-lanceolate, 2 in. long: fis. reddish-yellow spotted with brown, 1½ in. long. Brazil. chilénsis. To 4 ft.: lvs. obovate to lanceolate, fringed: fis. rose or red. Chile.

hæmántha. To 3 ft.: lvs. lanceolate to linear, to 4 in. long, glaucous beneath: fis. reddish-yellow spotted purple and tipped green, to 2 in. long. Chile. Var. ròsea has rose

Ligtu. To 2 ft.: lvs. of fl.-sts. linear, usually 20-30, to 3 in. long, lowest ones lanceolate: fls. whitish, lilac or pinkish, streaked purple, inner segms. often obtuse. Chile. Var. pdichra has longer narrower lvs.

lutes: A aurantiaca var.

Pelegrina. To 2 ft.: lvs. lanceolate, to 2 in. long: fts. liac spotted with red-purple, to 2 in. long. Chile. Var. álba has white fts.

peruviàna: A. versicolor.

pulchélla. To 3 ft.: lvs. lanceolate, to 3 in. long: fls. dark red tipped with green and spotted with brown. Brazil.

revoluta. To 1 ft.: lvs. linear, to 1½ in. long: fls. purplish, yellowish and spotted within, to ¾ in. long. Chile.

Sálteri: listed name for forms with colors ranging from pale pink to brick-red.

versicolor (A. peruviana). To 1 ft.: lvs. linear, 1 in. long: fls. yellow spotted with purple, 1 in. long. Chile.

ALTAMIRANOA: Villadia.

ALTERNANTHÈRA. Amaranthaceæ. Probably nearly 100 herbs or shrubs of warm or trop. countries, a few of which are grown as carpet-bedding subjects. The species in cult. are placed in the genus Achyranthes by some authors and in Telanthera by others. In gardens the plants are commonly known as Alternantheras. The hort. kinds are low compact herbs of the New World tropics with small opposite entire variously colored and variegated lys.: fls. minute, in small dense axillary clusters, but in cult. the plants are not often allowed to reach the blooming stage.

Alternantheras are usually kept only 6 inches high by shearing. They grow best in warm sunny situations. The plants are propagated by division or by cuttings; the latter are usually made from strong plants in the garden in August, wintered over in hotbeds or the greenhouse and potted off in March or April. Division requires less tume; the plants, after the first frost, are lifted and cut back to 3 or 4 inches; in early spring they are divided, the rooted shoots potted or placed in flats with plenty of room; in four to six weeks they should be ready for bedding-out.

amœna. Very dwarf: lvs. lanceolate to elliptic, green veined and blotched with red and orange. Brazil. Here belong the garden forms amábilis, spectábilis, ròsea.

Bettzickiana (Achyranthes Bettzickiana). Erect ann. or per. to 15 in., many ascending stout branches usually

swollen at nodes: lvs. narrow-spatulate, blotched and colored in many shades cream-yellow to red. Brazil. Most of the cult. forms belong here, as aurea; aurea nana compacta; Bésteri mosàlica, a light yellow variation mottled with red; Blárdil, purplish-crimson foliage; brilliantíssima, a bright red form; Gibsonil, light yellow variation; magnifica, more vigorous habit; Séyboldil, listed name for a yellow form. Var. týpica is 2-3 in. tall, lvs. olive-colored, upper ones red at apex. Var. spathulata, to 8 in. with red lvs. and sts.

paronychioldes of hort.: A. Bettzickiana.

philoxeroides. Usually decumbent: lvs. obovate to lanceolate, very short-stalked. Brazil.

versicolor. Copper A. Lvs. round-spatulate, copper- or blood-red. Brazil.

ALTHÈA. Malvaceæ. Tall straight leafystemmed pubescent or tomentose annuals, biennials and perennials with fis. in terminal erect racemes or spikes, grown in gardens for their showy bloom; native in the temp. regions of the Old World.

The perennials are given the usual cultivation. The biennials, especially A. rosea, are planted most often in July and transplanted to their permanent quarters the following spring. A new strain, sold as "annual hollyhocks," produces bloom the first summer by sowing the seed indoors in February.

álba: hort. name.

anemonæfidra: Ilibiscus syriacus var.

árdens: Hibiscus syriacus var.

armeniaca (A. multiflora). Per. to 3½ ft., finely tomentose: Ivs. 3-5-palmately divided, segms. linear-lanceolate to obovate, often toothed: peduncles as long as Ivs. or longer and several-fld.; fls. pink, to 1½ in. across. E. Medit. region.

cannabina. Per. to 6 ft., branched, scabrous: lvs. 3-5-palmately divided, lobes narrowly lanceolate, serrate: fla purplish, 1-2 on peduncles 2-5 times as long as lvs. Eu. Var. narbonénsis (A. narbonensis) has lvs. bluntly toothed and sepals ovate, acute.

chinénsis: A. rosea.

cœléstis: Hibiscus syriacus var.

ficifolia. Figleaf or Antwerp Hollyhock. Bien. to 6 ft.: Ivs. deeply 7-lobed and toothed: fis. lemon-yellow or orange, in terminal spikes, single or double, to 3 in. and more across. Eu.

frutex: Hibiscus syriacus.

Heldreichil. Sts. slender, stellate-hairy: lvs. cordate to suborbicular, lobes 5, obtuse: fls. rose-pink, short-peduncled, solitary or in 2's or 3's, petals 2-lobed, calyx-lobes triangular and acute. Greece.

Hohenáckeri (Alcea Hohenackeri). Probably bien., 3-6 ft. high: Ivs. cordate-orbicular to ovate, mostly deeply 5-7-lobed, margins crenate: fls. white with deep yellow throat or center. Asia Minor and Caucasus.

kragujevacénsis. Per. about 4 ft. high: lvs. triangularovate, slightly lobed, serrate, densely stellate-hairy: fis. rose-hlac, axillary, anthers purple. Serbia.

multifidra: A. armeniaca.

narbonénsis: A. cannabina var.

nudiflora. Bien. to 6 ft., hispid: lvs. rounded cordate, to 6 in. across, often 3-lobed, margin crenate: fis. white, to 4 in. across, subtending bracts absent, petals wedge-shaped and emarginate. Altai Mts., S. Siberia.

officinalis. Marsh-Mallow. Per. to 4 ft.: lvs. 3-lobed or unlobed, the upper ones rarely lobed, tomentose: fls. 1 in. across, blush or rose, in axillary clusters. E. Eu.; escaped in coast marshes in N. Amer.

pæonifidra: Hibiscus syriacus var.

pállida. Bien. or per. to 7 ft. high, hispidulous, not much branched: lvs. suborbicular, shallowly lobed, soft-hairy: fls. rose, to 3 in. across, nearly sessile. Cent. to E. Eu.

póntica. To 3 ft.: lvs. orbicular to peltate, 3-lobed, crenate, densely tomentose beneath and slightly so above, long-petioled: fls. violet, to 3 in. across, petals retuse, sepals ovate-triangular. N. E. Medit. region.

roses (A. chinensis). HOLLYHOCK. Hairy bien. or semiper. to 9 ft.: lvs. 5-7-lobed or -angled: fis. in long spike or wand-like raceme, red, rose, pink, yellow, white, to 3 in. and more across. China.—There are double vars. See Hollyhock.

semperfibrens: hort. name, perhaps for a double-fid. form of A. rosea.

sulphurea. Lvs. ovate to ovate-orbicular, simple or lobed, margin often obtusely crenate, densely floccose to woolly beneath: fls. pale yellow, petals 2-lobed, calyx-

lobes laciniate-lanceolate. Persia.—A form with violet fls. is known in the wild and may be expected in cult.

svriacus: Hibiscus syriacus.

taurinénsis: a confused name in the trade; the plants may usually be referred to A. armeniaca or A. officinalis. The true A. taurinensis of Eu. differs from A. officinalis in having the upper lvs. distinctly 3-lobed with the middle lobe elongate-lanceolate.

Tournefortiana. Erect per. to 5 ft.: lvs. 3-5-lobed, softly brown-villous, base cordate: fts. rose-pink, in terminal racemes, calyx harry: fr. about one-half as large as in A. rosea. Crete.

ALTHEA. SHRUB-: Hibiscus suriacus.

ALUM-ROOT: Heuchera.
ALYOGYNE: Crenfuegosia.

ALYSICÁRPUS. Leguminosæ. ALYCE CLOVER. Bien. or ann. herbs distributed throughout Old World tropics and nat. in those of New World. One species, A. vaginalis, is grown in the S. as a forage plant. Ann., sts. ascending, to 3 ft. long: lvs. simple, oblong to oblong-lanceolate, usually ½-2 in. long, glabrous, short-petioled, base subcordate, apex obtuse or emarginate to acute: fls. about ¼ in. long, papilionaceous, in racemes of 4-12, to 3 in. long: pod terete, to 3¼ in. long, nearly straight.—Propagated by seed, and when grown for forage seed is sown at rate of 5 lbs. to the acre for permanent pasture and double the quantity for a hay crop. Hay crops are harvested after fruit has set and a sufficient amount of seed shells out to re-seed the area for the next year. Alyce clover will grow on a more acid soil than most leguminous forage plants and is reported to have a nutritive value equivalent to that of alfalfa.

ALÝSSUM. Madwort. Cruciferæ. Ann. and per. mostly gray herbs and subshrubs: lvs. small, alternate on the st., sometimes making rosettes at base: fls. small, yellow or white, in terminal short racemes or clusters: pods or silicles short, nearly or quite orbicular in outline. Species about 100, in Eu. and W. Asia.

A few are grown in rock-gardens and borders, in open or sunny situations. They require the usual culture for perennials and are propagated by seed or by division of the roots.

alpestre. Variable gray tufted per. 3 or 4 in. high: lvs. obovate or oblong to linear, about ½ in. long: fls. yellow, in short racemes. Eu.—Some of the plants known as A. serpullifolium probably belong here.

alyssoides (A. calycinum). Ann., mostly branching at base, to 10 in. high: lvs. narrow-oblong to spatulate, usually under 1 in. long, grayish-canescent: fls. yellowish-white, in narrow terminal racemes, sepals persistent. Eu.; nat. in N. Amer.

amamum: catalogue name for a creeping plant with silvery lvs. and heads of yellow fis. in spring; see A. sphacioticum.

argénteum. Yellow-Tuft. Per., dwarf, dense, woody at base, 15 in. high: lvs. oblanceolate to spatulate, silvery-tomentose underneath: fis. deep yellow, in clustered heads, all summer. Eu.—Incorrectly known also as A. rostratum.

atlanticum. Per. to 1 ft., woody at base: lvs. lanceolate, hoary: fls. yellow, in simple racemes. S. Eu.—Probably a variant of A. montanum.

Bénthamii: Lobularia maritima.

Bornmulleri: a confused name whose botanical position is not well understood.

Borzeanum. Per. to 8 in. with woody roots and many stiff erect sts.: lvs. obovate or sometimes nearly orbicular, white- or gray-pubescent: fls. yellow, in corymbs or racemes. Rumania.

calfcinum: A. alyssoides.

chalcidicum. Similar to A. Markgraffii, differing in larger petals to 1/2 in. long and hairy ovary. S. E. Eu.

compactum: botanically this is a synonym for A. minutum, but plants in the trade may be A. saxatile var. or Lobularia maritima var.

condensatum. Per. to 5 in., sts. ascending, woody at

base: lvs. obovate-oblong, obtuse, base attenuate, canescent-hairy: fis. lemon-yellow, in racemes: pod narrowly elliptic-cuneate, $\frac{1}{16}$ in. long. Syria.

corsicum. Much branched per. to 1½ ft., woody at base: lvs. obovate, silvery: fls. yellow, small: pod convex with compressed margins, orbicular, glabrous, 2-seeded. Corsica.

corymbòsum. Per.: lvs. spatulate or lanceolate, usually dentate: petals notched: pod globose, glabrous, to 1/4 in. long usually 4 seeds in each cell. S. E. Eu.

créticum. Woody per , 1 ft. or less: lvs. obovate-oblong and obtuse, silvery: fis. rather large, yellow, in short racemes. Crete.—Sometimes confused with A. corymbosum from which it differs in its stellate-pilose pods.

desertòrum. Ann. to 4 in.: lvs. oblong, gray-hairy or silvery: fls. pale yellow: pod orbicular, to $\frac{1}{2}$ in. long, glabrous, in elongated racemes. N. E. Medit. region and Balkans.—Sometimes distributed as A. munimum, a name usually referable to Lobularia maritima.

diffusum: name of uncertain application; some of the material in the trade is A. montanum.

edéntulum: A. petræum var.

gemonénse: A. petraum.

gigantèum: Lobularia maritima.

halimifòlium. Much branched per. to 1 ft., woody at base: lvs. oblong, silvery: fls. white, large, in dense corymbs: pod orbicular, compressed, glabrous. S. Eu.

idæum. Silvery-green per. with short simple sts.: lvs. ovate-oblong, basal ones about ½ in. long: fls. whitish, in short panicle: pod compressed-convex, to ½ in. long, orbicular. Crete.

incanum: Berteroa incana.

leucadèum. Per. to 15 in., rhizome distinctly woody, leafy, silvery-gray: lvs. broad-linear, obtuse, entire, to 3 in. long; fls. yellow, to ½ in. long, in racemes: pod orbicular and flattish, to 5% in. long. Italy

lutéscens: vellowish form of Lobularia maritima.

maritimum: Lobularia maritima.

Markgráffii. Per. to 1 ft., sts. stellate-pilose: lvs. narrowly linear-spatulate, to 34 in. long: fls. bright yellow, to 34 in. across, in dense panicles, petals narrow, nearly twice as long as calyx, style short. Albania.—By some authors considered a variety of A. chalcidicum.

Mildeanum. Densely tufted per., shrubby, the flowering sts. ascending: lvs. hairy, silvery: fls. yellow, to ½ in. long: pod orbicular, usually longer than the pedicels. Rocks, Bulgaria

minimum: Lobularia maritima var., or possibly A. desertorum

Moellendorfianum. Per., silvery: lower lvs. more less spatulate, the upper ones ovate, all obtuse and ½ in. or so long. fls. yellow, in an umbel-like head. Bosnia.—Distinguished from A. montanum by its silvery fr. pedicels.

montanum. Per. to 10 in., but commonly low and compact: lvs. obovate-oblong to linear, grayish-canescent: fls. yellow, fragrant, in short clusters elongating in fr. Cent. and S. Eu., Caucasus.—Distinguished from A. repens by the absence of simple hairs among the stellate hairs of the pedicels.

odoratum: hort, name for Lobularia maritima.

ovirénse. Per. to 5 in., rarely to 1 ft. high, sts. ascending, base woody: Ivs. broadly obovate tapering abruptly at base, the upper ones lanceolate, all sparsely stellate-harry and green: fls. golden-yellow, petals hairy: pod hairy, in umbellate racemes. Cent. Eu.

petræum (A. gemonense). Whitish per, woody at base, 1 ft. or less, not much branched: Ivs. oblong-oblanceolate to spatulate, to ½ in. broad: fs. yellow, in short clusters, the petals notched: pod somewhat inflated, glabrous, suborbicular. S. Eu. Var. edéntulum (A. edentulum) is more diffusely branched with smaller pods and larger seeds.

podólicum: Schwereckia podolica.

procumbens: listed name, probably Lobularia maritima. prostràtum: listed name.

pyrenâicum. Dwarf shrublet without spines: lvs. obovate, white-tomentose: fis. white, anthers dark, petals orbicular: pod rhombic. Pyrenees.

rèpens. Low per. much like A. montanum but with larger orange fis. and the pedicels stellate-hairy with long simple hairs intermixed. S. E. Eu. Var. Wierzbickii (A. Wierzbickii) has erect sts. with densely hispid pedicel only 14 as long as pod and not equalling it.

Rochèlii: A. Wulfenianum

rostratum: see A. argenteum: the A. rostratum of botanists is an ann. and not known to be cult.

saxátile. Golden-Tuft. Gold-Dust. Basket-of-Gold. Rock M. Spring-flowering per. forming a spread-

ing mat, woody at bottom; lvs. oblanceolate to somewhat ing mat, woody at bottom: lvs. oblanceolate to somewhat spatulate, mostly with few obscure teeth, grayish, the greater part basal and 2-4 in. long: fis. golden-yellow, in racemes on branching sts.: pod orbicular, compressed, glabrous. Cent. and S. Eu. Several vars. are in cult.: compactum, Dwarf G.; compactum flore-plèno; lûteum (cutrinum, sulphureum); Silver Queen, palest yellow; varie-gatum.—Some of the material grown under this name is A. petræum.

serpyllifòlium: see A. alpestre.

sinulatum (Vesicaria sinuata). Per. to 20 in.: Ivs. spatulate to lanceolate, lower ones sinuate-dentate, upper entire: fls. sulfur-yellow, in simple racemes: pod inflated, globose to ellipsoid, usually 4-6-seeded. June. Macedonia.

sphacióticum. Densely tufted per. to 1 ft., sts. often spincioucum. Denseiv tutted per. to 1 tt., sts. often creeping: Ivs. obovate to oblong-linear, gray-hairy: fis. sulfur-yellow: pod compressed orbicular, to 1/4 in. across, stellate-pubescent, on pedicels to 1/4 in. long. Crete.—Not listed as cult. but some of the material grown as A. amamum belongs here.

spindsum. Woody and spiny, to 1 ft., silvery: lvs. long-lanceolate, to 2 in. long: fls. white or pinkish, in short racemes. S. Eu., N. Afr. Var. rdseum is listed.

stylosum: advertised as having bright vellow fis. in

Troòdii. Per. to 6 in., base woody, sts. erect, glandular-hairy: lvs. obovate-cuneate, to ½ in. long, obtuse: fls. pale yellow, large: pod flat, elliptical, usually long-acuminate at distal end. Cyprus.

Wulfenianum (A. Rochelii). Gray-canescent per. differing from A. monlanum mainly in the smooth pod twice as large. S. Eu.

ALÝXIA (Gynopogon). Apocynaceæ. Trop. evergreen woody plants in many countries with mostly fragrant fis. and glossy whorled or opposite lvs.: corolla salverform, the cylindrical tube swollen above the middle or contracted at throat: fr. a drupe. Propagated by seeds and cuttings.

olivæfórmis. Maile. Somewhat twining glabrous shrub: lvs. ovate to oblong, to 2 in. or more long, entire: fls. yellowish, mostly 4-lobed, to 2½ in. long, very fragrant. Hawaii, where it is much prized in garlands or leis.

AMARANTH: Amaranthus. Globe: Gomphrena globosa.

AMARANTHÀCEÆ. AMARANTH FAMILY. Mostly herbs of wide distribution, with opposite or alternate lvs., small unisexual or bisexual fls. subtended by dry scales, usually showy in mass, having small 2-5-parted perianth, 1-5 stamens, superior ovary, and fr. a utricle, achene or berry-like. Many of the genera are weedy, but some species are grown for ornament and potherbs, as Ærva, Alternanthera, Amaranthus, Bosea, Celosia, Deeringia, Frœlichia, Gomphrena, Iresine, Nototrichium, Trichinium. All are of simple cult., grown from seeds and from soft cuttings, and prefer open sunny positions.

AMARÁNTHUS. AMARANTH. Amaranthaceæ. About 50 coarse annuals native in mild and trop. climates in many parts of the world, some of them widely distributed as weeds of tilled lands and waste places; a few of them are cult. for the colored foliage and the heavy red spikes, and in some countries grown for greens: fls. minute and unshowy, in chaffy often colored heads or spikes: lvs. alternate, in ours broadly ovate or oval unless otherwise noted.

The species grow readily from seeds; sunny positions are best; the leaf colors are likely to be less brilliant in very fertile soils. Some of the weedy kinds may be grown in collections for general interest.

abyssinicus: A. caudatus.

amábilis: A. tricolor.

atropurpureus: A. caudatus.

bicolor: A. tricolor.

caudâtus (A. cruentus. A. paniculatus). Love-Lies-Bleeding. Tassel-Flower. Stout, branching, upright, 3-5 ft., with large colored showy coarse erect or some-

what nodding panicle which may be open and graceful or thick and clumpy. Tropics; commonly cult, and some-times spontaneous.—Variable; the effort to distinguish two pontaneous.—Variable; the effort to distinguish two ontaneous.—Variable; the effort to distinguish two A. caudatus and A. cruentus, does not hold. Garden attenuatives. Dussii, plants known as A. abyssinicus, atropurpureus, Dussii, elegantissimus, Margaritie, monstrosus, sanguineus, superbus, belong here.

chloróstachys: A. hybridus. coleifòlius: A. tricolor. cruéntus: A. caudatus. Dùssii: A. caudatus.

elegantissimus: A. caudatus.

gangéticus: A. tricolor.

Henderi: A. tricolor var. angustior.

hybridus (A. chlorostachys). Common tall weed, usually with green herbage, but sometimes reddish but plants not showy. Var. hypochondriacus. Princes-Feather. The cult. form, with many-branched showy panieles, red or brownish-red, the branches slender and graceful, short and creet or only somewhat spreading, terminal one erect or curving from the middle: bracts very sharp, about twice exceeding calyx: herbage usually reddish. Tropics.

hypochondriacus: A. hybridus var.

Margaritæ: A caudatus. melanchólicus: A. tricolor. monstròsus: A. caudatus. paniculàtus: A. caudatus.

retrofléxus. Red Root. To 10 ft., with green fls. in stout terminal or axillary spikes. Trop. Amer.; nat. in N. Amer. and Eu.

salicifòlius: A. tricolor vars. sanguineus: A. caudatus.

speciòsus aureus is listed as a yellow-lvd. form.

spléndens: A. tricolor var. supérbus: A. caudatus.

supérbus: A. caudatus. trícolor (A. gangeticus: A. melancholicus: A. amabilis). Erect, mostly much branched, 1-4 ft.: fi,-clusters small, globular, sessile in axils of lvs. or the upper ones 1 or 2 in. long and interrupted and contiguous in a narrow paniele-like infi: lvs. oval or ovate, the main ones 2½-4 in. broad, often blotched and colored and the plants then sometimes known as Josephs-Coat (A. bcolor, A. colejolius) and brilliant foims as "Combustion," "Molten Fire," "Sunshine" etc. Tropies; grown in the Orient for greens. Var. angústior (A. salicifolius partly. A. Hender). Plant usually slender: lvs. mostly 1-1½ in. broad. Var. angustissimus (A. salicifolius partly). Lvs. long-linear or nearly so, usually not surpassing ½ in. in width, often drooping. Var. spléndens (A. splendens) is nich red with brilliant light red foliage at top of plant. light red foliage at top of plant.

AMARCRINUM. Amaryllidaceæ. As the name indicates, a hybrid between the genera Amaryllis and Crinum. A. Howardii, recorded as A. Belladonna crossed with pollen of C. Moorei: fls. soft pink, somewhat fragrant, open funnelform with recurving segms, and declinate style, borne in very large clusters on sts. to 4 ft. long, of lasting quality. Produced in Calif. where it blooms in the open in summer and autumn; suitable also for pot cult. An earlier hybrid in Eu. of similar parentage has been called Crinodonna.

AMARELLA: Gentiana

AMARYLLIDÀCEÆ. AMARYLLIS FAMILY. Over 70 widely distributed genera of per. herbs having bulbous or fibrous roots or rhizomes, usually bisexual fls. with 6-parted perianth, 6 stamens and inferior 3-celled ovary; fr. a caps. or berry. The family furnishes many choice ornamental subjects as well as medicinal products and fiber. Those treated herein are: Agave, Alstroemeria, Amarcrinum, Amaryllis, Ammocharis, Anigozanthos, Beschorneria, Bomarea, Brayoa, Brunsvigia, Chlidanthus, Clivia, Cooperia, Crinodonna, Crinum, Curculigo, Cyrtanthus, Doryanthes, Elisena, Eucharis, Furcræa, Galanthus, Habranthus, Hæmanthus, Hippeastrum, Hyline, Hymenocallis, Hypoxis, Ixiolirion, Leucojum, Lycoris, Manfreda, Narcissus, Nerine, Pancratium, Phædranassa, Polianthes, Pyrolirion, Rhodohypoxis, Sprekelia, Sternbergia, Vallota, Zephyranthes. Many of these plants bear lily-like fls., but the family differs from the Liliaceæ in having inferior rather than superior ovary.

AMARÝLLIS. Amaryllidacex. One S. African bulbous herb with large luly-like fls., grown in pots or planted out in warm climates: peduncle or scape solid (not hollow). Most of the plants known as amaryllis in cult. are hippeastrums and other genera.

The bulbs should be stored in a dry cool place during the winter in cold climates, then repotted in a mixture of fibrous loam, leaf-mold and sand and placed in a warm position. Liquid manure should be applied when the fis. develon

Atamásco: Zephyranthes Atamasco.

sires. Lucaris aurea

Belladónna (Calheore rosea). Belladónna-Lily. Lvs. strap-shaped, appearing before or after the fls. which bloom in summer or autumn: fls. rose-red, to 3½ in long, fragrant, in umbels at top of solid scape to 2 ft. high.—There are many color forms from purple to white, and among the listed vars. are major, minor and rosea.

equéstris: Hippeastrum puniceum formosissima. Sprekelia formosissima.

Hállii: Lycoris squamigera.

Johnsonii: Hippeastrum Johnsonii. Josephinæ: Brunsvigia Josephinæ. longifdlia: Crinum longifolium.

lùtea: Sternbergia lutea.

praténsis: Hippeastrum pratense. purpurea: Vallota speciosa.

radiàta: Lycoris radiata. Reginæ: Hippeastrum Reginæ. reticulàta: Hippeastrum reticulatum.

sarniénsis: Nerine sarniensia. vittàta: Hippeastrum vittatum.

AMASÒNIA. Verbenaceæ. Trop. American subshrubs with scattered lvs. and yellow fls. in clusters which are racemed or panicled; grown in the greenhouse the same as Clerodendrum. but little known to gardeners.

calýcina. Lvs. to 1 ft. long, irregularly toothed: fis. drooping, to 2 in. long. British Guiana.

punicea. The plant known to hort, under this name is probably A. calycina.

AMATUNGULA: Carissa grandiflora.

AMBARELLA: Spondias cytherea.

AMBERBÒA (Volutaria and Volutarella). Herbaceous annuals sometimes grown in flower-garden, with alternate jaggedtoothed or pinnately-cut Ivs. and purple, violet or blue heads: fls. all tubular, outer row sterile; pappus of scales. Native in Medit. region, W. Asia and India.

maroccana. Ann. to 30 in.: lvs. lanceolate to ovate-oblong, entire to dentate or pinnatifid: fis. white, to ½ in. long, in dense pancles. W. Morocco.

muricata (Centaurea muricata). To 2 ft.: lvs. lanceolate: heads pink or purple. Spain, Morocco. Var. rosea is listed.

AMBROSIA MEXICANA: Chenopodium Botrys.

AMELÁNCHIER. SERVICE-BERRY. BERRY. SHADBUSH. Rosaceæ. Deciduous showy shrubs or small trees of the north temp. zone, with alternate toothed lvs., white fls. mostly in terminal racemes and fr. a small dark blue or black pome, sometimes edible. Desirable because of the abundant bloom in early spring, mostly preceding the foliage; also plants of good habit and attractive fr.

Amelanchiers are hardy in the North and thrive on a variety of soils. Propagated by seeds sown when ripe or stratified, by suckers when produced, or rare kinds by budding. See also Juneberry.

alnifòlia. To 7 ft., stoloniferous: lvs. obtuse, densely pubescent beneath when young: racemes erect, to 1½ in. long. Sask. to Colo.—Some of the material so listed is A. florida.

amábilis (A. sanguinea var. grandiflora). To 8 ft.: lvs. elliptic-ovate, to 2½ in. long, glabrescent: fis. in loose infl., petals ½-½ in. long. N. Y.

asiática. To 40 ft.: lvs. acute, densely white-tomentose beneath when young: racemes nodding. Japan, Korea; hardy N.

Botrvapium: A. oblongifolia.

canadénsis. To 30 ft.: lvs. acute or acuminate, tomentose on both sides when young: racemes nodding, to 2 in. long, fls. before lvs. Me. to Ga. and La.

fiórida. To 15 ft.: lvs. obtuse, becoming glabrous beneath: racemes erect, to 3 in. long. Mich. to Wash.

grandiflora. Hybrid between A. canadensis and A. læns: lvs. becoming glabrous, purplish when unfolding: fls. white, large, with obtuse petals. A pink-fld. form is known

humilis. Shrub to 5 ft., spreading by stolons: lvs. elliptic to oblong, to 2 in. long, acute, densely woolly beneath when young, serrate to below the middle: fts. in erect dense racemes. Vt. to Alta., south to N. Y. and Ia.— Differs from A. stolonifera in lvs. more coarsely serrate.

lèvis. To 40 ft.: lvs. short-acuminate, quite glabrous, purplish when young: racemes nodding. Newf. to Ga. and Ala. Var. rosea is listed as a color form.

oblongifòlia (A. Botryapium). To 25 ft.: lvs. oblong, obtuse or acute, white-tomentose beneath when young: racemes erect, short. Me. to S. C.

ovalis (A. rotundifolia, A. vulgaris). To 8 ft.: lvs. obtuse, Differs from other species in the styles free and very short. rotundifòlia. A oralis

sanguinea. To 10 ft.: lvs. ovate to ovate-oblong, to 3 in. long, acute, coarsely toothed: fis. large and showy, in drooping racemes. Ont. to Mich., south to Ala. Var. grandiflora

spicata. Hybrid, probably between A. oblongifolia and A. stolonifera: shrub to 18 ft.: lys. elliptic to oboyate, to 21/2 in. long, white-tomentose beneath when young, finely serrate to base.

stolonifera. To 4 ft., spreading by underground stolons and forming patches or colonies: lvs elliptic to nearly orbicular, serrate toward apex, at first white-pubescent beneath: fr. purplish, with bloom, sweet, sepals mostly recurved. Newf. to Mich. and Va.—Cult. as Dwarf Juneberry.

vulgàris: A. ovalis.

Compositæ. S. African herbs AMÉLLUS. with oblong lys. and blue-rayed fls. in many-fld. solitary heads; disk-fls. with double pappus of scales and bristles; one species sometimes planted in the flower-garden.

ánnuus (A. strigosus var. Willdenovii). Ann., diffuse or prostrate: lvs. to 2 in. long, usually with 1 tooth on each

AMESIA: a name once applied to the orchids treated as Epipactis or Serapias, which see.

AMETHÝSTIA. Labiatæ. One species, an ann. herb allied to Teucrium and Ajuga, but differing in the 2 posterior stamens reduced to small staminodia. A. cærùlea. To 2 ft., fragrant, glabrous, sts. purplish: lvs. trifoliate, lfts. ovatelanceolate, to 3 in. long, coarsely serrate, petiole channelled above: fls. sky-blue, to ½ in. long, in terminal and axillary corymbs whose pedicels are longer than petioles of subtending lvs., style blue and longer than stamens. Siberia.

AMHÉRSTIA. Leguminosæ. Indian tree, A. nobilis, reaching 40 ft. in height, with large pinnate lvs., the lfts. to 1 ft. long, long pendulous racemes of bright red and yellow fls. with 2 red petal-like bracts at base of calyxtube, upper petal 2 in. broad, staminal column prominent; pods woody, to 7 in. long and 2 in. wide. It requires rich well-drained soil and a trop, moist climate; propagated by layering or cuttings of half-ripened wood over bottom heat.

AMIÁNTHIUM. Liliaceæ. Per. bulbous herbs having linear lys. and small white fis, in terminal racemes, the perianth-segms. distinct: sometimes grown in the wild-garden. Propagated by division or rarely by seeds.

angustifòlium; Zigadenus angustifolius.

muscætóxicum (Zigadenus muscætoricus. Chrosperma muscætoricum). Flx-Poison. To 4 ft. high: lvs. to 2 ft. long and 1 in. wide: racemes to 5 in. long. N. Y. to Fla. and Ark.

AMÍCIA. Leguminosæ. Shrubs or subshrubs with alternate pinnate lvs., yellow papilionaceous fls. mostly in racemes, and fr. a narrow flat pod; native Mex. to Bolivia. One species is sometimes planted in S. Calif.

Zygómeris. To 8 ft.: lfts. 4 or 6, wedge-shaped, to 2½ in. long, glandular-dotted: fls. to 1½ in. long, subtended by large bracts. Mex.

ÁMMI. Umbelliferæ. Per. glabrous herbs of the Medit. region, Chile and Brazil, having pinnatisect lys. whose segms, have sharply serrate cartilaginous margins, small white fls. in compound bracted umbels, and fr. ovoidoblong, only slightly compressed, with primary ridges prominent and blunt. One species, A. majus, may be in cult. To 1½ ft.: umbels to 6 in. or more across, petals shorter than stamens with lobes often unequal, involucral bracts to 1 in. long, those of involucels linear and acute, others 3-divided: fr. about $\frac{1}{10}$ in. long. N. E.

AMMÒBIUM. Compositæ. Australian per. herbs grown as everlastings or immortelles, with yellow fls. in solitary heads surrounded by involucre of silvery-white bracts; pappus of few teeth.

Of easy cultivation, sometimes treated as a biennial when the seed is sown in September, but may be grown as an annual with seeds sown in spring. Flowers remain white if cut before full bloom and hung in shady airy place

alatum. Winged Everlasting. To 3 ft., white-woolly, the branches winged: lvs. mostly basal: heads to 2 in. across. Var. grandiflorum has larger heads.

AMMOCALLIS: Vinca rosea.

AMMÓCHARIS. Amaryllidaceæ. Two S. African bulbs, one of which may be cult. A. falcata. To 1 ft.: lvs. to 2 ft. long and 1 in. wide: fis. bright red, fragrant, in many-fld. umbels terminating a flat solid scape, the perianth-segms. clawed and reflexed. It may be grown in pots in the greenhouse or planted out and the bulbs stored in winter. It blooms in summer or autumn or in winter under glass; requires rich loamy soil.

AMMÓPHILA. Graminex. Per. grasses with creeping rootstocks, one useful as a binder in sandy soil, particularly along sca-coasts: lvs. long and stiff: spikelets in dense spike-like panicles; native along shores in the northern hemisphere. See Grasses.

arenaria. European Beach-Grass. Sea Sand Reed. Maram. To 4 ft.: lvs. to 1 ft. long, rolled inward, rough above, the ligule to 1 in. or more long: panicles to 1 ft. long and ½ in. thick. Eu.; intro. on Pacific Coast.—Propagated by rootstocks.

breviligulata. American Beach-Grass. The plant of shores and dunes of the Atlantic Coast and Great Lakes, formerly confused with the European species, is a larger

plant, with longer panicle and very short ligules: a good sand-binder.

AMOLE: Chlorocalum pomeridianum.

AMOMIS CARYOPHYLLATA: Pimenta acris.

AMÒMUM. Zingiberaceæ. Per. herbs with creeping rootstocks, leafy sts. and fls. in dense cone-like spikes beneath the foliage, having 1 petal-like staminode or lip.

Grown as foliage plants in warm regions; sometimes seen in economic collections under glass, as some of the species yield medicinal products. See Elettaria. They require rich soil and abundant moisture. Propagated by division in spring. See Zingiberacex.

Cárdamon. To 8 ft.: lvs. to 10 in. long and 3 in. wide: fls. yellow. E. Indies.

vitellinum: Alpinia vitellina.

AMÓRPHA. FALSE INDIGO. Leguminosæ. Shrubs bearing alternate pinnate lvs. with small lfts., small fls. in dense terminal spikes, and short slightly curved pods; native in N. Amer. and Mex.

Grown for ornament out-of-doors. Propagated by seeds, greenwood cuttings under glass, hardwood cuttings planted in sheltered position in autumn and left for a year, suckers or layers. The cultivated species are mostly hardy North.

angustifòlia: A. fruticosa var.

brachycarpa. Erect shrub to 3 ft., glabrous: Ifts. 21-45, oblong, to $\frac{5}{8}$ in. long and $\frac{1}{2}$ in. wide, overlapping: fis. dense, in panicles to 10 in. long: fr. to $\frac{1}{2}$ in. long. Mo.

californica. Similar to A. fruticosa, differing in its branchlets and rachis with prickle-like glands and in its longer and more lanceolate glandular-hairy calyx-lobes. S. and Cent. Calif.

canéscens. Lead-Plant. To 4 ft., plant usually densely white-hairy: lfts. to ¾ in. long: fls. blue, in spikes to 6 in. long. July-Aug. Man. to La. and New Mex.

cròceo-lanàta (A. fruticosa var.). Allied to A. fruticosa, differing in twigs, lvs: and calves densely tawny-pubescent. Ky. to Fla. west to Mo. and La.

elata: plants so listed in trade are probably A. fruticosa.
fragrans: A. fruticosa var. angustifolia.

fruticòsa. Bastard Indigo. To 20 ft., branchlets and rachis glabrous or somewhat pubescent, not with glandular prickles; lifts. to 1½ in. long, oblong, obtuse or slightly mucronate, glandular; fis. dark purple varying to pale blue and white, in spikes to 6 in. long, calyx-lobes short and obtuse. May-June. Sask. to Fla. and Mex. Var. angustifòlia (A. angustifòlia. A. fragrans). To 10 ft. or more: Ifts. mucronulate, strongly glandular; fis. purpleblue. Ill. to Tex. and Mex. Var. crispa has lits. with curled edges. Var. cròceo-lanàta is A. croceo-lanata. Var. tennessénsis (A. lennessensis). Lits, to 1 in. long: fis. violet-purple. Tenn.

glabra (A. montana). To 6 ft.: lfts. to 2 in, long: fls. blue, in racemes to 6 in. long, in spring. N. C. to Ga. and Ala.

herbacea. To 4 ft., grayish-pubescent: lfts. to 1 in. long: fls. violet-purple varying to white, the spikes clustered, to 1 ft. long, in spring. N. C. to Fla.

microphýlla: A. nana.

montàna: A. glabra.

nana (A. microphylla). To 1 ft.: Ifts. to 1/2 in. long: fls. purplish, in racemes to 6 in. long, in spring. Minn. to Rocky Mts.

nitens. To 9 ft.: lfts. to $2\frac{1}{2}$ in. long, shining: fls. in racemes to 10 in. long, in summer. Ga.

tennessénsis: A. fruticosa var.

virgata. Similar to A. fruticosa, but of lower stature, more sparingly branched and more broadly oblong and leathery lfts. with glandular petiolules and reflexed margins. S. U. S.

AMORPHOPHALLUS. Aracex. Very large herbs native in trop. Asia, with tuberous roots, large 3-parted lvs. with the segms. pinnately cut, and unisexual fls. borne on an upright spadix surrounded by a conspicuous spathe; grown as curiosities in the greenhouse. The fls. have a disagreeable odor and appear in advance of lvs.

The great Amorphophallus Titanum, "largest

flower in the world." is not in general cult, although a plant of it bloomed at the N. Y. Botanical Garden in 1937 and was fully reported in publications of that institution. The bell-shaped highly colored erect spathe was 4 ft. across, and the top of the spadix was about $8\frac{1}{2}$ ft. above the soil. The corm, which had been imported from Sumatra, weighed $113\frac{1}{2}$ lbs. after the flowering.

Plants thrive in a rich loams soil and should be kept dry and warm in winter. Propagated by offsets of the tubers potted singly and kept in a temperature of 65-70°. or more. Grown in greenhouses and sometimes in tubs for summer bloom, or planted out in mild climates.

campanulatus. To 2 ft.: lvs. to 3 ft. long and broad, the petioles spotted with white: spathes ovate, 8 in. long and 10 in. across, fleshy below spotted with white, purplish in center, with wavy margins; spadix about 10 in. long. E. Indies.

giganteus. Lvs. 3 ft. or more broad, pale green, the petioles variegated with white: spathes broadly ovate, 1 ft. long and 8 in. across, clouded with purple, the margins wavy; spadix slightly shorter than spathe. Malaya.

mossambicénsis. Small plant with spathe to 6 in. long, deep purple, spadix equalling or somewhat shorter than spathe. E. and S. Afr.

mozambiquanus: probably A. mossambicensis.

Rivièri: Hudrosme Rivieri.

AMPELODÉSMA. Gramineæ. One per tufted grass with stiff crect sts. to 5 ft. tall, grown for ornament in Calif. A. mauritánicus (A. tenax). Lvs. very long and narrow, becoming convolute, rough on edges: spikelets in long loose one-sided nodding panicles. Medit. region. See Grasses.

AMPELÓPSIS. Vitaceæ. Tendril-climbing shrubs native in N. Amer. and Asia, with alternate simple or compound lvs., small greenish fls. in long-stalked cymes, and fr. a berry. In Ampelopsis the tendrils do not bear expanded cup-like tips and the disk in the fl. is separate from the ovary and prominent, thus differing from Parthenocissus.

Ampelopsis is grown as a covering for walls and arbors, and is not particular as to soil. Propagated by seeds, also by cuttungs and layers. Cuttings of hard wood may be made in September under glass or stored until spring after the manner of grape cuttings; those of soft wood can be struck in the summer.

acontifôlia (A. dissecta, A. acontifolia var. dissecta). Lvs. of 3 or 5 lanceolate pinnately lobed lfts. to 3 in. long: fr. orange or yellow, sometimes bluish when young. China. Var. glàbra (var. palmiloba): lvs. 3-parted and segms. toothed and lobed.

arborea (A. and Vitis bipinnata. Cissus arborea). Pepper-Vine. Lvs. bipinnate, lfts. ovate, to 1½ in. long, coarsely toothed: fr. dark purple. Va. to Fla. and Mex.

bipinnata: A. arborea.

Bodinièri (A. micans). Lvs. ovate, to 4 in. long, unlobed or shallowly lobed, coarsely toothed, pale beneath. fr. dark blue. China.

brevipedunculāta (A. heterophylla var. amurensis). Lvs. cordate-ovate, to 5 in. long, with 3 coarsely toothed lobes: fr. lilac becoming blue. N. E. Asia. Var. citrulloides, lvs. deeply 5-lobed. Var. élegans (A. variegata, A. tricolor), lvs. variegated with white, green or pink. Var. Maximowiczii (A. heterophylla, Vitis heterophylla and var. humulifolia), lvs. deeply 3-5-lobed.

Chaffanjonii (A. Watsoniana). Lvs. pinnate, lfts. oblong, to 41/2 in. long, slightly toothed, purplish beneath.

cordata (A. and Vitis indivisa). Lvs. broad-ovate, to 5 in. long, toothed and only slightly 3-lobed: fr. blue. Va. to Fla. and Mex.

Delavayana. Lvs. cordate-ovate, to 5 in. long, 3-lobed or -parted or sometimes simple, crenate-toothed, usually pubescent beneath: fr. dark blue. China.

dissécta: A. aconitifolia.

Engelmannii: Parthenocissus quinquefolia var. flexudsa: A. brevipedunçulata, at least in part. hederacea: Parthenocissus quinquefolia. Henryana: Parthenocissus Henryana.

hentanh fila: Parthenociesus heptaphylla.

heteroph fila: A. brevipedunculata var. Maximowiczii.

humulifòlia (Vilis humulifolsa). Lvs. broad-ovate, to 5 in. long, 3-5-lobed, coarsely toothed, shining above, whitish beneath: fls. pale yellow or pale blue. China.

hypoglatica: Cissus hypoglauca.

indivisa: A. cordata.

japónica. Root tuberous: lvs. of 3-5 pinnate or pinnately lobed lfts. to 4 in. long, shining above, the rachis broadly winged: fr. blue. Japan, China.—Some of the material cult. under this name belongs to Parthenocissus trieus pidata.

lætévirens: Parthenocissus lætevirens.

Lòwii: Parthenocissus tricuspidata var.

megalophýlla. Lvs. pinnate or bipinnate, lfts. ovate, to 5 in. long, coarsely toothed: fr. black. China.

micans: A. Bodinieri.

orientalis (Vuis orientalis). Lvs. pinnate or bipinnate, lfts. to 3 m. long, sharply notched: fr. red. S. W. Asia, quinquefòlia: Parthenocissus quinquefolia.

Saint-Paulii: Parthenocissus quinquefolia var.

sempérvirens: Cissus striata.

Thómsonii: Parthenocissus Thomsonii.

tricolor: A. brevipedunculata var. elegans.

tricuspidata: Parthenocussus tricuspidata.

variegata: A. brevipedunculata var. elegans. Veitchii: Parthenocissus tricuspidata var.

virginiàna: Parthenocissus quinquefolia.

vitàcea: Parthenocissus quinquefolia var.

Watsoniana: A. Chaffanjonii.

AMPHICÁRPA. Hog-Peanut. Leguminosæ. Twining bean-like herbaceous vines of N. Amer. and Asia: lvs. of 3 lfts.: small fls. of two kinds, the upper papilionaceous ones in axillary racemes, those in lower axils without petals and fertile. Sometimes, but not originally, written Amphicarpæa.

monoica (Falcata comosa). Climbing to 8 ft.: Ifts. ovate, to 3 in. long: fis. purplish or white, ½ in. long: pods 1 in. long. N. Amer.

AMPHÍCOME. Bignoniaceæ. Himalayan per. herbs, sometimes woody at base, with alternate pinnate lvs. and funnelform red fls. in terminal racemes; grown in rock-gardens and greenhouses.

argûta. To 3 ft.: lfts. 5-9, lanceolate, to 1½ in. long, deeply toothed: fls. 1 in. long, narrowed at base, in racemes to 8 in. long.

emòdi. To 3 ft.: lfts. 11-15, cordate-ovate, with triangular teeth; fls. with orange corolla-tube.

AMPHILOPHIS: Andropogon saccharoides.

AMSÒNIA. A pocynaceæ. Per. herbs with alternate lvs., terminal panicles of narrow blue fls., included stamens, and long slender frs.; native in N. Amer. and E. Asia.

The amsonias are grown in shady positions in the hardy border for ornament. Propagated by division, seeds or cuttings.

Amsonia: A. Tabernæmontana.

angustifòlia: A. ciliata.

ciliàta (A. angustifolia). To 5 ft. tall, rarely more than 3 ft.: lvs. linear to oblong-lanceolate, to 2½ in. long, petiolate: fls. purplish-blue, corolla-tube longer than lobes. N. C. to Fla. and Tex. Var. texàna (A. texana) has a slightly longer corolla-tube than type. Okla., Tex.

salicifòlia: A. Tabernæmontana var.

Tabernæmontana (A. Amsonia). To 3½ ft.: lvs. ovate to lanceolate, to 4 in. long: fis. ¾ in. long, pubescent outside, in a dense cluster. May-July. N. J. to Fla. and Tex., in low grounds. Var. salicifolia (A. salicifolia) has narrower lvs. and fis. few in a loose cluster.

texàna: A. ciliata var.

AMYGDALUS: Prunus,

ANÁBASIS. Chenopodiaceæ. About a score of subshrubs or woody herbs of the Medit. region

eastward related to Salsola, with jointed sts. and opposite scale-like or inconspicuous lys. and minute fls. A. aphýlla is recently proposed for experimental cult. in dry regions of the Southwest as a source of anabasin, an insect poison. It is a green woody erect plant 12-20 in. high, with many upright branches, lys. reduced to scales, fls. in terminal spikes, fr. in a 3-winged calyx.

ANACÁMPSEROS. Portulacaceæ. S. African succulent herbs with fleshy lvs. and racemose fls. opening only in the sun, with 2 sepals and 5 fugacious petals; occasionally grown in the greenhouse. Propagated by seeds or by stem- and leaf-cuttings.

albissima. Sts. pure white, 1½ in. or less long: stipules broadly ovate and holding the very small succulent if. next above it: fis. inclosed within terminal stigmas.

álta. Sts. to 6 in., branched: lvs. obovate, 1/4 in. long, spotted, white-tomentose, stipules about length of lvs. and whitish

arachnoides. Lvs. ovate, ¼ in. long, cobwebbed, green and shining: fls. white, in 2-3-fld. racemes on scapes to 4 in. high. Var. grandiflora (A. rufescens) has purplish lvs. and fls.

filamentòsa. Distinguished from A. arachnoides by the axillary hairs longer than the webby-pubescent lvs. and larger rose fis.

lanceolata. Lvs. lanceolate, glabrous, with very long axillary hairs: fis. reddish, usually solitary.

Meyeri. Sts. short, with erect branches to 3 in. long: lvs. fleshy, broad-obovate, A in. long, stipules dense and longer than lvs.

papyracea. Sts. to 2 in.: stipules tongue-shaped, white, $\frac{1}{2}$ in. long, much longer than the thick lvs.: fis. yellow, sessile, solitary.

parviflora. Sts. to 2 in., branched: lvs. dense, obovate or cuneate, ½ in. long, tomentose, reddish-green, stipules longer than lvs.: fls. red, in racemes.

ruféscens: A. arachnoides var. grandiflora,

Telephiástrum. Lvs. ovate, 1/3 in. long, glabrous: fls. reddish, in 2-4-fld. racemes on scapes to 6 in. high.

tomentòsa. Differs from A, arachnoides by its smaller woolly-felted lvs. exceeded by the axillary hairs: fis. bright red.

ANACARDIACEÆ. CASHEW FAMILY. About 60 genera of woody plants with resinous bark, mostly in the tropics but some of them extending into cool temp. regions, sometimes evergreen; some species have medicinal, tanning and poisonous properties and yield material for varnishes, others are grown for their edible fruit, and still others for ornament. The family is characterized by alternate lvs., the small bisexual or unisexual fls. with a disk between the stamens, 1–6-celled ovary with 1 seed in each cell and 1–6 styles, and fr. commonly a drupe or nut. The following genera are sometimes cult. in our territory: Anacardium, Cotinus, Harpephyllum, Lithræa, Mangifera, Pistacia, Pleiogynium, Rhus, Schinus, Spondias.

ANACÁRDIUM. Anacardiaceæ. Trees and shrubs of trop. Amer., one cult. for its nuts, with simple leathery lvs., numerous small polygamous fls. in terminal panicles, 7–10 stamens, and kidney-shaped fr. borne on a greatly enlarged soft receptacle. Of easy cult. in regions free from frost. Propagated by seeds or choice varieties by shield-budding.

occidentale. Cashew. Evergreen spreading tree to 40 ft.: lvs. to 8 in. long and 4 in. wide: fis. yellowish-pink: fr. consisting of fleshy bright yellow or red receptacle (cashew-apple, from which sweetmeats and beverages are made) 2-3½ in. long, and kidney-shaped nut containing kernel edible when roasted. Trop. Amer.; nat. in all trop. countries; planted also in S. Fla.

ANÁCHARIS. Hydrocharitaceæ. Aquatic submerged perennials with soft leafy sts. and inconspicuous unisexual or bisexual fls.; grown in aquaria and ponds and spreading rapidly. Propagated by cuttings and winter-buds.

canadensis (Elodea canadensis. Philotria canadensis).
Water-Weed. Dirch-Moss. Elodea. Lvs. about ½ in. long and ½-½ in. wide, more or less obtuse, at the top of the st. strongly imbricated: fls. whitish, to ½ in. across, the pistillate with tube elongated, allowing fls. to float on surface, inclosed singly in a tight spathe constricted at the base; staminate fls. not known. Que. south and west; nat. in Eu.—Material in aquaria may also represent A. occidentalis, a plant with narrower more pointed not imbricate lvs., and distinct staminate fls.; native but not extending as far north.

dense (Elodez canadensis var. gigantea). Similar to the above, but of much stouter habit, longer internodes, white fis. about ¾ in. across, several being inclosed by a broad loose spathe not constricted at the base. S. Brazil to the La Plata River.

ANACYCLUS. Compositæ. Ann. or per. herbs, somewhat like the chrysanthenums and chamomiles, with pinnately cut lvs. and manyfld. solitary heads of yellow disk-fls. and white, yellow or purplish ray-fls.; pappus none or consisting of a crown or scales; native in Medit. region and Orient. Sometimes grown in the flower-garden.

atlanticus. Per, sts. prostrate, villous, to 3½ in. long: basal lvs. 2-3-pinnatisect, to 1¾ in. long, white-hairy, ultimate segms. linear-lanceolate, acute, st.-lvs. linear-lanceolate, to ½ in. long; head to ½ in. dam, hemispherical, unisexual. Mts. Morocco. Var. vestitus is listed.

depréssus. Bien. or per., sts. prostrate or ascending: lvs. 1-2-pinnatisect, segms. lanceolate, acute: heads to 2 in. across, ray-fls. dark red often margined white, or white. Morocco.

officinarum. Ann. to 10 in.: lvs. 2-pinnatisect into linear segms.: ray-fls. white marked purple beneath, heads 1 in. across. S. Eu.

Pyrèthrum. Per., procumbent: lvs. 2-pinnatisect into linear segms.: ray-fls. white, purplish beneath. S. E. Eu.

radiatus. Ann. to 2 ft., villous to glabrescent: lvs. 2-pinnatisect into linear-lanceolate segms. with mucronate apices: ray-fis. yellow, heads to 1½ in. across. Medit. region. Var. purpureum has the ray-fis. broadly striped maroon.

ANAGÁLLIS. PIMPERNEL. Primulaceæ. Widely distributed herbs having usually opposite or whorled lvs., axillary solitary fls. in shades of red, blue and white, wheel- or bell-shaped corolla, usually hairy stamens, and fr. opening transversely.

Seeds of the annual species may be sown where the plants are to be grown. The perennials are propagated by division and cuttings.

arvénsis. Poor Mans Weatherglass. Spreading ann.: lvs. ovate, to ½ in. long: fls. scarlet or white, about ¼ in. across. Nat. from Eu. and Asia. Vur. cærûlea has blue fls. Var. phomicea has red fls.

grandifidra: A. limfolia.

linitalia (A. grandsflora, A. Phillipsii). Per. or bien, to 1½ ft.: lvs. linear or linear-lanceolate, to 1 in. long: fls. blue, reddish beneath, ¾ in. across. Medit. region. Var. collina, fls. rose or purplish. Var. Monéllii, lvs. ovate or oblong.

Phillipsii: A. linifolia.

tensile. Ann. to 6 in.: lvs. orbicular-ovate, to ½ in. long: fis. red, bell-shaped. W. Eu. and Medit. region.—Fls. on longer pedicels than those of A. arvensis.

ANÁNAS. Bromeliaceæ. Stiff terrestrial per. herbs native in trop. Amer., usually grown for the edible fr.-head. For cult. see Bromelia and Pineapple.

bracteatus. Similar to A. comosus but fis. in showy red heads with large elongated spiny bracts. Brazil.

combsus (A. sativus). PINEAPPLE. St. to 4 ft.: lvs. in rosettes, to 3 ft. long and 1½ in. wide, with spiny tips and prickly edges: fis. bisexual, violet or reddish, borne in dense heads crowned with a tuft of lvs.: fr. fleshy and watery, being really a thickened st. in which the berries are im-

bedded, becoming 1 ft. long.—A few forms are cult. for ornament, as var. variegatus with striped lvs. and A. Porteanus with olive-green lvs. having a central yellow band. Var. cochin-chinensis is listed.

Porteanus: see A. comosus.

sativus: A. comosus.

ANAPALINA. Iridaceæ. A small S. African genus formerly combined with Antholyza from which it differs in the fl.-peduncle definitely terminated by the infl. and not continuing beyond as a naked stalk bearing some barren bracts at apex, and from Chasmanthe in all the perianth-lobes equal or nearly so. Cult. as for Gladiolus.

revolùta (Antholyza revoluta. Gladiolus pracox). To 2 ft.: lvs. lnear-subulate, to 1 ft. long: fis. bright red, in lax few-fid. secund spikes.

ANÁPHALIS. Compositæ. White-woolly perennials with leafy sts., interesting for the rockgarden and hardy border, the small white or gray corymbose heads remaining stiff and dry; fls. all tubular; pappus bristly. They are often cut before maturity, dried and dyed for use as everlastings.

margaritàcea (Antennaria margaritacea). Pearl Ever-LASTING To 3 ft.: Ivs. linear-lanceolate, to 5 in. long, entire, green above, white-tomentose beneath: heads white, ½ in. across N. Amer, Eu., N. Asia. Var. subalpina (A. subalpina) is of lower habit, has wider Ivs. and fewer heads in the infi.

subalpina: A margaritacea var.

triplinérvis. Lvs obovate or oblong, to 8 in. long, white-woolly beneath, colwebby above, 3-5-nerved: heads white, to 34 in across. Himalayas.

ANARRHÌNUM. Scrophulariaceæ. Bien. or per. herbs native in Medit. region: basal lvs. in rosette, serrate or dentate; st.-lvs. alternate, palmately divided or linear segms. entire or toothed: fls. 2-lipped, spur minute or absent, in long slender racemes. Distinguished from Antirrhinum and Linaria by absence of palate in throat of corolla. Propagated by seeds: of questionable hardiness north of New York.

bellidifòlium. Bien. to 2 ft.: basal lvs. spatulate, to 3 in. long, deeply toothed, st.-lvs. 3-7-parted, segms linear: fls. blue, limb often white-fringed, to ½ in. long, spur short and recurved, racemes erect.

crassifolium: Chænorrhinum origanifolium. The material cult. as A. crassifolium is usually A. bellidifolium.

ANASTÁTICA. Cruciferæ. One little ann., A. hierochántica, is sometimes grown for curiosity as Resurrection-Plant or Rose-of-Jericho. When ripe and dead the branches curve inward forming a ball-like object that rolls over the deserts and which opens out when moist. The seeds are borne in small hairy pods or silicles close along the branches and soon germinate when wet weather comes. The balls are sometimes sold; they open and close with moisture and dryness. It is a gray unattractive plant a few inches high, with oblong-spatulate toothed lvs. and minute white fis. The plant is easy to grow in warm locations. Algeria to Arabia and Persia.

ANASTROPHUS: Axonopus.

ANATHERUM: Vetiveria.

ANAY: Hufelandia.

ANCHISTEA: Woodwardia virginica.
ANCHOR-PLANT: Colletia cruciata.

ANCHUSA. ALKANET. BUGLOSS. Boraginaceæ. Old World hairy herbs with alternate simple lvs. and blue, violet or white funnelform or

tubular fls. in coiled leafy-bracted cymes or racemes; throat of corolla bearing scales. Of easy cult. in the flower-garden or border. Propagated by seeds in spring or division of the roots.

affinis. Per. to 2 ft.: lvs. ovate or ovate-lanceolate: fls. blue, 1/2 in, across. Trop. Afr.

angustifòlia: A. officinalis var.

azūrea (A. italica). Per. to 5 ft.: lvs. lanceolate to ovatelanceolate: fls. bright blue, to 3/4 in. across, in summer and autumn; calyx-lobes long-pointed. Medit. region. Var. florairénsis is listed as an improved hort. form.—Known in several hort. forms, as Dropmore, Opal, Perrys, Picotee, Pride of Doyer.

Barrelièri. Per. to 2 ft.: lvs. ovate-lanceolate: fls. blue with white tube and yellow throat, in spring. Eu., Asia Minor

capénsis. Bien. to 1½ ft.: lvs. narrowly lanceolate: fls. blue margined with red and with white throat, ¼ in. across, in summer and autumn. S. Afr. Var. álba has white fls.

incarnata: A. officinalis var.

itálica: A. azurea.

myosotidifldra: Brunnera macrophylla.

ochroleuca (A. procera). Bien. or per. to 4 ft.: lvs. linear-lanceolate, to 8 in. long, hispid: fis. pale yellowish-white to ivory, to ½ in. across. Caucasus.

officinalis. Bien. or per. to 2 ft.: lvs. lanceolate: fls. bright blue or purple, ½ in. across, in summer and autumn. Eu. Var. incarnata (A nonmata) has flesh-colored fls. Var. angustifòlia has narrowly lanceolate lvs.

procèra: A. ochroleuca.

riparia. Bien. or per. to 2½ ft.: lvs. narrowly lanceolate, to 6 in. long, hispid to setose: fis. blue to purplish-red, about ½ in. across, in loosely-fid. cymes. Cent. Eu.—Distinguished from A. oficinalis by its narrower lvs. and minute calvx-teeth.

sempérvirens: Pentaglottis sempervirens.

ANCISTROCÁCTUS. Hook Cactus. Cactaceæ. Small globular indistinctly ribbed cacti with prominent tubercles and many spines, one of the central spines always hooked: fls. borne at top of plant, campanulate with short tube.

brevihamatus (Echinocactus brevihamatus). To 4 in. high and 3 in. diam, tubercles grooved; radial spines 10-14, 34 in. long, white; central spines 4; fls. rose, 1½ in. long. S. Tex.

megarhizus (Echinocactus megarhizus). Plant usually solitary, to 3 in., with large roots; radial spines 20 or more, appressed, yellow becoming white; central spines strongly hooked. Mex.

Scheeri (Echinocactus Scheeri). Fishhook Cactus. Plant to 2 in.; radial spines 15-18, ½ in. long, white or yellowish: fis. greenish-yellow, 1 in. long. S. Tex., N. Mex.

ANDÌRA. ANGELIN-TREE. Leguminosæ. Trees mostly native in trop. Amer., with alternate pinnate lvs., fragrant papilionaceous fls. in terminal panicles, and drupe-like pods. They require trop. temperature and rich loamy soil. Propagated by cuttings over bottom heat, when seeds are not available.

inérmis (Vouacapoua americana). Cabbage-Tree. To 40 ft. or more: lits. to 2½ in. long: fls. hlac or pale rose: pods 1½ in. long. Trop. Amer., W. Afr.

ANDRÓMEDA. Bog-Rosemary. Ericacex. Low evergreen shrubs, now restricted to 2 species, with narrow entire revolute lvs., pinkish urn-shaped fls. in nodding terminal umbels, and capsular frs.

Grown in rockeries and borders and very hardy North. Propagated by seeds, cuttings of mature wood under glass, and by layers.

arbòrea: Oxydendrum arboreum.

cærùlea: Phyllodoce cærulea.

calyculatas Chamædaphne calyculata.

cassinifòlia: Zenobia pulverulenta var. nuda.

Cátesbæi: Leucothoé Catesbæi.

floribúnda: Pierrs floribunda.

giaucophýlla. Similar to A. polifolia but the lvs. white-tomentose beneath and fr. glaucous. Newf. to N. J. and Ind. japônica: Pieris japonica.

ligustrina: Lyonia ligustrina.

mariana: Lyonia mariana.

51

nítida: Lyonia lucida.

paniculata: Lyonia ligustrina.

polifolia. To 1 ft., the rootstocks creeping: lvs. oblong to linear, to 1½ in. long, the margins revolute, glaucous beneath: fls. ½ in. long. Eu., N. Asia, N. M. Amer. Var. montana, more dwarf and compact habit with darker lvs.

pulverulénta: Zenobia pulverulenta.

racemòsa: Leucothoe racemosa.

ANDROPÒGON. BEARD-GRASS. Gramineæ. Per. grasses widely distributed in both hemispheres, having narrow lvs. and spikelets in spike-like racemes which are borne singly, in pairs or clusters, florets awned, rachis prom-

inently bearded; a few grown for forage. See Grasses.

argénteus: A. saccharoides; see also A. hirtus.

furcatus. To 6 ft., branched above: lvs to 1½ ft. long and ½ in. wide: racemes to 5 in. long, 2-6 at tips of sts., florets awned. Me. to Fla. and N. Mex.

halepénsis: Sorghum halepense.

hirtus. To 3 ft.: lvs. to 1 ft. long and $\frac{1}{12}$ in. wide, slightly glaucous with white midrib: racemes to $\frac{1}{12}$ in. long, silvery-hairy, in pairs in loose panicles to 1 ft. long. Warm regions of the Old World.—Some of the material cult. as A. argenteus belongs here.

saccharoldes (A. argenteus. Amphilophis saccharoldes). To 3½ ft: lvs. to 8 m. long and ½ in. wide: racemes 1½ in. long, silky-hairy, in shining white panicles to 4 in. long. Colo. to Mex., W. Indies, N. S. Amer.

Sorghum: Sorghum vulgare.

ANDRÓSACE. ROCK-JASMINE. Primulaceæ. Small tufted herbs of Eu., Asia and N. Amer., sometimes grown in rock-gardens or low borders: lvs. mostly basal: fls. in shades of red and white, resembling primroses but the corolla shorter than the calyx and constricted at the throat. Generic name has four syllables.

Androsaces require well-drained soil which must not be allowed to dry out in time of drought. Propagated by seeds, division or cuttings.

alpina (A. glacialis). Per. to 3 in., loosely tufted: lvs. in rosettes at ends of branches, oblong-lanceolate, ½ in. long, hairy: fis. rose, solitary, ½ in. across. Alps.

arachnoidea: A. villosa var.

armeniaca. Bien. to 2 in.: basal lvs. oblong-lanceolate, to $\frac{5}{8}$ in. long, usually acute, somewhat laciniate-dentates fls. white, in 5-10-fld. umbel-like clusters. Asia Minor.

brigantìaca: A. carnea var.

carinata: A. Chamajasme var.

cárnea. Per. to 3 in.: lvs. linear, to ¾ in. long, forming rosettes: fls. in 3-7-fld. umbels, rose or whitish with a yellow eye, ⅓ in across. Alps and Pyrenees. Var. brigantiaca has narrower lvs. and white fls. Var. Hálleri (A. Halleri) has longer shining hairy lvs. Var. Lággeri (A. Laggeri) is more densely tufted and with short scape.

Chamsejásme. Per. to 3 in: Ivs. lanceolate to ovate, to ½ in long, hairy, forming rosettes: fls. in umbels, white with yellowish eye, to ½ in across. N. Asia, Eu., N. N. Amer. Var. carinàta (A. carmata), Ivs. keeled beneath.

Chúmbyi, chumbyiénse: A. sarmentosa var.

ciliàta. Per. to 3 in.: lvs. oblong-ovate, ¼ in. long, ciliate on margins, forming rosettes: fis. rose, ¾ in. across, solitary. Pyrenees.

coronopifòlia: A. lactiflora.

eximoldes: listed name.

folidsa. Per. to 5 in., stoloniferous: lvs. all basal but not in rosettes, obovate, to $1\frac{1}{2}$ in. long: fis. pink, in umbels. Himalayas.

glacialis: A. alpina.

Hálleri: A. carnea var.

Hausmannii. Densely tufted per. to 3 in.: lvs. overlapping in rosettes, spatulate, to $\frac{1}{2}$ in. long; fis. pale rose, to $\frac{1}{2}$ in. across. Mts. of Cent. and S. Eu.

hedræántha. Per. to ½ in.: lvs. oblong-lanceolate, ½ in. long, in rosettes: fis. violet-red, in 5-10-fid. umbels.

helvética. Per., densely tufted: lvs. lanceolate, very

small, in dense rosettes, hairy: fis, white, 1/4 in, across, solitary, nearly sessile. Alps.

láctea. Per. to 8 in.: lvs. linear or linear-lanceolate, to 34 in. long: fis. snow-white, 14 in. across, in umbels, the pedicels to 2 in. long. Mts. of Eu.

lactiflora (A. coronops/olia). Ann. to 1 ft.: lvs. linear-lanceolate, to 2 in. long, forming rosettes: fis. in large clusters, white, to ½ in. across. Siberia.

Lággeri: A. carnea var.

lanuginosa. Per covered with silky white hairs, prostrate: lvs. both basal and st, lanceolate-ovate, to ¾ in. long: fls. in dense clusters on scapes about 2 in. long, rose-colored, ½ in. across. Himalayas. Var Leichtlini, hort. form with white fls. Var. oculata is listed with hlac fls.

máxima. Ann. to 4 in.: lvs. ovate or oblong, toothed in upper part, in basal rosettes: fis. white or pink, in umbels terminating the scapes. Eu., Asia, N. Afr.

micropyhlla: A. mucronifolia.

mucronifòlia (A. microphylla). Laxly tufted, stolons to 1 in. long: lvs. imbricated in rosettes, obovate, to ½ in. long, obtuse, ciliate: fis. rose to lılac, usually 3-6 in. compact umbellate heads on scape to ½ in. long. N. W. Himalayas to Tibet.

obtusifòlia. Per. to 6 in.: lvs. lanceolate, to ¾ in. long, in rosettes: fis. white or pinkish, ⅓ in. across, in umbels. Alps.

ovata: listed name.

primuloides. Stoloniferous, the runners to 4 in. long: lvs. linear-lanceolate, to ½ in. long or the larger ones 2 in. or more, in rosettes, covered with silvery hairs: fis. in clusters on scapes to 5 in. high, pink, to ½ in. across. Hima-

puberulenta. Ann. to 8 in.: lvs. oblanceolate, to $1\frac{1}{4}$ in. long, pubescent, in rosettes: fls. white, $\frac{1}{6}$ in. across, in umbels, the pedicels to 2 in. long. Alaska to New Mex.

sarmentosa. Stoloniferous, the runners to 5 in. long: lvs. lanceolate or ovate-lanceolate, to 1½ in. long, in rosettes, covered with silvery hairs when young: fis. many, in clusters on scapes to 5 in. high, rose-colored, ½ in. across. Himalayas. Var. Chúmbyi (A. Chumbyi and chumbyiense). More cespitose and woolly. Forms with smaller crowded lvs. are Wátkinsii and yunnanénsis.

sempervivoides. Stoloniferous, the runners to 2 in. long lvs. ovate, to 1/4 in. long, fleshy, in rosettes on the stolons: fls. rose, 1/4 in. across, in umbels on scapes to 4 in. high. Himalayas.

septentrionalis. Ann. to 8 in.: lvs. lanceolate or oblong, to ¾ in. long, in rosettes: fis. white or pink, to ⅓ in. across, in umbels. Eu., Asia, N. N. Amer. Var. subumbellata (A. subumbellata) is of more dwarf habit; scapes to 2 in. or less. Ore. and Mont.

strigillosa. Tufted: lvs. narrowly oblong to obovate, to 3 in. long and ¾ in. wide, obtuse to acutish, usually hairy, base attenuated into petiole: fis. purple-violet, in umbels of 5-10. Himalayas.

subumbellata: A. septentrionalis var.

villosa. Per. to 3 in., densely white-hairy: lvs. lanceolate, in rosettes: fls. white or rose with yellowish-red throat, ½ in. across, in umbels. Eu., Asia. Var. arachnoidea (A. arachnoidea), lvs. oblong-ovate, to 1 in. high.

Vitaliana: Douglasia Vitaliana.

ANDROSTÈPHIUM. Liliacex. Cormous American herbs with basal linear lvs. and blue fls. in terminal umbels, the perianth-segms. united about half way; one species is sometimes planted in the wild-garden or border.

cærùleum (A. violaceum). To 8 in.: fis. lilac or violet, 1 in. long. Kans. to Tex.

violaceum: A. cæruleum.

ANEMARRHENA. Liliacex. A monotypic genus of N. China, belonging to the Asphodel tribe and characterized by its rhizomatous rootstock, fls. with 3 stamens having versatile anthers and the perianth-segms. free, not spirally twisting after flowering: infl. a much elongated raceme and fr. a loculicidal caps. A. asphodeloides. To 3½ ft.: lvs. basal, grass-like, to 2½ ft. long and 3% in. wide, long-tapering: fls. dull rose-purple, segms. linear, about 1/4 in. long.

ANEMONE. ANEMONE OR ANEMONY. WIND-FLOWER. Ranunculaceæ. Attractive perennials blooming in spring, summer or autumn, white, rose, red or even purplish; the lvs. are more or less divided or dissected or even compound; fls. lacking petals, the showy parts consisting of colored sepals; fr. an achene which in the Pulsatilla section has long feathery styles, but in no case is it ribbed; mostly native in the north temp. zone. As a Latin generic name the word is pronounced Anemo-ne (four syllables): as an English vernacular, Anem-one.

Anemones are valuable in all types of gardens, where they thrive in rich sandy loam, many in partial shade. Aside from the florists and Japanese anemones, the species are employed mostly in wild borders, rock-gardens, and for colomzing. The florists' tuberous-rooted kinds, as St. Brigid and The Bride, are useful for late winter and spring bloom in the house, being started in autumn in flats and handled after the manner of freesias. These and similar anemones may also be flowered out-of-doors, with the culture of tulips and hyacinths, if given good winter protection as they will not stand much frost. These florists, plants are of the species A gardengra A tyleng. plants are of the species A. coronaria, A. fulgens, A. hor-

The Japanese anemones are amongst the best perennial herbs for autumn bloom. They stand for some years in good land; the situation should be protected from strong

The anemones adapted to rock-garden conditions include, among others, A. baldensis, A. Drummondii and A. Halleri.

Most species can be propagated by seed or by root-division, the best time for the latter being in early spring; sow the seed in the fall as soon as it has ripened.

acutipétala: A. alpina.

albana. To 1 ft.: lvs. tripinnatifid, segms. oblong to linear, white-villous: fls. creamy-yellow, sometimes pale blue, erect. Siberia to N. Asia Minor.—Belongs in the Pulsatilla group.

Állenii: A. apennina var., A. nemorosa var.

alpina (A. acutipetala, Pulsatula alpina). To 1½ ft.: involucral lvs. short-petioled: fls. few in a cluster or solitary, cream inside, purple outside, to 3 in. across. May-June. Eu. Var. sulphurea is soft sulfur-yellow.

altaica. Per. to 8 in., with single st. bearing involuce of 3 petioled toothed lvs. and a single large white fl. Siberia, Japan.

angulòsa: Hepatica angulosa.

apennina. To 9 in. with tuberous roots: involucral lvs. long-petioled, ternately compound, lfts. deeply incised and appearing acute both in sinus and apex: fls. solitary, skyblue, to 1½ in. across, sepals pubescent without, at least on lower third, peduncle as long as st., slender. Mar.—Apr. Woods, Italy.—Sometimes confused with A. blanda. Var. diba, fls. white. Var. Allenii, fls. pale blue. Var. plēna, fls. double. Var. purpūrea, fls. mauve. Var. ròsea, fls. rosenink. pink.

atràta: hort. name for member of Pulsatilla section.

baldénsis. To 6 in.: involucral lvs. petioled: fls. solitary, white, often tinged rose outside, to 2 in. across. July-Aug. Rocky places in the high Alps.

blanda. To 8 in. with tuberous root: involueral lvs. ternately compound, lfts. not deeply incised and appearing somewhat obtuse: fls. solitary, deep sky-blue, sepals glabrous without. Cirece, Asia Minor. Vars. atrocerulea and rosea are in the trade.—This plant is often confused with its close relative A. apennina and may be distinguished from it by its usually smaller less markedly lacinate lfts., shorter petioles and shorter slender peduncles.

borealis: A. parviflora.

cærùlea: A. nemorosa var. Robinsoniana.

canadénsis (A. pensylvanica. A. dichotoma). Meadow A. To 2 ft.: involucral lvs. sessile: fis. solitary, white, to 2 in. across. May-Aug. On shores, in low places and open meadows. N. Amer.

caroliniana. To 1 ft., with tuberous root: involucral lvs. sessile: fis. solitary, cream or purple, to 1½ in. across. Apr.-May. Open places, Ill. to Fla. and Tex. Var. ròsea has dark rose-colored fis.

cernua. Differs from A. vernalis in the nodding fis. and more numerous pinnæ with larger teeth. Japan.

chrysantha: A. coronaria var. chrysanthemiflora.

chrysanthemifiòra: A. coronaria var.

coronaria. Poppy-flowered A. Poppy A. To 1½ ft., root tuberous: involucral\tvs. sessile, finely divided: fis. solitary, poppy-like, of many shades and combinations of red, blue, white, to 2½ in. across, early spring-June. Meadows, Medit. region.—The most common anemone of the

florists for forcing. In the trade are The Bride, St. Brigid, semi-double many colors, Victoria Giant. Var. floreplène has double fls. in many colors, and var. chrysanthemi-flora has very double fls. and is said to be of hybrid origin.

cylindrica. Candle A. To 2 ft.: involucial lvs. long-petioled: fis. in clusters, greenish-white, ¾ in. across. June-Aug.: achenes long and narrow. Open places, N. Amer

dahùrica. To 1 ft.: lvs. ternately divided, the lateral segms. 3-lobed and sessile, terminal segm. petioled, 3-lobed, with lobes 2-3-divided into linear acute segms.: fis. salmonpink to pale rose-purple, to 1½ in. across or more. Dauria.

decapétala. This species has been referred to A. carolin-iana but differs in broader segms, of If., involucre mostly above rather than below middle of scape, pink or greenish-white fis., and achenes buried in wool. Ala. to Ark. and Tex. Var. rôsea is listed.

deltoídea. To 1 ft.: involucral lvs. sessile, 3-parted: fls. solitary, white, about 2 in. across. Wash. to Calif.

demissa. Drooping A. To 10 in., rarely to 16 in., roots somewhat tuberous and woody: involucial lvs. sessile, 3-lobed: fis. white inside, purplish without, in clusters of 3-6, to 1½ in. across. Aug.—Sept. Himalayas to China.—The pubescent foliage forms somewhat of a spreading clump.

dichôtoma: A. canadensis.

Drúmmondii. Usually 4-8 in., and rarely to 12 in. tall: involucial lys. petioled: fls. cream-colored inside. blue out side, solitary, to 1 in. across. June-July. Rocky Mts. and Calif.—Foliage forms a close somewhat dense tuft. Considered by some authors to belong with A. baldensis.

elongata. Tall A. To 3 ft., roots small and fibrous: basal lvs. long-petioled, blades ternate, to 4 in. across, outer segms. much-divided. fls. white, to 1 in. across, in branched cymes. June. Himalayas.

fulgens. Fiame A. Scarlet A. To 1 ft., the root tuberous: involucial lvs. sessile, entire or slightly cut: fls. solitary, scarlet, the stamens black, to 2½ in. across. May-June. France. Var. multipétala is listed as a semidouble form.

globòsa (A. multıfıda). To 20 in.: involucral lvs. short-petioled: fls. red to whitish or yellowish, about 1 in. across May-Sept. Meadows and hillsides, W. N. Amer.

Hålleri (Pulsatılla Halleri). To 6 in., covered with sılky white hairs: involucial lvs. sessile: fis. lilac, 2½ in. across, sepals often cleft. June. Sunny places, Switzerland.

Hepática: Hepatica americana and nobilis.

horténsis (A. stellata). GARDEN A. BROAD-LEAVED A. To 10 in., the root tuberous involucral lvs. sessile, entire or only slightly divided: fis. red, rose, purple or white with brownish-violet stamens, to 3 in. across. May. S. Eu.

hudsoniana. To 1½ ft., silky-hairy: involucral lvs. short-petioled: fls. greenish or red, to 1 in. across, in few-fld. clusters, summer. N. B. to N. Y. and Mınn.

hupehensis: reported as a dwarf early-flowering form of A. japonica with pink or pale mauve fis. shaded with deeper pink on back.

hybrida: name of indefinite and various application.

japónica. Japanese A. Stout, branching, to 3 ft.: lvs. of 3 ovate toothed or lobed lfts.: peduncles several; fls. purplish, red, rose, white, to 3 in. across, Sept. to late frosts. Japan, China. Var. álba, fls. white; var. crispa, lvs. crisped on edges; var. Lésser is listed as an early-blooming crimsonon edges; var. Lésseri is listed as an early-blooming crimsonfid. form; var. rôsea supérba, fis. rose; var. rûbra, fis. red,
waxy. Some of the vernacular-named forms are: Alice,
rosy-carmine; Coupe d'Argent, white; Frau Marie Manshart, Herbstrose, double, rose; Honorine Joubert, white;
Kriemhilde, lilac; Lady Ardilaun, white; Loreley, silverpink; Louise Uhink, white; Magdalena Uhink, double;
Max Vogel, deep rose, semi-double; Mount Rose, double,
deep pink; Prince Henry, dark red; Profusion, semi-double,
rose; Queen Charlotte, semi-double, pink; Richard Ahrens;
Whirlwind semi-double white. Whirlwind, semi-double, white

lancifòlia. MOUNTAIN A. To 1½ ft.: involucral lvs. petioled, serrations blunt and somewhat rounded, center lft. broadest above middle: fls. white, to 1½ in. across, solitary, sepals commonly 5, the veins obvious, and branches abundant and strongly anastomosing. May. Pa. to Ga.—Has been confused with the European A. trifolia.

Leveillei. To 15 in., roots fibrous: lvs. kidney-shaped, 3-lobed, margins dentate: fls. white inside, rose-pink outside, to 1½ in. across, usually 1-2, sepals rounded and bearded at tip. Apr.-May. China.

lithophila. To 8 in., remotely long silky-pubescent: lvs. about 11/2 in long, deeply 3-cleft, segms. oblanceolate, lobed and toothed, glabrous and glossy green: fis. pale yellowish tinged with blue, to 11/2 in. across, silky-pubescent. July-Aug. Mts. of Mont. to Utah.

Lyallii. To 6 in., rarely to 1½ ft. lvs. trifoliate, petioled, segms. ovate to lanceolate, rounded toothed: fis. white to pale blue, to ¾ in. across, solitary. Apr. N. Calif. to

Vancouver Isl.—By some considered a var. of A. quinque

Anemone.

magellánica. Trade name, applied sometimes to a yellow-fid. plant, and sometimes to a white-fid. subject with deeply cut foliage.

mexicana. To 1½ ft., roots fibrous: lvs. ovate, lobes 3, diamond-shaped and more or less cleft, margins dentate: fls. white, usually 2-5, to 1½ in. across, sepals 5, spreading, ovate-oblong. July-Sept. Mex.

montana (Pulsatilla montana). Similar to A. Halleri but with glabrous ivs. and dark violet drooping fis. Eu., Caucasus. Vars. alba and rubra are color forms.

multifida: A. globosa. The true A. multifida of botanists, native in S. S. Amer., is probably not in cult.

narcissiflora. To 1½ ft.: involucral lvs. sessile: fls. several in a cluster, white, to 1 in. across. May-July. Mts. of Eu.—The American representative has been separated as A. zephyra which is distinguished by its lemon-yellow usually solitary fls. and lvs. less lobed.

nemorosa. European Wood A. To 8 in.: involucral lvs. petioled: fls. white or purplish, solitary, 1 in. across. Apr.—May. Eu., Siberia. Hort. vars. are: Alba (var. flore-pleno), pure white; Allenii, lavender-mauve; mājor, white; Robinsoniana (var. carulea), blue. Mar.—Apr.; ròsea (var. rubra fl.-pl.), reddish-purple; simplex, fls. white.

nigricans: considered to be a subspecies of A. pratensis: fis. purple-black.

Nuttalliana: A. patens var.

occidentalis (Pulsatilla occidentalis). To 1½ ft.: involucral lvs. sessile: fls. solitary, white or purplish, to 2 in. across. May. B. C. to Calif.

oregana. To 8 in. or more: involucral lvs. petioled, coarsely toothed; fis. blue, to 1½ in. across, solitary. Cascade Mts., Ore.

palmàta. To 9 in., the root tuberous: lvs. nearly orbicular, not divided, involucral lvs. sessile: fls. golden-yellow, solitary or in 2's, about 1 in. across. May-June. Medit. region. Var. álbida (var. alba), fls. white; var. flòre-plèno, fls. double; var. lùtea, fls. yellow.

parviflora (A. borcalis). To 1 ft.: involucral lvs. nearly sessile: fls. white or tinged with rose, to 1 in. across. May-June. N. Asia, N. N. Amer.

patens (Pulsatilla patens). Per. to 3-6 in. high when in bloom but becoming 1 ft. and more in fr.: Ivs. basal, appearing after the bloom, ternate (petiole not running through the blade), divided into many linear lobes, the involucre of sessile divided bracts: fis. purplish, rarely white, to 21/6 in. across. Eu., N. Asia; native Ill. to B. C. and Alaska in races sometimes separated as var. Nuttalliana (or var. Wolfgangana), and Pulsatilla (Clematis) hirsutesima and P. ludoviciana.

pensylvánica: A. canadensis.

praténsis. One of the Pulsatilla group from N. Eu.: to 12 in.: lvs. pinnately parted into linear segms.: fis. dark purple, hanging, with 6 reflexed sepals.

Pulsatilla (Pulsatilla vulgaris). Pasque-Flower. To 1 ft.: lvs. pinnately dissected (along a rachis), appearing with the fts.; involucral lvs. sessile, silky-hairy: fts. solitary, blue to reddish-purple, bell-shaped, to 2½ in. across Apr. Eu. Color vars. are alba, carpatica, lilácina, rûbra, variegata.

quinquefòlia (A. nemorosa var. quinquefolia). American Wood A. Differs from A. nemorosa in the slender sts., less lobed involucral lvs. and smaller fls. E. N. Amer.

ranunculoides. Yellow Wood A. To 8 in., the root-stock somewhat tuberous: involucial lvs. nearly sessule: fls. usually solitary, golden-yellow, to 1 in. across. Apr.-May. Eu., Siberia. Var. flore-pleno has partially double fls.

refiéxa. Per. to 9 or 10 in. bearing single slender st. with involucre of 3 petioled lvs. which have long very narrow toothed lfts.: fis. small, with reflexed sepals. Siberia.

Regeliana. Basal lvs. broadly ovate, tri-pinnatisect, segms. usually sessile with lanceolate to linear lacinize, acute; involucral lvs. laciniate: fis. blue-violet or rarely rose-colored, tips reflexed: achenes plumose. Mongolia.

rivulāris. To 3 ft., branched: fis. white or tinged blue outside, 1½ in. across, in many-fid. cymes. India, Ceylon. Var. grandiflòra is listed.

Robinsoniàna: A. nemorosa var.

rupicola. To 1 ft. silky: lvs. 3-parted, the segms. toothed or cut, the radical ones long-stalked: fis. 1 or 2, large and showy, white, often pinkish outside. Himalayas.

serratifòlia: listed name.

sibfrica. To 6 in.: involucral lvs. short-stalked: fis. solitary, white. Siberia.

sphenophfila. Similar to A. decapetala, but with lvs. very deeply cleft. Chile.

stellata: A. hortensis.

sulphurea: A. alpina var.

sylvéstris. Snowdrop A. To 1½ ft.: involucral lvs. long-petioled: fis. solitary or in 2's, pure white, fragrant, to 1½ in. scross, often nodding May-June. Eu., S. W. Asia. Var. fiòre-plèno has double fis.

thalictroides is Anemonella thalictroides.

trifolia. To 1½ ft.: involural lvs. petioled, serrations sharp-pointed, center lft. broadest at or below the middle: fls. white, to 1½ in. across, solitary or in 2's, sepals commonly 6-7 rarely 5, veins faint, running free to the tip, not markedly branched and not anastomosing. May. Eu.—Material in trade often confused with that of A. lancifolia.

tuberosa. To 1 ft., root tuberous: involucial lvs. short-petioled: fis. white or purplish, to % in. across, usually solutary. Ariz. to Utah.

vernalis (Pulsatılla vernalis). To 6 in : involucial lvs. pinnate, silky-hairy: fis. purple outside, white inside. Apr. Eu.

villosissima: said to be a fluffy form of A. narcissiflora.

virginiana. To 3 ft., branching above: involucral lvs. long-petioled: peduncles 2-5; fls. white or greenish, to 1½ in. across. June-Aug. Woods, N. S. to S. C. and Kans.

vitifòlia. Grape-leaf A. Vine-i faved A. To 3 ft., branched: lvs. deeply 5-lobed, densely tomentose beneath; involucral lvs. petioled: fls. white, to 2 in. across, in manyfid. cymes. July. Himalayas. Var. hupehénsis is A. hupehensis. Var. tomentòsa is more vigorous and with larger lvs. which are said to be more hairy beneath.

zéphyra: see A. narcissiflora.

ANEMONE, RUE: Anemonella thalictroides.

ANEMONÉLLA (Syndesmon). Ranunculaceæ. One delicate per. herb with tuberous roots, native in E. N. Amer., sometimes transferred to the wild-garden or colonized. A. thalictroides (Thalictrum anemonoides). Rue-Anemone. To 9 in.: lvs. ternately compound, those of the involuere sessile: fls. white or pink, to 1 in. across, in terminal umbels. Mar.-June. Var. flòreplèno has double fls. Var. ròsea is offered in the trade.—It thrives in partial shade in light moist soil. Propagated by division of roots in spring or autumn.

ANEMONÓPSIS. Ranunculaceæ. One Japanese per. herb to 3 ft., grown as a border plant. A. macrophylla. Lvs. ternately compound and cut: fls. pale purple, drooping, 1½ in. across, with many petals and petal-like sepals, borne in loose racemes.—Does best in rich soil in partially shady well-drained situations. Propagated by division of roots in spring or autumn or by seeds sown in sandy loam.

ANEMONY: Anemone.

ANEMOPÆGMA. Bignoniaceæ. Mostly Brazilian climbing shrubs with lvs. of 2-3 entire lfts., funnelform fls. in lateral racemes, and fr. a woody or leathery caps.; grown under glass or in the open in warm regions.

Chamberlaynii (A. racemosum. Bignonia Chamberlaynii). Lvs. of 2 oblong or ovate lits. to 7 in. long and a terminal tendrii: fis. pale yellow striped in throat with purple or white, to 3 in. long, in racemes longer than lvs.: fr. oval, to 6 in. long.—Dorantha Unguis-cali is sometimes grown under this name.

racemòsum: A. Chamberlaynii.

ANEMÓPSIS. Saururaceæ. One per. aquatic herb with aromatic rootstocks having medicinal properties. A. califórnica. Yerba Mansa. To 1½ ft., the st. with 1 broad clasping If. bearing 1-3 small lvs. in axil: lvs. mostly basal, ellipticoblong, to 6 in. long: ffs. very small, in a dense spike to 1½ in. long which is subtended by white petal-like involucral bracts. Calif., Ariz., Mex.

ANÈTHUM. Umbelliferæ. Ann. or bien. herbs native in the Old World, with lvs. 3-4-pinnately divided into linear segms., small yellow fis. in umbels, and flattened frs.; one

species grown for the seeds which are used for flavoring. Easily grown from seeds which should be sown in a warm open situation.

graveolens. Dill. To 3 ft.: lvs. very finely cut into thread-like divisions. Eu.: nat. in N. Amer.

ANGÉLICA. Umbelliferæ. Per. herbs with compound lvs., small white or greenish fls. in terminal umbels, and compressed frs.; sometimes planted in borders for bold effects. Propagated by seeds and sometimes by division.

Archangélica (Archangelica officinalis). Stout bien. or per., to 6 ft.: lvs. 2-pinnate into 3-parted lfts. Eu., Asia, in low ground.

atropurpurea. To 6 ft.: lvs. biternate, the divisions pinnate: umbels to 10 m. across. Newf. to Del. and Minn., in swamps.—Sometimes grown for medicinal purposes.

Cúrtisii. To 4 ft.: lvs. biternate, the divisions pinnate: umbels to 6 in. across. Pa. to Ga., in woods.

montana: A. sylvestris var. elatior.

Pancícii (Archangelica Pancicu). To 4½ ft.: lower lvs. triternate, segms. ovate-elliptic, acutely toothed, the lower ones petioled, terminal segm. 2-3-lobed, upper lvs. biternate, the segms. bipinnatisect: fls. small, white to pink. Bulgaria.

rosæfðlia. Sts. to 5 ft. long, scrambling: lvs. of 2-5 pairs of toothed lfts. to 2½ in. long: umbels to 3 m. across New Zeal.

sylvéstris. To 4 ft.: lower lvs. large, 2-3-pinnatisect; lfts. ovate or ovate-lanceolate, acute, scrrate, glabrous: fls. white, in compound umbels of 20-30 or more rays: fr. ½ in. long. Cent. Eu. Var. elatior (A. montana). Sts. to 7 ft., lfts. larger and more finely serrate, umbels 30-50-rayed: fr. ½ in. or more long. Croatia.

ANGELICA, JAPANESE: Aralia elata,

ANGELIN-TREE: Andıra.

ANGELÒNIA. Scrophulariaceæ. Per. herbs and subshrubs with opposite lvs. or the upper alternate, and showy 2-lipped tubular blue fls. solitary and axillary or in terminal racemes; native in trop. Amer. Grown readily in greenhouses in the N. and in the open far S. Propagated by seeds or softwood cuttings.

angustifòlia. Per. to 1 ft, glabrous: lvs. narrow-lanceolate, toothed: fls. violet or purple, in long racemes. Mex., Cuba.

grandiflora: probably a hort. form of A. salicariæfolia.

salicariæfòlia. Per. to 2 ft., sticky-pubescent: lvs. lanceolate to linear-oblong, to 3 in. long, toothed: fls. blue, to ¼ in. across, in leafy racemes. N. S. Amer.

ANGELS-TRUMPET: Datura arborea.

ANGIÓPTERIS. Marattiacex. Large ferns with short thick sts. and bipinnate fronds with sori in a marginal row; native in the southern hemisphere and grown sometimes in greenhouse collections. For cult. see Ferns.

evécta. St. or caudex 2 ft. thick and 2-6 ft. high: pinnæ to 1 ft. long, entire or toothed. Japan to Australia and Madagascar.

pruinosa. Probably a pruinose-nigrescent form of A. evecta. Java.

ANGÓPHORA. GUM-MYRTLE. Myrtaceæ. E. Australian trees or shrubs told from Eucalyptus by opposite lvs.; fl. white, in terminal corymbs; frs. capsular. Rarely planted in S. U. S.

lanceolata. Large tree with smooth deciduous bark: lvs. lanceolate, to 5 in. long.

ANGRÈCUM. Orchidaceæ. Epiphytes with very thick lvs. and fls. usually in racemes, the sepals and petals similar, the lip with side lobes small or lacking, entire middle lobe and commonly long slender spur; grown in the hothouse. For cult. see Orchids.

distichum: Mystacidium distichum.

eburneum. Sts. to 4 ft. high: lvs. to 2 ft. long and 2 in. wide: fls. to 4 in. across, the sepals and petals green, the

lip ivory-white with green spur about 3 in. long, in 8-15-fid, racemes longer than lvs. Dec.-Mar. Madagascar.

Eichlerianum. Sts. pendulous, to 3 ft. long: lvs. to 5 in. long and 2 in. wide. fls. about 3 in. across, 1-3 together on stalks about length of lvs., the sepals and petals yellow-green, the lip white, greenish-yellow near base, with spur about 2 in. long. June-Sept. Trop. W. Afr.

gracilipes. Lvs. strap-shaped, to nearly 8 in. long, retuse: infl. 1-fid., axillary, to nearly 8 in. long; fls. showy white, to nearly 3 in. across; sepals and petals lanceolate, spreading; spur slender, about 2½ in. long. Madagascar.

Leonis. Sts. very short or wanting: lvs. to 10 in. long, equitant, lanceolate, falcate: racemes 3-7-fld.; fls. to 3 in. across; sepals and petals white; lip white with spur to 6 in. long. Comoro Isls., Madagascar.

modéstum: Acrangis modesta,

Sanderiànum: Aéranais modesta.

Scottianum. Acrunis monesta.

Scottianum. Sts. elongate, pendulous, to 20 in. long: lvs. to nearly 5 in. long, cylindrical: fls. 1-3 on stalks about as long as lvs.; fls. to 2 in. across, pale yellowish changing to white; spur pale reddish-brown, to 5 in. long. May-Aug. Comoro Isls.

sesquipedale (Macroplectrum sesquipedale). Sts. to about 3 ft. high: lvs. densely 2-1anked, ligulate-oblong, to 1 ft. long and 2 in. wide: racemes 2-4-fld., about as long as lvs; fls. the largest in genus, to 7 in. across, ivory-white, with spur to 1 ft. long. Nov.-Mar. Madagascar.

ANGULÒA. Orchidacex. Terrestrial orchids from the Andes of Colombia, Ecuador and Peru, with pseudobulbs bearing 2-3 plaited lvs. and large ils. solitary on long erect scapes, the fleshy sepals and petals connivent and almost concealing the smaller 3-lobed lip; grown in a cool greenhouse. See Orchids.

Clówesii. Pseudobulbs to 6 in. long: lvs. to 2 ft. long: fls. yellow, solitary on scapes to 1 ft. long. May-June. Var. ebúrnea has ivory-white fls.

ebúrnea: A. Clowesii var.

Rúckeri. Somewhat smaller than A. Clowesii but with olive-green fls. which are brown or spotted within, on scapes to 8 m. long. May-June.

ANHALONIUM: Ariocarpus, Lophophora, Roseocactus.

ANIGOZÁNTHOS. Amaryllidaceæ. Odd Australian per. herbs with thick rootstocks, linear or sword-shaped basal lvs. and large red purple, green or yellowish fls. borne in one-sided woolly racemes or spikes, the perianth-tube very long.

Grown in the greenhouse or out-of-doors in the South. It does best in a mixture of peat, loam and sand and should be well watered except in the winter rest period. Propa-gated by division of the roots.

flávida. Differs from A. Manglessi in fls. to $1\frac{1}{4}$ in. long, almost entirely red, and anthers with appendages.

Mánglesii. To 3 ft., the st. covered with red wool: fls. green, red at base, 3 in. long, with very narrow tube, woolly.

ANISACÁNTHUS. Acanthaceæ. Shrubs native in Mex. and W. N. Amer., with opposite entire lvs. and red tubular 2-lipped fls. in one-sided terminal spikes; sometimes cult. in S. Calif.

Thürberi. To 5 ft.: lvs. lanceolate or oblong, to 2 in. long, pubescent. fls. to 1½ in. long. Ariz., New Mex., Mex.

Wrightii. To 4 ft., glabrous or nearly so: lvs. oblong to ovate-lanceolate, acute, to 2 in. long: fis. purplish-red, to $1\frac{1}{2}$ in. long, in naked panicles. Tex.

ANISE: Pimpinella Anisum. Star: Illicium verum.

ANISOSTICHUS: Bignonia capreolata.

ANISÓTOME. Umbelliferæ. Aromatic herbs of New Zeal., having pinnate lvs. and mostly unisexual white or red fls. in compound umbels; one species is semetimes grown in mild regions for ornament.

latifòlia (Ligusticum latifolium). Per. to 6 ft. or more: lvs. leathery, shining, 2-pinnate: fls. red, in umbels to 3 in across.

ANNATTO: Bixa Orellana.

ANNEST TA. Calliandra

ANNONA. Annonaceæ. Mostly trop. American trees and shrubs grown for the edible frs. in warm climates: lvs. alternate, simple and entire: fls. solitary or clustered, mostly thick or fleshy and of odd dull colors: fr. a large fleshy syncarp formed by the fusion of the carpels and receptacle. For cult. see Cherimova.

Cherimòla. Cherimoya. To 25 ft., deciduous: lvs. ovate to ovate-lanceolate, to 10 in. long, velvety-pubescent beneath: fls. fragrant, yellow- or brown-tomentose outside, 1 m. long; fr. globular to conical, light green, to 5 in. long, smooth or with small tubercles. Andes of Peru and Ecuador.

diversifolia. ILAMA. To 25 ft.: lvs. elliptic to oblanceo-late, to 5½ in. long: peduncles with leaf-like bracts at base: fls. maroon, 1 in. long: fr. oval or round, to 6 in. long, pale green or pink, with stout tubercles or sometimes smooth. Mex., Cent. Amer.

glabra. Pond-Apple. To 40 ft., evergreen: lvs. ovate to oblong, to 7 in. long: fts. yellowish marked with red inside, fragrant, 1 in. or more long. fr. ovoid, yellowish, to 4 in. long, smooth. Trop. Amer., W. Afr.—Grown as a stock.

muricata. Soursop. Guanabana. To 20 ft., evergreen: lvs. obovate to elliptic, to 5 in. long: fls. yellow, 1 in. or more long: fr. ovoid, to 8 in. long, dark green, covered with short fleshy spines. Trop. Amer.

reticulata. Custard-Apple. Bullocks-Heart. To 25 ft., deciduous or half-evergreen: lvs. oblong-lanceolate to lanceolate, to 8 in. long: fls. yellowish, 1 in. long: fr. heart-shaped or oval, reddish-yellow or -brown, to 5 in. across, smooth, the carpels marked by impressed lines. Trop. Amer.

squamosa. Sugar-Apple. Sweetsop. To 20 ft., deciduous: lvs. oblong-lanceolate to lanceolate, to 6 in. long: fls. greenish-yellow, to 1 in. long: fr. round, heartshaped or conical, yellowish-green and glaucous, to 3 in. across, tuberculate and the carpels falling apart. Trop.

ANNONACEÆ. Annona Family. Over 70 genera of trees and shrubs of wide distribution, mostly in the tropics, having simple alternate lvs., usually bisexual fls. with 3 sepals and 6 similar petals, numerous stamens, and fr. a syncarp or caps. The family yields edible frs. as well as ornamental subjects in the genera Annona, Artabotrys, Asimina, Cananga, Rollinia.

ANNUALS (abbreviated ann. in this book). An annual is a plant that naturally completes its life within one year (Latin annuus, of a year's duration) from germination to seeding and death. In a horticultural sense the word frequently denotes a plant that blooms the first year from seed, whether or not it then completes its cycle and dies. Thus, the common bachelor button or cornflower (Centaurea Cyanus) is an annual, but four-o'clock is a perennial that blooms freely from seed the first year and is listed with annuals. In the northern states the red pepper is classed as an annual, but the plant is perennial in its native tropical regions.

Plants that live only one year because they are killed by frost but which in mild climates or under glass may live two years or more are properly plur-annuals, as the tomato, red pepper, castor-bean, scarlet runner bean, and many more. Other plants treated as annuals but that are carried over winter as bulbs or tubers are pseud-annuals, of which dahlia, potato, gladiolus are examples. In this book the term annual is employed mostly in the horticultural sense to designate plants grown from seeds for bloom or fruit only the same season.

Annuals are of simple cultural requirements as a rule. They lend themselves well to amateur gardening and experiment, and they possess a fascination all their own. The range of stature, habit and flower-color is very wide. Some of them are attractive vines. Mostly they can be grown with success in the northern states if sown directly in the garden when the weather becomes settled, in well-prepared "quick" soil. In warm climates many of them are grown in the cool season. Species that bloom very late, as cosmos, single dahlias, moonflowers, castorbeans, may be started indoors in pots or flats. Some kinds are classed as "hardy," which may be sown before frosts have ceased; others are "half-hardy," an intermediate indefinite class that may be sown before the full warm weather comes; others are "tender," that require the arrival of steady warmth before sowing or that are commonly started under glass. In North America these terms are now little used.

Ordinarily the seeds of annuals are sown liberally. Many may not germinate. Even if they all come up, the combined strength of the rising plantlets will break the crust on hard soils; and in the thinning which follows, only strong and promising plants are allowed to remain. Better effects are also often obtained when the colors are in masses, especially if the flowers are thrown into the bays of heavy shrub borders. Plants continue to bloom for a longer period if they are not allowed to produce seeds. The flowers should be picked, if possible, as soon as they begin to fade. Most annuals should be in good bloom at three months from seed, and

many of them at two months.

Wide choice is possible in the kinds of annuals. One's personal preference must be the guide. Yet there are some groups considered to be standard or general-purpose plants. They are easily grown almost anywhere, and are sure to give satisfaction. The remaining plants are mostly such as have secondary value, or are adapted to particular purposes or uses. Following are some of the groups of general-purpose annuals: Petunia, phlox, pink or dianthus, larkspur or delphinium, calliopsis or coreopsis, pot-marigold or calendula, bachelors-button or Centaurea Cyanus, clarkia, zinnia, marigold or tagetes, mignonette, collinsia, gilia, California poppy or eschscholzia, verbena, poppy, China aster, sweet pea, nemophila, portulaca, silene, candytuft or iberis, alyssum, stock or mathiola, morning-glory, nasturtium or tropæolum, scabiosa, salpiglossis, amaranthus, cockscomb. Some of the fruit-bearing plants belong with the ornamental annuals, as the gourds of many kinds, and the red peppers or capsicums.

White-flowered annuals: acroclinium, ageratum, alyssum, ammobium, antirrhinum, arctotis, argemony, aster, balsam, brachycome, browallia, candytuft, centaurea, chrysanthemum, clarkia, cosmos, delphinium, dianthus, fouro'clock, gomphrena, helichrysum, lavatera, lobelia, lupinus, malope, matricaria, nemesia, nemophila, nicotiana, nigella, petunia, phlox, poppy, portulaca, rhodanthe, scabiosa, schizan-

thus, verbena, zinnia.

Pink-, rose-, and red-flowered annuals: abronia, acroelinium, amaranthus, anagallis, antirrhinum, aster, balsam, cacalia, candytuft, centaurea, chrysanthemum, clarkia, cockscomb, convolvulus, corcopsis, cosmos, delphinium, dianthus, four-o'clock, gaillardia, godetia, gomphrena, gypsophila, helichrysum, lavatera, linaria, linum, lupinus, lychnis, malope, morning-glory, nasturtium, nemesia, phacelia, phlox, poppy, portulaca, rhodanthe, salpiglossis, salvia, saponaria, scabiosa, stock, sweet pea, verbena, zinnia.

Blue-, lilac-, lavender-, and purple-flowered

annuals: ageratum, anagallis, anchusa, antirrhinum, aster, balsam, brachycome, browallia, campanula, candytuft, centaurea, convolvulus, cosmos, delphinium, gilia, linaria, lobelia, lupinus, machæranthera, nemesia, nemophila, nicotiana, nigella, nolana, petunia, phacelia, phlox, portulaca, salpiglossis, salvia, scabiosa, specularia, sweet pea, torenia, trachymene, verbena.

Yellow- and orange-flowered annuals are to be found in the following genera and groups: abronia, argemony, cacalia, calendula, California poppy, centaurea, chrysanthemum, coreopsis (calliopsis), cosmos, dimorphotheca, emilia, erysimum, evening-primrose, four-o'clock, gaillardia, helichrysum, hunnemannia, marigold, nasturtium, poppy, sanvitalia, sunflower, theles-

perma, thymophylla, venidium, zinnia.

Annuals that continue to bloom after the first autumn frosts: Abronia umbellata, Adonis astivalis, Adonis annua (autumnalis), Argemone grandiflora, calendulas, callirrhoë, Centaurea Cyanus, centauridium, Cheiranthus Cheiri, chrysanthemums, Convolvulus tricolor, dianthus of various kinds, Erysimum Perofskianum, Erysimum asperum (arkansanum), eschscholzias in several varieties, Gaillardia pulchella picta, Gilia achilleæfolia, Gilia capitata, Gilia laciniata, Gilia tricolor, Iberis affinis, Lavatera trimestris, Lychnis Cœli-rosa (oculata), Lychnis elegans, Lychnis Viscaria, mathiolas or stocks, Œnothera Lamarckiana, Œnothera Drummondii, Œnothera rosea, Phlox Drummondii, Salvia splendens, Salvia farinacea, Salvia Horminum, verbenas, Virginia stocks.

Annuils adapted to edgings: abronia, ageratum, alyssum, antirrhinum (dwarf), brachycome, California poppy, candytuft, collinsia, corcopsis (dwarf), dianthus, godetia, Gypsophila muralis, lobelia, marigold (dwarf), mesembryanthemum, nemophila, nigella, pansy, phlox, portulaca, sanvitalia, Saponaria ocymoides (perennial),

erbena.

Annuals that are tendril- or petiole-climbers: balloon-vine, balsam-apple, balsam-pear, canary-bird-flower, cobea, eccremocarpus (grown as annual North), gourds, nasturtiums, sweet pea, wild eucumber.

Annuals that are twiners: bean (scarlet runner and hyacinth bean), cardinal climber, cypressvine, gourds, Japanese hop, moonflower, morning-glory and related plants, thunbergia.

ANÒDA. Malvaceæ. Mostly ann. herbs, or grown as such in cold regions, of warm countries, with alternate commonly lobed lvs. and purple or lilac fis. solitary in the axils; occasionally grown under glass or in the open for summer and autumn bloom. Propagated by seeds.

cristata (A. Dilleniana). To 2½ ft., sts. yellow-pilose to nearly glabrous: lvs. simple to 3-lobed, triangular-lanceolate to hastate, entire or serrate, usually glabrous beneath except on veins: fis. rose-pink to lavender, to nearly 2 in. across, on long naked pilose peduncles. Cent. Amer.

Dilleniana: A. cristata.

hastata. Lvs. arrow-shaped, the upper heart-shaped and 5-angled: fis. blue or white, about 1½ in. across. Mex. to Peru.—Differs from A. lavateroides in the reticulated carpels.

lavateroides. Lvs. heart-shaped to arrow-shaped, toothed or entire: fis. violet, purple or white, to 2 in. across. Tex. to Mex. and S. Amer.

parviflora. Similar to A cristata, from which it differs in lower lvs. cordate and the upper ones hastate, erenate petals and larger calyx. Mex.

triangularis. To 3 ft., much branched: lvs. triangular, toothed at base is. lilac, 1% in. across. Mex.

Wrightii. To 2 ft.: lvs. ovate or oblong-ovate, scarcely lobed: fis. yellow, 3/2 in. across. New Mex.

ANOGRA: Enothera.

ANOMATHECA: Laneirousia cruenta.

ANÓPTERIS. Polypodiaceæ. One delicate fern native in the W. Indies and sometimes seen under glass. A. hexagona (Pteris heterophylla). Fronds tufted, of two kinds, to 2 ft. long, 2-3 pinnate, with marginal indusia. See Ferns.

ANÓPTERUS. Saxifragacex. Small trees or shrubs from Australia and Tasmania, having glabrous alternate persistent leathery lvs. and terminal racemes of white fls.: petals, stamens and calyx-lobes 6-9: fr. an oblong-conical caps. dehiscing by 2 recurved valves; seeds winged at one end.

glandulòsus. Shrub or small tree to 40 ft.: lvs. ellipticlanceolate to obovate, to 8 in. long, serrate: fls. in racemes 3-6 in. long. Tasmania.

ANOTA. Orchidaceæ. Epiphytic orchids with leafy sts. and fls. in racemes, the lip entire and spurred. See Orchids for cult.

densifiòra (Vanda densiflora. Saccolabium giganteum). Sts. to 8 in.: lvs. to 1 ft. long and 2 in. wide: fls. 1 in. across, in dense many-fld. pendulous racemes to 16 in. long; sepals and petals white spotted at base with violet, lip purple, white near base. Nov. Burma.

violacea (Vanda violacea. Saccolabium violaceum. Rhyn-chostylis violacea). Similar to the above but with white sepals and petals spotted with violet and violet lip. Dec.-Mar. Philippines.

ANSÉLLIA. Orchidacex. African epiphytic orchids of a few closely related species, of which one is sometimes grown in the hothouse. See Orchids. A. africana. Sts. elongate, bearing 4-7 linear lys. to 1 ft. long: fls. yellowish spotted with chocolate-brown, about 1 in. long, in manyfld. terminal panicles to 16 in. long. Dec.-July.

ANTELOPE-BRUSH: Purshia.

ANTENNÀRIA. EVERLASTING. PUSSYS-TOES. Compositæ. Per. white-woolly herbs with lvs. mostly basal and small clustered heads, the fls. diccious and tubular; pappus of bristles.

Sometimes grown for the dry flower-heads or in rock-gardens and adapted to poor soil. Propagated by seeds and division.

alpina. To 6 in., stoloniferous: lvs. oblanceolate, to in long, silky-tomentose at least underneath, heads in across, with brownish-green involucial bracts in fertile heads. Alaska to B. C. and Lab.

Aprica. Soft-woolly, making patches, to 12 in. or less, with leafy stolons: lvs. mostly spatulate and obtuse, to 1 in. or more long, tomentose on both sides, those on st. linear: heads about ½ in. across, the involucral bracts white or pink. S. D. to New Mex. and west.

campéstris. To 4 in.: rosette lvs. obovate, to 13/4 in. long, tapering at base, harry beneath and nearly glabrous above; st.-lvs. linear, to % in. long, acute: heads sessile, about 1% in. across, involucial bracts white or pink. Mich. to Sask., south to Mo. and Kans.

canadénsis. To 12 in., slender: lvs. spatulate or oblanceolate, to 1½ in. long, nearly or quite obtuse, with 1 prominent nerve: heads about ½ in. high, in close cluster, the involucre green. Newf. to Conn. and west.

cándida: A. dioica.

carpáthica. To 10 in., woolly: lvs. oblanceolate to linear, to 2 in. long: heads ½ in. across, with brownish-purple involucral bracts. N. N. Amer., Eu., N. Asia.

dioica (A. conduda. A. tomentosa). To 1 ft., stoloniferous: Ivs. spatulate, to 1 in. long: heads ½ in. across, with white or rose involucral bracts. Eu., Asia; reported as having escaped in N. Amer. Var. rosea is listed.

fállax. To 16 in., sts. occasionally glandular: rosette lvs. rhombic-ovate, to 3½ in. long and 2 in. across, but often smaller, densely white-woolly, obtuse; st.-lvs. oblong to

spatulate: heads in dense corymb, styles often pink to crimson. Que, to Minn, south to Va. and Tex.

lanata. To 6 in., densely woolly: lvs. spatulate-lanceolate to linear, to 2 in. long: heads in dense clusters. Mts., B. C. to Ore.

magellánica. To 2 in., many-stemmed: lvs. oblong-linear, tomentose: heads 5-6, in sessile cymes. Magellan region

margaritàcea: Anaphalis margaritacea.

mèdia. To 4 in., woolly rosette lvs. spatulate to broadly oblanceolate, to ½ in. long: heads 4-7, to ½ in. across, bracts very dark green, often white tipped. Alta. to B. C. south to Colo. and Calif.

microphylla (A. parvifolia probably). Slender, to 12 in., with very short stolons: Ivs. spatulate, obtuse or apiculate, \$\frac{3}{4}\$ in. or less long, silky both sides: heads about \$\frac{1}{4}\$ in. high. Sask. south and west.

neglécta. To 12 in., the slender stolons leafy at tip: lvs. mostly oblanceolate, tapering to base, tomentose but nearly glabrous above, 1-nerved, to 1½ in. long: heads about ½ in. across, the involucre brownish with white tips. Me. to Va., Kans. and Wis.

neodioca. Slender, to 12 in., woolly, with many leafy stolons: lvs. broad-ovate to spatulate, only indistinctly 3-nerved, to 1 in. long, apiculate, white-tomentose underneath: heads to ½ in. broad, the involucre with white tips. Newf. to Va. and west.

obovata. To I ft., stoloniferous: lvs. obovate, I in. long, tomentose both sides: heads about 1/2 in. high. Man. to

parvifòlia: see A. microphylla.

ramòsum: listed name.

rhodantha. To 6 in.: lvs. spatulate to linear, to 34 in. long; heads 14 in. long, involucial bracts tipped with red.

ròsea. To 1½ ft., stoloniferous, white-tomentose: lvs. oblanceolate, to ¼ in. long, heads to ¼ in. long, with rose involucial bracts. Alaska to Calif. and Colo.

subviscosa. To 12 in., stoloniferous: rosette lvs. spatulate, to $\frac{5}{8}$ in. long, obtuse or mucronate, densely white-tomentose, glandular-hairy above: fls. in 3–9 heads, bracts glandular-viscid, cream-colored or rose-tipped. Que.

tomentòsa: A. dioica.

umbrinélla. To 4 in., stoloniferous: lvs. spatulate, to ½ in. long, white-tomentose: heads about ¾ in. high. B. C. to Colo.

ÁNTHEMIS. Compositæ. Herbs with finely cut strong-scented foliage and solitary fl.-heads, the ray-fls. yellow or white, disk-fls. yellow; pappus none or a minute crown.

A few kinds are useful in wild-gardens and the border, blooming from midsummer to frost. Propagated by seeds and division.

Aizoón: Achillea ageratifolia var.

altissima. Ann. to 3 ft.: lvs. 2-3-pinnatisect into lanceolate segms.: ray-fls. white, in heads to 2 in. across. S. Eu. arábica: Cladanthus arabicus.

austriaca. Ann. or bien. to 2 ft., sparingly branched: lvs. 1-2-pinnatisect into lanceolate segms.: ray-fis. white, in heads to 1¾ in. across, outer involucral bracts ciliate.

Biebersteiniana (A. Rudolphiana). To 1 ft. or less: lvs. bipinnate, silvery-white-tomentose: ray-fis. yellow, heads to 1 in. across. Mts. of Cent. Eu.—Adapted to rockery.

carpática (A. styriaca). Per. to 6 in., with many sts.: lvs. pinnate into narrow segms. which are entire or 3-lobed. heads to 1½ in. across, rays white. E. Eu.

cinèrea. Spreading per to 1 ft., gray-pubescent or -tomentose: lvs. ovate, bipinnatisect into oblong obtuse segms.: heads large, with white rays longer than the disk. Balkans.

Kélwayi. Similar to A. tinctoria (of which it is apparently a form) but with deeper yellow fls. and foliage more finely

macedônica. Bien. to 5 in.: lower lvs. pinnate into 3-5 linear segms., upper ones undivided: heads small, long-stalked, rays white. Macedonia.

marfatha. Per. to 2 ft. or more, branched above lvs. 2-pinnatifid into linear-lanceolate segms.: heads few, 1 in. and more across, rays white. Eu.—Probably only a variant of A. Triumphettii.

montana.: Per. to 10 in., silky-pubescent: lvs. pinnatisect into linear segms.: ray-fls. white. S. Eu.

nóbilis. Chamomile. Per. to 1 ft.: lvs. pinnatisect into narrow-linear segms.: ray-fis. white. Eu. Var. grandiflòra has larger sometimes yellow fis. and flòre-plèno double.

parpássii: A. tinctoria. ptarmicifórmis: hort, name.

Rudolphiana: A. Biebersterniana.

ruthénica. Ann. to 1½ ft.: lvs. 2-3-pinnatisect, oblong, woolly: ray-fis. white, heads to 1½ in. across, solitary on stout peduncles, outer bracts laciniate. Cent. Eu.

Sáncti-Johánnis. Per. to 3 ft., slightly branched: lvs. 2-3-pinnatisect, segms, apiculate-tipped: ray-fis. deep orange, heads to 2 in. across, solitary on leafless peduncles to 6 in. long. Bulgaria.—Differs from A. tractoria in its blackmargined ciliately-incised involucral bracts, deeper colored fls. and in the achene having a distinctly toothed crown.

styriaca: A. carpatica.

tinctòria (A. parnassii). Golden Marguerite. Per. to 3 ft.: lvs. 2-pinnatisect into oblong or ovate segms.: ray-ffs. golden-yellow, in heads to 2 in. across. Eu., Asia. Vars. pállida and álba are hsted.

Triumphéttii. Per. to 2½ ft. high: lvs. 1-pinnatisect, segms. oblong, serrate, tomentose beneath: ray-fis. white, heads to 1½ in. across. Medit. region.

ANTHER: the pollen-bearing part of the stamen, borne at the top of the filament or sometimes sessile.

ANTHÉRICUM. Liliacex. Herbs with tuberous or fleshy roots, linear basal lvs., and small white wheel-shaped fls. in loose racemes terminating slender scapes.

Grown as border plants with protection or in cool green-houses in pots or benches. Of easy cultivation. Propagated by stolons, division, and by seeds when available.

Bichétii. Lvs. variegated with white. W. trop. Afr.—The botanical identity of this plant is uncertain, as is also that of *Phalangium Bichei* which is probably the same.

comòsum: Chlorophytum comosum.

elatum: Chlorophutum elatum.

Goldianum: hort, form with lvs. variegated with cream; probably referable to Chlorophytum clutum.

graminifòlium: A. undulatum.

Liliago. St.-Bernard-Lily. To 3 ft, not branched: lvs. to 1 ft long: fls. about 1 in. across. Eu. Vars. gigantèum and major are larger forms, and var. grandiflorum is listed with larger fls.

Liliástrum: Paradisea Liliastrum. Mandaianum: Chlorophytum comosum. picturatum: Chlorophytum comosum.

plumdsum: Bottronea thysanoloides.

racemdsum: catalogue name, probably of A. ramosum. ramdsum. To 2 ft., st. branched: fls. smaller than in A. Liliago Eu.

Rénari: catalogue name.

undulatum (A. graminifolium). Lvs. linear, acuminate, to 15 in, long and 16 in, wide; fis. white, in lax ragemes to 6 in long, segms, obtuse, to ½ in long, on solitary jointed pedicels. S. Afr.

variegatum: Chlorophytum elatum or comosum.

vittatum: Chlorophytum elatum.

ANTHOLYZA. Iridaceæ. The identity of the plants ascribed in the literature to this genus is considered to have been imperfectly understood until the relatively recent study of them by the late N. E. Brown, who demonstrated that the plant long known as A. æthiopica belonged to another genus and that the true Antholyza (A. ringens, not known to be in cult. here) as known to Linnaus had been misinterpreted by subsequent authors and erroneously placed in the genus Babiana. The synonymy of the plants in cult. or listed as Antholyza follows:

æthidpica: Chasmanthe æthiopica.

floribunda: Chasmanthe floribunda. paniculata: Curtonus paniculatus. præálta: Chasmanthe floribunda.

revoluta: Anapalina revoluta.

ANTHOPOGON: Gentiana.

ANTHOXÁNTHUM. Gramineæ. Ann. and per, grasses adapted to meadows, fragrant when drying, the spikelets in spike-like terminal

panicles, florets awned; native of Eu., Asia. and N. Afr. See Grasses.

aristatum (A. Puelii). Ann. to 1 ft.: lvs. to 4 in. long and ½ in. wide: panicles to 1½ in. long, conspicuously awned. Eu.; escaped in E. N. Amer.

grácile. Tufted ann. to 8 in.: lvs. hairy: spikelets ½ in. long, silvery and shining, conspicuously awned, in racemose panicles. Medit. region.

odoratum. Sweet Vernal-Grass. Per. to 2 ft.: lvs. to 6 in. long and 1/4 in. wide: panicles to 3 in. long, bronzygreen, early. Eu., Asia; nat. in N. Amer.

Puélii: A. arıstatum.

ANTHRÍSCUS. Umbelliferæ. Herbs with pinnately compound lvs., small white fls. in compound umbels, and compressed frs.; grown for the lvs. which are used like parsley.

They are of easy cultivation in any soil, thriving in shaded situations. Propagated by seeds.

Cerefòlium. SALAD CHERVII. Ann. to 2 ft.: lvs 2-pinnate, the segms. ovate and deeply cut, giving the foliage a very finely divided appearance: fr beaked. S. E. Eu, W. Asia; nat. in N. Amer. See Chernil.

sylvestris. Per. or bien. to 3 ft.: lvs 2-pinnate, the segms. ovate-lanceolate and deeply cut: fr. not distinctly beaked. Eu., W. Asia.

ANTHÙRIUM. Araceæ. Trop. American perennials of varied habit, having arrow- or heart-shaped entire or lobed lys, and bisexual fls. in denselv-fld. spadices subtended by widely spreading or reflexed often colored spathes: grown in the greenhouse for the striking foliage and spathes.

Anthuriums require high temperatures, never below 55° in winter, and a humid atmosphere. They thrive in rough fibrous loam and the roots should be kept well covered. Repotting is necessary only every few years with older plants. Propagated by suckers or root-cuttings placed in pots over bottom heat; also by seeds under a bell-glass in a temperature of about 80°.

álbum. Hybrid with A. Andræanum as one parent, or a variant, having white spathes.

Andræànum. Lvs. oblong-ovate, heart-shaped at base with deep narrow smus, to 1 ft. long and 6 m wide, green, the petiole longer than blade: spathes spreading, cordate, to 6 in. long, orange-red varying to rose or white. Colombia. Var. gigantèum is listed as having larger spathes. Var. rôseum has a glossy rose-pink spathe. Var. rûbrum is similar but spathe is darker red.

atrosanguineum: hort. name, probably for form of A. Scherzerianum or A. splendidum

bogoténse. Lvs. cordate, to 2 ft. long and 16 in. wide, long-acuminate, dark green: spathes broadly lanceolate, spreading, 8 in. long, yellowish. Colombia.

Brownii. Lvs lanceolate-cordate, to 3 ft long and 20 in. across, shining green above, paler beneath: spathes lanceolate, spreading, 6 in. long, green tinged with purple. Colombia.

cárneum. Hybrid between A. Andraanum and A. nymph.vfolium with rose-colored spathes.

cordatum (Pothos cordatus). St. to 1 ft.: lvs. triangular-cordate, to 16 in. long and 12 in. wide, leathery, bright dark green above, on petioles longer than lvs: spathes green, linear-lanceolate, to 8 in. long, very long-acuminate; spadix brownish-green, longer than spathe. W. Indies.

crystállinum. Lvs. cordate-ovate, to 14 in. long and 10 in. across, deep velvety-green prominently vened with white, pale rose beneath: spathes linear-oblong, to 6 in. long, green. Colombia.

ferrierense. Hybrid between A. Andraanum and A. ornatum with ovate-cordate lvs. and spathes, the latter rosy, and white spadices.

Forgétii. Lys. to 14 in. long and 9 in. wide, peltate, deep velvety-green, venation lighter: spathes to 6 in. long and 3/8 in. wide, green. Colombia.

grande. Lvs. oblong-ovate, to 2 ft long and 16 in. wide: spathes ovate-cordate, 6 in. long, white or purplish. Bolivia.

Hookeri (A. Huegeln). Lvs. obovate-oblong, to 4 in. long, short-petioled, midrib sharply keeled beneath, green, dotted black: spathe lanceolate-acuminate, shorter than spadix, latter to 10 in. long on peduncle to 15 in. long. W. Indies.

Huegèlii: A. Hookeri.

magnificum. Lvs. cordate-ovate, to 1½ ft. long and 10 in. wide, olive-green above with prominent white veins, the petioles 4-angled: spathes lanceolate, 8 in. long, becoming recurved, green or reddish. Colombia.

regale. Lvs cordate-oblong, to 16 in. long and 8 in. wide, very long-acuminate, green above with veins becoming whitish, paler beneath: spathes broadly lanceolate, 3 in. long. Peru.

Rothschildianum: A. Scherzeranum var.

Scherzeinaum: A. Scherzeinaum vir.

Scherzeinaum. Lvs. oblong-lanceolate, 8 in long and 2 in. wide, long-pointed, green: spathes broadly ovate, 3 in. long, deep red varying to rose and white; spadix spirally coiled, yellow. Cent. Amer. Var. álbum, spathes white. Var. atrosanguíneum, spathes red. Var. gigantèum has larger spathes. Var. maximum, spathes scarlet, large. Var. roseum, spathes rose-colored. Var. Rothschildianum has red spathes spotted with white.

splendidum. Lvs. cordate-ovate, leathery, blue-green, glaucous with blistered-like appearance, the depressions and nerves brownish. Colombia.—Many hort. forms and hybrids have been developed in part from this plant.

tetragonum. Lvs. oblong to obovate-lanceolate, to 4 ft. long and 1½ ft. wide, glaucous-green above, yellowish below: spathes oblong-lanceolate, to 8 in. long. Costa Ruca.

Veitchii. Lvs. long-oblong, to 3 ft. long and 10 in. wide, cordate at base, rich metallic-green with prominent veins: spathes ovate-lanceolate, 3 in. long, erect or becoming reflexed, greenish-white. Colombia.

velütinum. Lvs. cordate, 10 in. long and 6 in. wide, shining green. Colombia.

Warocqueanum. Lvs. cordate-lanceolate, 3 ft. long and 10 in. wide, velvety-green venned with white: spathes linear-lanceolate, reflexed, 4 in. long, green. Colombia.

ANTHÝLLIS. Leguminosæ. Per. herbs or subshrubs from Eu., N. Afr. and Asia, with pinnate Ivs. and papilionaceous fls. in dense clover-like heads; grown for ornament and A. Vulneraria for forage in Eu. on poor soils. Propagated by seeds, division and cuttings.

alpéstris: A. Vulneraria var.

Barba-Jovis. Jupiters-Beard. Silky-hairy evergreen shrub to 12 ft.: Ifts. to ¾ in. long: fts. yellowish-white. S. Eu.

Dillènii: A. Vulneraria.

montana. To 1 ft. or less, white-silky lvs. pinnate, the many lfts. small and entire, oval or oblong fts. purple or pink, in dense involucrate heads. Alps. Vars. atrorubens, carminea and rubra are color forms.

tetraphýlla. Ann., mostly prostrate: lvs. with large terminal lft. and 2-4 small lateral lfts.: fls. yellowish-white striped with pink. Medit. region.

Vulnerària (A. Dilleni). Kidney Vetch. Woundwort. To 1 ft.: lvs. with terminal lft. 1 m. long, lateral lfts. small or none fls. yellow to deep red. Eu., W. Asia. Var. alpéstris! To 8 in . basal lvs. simple, ovate-lanceolate: fls. in later heads. Eu.

Webbiana. Ladys-Finger Vetch. Per. to 10 in., sts. decumbent or erect, branched. Ifts. 7-11, oval-acute, terminal lift. much larger than laterals, all with appressed white-silky hairs. fls. rose, in terminal heads. Teneriffe.

ANTIÀRIS. Moraceæ. Evergreen trees of Malaya and Australia with alternate lvs. and unisexual fls, the staminate in dense heads and the pistillate solitary; one intro. in S. Calif.

toxicaria. Upas-Tree. To 250 ft., the milky juice poisonous: lvs. oblong, to 8 in. long, entire or slightly toothed: fr. a fleshy purple or red drupe. Malaya.

ANTICLEA: Zigadenus.

ANTIDÉSMA. Euphorbiaceæ. Trees and shrubs native in the tropics of the Old World; the bark of some species furnishes cordage and frs. are sometimes edible: lvs. alternate, simple: fls. diœcious, without petals, in spikes or racemes: fr. a small fleshy drupe. Sometimes cult. for ornament in warm regions. Propagated by cuttings.

Bûnius. Bignay. Evergreen tree to 30 ft.: lvs. oblong, shining, to 6 in. long: fis. green, in spikes: frs. currant-like, red, often made into preserves. India, Malaya.

ANTÍGONON. Polygonaceæ. Tendril-climbing vines with alternate entire lvs. and red, pink, white or yellowish fls. in racemes terminating in a tendril.

One species is commonly grown in warm climates to cover verandas, bushes and fences. Of easy cultivation, but the soil should not be too rich, for the best bloom; it may also be grown in a warm light greenhouse. Propagated by seeds and cuttings.

16ptopus. Coral-Vine. Pine-Vine. Corallita. Confederate-Vine. Rosa de Montana. Climbing to 40 ft.: Ivs. arrow-shaped or cordate-ovate, to 4 in. long: fis. bright pink, in axillary racemes, outer sepals ovate in fr.. the achenes obscurely angled. Mex. Var. álbum has white fis.

macrocárpum. Similar to A. leptopus, differing in the thicker more hairy lvs. to 5 in. long, the outer sepals orbicular in fr. and the achenes with wing-like angles. Costa Rica; intro. in W. Indies and S. Fla.

ANTIPHYLLA: Saxifraga oppositifolia.

ANTIRRHINUM. SNAPDRAGON. Scrophulariaceæ. Erect, climbing or procumbent herbs usually grown as annuals, with sac-shaped 2-lipped fis. in rose, red, purple, yellow and white.

The snapdragon grown in gardens and for cut-flowers in greenhouses is A. majus. For the garden, treat the same as any annual. Plants sometimes winter over, if well protected, and bloom early in spring. For greenhouse culture the seed for the first lot is planted in July; by successive sowings the grower may have snapdragons all the year.

angustifòlium: A. siculum.

antirrhinifidrum: Maurandia antirrhiniflora.

Asarina. Procumbent per., sticky-pubescent: lvs. cordate-ovate and crenate, 5-lobed or -nerved: fis. white or pinkish, 1½ in. long, solitary. S. W. Eu.

assúrgens: A. sıculum.

carnifolium; listed as having blue fls.

Coulterianum. Chaparral S. Ann. to 3 ft., erect or climbing, glabrous except the infl.: basal lvs. ovate, to 114 in. long, entire: fls. purplish to white with yellowish hairy palate, 13 in. long, in spike-like racemes. Calif.

crassifolium: Chanorrhinum origanifolium. The material in cult. as A. crassifolium is usually Anarchinum bellulifolium.

gibraltáricum: listed as a per. with "reddish-green foliage and pink fls."; not known botanically.

glandulòsum. Viscid erect per. to 5 ft.: lvs lanceolate, sessile, to 2/5 m. long, those on sterile shoots linear: fls. pink, in dense racemes, to 3/5 in. long. Calif.

glaredsum: Chanorrhinum origanifolium.

glutinosum. Prostrate much branched per., stickypubescent lvs. oval, entire: fls. yellowish-white with lipred-striped, in racemes. Spain.

Huètii: A. sempervirens.

latifòlium. Per. to 2 ft., sts. somewhat woody, glandularhairy: lvs. ovate to ovate-lanceolate, pubescent: fls. yellowish or purple, to 1½ in. long, in terminal spikes. S. W. Eu.

majus. Common or Large S. Per. to 3 ft., glabrous except infl.: lvs. lanceolate or oblong-lanceolate, to 3 m. long, entire: fls. purplish-red varying to white and other colors, to 1½ in. long, in long terminal racemes. Medit region; escaped in E. U. S. Forms in the trade are grouped under Tall, 2-3 ft., Intermediate or Half Dwarf, 15-18 in., Dwarf or Tom Thumb, 6-9 in.

maurandioides: Maurandia antirrhinistora.

maximum: a giant race of A. majus with very large fls. molle. Per. to 1½ ft., softly woolly and whitish: lvs. suborbicular to ovate, to ¾ in. long, lateral veins seemingly absent: fls. whitish to pale yellow, to ½ in. long, in loose leafy spikes. S. W. France.

nanum: a hort, race of A. majus.

Nuttallianum. Ann. to 3 ft., climbing, sticky-pubescent: lvs. broad-ovate, to 2 in. long: fis. blue or violet with white spot on lower lip. S. Calif.

Orôntium. Ann. to 1 ft., glabrous or pubescent: lvs. linear, to 2 in. long: fis. purple, ½ in. long, solitary. Eu., Asia; escaped in N. Amer.

præcox: Linaria spartea.

pùmilum. Botanically this is a synonym of *Linaria flava*, which see, but some of the material so listed in the trade may be a dwarf form of *A. majus*.

sempérvirens (A. Huetii). Evergreen procumbent much branched per., tomentose: lvs. ovate or oblong: fls. white spotted purple, with yellow throat. Pyrenees.

siculum (A. angustifolium. A. assurgens). Much

branched per. to 2 ft., pubescent or glabrous: lvs. linear-lanceolate, to 1½ in. long: fts. white or yellowish with yellow throat, to 1 in. long, in racemes. Medit. region.

speciòsum: Galvezia speciosa.

ANYCHIA: Paronychia argyrocoma.

APETALOUS: lacking or without petals.

APHANÓSTEPHUS. Compositæ. Ann. or bien. herbs having alternate lvs. and solitary fl.-heads with white, violet or purple ray-fls. and golden disk-fls.; pappus a crown.

skirrobasis. To 1½ ft.: lvs. spatulate to linear, to 2½ in. long, gray-pubescent, the lower toothed or cut: ray-fls. white, to 1 in. across. Tex. to Fla.—Adapted to the flower-garden, with the look of erigeron.

APHELÁNDRA. Acanthaceæ. Trop. American herbs or shrubs with opposite simple lvs. and yellow, orange or red 2-lipped fls. in dense terminal spikes with large overlapping bracts.

Aphelandras are grown under glass for the showy bracted spikes and are of easy cultivation. After blooming the plants should be rested. Propagated by cuttings of half-ripened wood or of young growth with a heel, and by seeds when obtainable.

aurantiaca. Lvs. ovate to oblong, to 1 ft. long, deep green above, pale beneath: fis. orange, 2½ in. long, in spikes to 6 in. long. Mex. to S. Amer.

Lèopoldii: A. squarrosa.

squarrosa (A. Leopoldi). Lvs. ovate, to 1 ft. long, dark green veined with white above: fis. pale yellow, 1½ in. long, in spikes to 1 ft. long, bracts orange-yellow. Brazil.

tetragòna. Lvs. oval, to 9 in. long, green: fis. scarlet, 2 in. long, the lateral lobes of lower lip very small, in clustered spikes to 8 in. long. W. Indies, S. Amer.

APHYLLÁNTHES. Liliaceæ. One perfibrous-rooted herb native in Medit. region, somewhat allied to Aloe. A. monspeliénsis. To 10 in., with tufted juncus-like leafless sts.: fls. blue, rarely white, in oblong terminal 1-2-fld. heads, corolla withering-persistent.

APICRA. Liliaceæ. S. African aloe-like succulents with short sts., crowded or spirally arranged lvs. and greenish fls. in racemes. Cult. as for Succulents.

aspera. St. to 6 in.: lvs. triangular, 5% in. long and wide, warty on back: fls. greenish tinged pink, 3% in. long, in a simple infl. to 1 ft. high.

pentagona (Haworthia pentagona). St. to 1 ft.: lvs. triangular-lanceolate, to 2 in. long and ¾ in. wide, in 5 rows: fls. ½ in. long, the infl. to 1½ ft. high.

APIO: Arracacia xanthorrhiza.

APIOS. Leguminosw. Tuberous-rooted twining herbs with pinnate lvs., papilionaceous fls. in short racemes, and long flat pods; native in E. N. Amer. and Asia, one sometimes grown in the wild-garden. Propagated by tubers and by seeds.

americana (A. tuberosa. Glycine Apios). GROUNDNUT. POTATO BEAN. WILD BEAN. To 8 ft., the roots with strings of tubers: lfts. 5-7, to 3 in. long: fis. brown, fragrant, in late summer. N. B. to Fla. and Tex.

tuberdsa: A. americana.

APIUM. Umbelliferæ. Herbs with pinnately compound lvs., small white fls. in compound umbels, and compressed frs.; one species is a common vegetable grown for the blanched lf.-stalks and a var. for the edible roots. See Celeru.

graveolens var. dúlce (Celeri graveolens). Celerx. Bien. to 3 ft., strong-smelling: lvs. pinnate, each of the 5-7 lfts. ternately compound and often again divided or toothed. Widely distributed. Var. rapaceum, Celeriac, has thickened turnip-like edible root-crown.

Petroselinum: Petroselinum crispum.

APLÉCTRUM. Orchidaceæ. One N. American terrestrial species, sometimes transplanted to

the wild-garden or border. A. hyemale (A. spicatum). PUTTY-ROOT. ADAM-AND-EVE. Lf. to about 7 in. long and 3 in. wide, arising from the corm: fls. yellowish-brown, with narrow sepals and petals and 3-lobed lip, borne on racemes to 4 in. long on leafless scapes to 20 in. high. May-June.

APLOPAPPUS: Ericameria ericoides.

APOCYNACEÆ. Dograme Family. Herbs, shrubs and trees, sometimes vines, of about 130 genera most abundant in trop, countries, grown for ornament or a few for the edible fr. The family is characterized by the prevailingly milky juice, regular fls. with gamopetalous corolla, sagittate anthers, single style, and fr. usually of 2 long follicles; from Asclepiadaceæ the family is distinguished by the absence of corona in the corolla, separate filaments, and anthers not connected with the stigmas, and other technical characters. Genera herein treated are Acokanthera, Allamanda, Alstonia, Alyxia, Amsonia, Apocynum, Aspidosperma, Beaumontia, Carissa, Dipladenia, Echites, Ervatamia, Funtumia, Lanugia, Mandevilla, Mascarenhasia, Nerium, Ochrosia, Plumeria, Rhazya, Stemmadenia, Strophanthus, Tabernæmontana, Thevetia, Trachelospermum, Vallaris, Vinca.

APÓCYNUM. DOGBANE. A pocynaceæ. Per. herbs with milky juice, tough fibrous bark, opposite entire lvs., small white or pink bell-shaped fls. with appendages in the throat, borne in cymes, and long slender frs. Sometimes planted in the hardy border and the roots have medicinal qualities; propagated commonly by division.

androsæmifòlium. Spreading D. To 4 ft: lvs. to 4 in. long and $2\frac{1}{2}$ in. wide, pale beneath, apex acute: fls. pinkish, $\frac{1}{3}$ in. across, corolla twice as long as calyx. N. Amer.

cannábinum. Hemp D. Indian Hemp. To 8 ft.: lvs. to 6 in. long and 3 in. wide: fls. greenish-white, corolla not much longer than calyx. Conn to Wis. and Kans.

pùmilum. To 20 in., usually pubescent: lvs. ovateorbicular, to 2½ in. long, apex obtuse: fls. rose-pink, corolla twice as long as calyx. Utah to Calif., north to Mont. and Wash.

APONOGÈTON. The only genus of Aponogetonaceæ. Aquatic per. herbs from Asia, Afr. and Australia, with tuberous rootstocks, floating or submerged lvs., fls. in spikes, and fr. of 3 or more hard follicles.

Aponogetons are grown in ponds in the greenhouse, or A. distachyus out-of-doors although tender North. They should be potted and plunged 1½ to 2 feet under water. Temperatures of 65-710° should be given A. fenestralis. Propagated by division, offsets, or by seed when available. The flowers should be pollinated and kept above water to produce good seeds.

distachyus. Cape Pondweed. Water-Hawthorn. Lvs. floating, solid, linear-oblong. Cape of Good Hope. Var. Lagrangei has lvs. violet beneath and fls. with violet instead of white bracts. Var. gigantèus is an improved form.

fenestràlis (Ouvirandra fenestralis). LACE- or LATTICE-LEAF. Lvs. submerged, only a network of veins, broadoblong. Madagascar.—Grown in tubs or under protected conditions.

APOROCÁCTUS. Cactaceæ. A small genus of slender creeping, hanging or clambering vine-like diurnal cacti, emitting aerial roots: fls. rather small, solitary on the areole, funnelform, pink or red: spines several at each areole, small. See Cacti.

Conzáttii. Sts. ½-1 in, diam., with 8-10 rather prominent ribs: fls. nearly straight, to 3½ in. long, red, inner perianth-segms. acute but not acuminate. Mex.

flagelliformis (Cereus flagelliformis). RAT-TAIL CACTUS.

61 Apple

Sts. 1/2 to nearly 1 in. diam., with 10-12 ribs; fls. strongly bent just above ovary, about 3 in. long, crimson; outer segms. narrow, more or less reflexed; inner ones apiculate. Probably Mex.—A good window, conservatory and basket plant; often grafted on other and erect cacti, also hybridized with other species; of easy cult.

flagriformis. Differs from A. flagelliformis in its oblong outer perianth-segms., acuminate inner ones and darker crimson fls. Probably Mex.

léptophis (Cereus leptophis). Sts. cylindric, to $\frac{1}{2}$ in. diam., with 7-8 ribs, often creeping: fls. strongly bent just above the ovary, about 2 in long. Mex.

Mállisonii (Selenicereus Mallisonii. Cactus Mallisonii. Cereus Mallisonii. Cereus Smithui. Cereus crimsonii). Hybrid between A. flagelliformis and Heliocereus sp.: sts. weak, creeping, usually 6-angled, to 1 / in. diam.: fls. usually crimson but color variable in degree, tube may be very short or elongated.

Martianus (Cereus Martianus). Much like A. Conzuttii but fis. deep rose-color and inner perianth-segms. long-acuminate: sts. to ¾ in. diam. Mex.

APPLE. The common cultivated varieties of apple are forms of Malus sylvestris, probably native in Europe and southwestern Asia. The paradise (or "garden," as the name signifies) apple is a bush or small-stature form of the same species, on which common varieties are sometimes budded or grafted to prevent the trees from growing large or to dwarf them; this race has been called Malus pumila. The true crabapples are Malus baccata, and some of the larger crabs may be hybrids between the two species. Other species may be involved in the long development of the domesticated apple, but this subject is not yet sufficiently understood. See Malus.

The great variation in the adaptability of varieties of apple to different soils and climates makes its cultivation possible over a wider range of territory than with most other temperatezone fruits. Commercial orchards are located as far south as the mountains of Georgia and New Mexico and north into Maine, Wisconsin, and parts of Canada. In home plantings, by careful choice of varieties, the range is much wider, extending from the Gulf states to the more rigorous climates of the northern plains states. The larger commercial plantations, however, are localized in regions particularly well adapted to the apple, as, for example, western New York, the Shenandoah-Cumberland Valley and the valleys of the Pacific Northwest, and others.

Soils for the apple are of wide range. Although some apple varieties are restricted to certain soil types for their best development, most kinds will succeed on any good agricultural soil that is fairly deep and well drained. Friable, rather heavy, sandy, or gravelly loams with good humus content and with an open subsoil are considered ideal. In general, for any given variety, climate is of much more importance than soil type, provided the soil is at all suitable, particularly as to drainage.

Propagation of named varieties is by either budding or grafting on one-year apple seedlings, either French or American grown. For budding, the seedlings are set out in early spring in the nursery row, and the buds set in July and August when the bark of the stock slips readily. Early the following spring the stocks are cut off above the bud forcing it into vigorous growth. Rootgrafting is a common practice in the southern nurseries. Cions 4-6 inches long are whipgrafted on either whole or piece roots in the winter and the grafts stored. In early spring the grafts are planted out and make two-year trees at the end of the second season. Root-grafted

trees are preferable for planting hardy varieties in cold climates because the graft union is below the surface of the ground and thus the tender stock is protected from the cold.

Planting is undertaken with either one-or two-year nursery trees. These are best set out in the early spring in the northern states but may be set in the fall to advantage in milder climates. The standard planting distance on good soils for vigorous sorts, such as Baldwin and Greening, is 50 x 50 feet. On light soils 40 x 40 feet is satisfactory and with weakergrowing varieties, such as Wealthy or Wagner, 35 feet is ample. A common commercial practice is to plant filler trees of early bearing varieties between the permanents. These are removed after twelve to fifteen years, when they begin to crowd. The most important consideration in planting trees is to tamp the soil firmly about the roots.

Tillage and fertilizers are various. Apples can be grown successfully under either sod or tillage. The latter method is often followed in commercial orchards where the soil is readily tillable without risk of serious erosion and consists of annual fall or spring plowing or disking followed by three or four cultivations with disk or harrow in the early spring. The last cultivation should be about July first after which a natural cover-crop of weeds or sowed crop, such as buckwheat, rape, or vetch, is allowed to grow. In sod culture, which is adapted to home plantings and where the land is too rough or stony for tillage, the trees are allowed to grow in a natural sod of grass, or one composed of sowed clover or alfalfa. This is moved once or twice a year and the movings either allowed to lie where they fall or placed about the tree as a mulch. Trees growing in non-leguminous sod must be fertilized with manure or commercial nitrates if good yields are to be obtained. Sodium nitrate, or ammonium sulfate, at the rate of 8-12 pounds to a mature tree, applied just as the buds open, is effective.

Younger trees, of course, require much less, as for example, 2–4 pounds for a ten-year-old tree. The nitrate should be spread under and several feet beyond the branches, not next the trunk. Any readily available nitrogenous fertilizer may be used instead of those named, the amount supplied depending on the actual nitrogen content. Cultivated trees usually need no fertilizer of any kind except on poor humus-depleted soils where nitrate may be beneficial to the tree, or a complete fertilizer may be used to increase the growth of the cover-crop and so benefit the trees indirectly by increasing the supply of humus. Rarely soils are found which show potassium, boron or other minor-element deficiencies.

Pruning at time of setting the one-year whip consists in heading at the desired point, 30 to 40 inches being a satisfactory height. In the case of two-year trees all lateral branches are cut off except one upright growing shoot at the top, called the leader, and one or two others spaced as far apart as possible along the main stem. A good practice is to head these back about a fourth of their length, leaving the uppermost branch the longest. From this time until the tree comes into bearing it should be pruned as little as possible, removing only

suckers and such branches as interfere with the development of the frame-work of the tree. When the trees are in full bearing and especially with old trees, the tops must be thinned to reduce the number of fruit-spurs and to prevent injury to the lower limbs by shading. Dead or diseased limbs, those that rub others badly, and suckers should be removed as soon as discovered. If trees are too tall they may be headed back to vigorous side branches. Apple trees may be pruned at any time when they are dormant.

Harvesting, marketing, and yields require few special comments. The apple crop is hand-picked into bags or buckets, when the fruit is mature but still firm. The degree of care necessary in handling varies with the variety. Tender fruits like McIntosh should never be poured from one container to another, whereas Baldwin and Ben Davis may, with care, be handled in that way. Marketing is done in various ways. Recently much fruit has been sold in roadside markets, at the farms. Where the markets are near, the crop, packed in bushels or hampers, is trucked directly to the wholesaler or to retail stores. In most of the large fruit districts, however, the fruit goes to the general market, either in boxes, special crates or bushel baskets. Barrels are used mostly for export.

Under good cultural conditions, early bearing varieties such as Wealthy and McIntosh begin the tenth year may yield 5-15 bushels to a tree in the bearing year. Late bearing varieties like Northern Spy may not fruit until after eight to ten years in the orchard. Mature trees may yield from 10 to 50 bushels in a single year. On the average, however, 15 to 20 bushels to a tree or 300 to 500 bushels an acre are considered

good yields.

Storage should be provided as soon as the crop is off the trees, if it is to be kept for any length of time. The best cold storage temperature is about 31° F. Apples will not freeze above 29° F. Developments in gas storage indicate that the season can be greatly prolonged by storing in atmospheres of reduced oxygen and increased carbon dioxide content. Fruit can be stored fairly well for home use in outside storage cellars or in a special compartment of the house cellar. In either case the temperature should be kept as near as possible to 31° F. by regulating ventilators or windows. An earth floor in such a storage will aid in keeping the air moist. Sprinkling the floor now and then with water may be necessary to keep the fruit from shrivelling.

Varieties are numberless but the commercial kinds are not numerous. The choice of suitable varieties for planting in different regions is of the greatest importance. Bud sports or mutations of many varieties have been propagated and may be superior in color to the standard sorts. The following lists include most of the best varieties arranged in order of ripening and are chosen to give a succession for the home planting. Commercial varieties are starred (*).

Varieties of more than average hardiness adapted to the northern states or cold situations: *Yellow Transparent, Early McIntosh, *Oldenburg, *Wealthy, *McIntosh, Fameuse, Cortland, *Delicious, Tolman Sweet, *Northern Spy.

Varieties adapted to New York and New England: Yellow Transparent, Early McIntosh,

*Oldenburg, Gravenstein, *Wealthy, *McIntosh, Twenty Ounce, Cortland, *Rhode Island Greening *Baldwin, *Red Canada, *Delicious, *Northern Spy, Rome.

Varieties adapted to the southeastern states. especially the Shenandoah-Cumberland Valley and the Eastern Shore: *Yellow Transparent, *Red June, *Williams Favorite, *Summer Rambo, *Grimes Golden, *Jonathan, *Stayman Winesap, *Winesap, *Yerk Imperial, *Yellow Newtown,

Varieties adapted to the southern and Gulf states: Red Astrachan, Red June, Hackworth, Rome, Delicious, Arkansas, Winesap, York Imperial, Yates, Terry, Romanite.

Varieties for the Middle West: *Yellow Transparent, Red Astrachan, Oldenburg, *Benoni, Wealthy, *Jonathan, *Grimes Golden, *Delicious, Ben Davis, Missouri Pippin, Golden Delicious.

Varieties for the Pacific Coast and Rocky Mountain states: *Gravenstein, *Jonathan, *Winesap, *Stayman Winesap, *Ortley, *Esopus, Grimes Golden, *Delicious, *Golden Delicious,

In the parts of Canada bordering the Great Lakes the varieties recommended for New York and the northern states are satisfactory. following list is made up of the hardiest varieties that will stand extreme cold: Tetofsky, Oldenburg, Charlamoff, Whitney, Wealthy, Hibernal, Longfield, Patten Greening, McIntosh, Milwaukee, Baxter, Scott Winter, Haralson.

To insure cross-pollination, several varieties of apples should be planted together. Although most varieties are satisfactory sources of pollen, Baldwin, Gravenstein, Arkansas, Rhode Island Greening and some others are exceptions and should not be relied on as pollenizers. In commercial orchards, yields can often be increased by bringing in colonies of bees at blooming time to distribute pollen. One strong colony to every two or three acres is considered to be sufficient.

Of the many diseases affecting the apple the most important is apple scab which may cause many of the blossoms to drop off, and disfigure fruit and leaves. The most important pest is the codlin-moth which is responsible for most wormy apples. Other insects of lesser, though often of great importance, are the San José scale, apple red-bugs, aphids, apple maggots, borers, and a number of caterpillars. The control of these pests and diseases is a complicated problem in which the commercial grower needs expert guidance based on a knowledge of the pests present and their stage of development. In home orchards of many localities, reasonably good control of scab and codlin-moth and other chewing insects can be obtained with three sprays. The first, called the delayed dormant spray, should be applied just as the tips of the buds are showing green, the second or calyx spray just after the petals have fallen and the third about two or three weeks later. Liquid lime-sulfur, 1 gallon to 50 of water with 1-2 pounds of powdered arsenate of lead added, may be used in all of these sprays. Scale can be controlled by using lime-sulfur, 1 gallon to 11 of water in the delayed dormant spray or with oil emulsions while the trees are dormant. Aphids, red-bugs, and other sucking insects can be kept in check by adding 1/2 pint of nicotine sulfate to 50 gallons of spray. The delayed dormant is the most effective spray for aphid control, the

calvx for red-bugs. If only one spray can be applied, the calvx application is of the most importance but often will not give satisfactory control.

In many regions east of the Rocky Mountains borers are a serious pest. These are found at the bases of young trees where their presence is indicated by sawdust-like fragments of wood on the ground next the trunk, or by dark sunken areas in the bark. An effective control is to dig out the grubs with a sharp knife, or to kill them by forcing a wire into the burrow. This should be done in September and again in

the early spring.

Field-mice frequently cause great damage, especially in the sod orchard, by girdling the voung trees at the base. Effective protection may be secured by placing guards of 1/3-inch mesh wire netting about the trees at the base, making sure that the guard fits the ground closely. A piece of netting 15 x 18 inches will make a guard that will be adequate until the tree is 5-6 inches in diameter. Pine mice, if present, may dig under such guards; they may be controlled by poisoned bait placed in the burrows and runways. Diced carrots or apples with powdered strychnine or white arsenic sifted on them are effective for both kinds of mice.

APPLE, BALSAM-: Momordica Balsamina. Custard-: Annona reticulata. Kei-: Dovyalis cafira. Malay-: Eugenia malaccensis. Mammee-: Mammea americana May-: Podophyllum. -of-Peru: Nicundra Physiolofes. Otaheite-: Spondus cytherca. Pond-: Annona glabra. Rose-: Eugenia Jambos. Star-: Chrysophyllum Cainto. Sugar-: Annona squamosa. Vi-: Spondias cytherea. Wood-: Feronia Li-

APRICOT. A stone-fruit, ripening mostly in advance of peaches, pubescent or smooth at maturity, with a flat stone or pit that is not corrugated or furrowed on the side; much prized as a summer fruit in the regions where it is grown, also for dessicating and canning. It is about as hardy as the peach. The apricot is of one prevailing species, Prunus Armentaca, native in China, the so-called Russian race being small-fruited hardy kinds adapted to severer winters than the usual large-fruited commercial kinds. The Japanese Prunus Mume yields a few fruit-bearing varieties, as Bungo and Bungoume, but it is not greatly grown except as an ornamental tree for its early bloom (the "plum flowers" of Japan).

Regions of apricot growing are determined largely by the early blooming period and consequent damage from late spring frosts. Its cultivation, therefore, is confined mostly to regions where such frosts are not common. Commercially it is grown on the Pacific Coast, and in some of the Rocky Mountain states, about 95 per cent of the crop being produced in California. In home gardens it is planted sparingly wherever peaches thrive, and while not dependable in bearing gives occasional crops and in some cases may supply local markets.

Soil and planting for apricots depend somewhat on the stocks on which the tree is worked. Light soils are best in the case of peach and apricot stocks, whereas plum stocks adapt the apricot for growth upon the heavier soil types. As with other fruits, good drainage is necessary. One- or two-year trees are planted in the early spring in the East and in the late fall in California. The common planting distance is 24 x 24 feet.

Cultivation, cover-crops, and in the West

irrigation, are the common commercial practices, as with the peach. Trees in the home planting should be mulched to keep down the grass and if growth is not fairly vigorous they should be fertilized with manure or 2-3 pounds of nitrate to a tree, applied early in the spring.

Propagation is by budding on apricot, peach or myrobalan stocks. Apricot stocks are considered best in the West and peach or plum is

used in the East.

The young trees are pruned to give them a balanced head according to the modified leader system. Bearing trees require moderate heading and thinning to assure renewal of fruit-spurs

and invigorate new growth.

Harvesting and marketing are much as for the peach. For home use the fruit ripens on the tree to advantage. Commercially, for shipping and canning, it is hand-picked, preferably with the stems attached, while still firm but full size and just beginning to take on the vellow color. For drying the fruit is allowed to become riper but not soft and in some cases is shaken from the trees. For eastern shipment, apricots crepacked in five-pound baskets, four baskets to the crate, and sent through in iced cars. Storing this fruit for any length of time is not practicable.

Varieties recommended for planting in the East are the Early Moorpark, Early Golden, Helmskirk, Moorpark and Peach. In California the Blenheim, Royal, Tilton, Peach, Newcastle, Helmskirk and Moorpark are among the most important. For the northern limits of apricotgrowing, the Russian varieties are to be recom-mended but are recognized as inferior.

Curculio, bacterial leaf-spot and brown-rot are difficult to control in the case of the apricot. In the East the same spray program recommended for the peach is of value. Borers can be controlled with paradichlorobenzine as with the peach, using about 34 ounce to a tree. In the commercial orchards of the West the spray program is more complex and special practices with expert guidance are advised.

APPRESSED: closely and flatly pressed against, as bracts applied to or appressed against a stem; adpressed.

APTÈNIA. Aizoacex. Monotypic S. African separated from Mesembryanthemum mostly by technical characters of fr.; calyx lobed to the ovary; parts of caps. lacking wings or flaps. Frequently seen in conservatories and window-gardens. For cult. see Mesembryanthemum. A. cordifòlia (M. cordifolium). Diffuse per., sts. to 2 ft. long, minutely papillose: lvs. opposite, flat, ovate, to 1 in. long: fls. purple, about ½ in. across. Var. variegata has variegated lvs.

AQUATICS are plants that pass their life in deep water; the word is frequently but improperly employed for those that grow in bogs, swamps and about the borders of ponds and lakes. The true aquatic plants usually have floating parts, and some of them are not permanently attached to the bottom. See Bog Plants.

AQUIFOLIACEÆ. HOLLY FAMILY. Three genera of trees and shrubs, sometimes evergreen, with alternate simple lvs., small fis. with mostly 4-6 sepals, petals and stamens, a superior ovary, and fr. a berry-like drupe. Ilex and Nemopanthus are cult. for ornament.

AOUILÈGIA. COLUMBINE. Ranunculacex. Hardy per, herbs with attractive ternately compound lys, and spurred fls, in white, vellow, blue, lavender, red.

Columbines are favorites in rock-gardens and the peren-Columbines are favorites in rock-gardens and the perennial border. They thrive in light sandy loam and some of them in shaly soils. Propagated by seed or by division in the spring; seeds sown in spring should give good blooming plants the following year. The clumps should stand 12-18 inches apart. Protection from strong winds favors their development and safeguards the bloom.

The common garden aquilegias do not belong to clearly The common garden adullegias do not belong to clearly recognized species; they are mutants or hybrids. Probably A. glandulosa, A. vulyaris, A. subrica, A. cærulea, A. chrysantha, and A. Skinneri are the main parents. The Old-World species are characterized by strongly hooked spurs and the American kinds (except certain undomesticated ones in the Rocky Mountains and westward) by straight or at least not hooked spurs although there may be a knob at the end. It is supposed that the character of the spur in the horticultural kinds is an indication of parentage. The "long-spurred hybrids" are now popular.

akiténsis. To 6 in.: fls. with pale purple sepals and pale yellow petals, the spurs nearly straight. Japan.

alpina. To 1 ft.: fls. blue, to 2 in. across, with incurved spurs about length of petal-limb and sepals twice as long. July-Aug. Switzerland. Var. álba, fls. white. Var. atroviolacea, fls. dark violet-purple. Var. cærulea, fls. blue. Var. supérba does not differ from the type. Var. grandiflora is listed as an improved large-fld. form.

árctica: A. formosa.

atrata: A. vulgaris var.

atropurpurea: confused name; botanically the name has been applied to plants of A. Buergeruana and also of A. viridiflora, but the material in the trade may be a color form of A. vulgaris.

aurea. To 20 in., tufted with many erect sts.: lvs. mostly basal, biternate, primary segms, petioled, to 1½ in. across, middle one 3-divided, lobes oblong to linear, obtuse: about % in. long, spurs hooked. July-Aug. Bulgaria.—
The material in the trade under this name may be A. chrysantha, a species having straight and much longer spurs.

baikalénsis: hort. name for a form with large violetblue long-spurred fis.

Bauhinii: A. Einseleana.

Bertolonii (A. Reuters). To 1 ft., alpine: lvs. small, glaucous: fls. about 1 in. across, blue-violet, spurs very short, knobbed. S. Eu.

bicolor: A. sibirica.

brevistyla. Per. to 3½ ft.: basal lvs. biternate, st.-lvs. ternate or simple, lfts. coarsely crenate: fls. nodding, about ¾ in. long, sepals blue, petals yellowish-white, spurs hooked, to ½ in. long. Munn. to Alta. and north to Yukon.

Buergeriàna. To 1 ft.: fls. to 1½ in. across, yellow tinged purple, spurs nearly straight, as long as petal-limbs. Japan.

cærilea. Colorado C. To 3 ft.: fls. to 2 in. across, the blue-purple sepals longer than white petal-limbs; spurs to 2 in. long, straight or spreading, knobbed at end. May—June. Rocky Mts.; the state fl. of Colo. Vars. álba and candidíssima have white fls.; citrina, fls. yellowish; cùprea, fls. copper-red with darker spurs; föliis-aùrea, lvs. variegated yellow; Héleniæ, fls. blue and white; hýbrida and lùtea, sepals blue or pink and petals white or yellow; rôsea is listed as having rose-pink fls. There is a wild var. albifòra with white fls. flora with white fls.

califórnica: A. formosa var. truncata.

canadénsis. Common American C. To 2½ ft.: fls. 1½ in. across, with yellowish or red sepals about as long as yellowish petal-limb; spurs red, nearly straight, knobbed at end, to ¾ in. long. May-July. N. S. to Fla. and Tex. Var. nana, 1 ft. high. Var. flavéscens (A. flavescens), with yellow fls. is known to merge imperceptibly into forms of

caryophylloides: garden name.

caucásica: A. vulyaris var. olympica.

chrysántha (A. thalactrifolia of Amer. authors). Golden or Golden-spurred C. To 4 ft., much branched: fis. to 3 in. across, yellow, the sepals much longer than petalimb; spurs straight, to 2½ in. long. May-Aug. Rocky Mt. region and Tex. Some of the vars. are: ślba, fis. whitish; ślba-plèna (var. grandiflora alba), fis. whitish, partly double; flavéscens, fis. tinged with red; flôre-plèno, fis. double; grandiflora sulphùrea, fis. deep yellow; Jæschkānii, Redevices C., dwarf, with red spurs, probably a hybrid; nāna, dwarf.

citrina: A. cærulea var.

clematidea. To 1½ ft.: fis. to 3 in. across, with well-developed spurs. A hybrid race differing from A. clemati-flora by its much longer spurs.

clematifiòra. To 1½ ft.: fis. to 3 in. across, pale pink and blue, the 10 sepals and petals of equal size and similar shape, spurs greatly reduced or absent. A hybrid race of garden origin.

clematiquilla. Fls. large, white, with long spurs; hort. form.

delicatissima: a strain of hybrids with pink and rose long-spurred fls.

discolor. Fls. of medium size, nodding in bud, with blue petal-like sepals about twice as long as whitish petals, spur length of petals, slightly curved at tip. Mts., N. Spain.

ecalcarata: plants of this name in the trade are variously described and are of unknown botanical identity. The botanical status of the name is further confused because it has been applied to three different plants, one from China, a second from Colo. and the third of hort. origin and said to be a synonym of A. vulgaris. The Colo. plant is per. to 2 ft., basal lys. ternate, lifts, sticky glandular-puberulent beneath: fis. ivory-white, to 1 in. across, with spurs reduced to seculiate outgrowths. to sac-like outgrowths.

Einseleana (A. Bauhinii). To 15 in., sts. erect and little branched: Ifts. somewhat hairy but not glandular-stucky, segms. ovate to roundish: fls. bluish-violet, to 1½ in. across, spurs short, nearly straight. Limestone regions of Austrian

elegántula. To 16 in., usually with only 1 lf.: fis. yellow with straight scarlet spur to 34 in. long. Colo., Utal New Mex.

erécta: hort, name, possibly a var. of A. vulgaris.

exímia: A. formosa.

Faurièri. To 8 in.: lvs. biternate into orbicular lfts.: fis. solitary, large, with narrow horned spurs. Japan.

fiabelläta. Fan C. To 1½ ft.: fs. 2 in. across, nodding, lilac, sepals twice as long as petal-limb which is often white, spurs incurved, shorter than petal-limb, summer. Japan. Var. nāna-ālba (var. flore-alba) is dwarf with pure white fis.

flavéscens: A. canadensis var., A. chrysantha var.

florariénsis: hort. name.

formòsa (A. arctica. A. eximia). SITKA C. To 3 ft.: to 2 in. across, nodding, the red sepals twice as long as formòsa (A. arctica. fis. to 2 in. across, nodding, the red sepais twice as long as yellow petal-limb; spurs red, straight, about length of sepals. May-Aug. Calif. to Alaska and Siberia. Var. hýbrida (A. californica var. hybrida, A. superba), supposed hybrid between A. formosa and A. chrysantha. Var. nanafiba, dwarf, pale sometimes nearly white. Var. pauciflora (A. pauciflora) is almost stemless and tufted. Var. rùbroplèna, fis. double. Var. truncâta (A. truncata, A. californica), petal-limb very short.

glandulòsa. Altai C. To 1½ ft.: fls. to 3 in. across, nodding, lilac-blue, the sepals twice as long as the white-bordered petal-limb, spurs much incurved, ½ in. long, spring, early summer. Siberia. Var. jucúnda (A. jucunda), fls. somewhat double, with white petal-limb. Var. måjor is listed as a larger form having blue and white fls.

grata: a confused name of uncertain botanical standing. havlodgénsis: a blue-fid. race with long spurs; hort.

Héleniæ: A. carulea var.

hirsutíssima: listed name.

hýbrida. A name of uncertain application to include hybrids between several species.

Jæschkanii: A. chrysantha var.

Jetschauii: listed name, perhaps a misspelling for A. chrysantha var. Jæschkanii.

Jonesii. Tufted stemless plant with scapes 2 in. high bearing a solitary erect blue or purple fi. ½ in. long, spurs slightly curved, ½ in. long. Alta. to Wyo.

jucúnda: A. glandulosa var.

Kitaibėlii. To 114 ft.: lower lvs. dense, sparingly villous, lobes obtuse: fls. blue, large, sepals very short, spur short, incurved at tip, glabrous. Cent. Eu.

lactiflora. To 1½ ft.: fls. ½ in. long, the white or bluish sepals twice as long as petal-limbs, spurs nearly straight, ¼ in. long. Siberia.

lappónica: listed name of plant to 2 ft., with violet short-spurred fls.: botanical status unknown.

leptocèras. To 1 ft.: fls. violet with tips of sepals greenish and of petal-lumbs yellow, spurs slightly curved, 1/2 in. long. Siberia.

long issima. To 3 ft.: basal lvs. triternate with narrowly segmented deeply-lobed lits.: fis. pale yellow, the sepals longer than petals, the spurs 5 in. and more long. July-Oct. S. W. Tex., Mex.

lùcida: listed name of plant to 2 ft., having dark purple double fis.; probably a garden hybrid.

lùtea. Probably a hybrid between A. czerulea and A. chrysantha.

Moorcroftiana. To 21/2 ft., sts. branched: fls. white, moorcrottana. To 2½ ft., sts. branched: fis. white, straw-colored to blue or purple, usually 3-9, rarely solitary, to 2 in. across, spurs short and incurved at tip. June-Sept. Himalayas. Var. cactiflora is advertised. Var. suaveolens Himalayas. Var. cactiflora is advertise has fis. to 3 in. across with longer spurs.

nevadénsis. To 2 ft., sts. hairy: basal lvs. biternately divided: fls. pale to dark blue, about $1\frac{1}{2}$ in. across, spurs long and incurved at tip. Spain.

nígricans: A. nulogras.

nívea: A. vulgaris var.

olýmpica: A. vulgaris var.

oxypétala: probably a catalogue error for oxysepala.

oxysépala. EARLY C. To 2½ ft.: fls. to 1½ in. across, with blue sepals much exceeding the white petal-limbs; spurs bent inward, knobbed, shorter than petal-limb. June. Siberia.

pauciflòrå: A. formosa var.

pubescens. To 11/5 ft.: basal lvs. 1- or 2-ternate with rounded lobes: fls. about 1 in. across, erect, cream-yellow varying to white or pink, spurs nearly 1 in. long, straight or spreading. Calif.

publiflora. A soft-pubescent form of A. vulgaris with short spurs. Himalayas.

pyrenàica. To 1 ft.: fis. deep blue, about 2 in. across, the sepals about length of petal-limb, the spurs short and incurved. June-July. Pyrenees.

Reuteri: A. Bertolonii.

sachaliénsis: listed name.

saximontana. To 8 in.: fls. greenish or blue with yellowish petals, spurs blue, 1/4 in. long, incurved or hooked. Colo., Utah.

scopulorum. To 8 in., glabrous or pubescent above: lower lvs. biternate, glaucous, segms. 3-lobed, sessule, rarely to ½ in. long; fls. pale blue to pale purple, spurs to 2 m. long, slender and straight. Mts. of Utah.

sibfrica (A. bicolor. A speciosa). SIBERIAN C. To 2 ft.: fls. to 3 in. across, hlac-blue, the sepals twice as long as petal-limb, spur very incurved or even cooled, to ½ in. long, summer. E. Siberia. Var. flore-plèno, fls. double. Var. spectábilis (A. spectabils), fls. large, with tips of setal limbs replay. petal-limbs yellow.

Skinneri. Mexican C. To 3 ft.: fls. about 1½ in. across, nodding, the greenish-yellow sepals much longer than yellowish petal-limb; spurs pale red, straight, to 2 in. long. July-Sept. Mts. Mex., Guatemala. Var. flore-pleno has double fls.

speciòsa: A. sibirica.

spectábilis: A. sibirica var.

stellata: A. vulgaris.

striata: listed as a double striped-fld. form of A. vulgaris. Stùartii. Hybrid between A. glandulosa and A. vulgaris var. olympica: fls. hlac-blue, very large, spurs incurved. May-June.

suavèolens: A. Moorcroftiana var.

supérba: A. formosa var. hybrida.

thalictrifòlia. To 2½ ft, sticky: lvs. biternate, glandu-lar-hairy, lfts petioled: fls. blue-violet, to nearly 1 in. across, spurs'about ½ as long as sepals, straight. Alps of S. Austria and N. Italy.—The American plant sometimes referred to as A. thalictrifolia is A. chrysantha.

transsilvánica: A. vulgaris.

truncata: A. formosa var.

Vervæneana: A. vulgaris var.

viridiflora. To 1½ ft.: fls. about 1 in. across, greenish, sepals and petals about equal, spurs straight, ½ in. long, summer. Siberia. Var. atropurpurea, see A. atropurpurea.

summer. Siberia. Var. atropurpurea, see A. atropurpurea. vulgaris (A. stellata. A. nigricans. A. transsilvanica). European C. To 2½ ft.: fis. to 2 m. across, nodding, blue, purple, white, the sepals longer than petal-limb, spurnhobbed and much incurved, about length of petal-limb, summer. Eu., Siberia. Vars. álba-plèna and flore-plèno have double fis. Var. atrâta (A. atrata), plant to 1 ft., fis. blue. Cent. Fu. Var. atrofsea, fis. deep rose-pink. Var. compácta is listed. Var. erécta, said to be a dwarf form with fis. borne erect. Var. hýbrida is probably a cross between A. canalensis and A. rulgaris, with lilac-purple spurs. Var. nívea (var. alba), Munsteans White C., fis. large, pure white. Var. offmpica (A. olympica, A. Wiltmanniana, A. caucasica), sepals lilac, petal-limb white. Var. Vervæne-àaa, lvs. lined with yellow.

Wittmanniana: A. vulgaris var. olympica.

Wittmanniana: A. vulgaris var. olympica.

ARABIDÓPSIS. Mouse-ear Cress. Cruciferæ. Ann. or per. white-fld. herbs of Eurasia and N. Amer., differing from Sisymbrium in pod 4-angled not terete, and from Arabis in pod flattened at right angles to the cross-partition and not parallel to it.

Thalians (Arabis Thaliana. Sisymbrium Thalianum).
Ann. to 18 in., usually branched: basal lvs. spatulate, to 2½ in. long, remotely toothed, sparsely stellate-hairy: fls. white, about ½ in. across, in terminal racemes: pods to ½ in. long, glabrous, ascending, beak very short. Eu., nat. in E. and Cent. U. S.

ÁRABIS. ROCK-CRESS. Crucifera. Annuals. biennials and perennials, mostly low, with white, pink or purple fls. in terminal spikes or racemes. pods or siliques long and narrow: more than 100 species in widely separated temp, regions, a few

Some of the rock-cresses are alpine, grown in the border or rock-garden. They require plenty of sun but many of them thrive even in poor soil. They are prevailingly spring and early summer bloomers. Some of them produce attractive mats of late-season foliage. Propagated by division, seeds or cuttings.

álbida (A. Billardieri. A. caucasica). Wall R. Tufted whitish soft-pubescent per. to 1 ft.: lvs. spatulate and tapering to base, 1-3 in. long, coarsely toothed on upper broad part: fls. to ½ in long, white, in early spring, fragrant, in loose racemes. Caucasus.—Sometimes double-fld., and forms with vari-colored foliage. There are also compact forms with vari-colored foliage. There are also compact forms. Listed vars. include argentea-variegata, lutéscens, nana compacta, rôsea, supérba and variegata.

Allionii. Per.: lvs. glabrous, ovate-oblong and somewhat toothed, those on st. ovate and sessile: fis. white, with erect petals. Italy.

alpina. Mountain R. Per., mostly more slender than A. albida and less pubescent: lvs. oblong to oblong-acute, broad at base, sharply toothed along sides: fis. smaller, white. Mts., Eu.—Apparently not common in cult., the stock usually grown under this name being A. albida. Vars. listed under this name include álba, compácta, grandiflora, nàna, ròsea, supérba, variegàta.

androsacea. Per. to 21/2 in., densely cespitose, silveryharry: lvs. mostly in dense rosette, oblong-elliptic, nearly entire, st.-lvs. linear: fls. white, in corymbose racemes: pods erect, to ½ in. long, short-pedicelled. S. E. Eu.

arenosa. To 6 in., hairy: lvs. pinnatifid, upper ones toothed: fis. rose, sometimes white or blush, on spreading pedicels. Eu.

aubretioldes. Densely tufted little per., either somewhat tomentose or green: lvs. very small, obovate and obtuse, those on st. ovate and clasping: fls. purple. Asia Minor.

bellidifòlia. Per. to 9 in.: lvs. glabrous, spatulate or those on st. oblong-ovate and sessile, sparingly toothed: fls. white, in short racenes. Pyrenees, Alps.

Billardièri: A. albida.

blepharophylla. Per. to 1 ft.: lys. spatulate to oblong, toothed or entire, margins ciliate: fls. rose-purple, fragrant, ½ in. long. Calif.

Brèweri. Per. to 6 in., much branched, pubescent: lvs. spatulate to lanceolate, usually entire: fis. red-purple, 1/2 in. long. Calif.

cærulea. Per. to 6 in., with tap-root, st. producing short stolons terminating in rosettes: basal lvs. spatulate to short stoions terminating in rosettes; basai ivs. spatiants to lanceolate-ovate, glabrous or sparsely pubescent, usually chate, thick and glossy green; fs. bluish-llac or rarely white, petals to ½ in. long, in 5-8-fid. somewhat branched and erect infl.: pods small, about ½ in. long. Bavarian and Salzburg Alps.

canéscens. Per. to 1 ft, densely cespitose, short-stellate-pubescent: lvs. narrowly spatulate to linear-oblanceolate, to 1 in. long and ½ in. wide, obtuse, densely pubescent producing bluish-green effect: fls. white to pale purple, to ½ in. long, pedicels recurved: pods pendulous, usually 1½—2 in. long and nearly ½ in. wide. Dry plains of Mont., Wyo. and Ore.

carduchòrum (Draba gigas). Per a few in high: lvs. in rosettes, linear, margins ciliate: fls. white. Armenia.—Some of the material grown as Draba fladnizensis belongs

caucásica: A. albida.

cebennénsis. Per. to 2½ ft., villous-pubescent, sts. erect: lvs. ovate to ovate-lanceolate, all petiolate, irregularly toothed, acuminate: fls. violet to pale violet-purple, to nearly 1/2 in. across: pods erect. France.

cenisia: A. corymbiflora.

cóckilis: catalogue name.

collina. Per., gray-pubescent: lvs. oblong, wavy-toothed, on st. sessile: fls. white. Italy.

corymbifldra (A. cenisia). Bien. or per. to 8 in.: lvs.

oblong, entire or slightly toothed: fis. white, $\frac{1}{3}$ in. long. Mts. of Eu.

corvmbosa: listed name.

Drúmmondii. Bien. to 2 ft., somewhat glaucous, nearly glabrous: lvs. oblong to lanceolate: fls. white or pink, 1/3 in. long. Mts., Que. to Alta. and New Mex.

Féndjeri. Bien. or short-lived per. to 20 in.: basal lvs. oblanceolate to % in. and rarely 1½ in. long, chate, acutish, st -lvs. linear- to oblong-lanceolate: fls. pink to white, on ascending pedicels to % in. long: pods slightly curved, to 2 in. long. Wyo., Ida.

Ferdinandi-Coburgii. Small: lvs. in gray rosettes that become green in winter: fls. small, yellowish. Macedonia.

Gerárdii. Bien., hairy: lvs. oblong, finely toothed, the st.-lvs. cordate at base: fis. white. Eu.

glabra. Bien, strictly erect, to 4 ft., glabrous above, glaucous: lvs. oblong to oblanceolate, dentate, on sts. sagittate and sessile: fls. yellowish-white, small: pods erect-appressed. N. B. to Pacific Coast, south to Pa., Eu., Asia.

glaûca. Per., stellate-pubescent: st.-lvs. ovate to ovate-lanceolate, obtuse, clasping: fls. not known: pods ascending, cylindrical, apex long-attenuate with long persistent style. Japan.

Hálleri. Slender weak pubescent or nearly glabrous bien. to 1 ft.: lvs. lyrate with large terminal lobe, on st. oblong or lanceolate and toothed: fis. apparently purple. Hungary.

hirsûta. Bien, erect, to 2½ ft., mostly hairy-pubescent: lvs. spatulate and dentate, on st. oblong and clasping: fls. greenish-white, small. Widely distributed in N. Amer., Eu, Asia.

Holboellii. The true A. Holboellii is a Cent. European species and not known to be in cult.; the plants so-named in cult. originating in W. Amer. are referred to A. retrofracta.

Kéllereri. Hybrid between A. bryoides and A. Ferdinandi-Coburgii: distinguished by the deciduous ashy-gray lanceolate small lvs. hairy on both sides.

Koèhleri. Per. to 6 in.: lvs. narrow-lanceolate to spatulate, to 1 in. long, entire, on st. few and very narrow: fis. scarlet, to $\frac{1}{2}$ in. long, in short racemes. Ore.

Lyallii. Per. to 10 in., mostly glabrous: lvs. spatulate to narrow-oblanceolate, to 1 in. long, entire, on st. narrow: fls. rose, 1/4 in. long. N. W. U. S., B. C.

lyrata. Per. to 1 ft.: basal lvs. oblong-oblanceolate, to 2 in. long, coarsely lyrately lobed, st.-lvs spatulate to linear, to 1 in. long, entire: fls. white, to ½ in long: pods to 1½ in. long. Conn. to S. C. west to Sask. and Mo.

móllis. Per. to 2 ft., lightly pubescent, erect, little branched: lvs. ovate or roundish, cordate and blunt-dentate, long-petioled, on st. clasping: fis. white, in terminal racemes. Caucasus.—Plants recently cult. under this name are probably all A. procurrens.

muralis (A. rosca). Bien. or per, tufted at base, pubescent, to 10 in.: lvs. spatulate and dentate, on st. oblong and sessile: fis. white or rose, in elongating terminal racemes. S. En.

òvirens. By recent authorities considered to be a subspecies of *A. Halleri*, from which it differs in its usually entire ovate long-petioled basal lvs. and pod nearly twice as long. E. and Cent. Eu.

procurrens. Per. to 1 ft., with creeping stolons: lvs. oblong to lanceolate or obovate, entire, pointed: fls. white, in elongating racemes. S. E. Eu.—There is a form with vari-colored foliage.

pûmila. Per. to 10 in., st. short, lateral shoots terminating in rosettes: basal lvs. obovate, petioled, ciliate, st.-lvs. ovate-lanceolate: fls. white, to 1/4 in. long. Cent. Eu.

purpuráscens. Per. to 2½ ft., pubescent, usually lividpurple: Ivs. obovate to oblong, toothed: fls. rose-purple, ¾ in. long. Ore.

purpurea. Per., at distinctly woody at base: lvs. obovate to oblong-cordate, remotely toothed to entire: fis. rose-pink to pale purple, about 1/4 in. long. Greece.

racemòsa: listed name.

retrofrácta. Bien. or per. to 20 in.: basal lvs. oblanceolete, to 1½ in. long, mostly entire, densely stellate-hairy; st.-lvs. lanceolate, base sagittate: fls. white or pinkish, to ½ in. across, in secund racemes: pods to 2½ in. long, on abruptly reflexed pedicels to ½ in. long. Man. to B. C. south to Neb. and Calif.

ròsea: A. muralis.

stellaris ròsea; hort. name, probably for form of A. Stellers.

Stélleri. Small: lvs. oblong or spatulate, the upper ones toothed and partly clasping: fis. white, in a corymbose raceme. E. Asia.

stricta. Per. to 6 in., nearly glabrous: lvs. thickish and shining, oblong, crenate, radical ones in rosette, on st. small and sessile: fls. yellowish-white, in short racemes. Eu.

Stùrii. Compact garden plant with large clear white fis.: botanical position uncertain.

Súendermannii, Hybrid between A. Ferdinandi-Coburgu and A. procurrens: Ivs. lanceolate, twice as large as in A. Ferdinandi-Coburni.

Suksdórfii. Per, tufted, to 8 in.: lvs. oblong to lanceolate, slightly pubescent: fls. white, ½ in. long. Wash.

Thaliana: Arabidopsis Thaliana.

Túrrita. Bien. or per. to 2½ ft., pubescent: basal lvs. in rosette, elliptic, toothed, blue-violet beneath: fis. yellow, ½ in. long, in many-fid. racemes. Eu.

vochinénsis. Per. to 6 vn., cespitose, st. producing numerous short rosette-terminated stolons: basal lvs. obovate, obtuse, glabrous or remotely pubescent beneath: fis. white, to ½ in. long, on erect mostly unbranched leafy peduncles. Cent. Eu.

ARÀCEÆ (sometimes written Aroidex). Arum FAMILY. AROIDS. More than 100 genera widely distributed (but most abundant in trop. countries), of varied habit and foliage but characterized by the infl. which is composed of a denselvfld. spadix having the staminate fls. at the top and the pistillate below, and subtended by a bract or spathe which is often colored and showy and constitutes (as in the florists calla) the ornamental part of the plant: fls. without perianth or these parts merely scale-like; stamens 1-many: fr. a berry borne tightly on the spadix. The family furnishes many plants grown for ornament, curiosity and food; some of them are prominent "foliage plants." All are essentially herbs, but some have more or less woody sts, and attain a shrub-like character and many of them are root-climbers on trees. The family yields acrid and medicinal qualities, and a few species produce edible tubers and frs. Among cult. kinds are the genera Acorus, Aglaonema, Alocasia, Amorphophallus, Anthurium, Arisæma, Arum, Caladium, Calla, Colocasia, Cryptocoryne, Dieffenbachia, Dracunculus, Helicodiceros, Ho-malomena, Hydrosme, Lysichitum, Monstera, Orontium, Peltandra, Philodendron, Pistia, Rhektophyllum, Sauromatum, Schismatoglottis, Scindapsus, Spathiphyllum, Symplocarpus, Syngonium, Thomsonia, Xanthosoma, Zantedeschia.

ARACHIS. Leguminosæ. Peanuts are grown in gardens as a novelty and in conservatory collections of economic plants and commercially in field culture in mild long-season climates: lvs. compound: fls. yellow, papilionaceous, in axillary spike-like clusters: seed-pods, the peanuts, are carried beneath the ground where they mature; mostly native in Brazil, one only cult.

Since the vines are very tender to frost, the plant cannot be grown in the garden farther north than central New York, but commercially from Virginia south. If the pods are too hard, the seeds should be removed for planting. When sown under glass a medium temperature only is required. In the open the plants of the bunch type should stand 6-10 inches apart, in rows 30-36 inches apart.

hypogèa. Peanut. Goober. Groundnut. Ann. to 20 in., procumbent: lfts. 4, to 2½ in. long.

ARACHNANTHE: Arachnis.

ARÁCHNIS. Orchidaceæ. Epiphytes native in Asia, with fls. in panicles, the sepals and petals equal, lip shorter and 3-lobed. See Orchids.

Clarkei (Arachnanthe Clarkei. Esmeralda Clarkei). Sts. long and pendulous: lvs. to 6 in. long and 1½ in. wide: fls. about 2½ in. across, the spreading sepals and petals yellow striped transversely with brown, the lip about the same length and yellow spotted with brown, in 3-4-fld. clusters to 8 in. long. June-Aug. Himalayas.

Lowii (Arachnanthe, Renanthera, Vandopsis and Vanda Lowii). To 6 ft.: lvs. to 2½ ft. long and 2½ in. wide: fis to 3 in. across, the lower ones orange-yellow finely spotted with red, the upper ones greenish-yellow with large brown spots, in pendulous many-fid. racemes to 9 ft. long. Aug.-Nov. Borneo.

ARAGALLUS: Oxytropis.

ARÀLIA (Dimorphanthus). Araliaceæ. Herbs. shrubs or trees with alternate pinnate lvs., small whitish fls. in umbels which form terminal panieles, and berry-like frs.; planted out-of-doors and most of them nearly or fully hardy N.

Some of the smaller native aralias are planted in borders or naturalized in woods; the larger species make bold lawn specimens and provide somewhat subtropical effects with the large leaves; some of them, as A. spinosa, are grown for curiosity. They thrive in rich soil. Propagated by seeds in spring, or by root-cuttings with heat.

aurea: a yellow-lvd. form, probably of Polyscias Guilfoylei or P. Balfouriana.

Balfouriana: Poluscias Balfouriana.

cachemírica (A. cashmeriana). Per. herb to 8 ft.: lvs. 1-3-pinnate, the lfts. to 3 in long: infl. with prominent bracts to 1½ in. long. Himalayas; to be planted only far S.

californica. Per. herb to 10 ft.: lvs. 2-pinnate, the lfts. to 1 ft. long; fls. in panicles to 1½ ft. long. Ore. to Calif.

cashmeriàna: A. cachemirica.

Chabrièri: El rodendron orientale.

chinénsis (A. sinensis). To 30 ft., somewhat spiny: lvs. 2-pinnate, the lfts. to 6 in. long and pubescent beneath: fls. in panieles to 2 ft. long. China.

cordata (A. edulis). UDO. Per. herb to 8 ft.: lvs. of 3-5 lfts. to 8 in. long. Japan.—In spring the young blanched shoots are eaten.

crassifòlia: Pseudopanax crassifolium.

edùlis: A. cordata.

elata (A. chinensis var. mandshurica. A. japonica. Dimorphanthus mandshuricus). Japanese Angelica. To 50 ft., usually prickly: lvs. 2-pinnate, the lfts. to 5 in. long, when young pubescent on veins beneath: infl. with spreading somewhat umbellate branches to 1½ ft. long. Manchuria, Korea, Japan. Var. aireo-variegata has lvs. variegated with yellow. Var. canescens is densely tawnypubescent beneath.

elegantissima: Dizygotheca elegantissima.

filicifòlia: Polyscias filicifolia. fruticosa: Polyscias fruticosa. Guilfoylei: Polyscias Guilfoylei.

hispida. Bristly Sarsaparilla. Per. herb or subshrub to 3 ft., bristly: lvs. 2-pinnate, the lfts. to 3 in. long. Newf. to N. C. and Minn.

japônica: A. elata and Fatsia japonica. Kerchoveana: Dizygotheca Kerchoveana.

mandshurica: A. elata.

Maximowiczii: Kalopanax pictus var. monstrosa: Polyscias Guilfoylei var.

Moseri: Fatsia japonica var.

nudicaulis. WILD SARSAPARILLA. Per. herb to 1 ft. nearly stemless: lvs. 2-pinnate, the 3-5 lfts. to 5 in. long. Newf. to Ga. and Colo.

papyrifera: Tetrapanax papyriferum.

pentaphýlla: Acanthopanax Sieboldianus.

quinquefòlia: Panax quinquefolium.

racemòsa. American Spikenard. Per. broad herb to 6 ft.: lvs. very large, of 3-5 lfts. to 6 in. long: berries brownpurple. N. B. to Ga. and Mo.

Sièboldii: Fatsia japonica.

sinénsis: A. chinensis.

spinòsa. Devila-Walking-Stick. Hercules-Club. To 30 ft., very spiny: lvs. 2-pinnate, the lfts. to 3 in. long and glabrous beneath: fis. in panicles to 4 ft. long. S. N. Y.

trifdlia: Panax trifolium. Veitchii: Dizygotheca Veitchii. Victòria: Polyscias Guilfoylei var.

ARALIACEÆ. ARALIA OF GINSENG FAMILY. More than 50 genera, widely distributed in temp. and trop. regions of eastern and western hemispheres, herbs, shrubs and trees, often having aromatic or odoriferous foliage, with mostly alternate simple to much compound lvs., small, regular, bisexual or polygamous fis. that are individually not showy, borne in close umbels or heads, having very small calyx, usually 5 petals, 5 stamens, inferior 1- or more-celled

ovary, and fr. a berry or drupe in which feature the family differs from Umbelliferæ. Many species have medicinal value, and the following genera are planted for ornament: Acanthopanax. genera are planted for ornament: Acanthopanax, Aralia, Brassaia, Dizygotheca, Echinopanax, Fatsia, Gilibertia, Hedera, Kalopanax, Meryta, Nothopanax, Oreopanax, Panax, Polyscias, Pseu-dopanax, Schefflera, Stilbocarpa, Tetrapanax, Trevesia, Tupidanthus. Various plants formerly known as Aralia and Panax are now distributed in other genera. In the juvenile stage many of the woody araliads are attractive in foliage and are prized under glass, but it may be impossible to name them confidently until they arrive at flower and fruit. Those with palmately compound lys., the petioled entire large glossy lfts. arising from the top of the petiole, are likely to be Schefflera or Tupidanthus.

ARALIA, FALSE: Dizygotheca.

ARAR-TREE: Tetraclinis articulata.

ARAUCÀRIA. Araucariaceæ. Evergreen trees of great height, of about 12 species in S. Amer., Australia and Pacific Isls., having symmetrical whorled branches and scale-like, awl-like or flat stiff lvs. usually closely overlapping, and large woody cones. The secondary branches are woody cones. The secondary branches are mostly in 2 laterals rows and in mature trees are early deciduous, leaving the primary branches naked except at the tips. Juvenile forms persist until trees are large, often to 20-50 ft. Young trees of different species may be closely similar and juvenile lvs. of all species are larger than adult lvs. and may differ from them also in form and arrangement.

Araucarias are grown in warm regions and as pot-plants in juvenile forms. See Conifers. Specimens can be grown in the open only in the warmer parts of the country, as in Florida and California, except A. araucana which will stand considerably farther north.

angustifòlia (A. brasiliana). Lvs. loosely imbricated, oblong-lanceolate, to 2 in long, sharp-pointed, glaucousgreen. Brazil. Var. élegans (A. gracilis), branches more siender and lvs. narrower; var. Ridolfiàna, robust form with larger lvs.

araucana (A. imbricata). Monkey-Puzzle. Lvs. densely imbricated, ovate-lanceolate, 1-2 in. long, leathery, sharppointed. Chile.

Balánsiæ. Adult lvs. densely imbricated, ovate, carinate, obtuse, dark olive-green, ½ in. long. New Caledonia.

Bidwillii. Bunya-Bunya. Juvenile lvs. spreading, mostly in 2 rows, ovate- to oblong-lanceolate, to 2 in. long, sharp-pointed, firm and glossy; adult lvs. imbricated, spiral, ovate, to ½ in. long, acute, rigid, woody: staminate cones 3-5 in. long, ½ 1-½ in. diam.; ovulate cones 7-9 in. long, 6-8 in. diam. Australia.

brasiliana: A. angustifolia.

brasiliàna: A. angustifolia.

columnàris (A. Cooki). New-Caledonian-Pine.
Juvenile Ivs. awl-shaped, deep green, firm, to ½ in. long, adult Ivs. imbricate, lance-ovate to triangular, to ¼ in. long, obtuse, rigid, with blunt incurved apex and prominent midrib; phyllotaxy ¼, ¼, ¼1: mature tree columnar; secondary branches mostly in 2 rows: staminate cones 1½-3½ in. long, ½-¾ in diam; ovulate cones ovoid to elliptoid, 4-5 in. long. New Caledonia, New Hebrides. Var. péndula, has drooping twigs and less closely imbricate Ivs.—Young trees—to 25 ft. with only juvenile foliage—are difficult to separate from A. excelae but the habit of mature trees is distinctive. Much material in cult. passing as A. excelsa is of this species. A. columnaris has deeper green foliage and closer tiers of branches and makes a better ornamental tree, except in age.

Coòkii: A. columnaris.

Coòkii: A. columnaris.

Cúnninghamii. Hoop-Pine. Juvenile lvs. needle-like, laterally compressed, to ½ in. long, spiny pointed, often recurved; adult lvs. awl-shaped to lanceolate, incurved, imbricate: mature tree with fuffed twig clusters at end of naked branches: staminate cones 2-3½ in. long, ½-½ in. diam.; ovulate cones ovoid, 2½-3½ in. long, 1½-2½ in. diam.; Australia. Var. glauca has silvery-glaucous foliage; var. taxifòlia has the secondary branches freely branching.

excélsa. Norfolk-Island-Pine. Juvenile lvs. awl-

shaped, incurved, laterally flattened, decurrent, light green, soft, to ½ in. long; adult lvs. closely imbricate, lanceolate to ovate-triangular with blunt incurved apex and obscure midrib: phyllotaxy ½; mature tree pyramidal: staminate cones 1½-2 in. long; ovulate cones subglobose, 3-5 in. long, 3½-6 in. diam. Norfolk Isl. Var. álbo-spica, Silver-Star A., young branchlets white-tipped; var. glauca, lvs. bluish-green; var. robústa, Emerald A., lvs. deep green; var. virgāta, secondary branchlets very short.—The usual species grown by florists for pot-plants, propagated by cuttings of vigorous erect tip shoots. Part of the material passing under this name is A. columnaris.

grácilis: A. angustifolia var. elegans.

imbricata: A. araucana.

Rûlei. Lvs. densely imbricated, oblong-lanceolate to elliptic, to ¾ in. long, obtuse, silvery-gray above, glossy below. New Caledonia. Var. Goldieana, less branched and lvs. narrower; var. patens, lvs. loosely imbricated; var. polymôrpha is a juvenile stage.

ARAUCARIACEÆ. ARAUCARIA FAMILY. A few genera, mostly of resinous evergreen coniferous trees in the southern hemisphere, of which two. Agathis and Araucaria, are grown in N. Amer. as conservatory subjects or in the open where climatic conditions permit. Until recently they have been treated with the Pinaceæ, but they differ in technical characters of the cone whose scales are without distinct bracts and bear only a single ovule: lvs. alternate, awlshaped to broadly ovate, often leathery.

ARAÙ IIA. Asclepiadacea. Woody twiners with salver- or bell-shaped fls. in axillary cymes, large leafy calyx, and long leathery pods; native in Brazil and Argentina. Grown under glass from cuttings or out-of-doors from seed sown in heat in early spring.

sericôfera (Physianthus albens). Lvs. oblong, to 4 in. long, dark green above, white and mealy beneath: fls. white or pinkish, to 1 in. across. S. Brazil.

ARBORETUM. A growing collection of trees (Latin arbor, tree); in common application, a living collection of trees and shrubs, that is, of woody plants. The term ordinarily connotes a plantation of many kinds of woody plants permanently maintained for purposes of study, investigation, and education, a distinction from a grove, forest, nursery, or a parking. An arboretum may be one of the integral parts of a botanic garden.

ARBORICULTURE. The cultivation of trees: in common usage often applied to the growing of woody plants, as trees and shrubs. It implies the cultivation of the plants as individuals rather than as elements in a forest, the latter subject being silviculture and part of the larger domain of forestry. Arboriculture is to be distinguished also from the growing of trees for a particular product, as the raising of fruit which is fruit-growing or pomology. The study of trees is a large and important branch of human activity.

ARBOR-VITÆ: Thuja. False: Thujopsis dolabrata. Hiba: Thujopsis dolabrata.

ARBUTUS. Ericaceæ. Evergreen trees and shrubs native in the Medit. region and W. N. Amer., having red flaking bark, alternate lvs., red or white urn-shaped fls. in terminal panicles, and fr. a red berry-like drupe.

Arbutuses are grown out-of-doors in warm regions or under glass in the North. They do best in well-drained soil with protection from the wind. Propagated by seeds, by cuttings of half-ripened wood in the fall under glass, and also by layers, budding or veneer-grafting.

Andráchne. To 40 ft.: lvs. ovate, to 4 in. long, usually entire: fls. dull white, in panicles to 4 in. long. Medit. region. canariénsis. To 30 ft.: lvs. oblong-lanceolate, to 6 in. long, toothed, glaucous beneath; fls. greenish-white, nearly 1/2 in. long, in erect panicles in spring. Canary Isls.

Ménziesii. MADRONA. To 50 or 100 ft.: lvs oval to oblong, to 5 in. long, entire, glaucous beneath: fls. white, 14 in. long, in erect panicles to 6 in. long. May-June. B. C. to Calif.

Unddo. Strawberry-Tree. To 30 ft.: lvs. oblong, to 4 in. long, toothed, shining above: fls. white or pinkish, ¼ in. long, in drooping panicles to 2 in. long, in autumn. S. Eu., Ireland; stands in Ga. Var. integérrima has entire lvs. Var. rùbra (var. Croomu) has deep pink fls.

ARBUTUS, TRAILING: Enigwa repens.

ARCEUTHOBIUM: see Loranthaces.

ARCHANGELICA: Angelica.

ARCHONTOPHÈNIX (Loroma). King Palm. Palmaceæ. Unarmed monœcious forest featherpalms of trop. and subtrop. Australia, of two or three species: trunk single, ringed, the upper part represented by a smooth green sheathing column of lf.-sheaths: pinnæ many, long and narrow, entire or somewhat bifid at apex, mostly drooping or hanging and often turned edgewise: spathe-lvs. 2, formed in the sheath of lower lvs. and expanding after the lf. falls: infl. compound on a short white peduncle, the long strands at first hanging; fls. typically in 3's, the middle one small and pistillate but often bearing staminodes; staminate fls. 3-angled, with a pistillode; anthers 8-24: fr. small, red, globose or ellipsoid, 34 in. or less diam., the exocarp or outer shell soon decaying on the ground and exposing a covering of strong fibers; seed not furrowed, the albumen strongly ruminate. King palms are grown in S. Calif., Fla., Bermuda and in American tropics. For cult. see Palm.

Alexandrae (Ptychosperma Alexandrae). Alexandra Palm. To 70 or 80 ft., in native regions: trunk enlarged or bulging toward base: under surface of pinns: prominently grayish-white, middle width of largest ones 1½-2 in. or less, side nerves very prominent: fis. white or cream-color: fr. about ½ in. long, the fibers (under shell) close and not very prominent. Var. Beatricæ. Step Palm. Bole enlarged at base and rings so deep that the trunk appears to have steps.

Cunninghamiana (Ptychosperma and Loroma Cunninghamiana Loroma amethystina) Piccabeen Palm Trunk not enlarging below, unless merely at surface of ground: under surface of pinne green or not gray-glaucous, the side nerves not particularly prominent, width 2-4 in. at middle in the central part of If.: Ifs like or purphsh: fr. somewhat larger, the fibers or strands strong and loose.—
This palm is known to planters as Scafortha elegans.

ARCTERICA: Pieris nana.

ÁRCTIUM. Burdock. Compositæ. Coarse rank-smelling biennials or short-lived perennials with large alternate lvs. and tubular florets, purple to nearly white, clustered in bur-like heads; pappus of short scales; native in Eu. and Asia, some widely distributed as weeds.

One species is grown for its edible roots and one for medicinal purposes. In Japan the roots are eaten when 2 feet long or less; the plant is treated as an annual, seeds sown in May producing edible roots by autumn and the fall-sown crop harvested in spring.

Lappa (Lappa major. L. edults). Great B. Gobo of the Japanese. Stout, much branched, to 8 ft.: lvs. cordate-ovate, to 20 in. long, white-woolly beneath heads 1½ in. across, in flat-topped clusters. Eu.; nat. in N. Amer.

minus (Lappa minor). COMMON B. Similar to A. Lappa but not over 6 ft. high, the lvs. smaller and heads to 3/2 in. across. Eu.; nat. in N. Amer.

ARCTOSTÁPHYLOS (Uya- Ursi). BEAR-Ericacex. Evergreen BERRY. MANZANITA. shrubs and small trees with alternate usually entire lvs., small urn-shaped nodding fls. in terminal racemes or panicles, and fr. a red or brownish drupe. The trailing species are grown for ground-cover in the N. and the others in

warmer regions for ornament. Cult. as for Arbutus.

alpina: Arctous alpinus.

Andersonii. To 8 ft. and more: lvs. crowded, oblong or ovate, to 2½ in. long, cordate at base: ovary pubescent.

bicolor (Xylococcus bicolor). To 6 ft.: lvs. oblong, to 2½ in. long, shining above, white-tomentose beneath, the margins revolute: fis. rose; ovary hairy at top. Calif., Lower Calif.

canescens. To 6 ft., white-pubescent: lvs. ovate, to 3 in. long: ovary densely tomentose. Calif.

cinèrea. To 6 ft., with ash-colored branchlets: lvs. oblong or obovate, whitish-green, to 1 in. long: fis. rose or nearly white; ovary hairy at top. Ore.

columbiana. Erect shrub to 12 ft., young sts. densely pubescent: lvs. oblong to oblong-ovate, to 23\(\xi\) in. long, pale green, tomentulose beneath: fls. white, in clustered racemes: fr. red. Wash.—By many authors not considered distinct from A. tomentosa.

diversifolia (Comarostaphylis diversifolia). To 15 ft.: lvs. elliptic or oval, to 3½ in. long, tomentose beneath, the margins toothed and revolute: fls. light pink; ovary pubescent. S. Calif., Lower Calif.

franciscana. Low procumbent shrub, sts. often rooting: lvs. bright green, broadest at or below the middle: fls. white, on glabrous pedicels in short terminal clusters: fr. depressed-globose, to ½ in. across, dull. Calif.

glandulòsa. Low spreading shrub, sticky-glandularhairy throughout: lvs. ovate-elliptic to lanceolate, petioled: fls. white, to 1/2 in. long: fr. brown. Calif. Var. crassifòlia is listed

glauca. Great-Berried M. To 30 ft.: lvs. oval or broadovate, to 2 in. long, glabrous, pale green: fis. white; ovary glabrous. S. Calif., Lower Calif.

Hookeri. To 2 ft., or procumbent: lvs. ovate or elliptic, to 1 in. long, shining: ovary glabrous. Calif.

insularis. Erect shrub to 10 ft. high, sometimes treelike: Ivs. ovate to elliptic, to nearly 2 in. long, obtuse, bright green: fls. white, in large panicles: fr. yellowishbrown, nearly globose, glabrous. Santa Cruz Isl., Calif.

manzanita. Erect shrub to 12 ft. and sometimes much more, crooked-branched, young parts pubescent: lvs. thick, oblong, pale green, to 1½ in. long: fls. white, sometimes tinged pink, in drooping panicles. Calif.

Mariposa. To 8 ft.: lvs. oval or elliptic, to 1% in. long, stiff, white-glaucous: ovary glandular-hairy. Calif.

mēdia. Procumbent, branching, sts. to 2 ft. long and 1 ft. high: lvs. obovate, blade to 1 in. long, puberulent beneath: fls. white or pale pink, in terminal racemes. Wash.—Possibly a hybrid of A. tomentosa and A. Uva-ursi.

nevadensis. To 9 in., with creeping rooting sts.: lvs. obovate, to 1 in. long: ovary glabrous. Calif.

nummularia. To 1 ft.: lvs. ovate to oblong, to 3/ in. long, glabrous: fls. white; ovary pubescent, Calif. Var. compacta is listed.

pátula. To 5 ft. or more: lvs. orbicular, to 1½ in. long, bright green; fls. deep pink; ovary glabrous. Ore., Nev., Calif.

pùmila. To 8 in., prostrate: lvs. obovate, to $\frac{3}{4}$ in. long: ovary glabrous. Calif.

pungens. To 8 ft.: lvs. oblong to elliptic, to 1 in. long, becoming glabrous: ovary glabrous. Calif. to Mex.

Stanfordiana. To 6 ft., with dark red sts.: lvs. ovate to oblaneolate, to 1½ in. long, glabrous: fis. pink or lilac; ovary glabrous. Calif.

tomentosa. Woolly M. To 18 ft.: lvs. broad-ovate to oblong, to 2 in. long, tomentose beneath: fis. white or pink; ovary tomentose. B. C. to Calif.

Üva-úrsi. Prostrate and creeping: lvs. obovate, to 1 fn. long, glabrous, the margins revolute: fis. white or pinkish. Eu., N. Asia, N. Amer.

ARCTOTIS. Compositæ. More or less white-woolly S. African annuals with alternate lvs. and solitary radiate heads; pappus lacking or a crown of scales; grown in the flower-garden. Propagated by seeds.

acaùlis (A. scapigera. A. speciosa). Stemless: lvs. oblong, cut, lobed or lyrate, 6-8 in. long, white-tomentose beneath: fig. with yellow rays purplish beneath, on scapelike peduncles.

acorus: hort, name; plant listed as somewhat succulent, to 20 in. high, lvs. silvery, wavy, with white ray-fis. and blue disk

breviscapa (A. leptorhiza var. breviscapa). Stemless: lvs. oblong-lanceolate, to 6 in. long, pinnately cut, longer than

scape: fis. with orange rays and dark center, the heads to 2 in. across. Var. aurantiaca. Fis. orange-yellow with purple disk.

calendulàcea: Cruptostemma calendulaceum.

F6steri. Per. to 3 ft.: lvs. lyrate-pinnatifid, lower ones to 16 in. long, petioled, white-woolly beneath, lobes oblong, toothed, terminal one largest; upper lvs. sessile and margins often entire: heads solitary, to 4 in. diam., ray-fls. white to pale salmon-pink with golden-yellow and purple spot at base, red outside, disk-florets brownish tipped black.

grándis: A. stæchadifolia var.

Gúmbletonii. St. very short: lvs. to 1 ft. long and 1½ in. wide, pinnately cut or lobed: ray-fls. deep orange-red marked at base with brown, the heads 3 in. across, on peduncles to 1 ft. high.

høbrida: hort, name.

lævis (A. squarrosa). Per. to 8 in., woody at base: lvs. slightly glandular, usually pinnatifid, the lateral lobes to 3 in. long and nearly ½ in. wide: ray-fis. brownish-orange suffused scarlet, disk-fis. dark brownish-purple to nearly black, on naked peduncle.

scarigera: A. acaulis.

speciòsa: A. acaulis.

squarròsa: A. lævis.

stochadifòlia. African Daisy. Bushy, to 2½ ft.: lvs. obovate, to 4 in. long, toothed: ray-fls. white or white and pale violet, in heads to 3 in. across, the stalks much longer than lvs. Var. grándis (A. grandis) has lvs. to 6 in. long, obovate-oblong, toothed, and long fl.-sts.

ARCTÒUS (Mairania). Ericaceæ. Deciduous low shrubs grown for ground-cover, having alternate finely toothed lvs., urn-shaped fls. in terminal clusters, and fr. a berry-like drupe. Propagated by seeds and cuttings. Does best in shady cool locations.

alpinus (Arctostaphylos alpinu). BLACK BEARBERRY. Lvs. obovate or oblanceolate, to 1½ in. long, turning red in autumn: fls. white tinged with pink, ½ in. long: fr. black. N. Eu., N. Asia, N. N. Amer.

erychrocárpus: A. ruber.

rûber (A. erythrocarpus). Differs from A. alpinus in its brighter green ivs., narrower and more entire corolla and bright red larger fr. N. W. N. Amer. and E. Asia.

ARDÍSIA. Myrsinaccæ. Trees and shrubs with alternate simple leathery lvs., small white or rose fls. in cymes or panicles, and berry-like frs.

Grown out-of-doors in warm climates and one a popular greenhouse subject. Propagated by seeds sown late in winter or early in spring; also by cuttings of half-matured wood over bottom heat.

crenata: A. crispa.

crenulàta: A. crispa.

crispa (A. crenuta). Lvs. oblong-lanceolate, to 3 in. long, wavy-margined, pale beneath: fls. white: berries coral-red, ½ in. across. Malaya, China.—Shrub, but grown as a pot-plant in conservatories and residences for its abundant crop of durable bright red berries.

japónica. To 1½ ft.: lvs. elliptic, to 4 in. long, shining, crowded at ends of branches: fls. white: berries red, ½ in. across. Japan, China.

paniculata (A. Pickeringia, Icacorea paniculata). MARLBERRY, To 20 ft.: lvs. oblanceolate, to 7 in. long, entire: fls. white: berries black and shining, ½ in. across. S. Fla., W. Indies, Mex.

Pickeringia: A. paniculata.

ARÈCA. Palmaceæ. Graceful mostly very slender-stemmed unarmed monoccious ringed feather-palms of trop. Asia and the Pacific Isls. and Australia, with spadix below the Ifcrown or in some species among the foliage, some of the species soboliferous: base of petiole widely expanded and clasping; pinnæ close together and often joined, with several prominent ribs: spadix much branched, staminate fis. occupying the terminal part of the branches or spikes, stamens 3-6; large and few pistillate fis. at the base: fr. oblong or ovoid, more or less drupe-like, 1-seeded, base inclosed in the enlarging perianth. Formerly the genus Areca was very broadly conceived, and many genera have

been segregated from it. As a result, the nomenclature of the group is much confused and old literature should not be followed. Planted in S. Fla. See *Palm*.

alba: Linoma alba.

Alicæ. Referable to A. triandra, erroneously supposed at time of publication to be native in Australia. Plants grown under this name may be Arikuryroba schizophylla.

airea: see Linoma.

Baueri: Rhopalostylis Baueri.

Cáthecu. Betel. Palm. Very slender palm with solitary trunk to 100 ft. and 6 in diam., leafless below the relatively small crown: lvs. 3-6 ft. long, with many broad rather soft pinne not taper-pointed and irregularly notched or crose at apex and the upper ones confluent: fr. ovoid to globular-ovoid, mostly 2 in. or less long, orange or scarlet, with soft fibrous covering. Probably Malaya; cult. in India and elsewhere for the nut which is chewed along with the lf. of betel pepper. I.vs. sometimes variegated. Fls. fragrant. The name is commonly spelled Catechu but it was not so written by Linneus, author of the name, in the three editions of Species Plantarum.

glandiformis. Tall and slender, with marked rings: lvs. to 8 ft. long; pinns long-pointed, the midrb prominent underneath and secondary nerves more or less marked: spadix short, branched near base into branches 1 ft. or so long; pistillate fls. aggregated at base of branches, perianth enlarging. Moluccas.

Ilsemánnii. Hort. name for a palm from the Pacific Isls., perhaps not an Areca: sts. red: young lvs. dark red, becoming green. Apparently no longer offered in N. Amer.

lutéscens: Chrysalidocarpus lutescens.

Normánbyi: Normanbya Normanbyi.

rùbra: see Linoma.

sápida: Rhopalostylis sapida.

singaporénsis: probably Ptuchoraphis singaporensis.

speciosa: Hyophorbe amaricaulis.

triandra. Very attractive soft-lvd. palm making several green strongly ringed slender leafy sts. 5-10 ft.: lvs. bright green, 3-5 ft. long, with decurved broad pinne toothed or shallowly cut-lobed at the apex, the terminal pinne confluent or deeply 2-lobed: fr. oblong or long olive-like, red or orange-scarlet at maturity. India, Malaya.

Verschaffeltii: Hyophorbe Verschaffeltii.

ARECÁSTRUM. Palmacex. Separated from Cocos on good botanical characters, considered as a single polymorphous species; native from Bahia in Brazil to Uruguay, Argentina, Paraguay and Bolivia. Unarmed monoccious feather-lvd. tree with solitary ringed trunk; spadix from axils of lower lvs., the staminate fls., with 6 stamens, on upper part of the branches and pistillate on lower part; spathe strongly plicatesulcate, or grooved, on outside; pistillate fls. ovate when closed, the petals valvate at apex: fr. variable, 1 or 2 in. long, globose, ovate, elliptic or obovate; nutlet with thick bony wall; albumen of seed solid and not ruminate. In cultivation the trees vary widely in stature and habit, but these differences may not be botanically significant any more than comparable divergencies in apple trees, American elms and coconuts. See Palm.

Romanzoffianum (Cocos Romanzoffiana. C. plumosa). Queen Palm. Medium-sized tree to 30 ft. or more, the trunk smooth and plainly ringed, usually carrying a few dead hanging lvs. and old bases under the graceful crown: lvs. 8-15 ft. long, decurved, many or most of the mature pinnae (which are soft in texture) making a characteristic bend or knuckle beyond or near the middle at the point where they begin to droop; pinnae many, green both sides, mostly not exceeding 1 in. broad and most of them narrower, long-pointed, with faint side nerves: spathe 2-3 ft. or more long; branches of big spadix drooping: fr. globose to globose-ovate, about 1 in. lengthwise (to 1½ in.) and nearly or quite as long as broad, borne in a heavy hanging truss. Cent and S. Brazil. Commonly planted in S. Fla. and S. Calif. and in tropics. Var. australe (Cocos australis of botanists, not hort. C. Arechavaletana. C. Datil. C. flexuosa of hort.). Fr. ovate-elliptic, the breadth distinctly less than the length and sometimes only about half as much: considered to be a more slender and graceful tree than the species and with rather smaller crown, but this

is to be confirmed; this var. appears to be the prevailing form of the tree commonly planted in S. Calif., Fla. and elsewhere as Cocos plumosa. S. Brazil, Uruguay, Paraguay, Argentina. Var. botryóphorum (Cocos botryophora). Very tall robust tree with heavy upright crown. fr. large, globoseovate or -obovate, 1½-2 in. long. Brazil.

AREGÈLIA. Bromeliacex. Epiphytic herbs with prickly-toothed lvs. in a basal rosette and white, violet or blue fls. in simple dense heads among the lvs.; sometimes grown under glass. For cult. see Bromelia.

marmorata. Stemless: Ivs. lorate, to 1 ft. long, in rosettes of 10-15, marbled with patches of reddish-brown on both sides, bright red spot below cuspidate tip, marginal prickles small: fls. pale violet, corolla scarcely longer than calyx, heads to 2 in. duam. Brazil.

spectábilis. To 18 in.: lvs. lanceolate to spatulate, to 15 in. long, light green transverse bands across reverse sude, margins serrulate, rounded apiculate apex with noticeable red spot: fis. white becoming pale blue at tip. Brazil.

tristis. Lvs. to 1 ft. long and 6 in. wide, mottled with brown: fis, purple. Brazil.

ARENARIA. Sandwort. Caryophyllaceæ. Low herbaceous annuals and perennials, often forming mats, suitable for borders, carpets, rockand alpine-gardens, walls and lawn clumps: spring or summer-blooming; fls. usually white, small, terminal or clustered, sometimes axillary: lvs. entire, narrow and opposite: native around the world but rare in the tropics.

A few of the kinds entered here are listed in the trade also as Alsine, and a troublesome question of nomenclature is involved. For our purposes, however, they are retained in Arenaria. Usually only the perennial species are cultivated and these require no special soil or treatment unless they are alpines. Propagated by division and by seeds, the rare species sometimes by cuttings.

æquicaulis: A. verna var. pubescens.

alpina: plants so named are referable to A. sajanensis.

Arduinii: probably A. gramınıfolia.

Armeriástrum. Tufted per. vs. linear-lanceolate, obtuse, very short, glabrous, somewhat ciliate: fls. white, usually 3-4 in dense head-like cymes, petals longer than the lanceolate sepals; peduncles glandular-puberulent. Spain.

austrlaca. Per. to 10 in. lvs. linear-lanceolate: fls. white, in 2's, on glabrous pedicels and peduncles; pedicels 6-9 times as long as calyx. Alps.

baleárica. Corsican S. To 3 in., creeping: lvs. ovate, to ½ in. long, glossy, thick and ciliated. fis. white, solitary, on long slender capillary pedicels. Balearic Isls., Corsica; not hardy north of N. Y. City.

banática. To 8 in. or less: lvs. ciliate: fis. white with white sepals striped green, in 3-5-fid. clusters. S. E. Eu.—Probably not distinct from A. setacea.

Bauhindrum: A. liniflora.

biflora (Alsinopsis biflora). Per. with decumbent sts.: lvs. obovate, to 1/4 in. long: fls. white, usually in pairs, sepals obtuse, non-glandular, slightly shorter than pedicels. Greenland to B. C.

cæspitòsa: A. verna var.

capillaris. Per. to 8 in. with numerous very slender sts.: lvs. mostly basal, awl-shaped, ½ in. or more long: fls. white, in loose cymes. B. C. to Calif., Asia. Var. formosa is listed but may not differ appreciably from typical form.

caroliniana (A. squarrosa. Sabulina caroliniana). Tufted per. to 10 in.: lvs. awl-shaped, stiff; internodes short: fis. white, ½ in. across, in few-fid. terminal cymes. N. Y. to Fla.—Differs from A. capullaris in its shorter lvs. and internodes.

caucásica: A. pinifolia.

cephalotes. Sts. erect: lvs. filiform, ciliate: fls. in a compact thyrse, petals exceeding the ovate-acuminate sepals. S. Russia.

ciliàta. Per., finely pubescent, sts. ascending, to 1 ft. long: lvs. ovate, acute, many-nerved, ciliate: fis. white, usually 2-6 in loose cymes, pedicels'commonly 2-4 times as long as calyx, sepals ovate-lanceolate, slightly shorter than the entire petals: caps. ovoid, about as long as calyx.

compacta. Cushion-like per, to 2 in.: lvs. linear, minutely glandular and denticulate, to 1/8 in. long: fis. white, solitary. Mts., Calif.

congésta. Per. to 10 in.: lvs. needle-like, to 2 in. long,

ciliate-serrulate near base, dense and viscid: fls. white, in congested heads, on simple slender peduncles. Colo. to Calif. and Wash.

cuspidata: listed name. Aéccidas son A laricifolia

formòsa: A. capillaris var.

glabréscens (A. macradenia). Shrubby per. to 1 ft., glabrous: lvs. filiform, to 134 in. long: fis. white, sepals ovate-lanceolate, acute. Utah to Ariz. and Nev.

grácilis. Slightly tufted sticky-pubescent per. to 4 in.: s. lanceolate: fis. white, in 2's on long pedicels, petals bifid. S. E. Eu.

graminfòlia (A. Rosanii). To 1 ft., glandular-pubescent: lvs. narrowly lanceolate, borne stiffly erect, to 2 in. long, acute: fls. white, in compact heads on peduncles to 1 in. long. Eu.—Not known to be cult.; plants so listed are long. Eu.-

grandiflora. To 10 in. or less: lvs. flat awl-shaped, ciliate: fls. white, large, solitary or in 2's or 3's, sepals with single conspicuous midrib, glandular-puberulous: caps. longer than calyx. Eu.—Runs into many forms although much of the material so listed is A. larcifolia.

grœnlándica. Ann., glabrous, very low, forming mats, the decumbent or erect sts. bearing 1-5 white fis.: petals twice as long as the obtuse sepals: lvs. small and narrow. Greenland and Lab. to mts. of N. C.

Hookeri. Tufted per. to 6 in.: lvs. subulate, ¼-2 in. long, sharp-pointed: fs. white, in dense cymes, sepals narrowly lanceolate and shorter than petals. Mont. to

juniperina (Alsine juniperina). Tufted, to 6 in.: lvs. awl-like, nodes swollen, internodes to 1/4 in. long: fis. white, in umbellate cymes, sepals about 1/8 in. long. Mts. of E. Eu., Asia Minor.

Kingii. Per. to 4 in., sts. somewhat woody, glandular above but glabrous below: lvs. filform, to 3 in. long, mostly erect, to 1½ in. long; fis. white, petals deeply 2-cleft, slightly longer than the lanceolate and glandular-puberulent sepals. Mts. of Utah and Nev.

Mis. of Utah and Nev.

Koriniana. Per. to 15 in.: lvs. narrowly linear-lanceolate, setaceous, arising from jointed nodes along erect sts., margin scabrous: fis. white, in 2-7-fid. cymes to biternate corymbs, long-pediceled, petals about twice as long as the ovate obtuse sepals. Russia.—Similar to A. Presli, differing in its much less leafy sts. and technical characters of the caps. Much of the material listed as A. Koriniana is A. Preslii.

Kotschyana. Per to 6 in., glabrous: lvs. linear. acute. to in, long: fls. white, in cymes, on pedicels nearly 1 in. long or more. Asia Minor.

Landriana: listed name.

laricifòlia. To 8 in.: lvs. awl-shaped, falcate, to % in. long, acute: fls. large, white, solitary or clustered, sepals lanceolate-oblong, 3-nbbed, hairy: caps. shorter than calyx. Switzerland.—Much of the material listed as A. grandifora, A. pinifolia and A. flaccida belongs here.

Ledebouriàna. Alpine per., cespitose, glabrous, dichotomous, branched to 6 in. long: lvs rigid, narrow-awl-shaped and crowded: fls. on stiffish slender glabrous pedicels, sepals keeled, glabrous, mucronate, half as long as petals. S. E. Eu.

leptôcladus. Ann. similar to A. serpyllifolia, differing in its smaller narrower lvs., with slenderer branches and narrower caps. Eurasia; escaped in Va. and N. C.

liniflora (A. Bauhmorum). Tufted, to 8 in.: lvs. narrowly linear, acute: fls. white, to ½ in. across, sepals densely hairy, shorter than the caps. Eu.

lithophila. Per. to 1 ft., smooth: lvs. filiform, usually 34-2 in. long, erect: fis. white, petals twice as long as obtuse sepals. Sask. to Wyo. and Ida.—Perhaps only a variant of A. congesta from which it differs in its more open infl. and non-keeled sepals.

longifòlia: A. Preslii.

macradènia: A. glabrescens.

macrántha (Alsinopsis macrantha). Spreading tufted per. to 4 in.: lvs. subulate-filiform, to ½ in. long, obtuse, glabrous, 1-nerved: fis. white, petals longer than the acute sepals. Colo.

marina: Spergularia salina.

montana (Alsine montana). To 4 in.: lvs. lanceolate, to 3/4 in. long: fis. white, large, solitary, petals 2-3 times as long as calyx. S. W. Eu. Var. grandiflora is listed.

muscosa (Mochringia muscosa). Per. to 1 ft., glabrous, bright green's lvs. linear-filiform, to 1 in. long, acute, fleshy, 1-nerved: fis. white, in cymes of 2-6, sepals lanceolate, styles 2: caps. 4-valved. Cent. and S. Eu.

nórica: hort. name.

obtusiloba. Allied to A. sajanensis and often confused with it, differing in lvs. obtuse and more oblong, calyx and pedicels glandular, and wider petals. Alta. to New Mex.

octandra (Minuartia aretioides). Cespitose per. to 2 m., many-stemmed: lvs. linear-lanceolate to ovate, to ½ in. long, obtuse, fleshy, 3-nerved: fls. whitish, petals 4 and shorter than lanceolate sepals, styles usually 3, Austrian

pátula. Ann. to 10 in., finely pubescent to glabrous: lvs. linear-filiform, to 1 in. long, obtuse to acutish: fls. white, several in open terminal cymes, petals emarginate, sepals lanceolate, ribbed, acuminate. Ky. to Minn. south to

peploides. Branches procumbent, fleshy, to 4 in.: lvs. ovate-elliptic, to ½ in. long, light green, fleshy: fls. white. Eu., N. Amer.

pinifòlia (A. caucasica). Dwarf cespitose per with ascending parts: Ivs. narrow-awl-shaped or bristle-like, usually ½-1 in. long: fls. white, in small corymbs. Asia

Minor.

Préslii (A. longifolia. A. graminifolia of hort.). Tufted, glabrous, to 15 in.: lvs. linear and flaccid, the basal ones grass-like, to 8 in. long, st.-lvs. to 2 in. long, margins usually rough: fls. white, in loose open corymbis, petals about twice as long as ovate and usually obtuse sepals. Cent. Eu.—Widely distributed as A. graminifolia but this name must be reserved for the plant so listed in last column and differing from A. Preslii in its shorter stiff lvs. and compact head-like infl. Most of the material in the trade as A. tmolea is A. Preslii.

pùbera: Stellaria pubera.

pungens. Forming bristly tufts to 8 in. and more high: pungens. Forming oristly tutts to 8 in. and more night lvs. thorny, very narrow, nodes swollen: fis. white, solitary or in compact clusters, terminal or in axils near tip of branches. Spain.—Resembles A. jumperina from which it may be distinguished by its sepals 1/4 in. long or more and internodes more than 1/4 in. long.

purpuráscens. Decumbent, tufted, to 4 in.: lvs. ovate-lanceolate: fis. rose-lılac, 2-3: caps. cylindrical and much exceeding calyx-lobes. Pyrenees.

pusfila (Alsine pusilla). Ann. to 2 in: lvs. lanceolate, to 16 in. long, usually glabrous: fis. white, petals shorter than sepals. Calif. to Wash.

racemosa. Somewhat woody per. to 3 in. high, making mats: lvs. awl-shaped, curved, to 1/4 in. long, puberulous-cilate: fls. white, solitary, sepals lanceolate, acute and nearly as long as petals. Spain.

rectiva (Alsine recurva). Low tufted per. to 5 in., woody at base; lvs. subulate, to ½ in. long, often clustered: fls. white, openly corymbose, petals as long or longer than the 5-7-nerved lanceolate sepals. Asia Minor.

rèpens. Per., prostrate, pilose: lvs. ovate, subsessile: fis. solitary in axils, on short leafy peduncles, sepals:lanceolate, acute, as long or longer than corolla. Nativity not known.

rígida. Per. to 1 ft., branched: lvs. linear, to 5 in. long, margins rough: fls. white, in panieles. S. Russia.—Differs from A. Preslui in panieles compact and petals about as long as sepals.

Rosanii: A graminifolia.

rotundifòlia. Spreading tufted branches to 6 in.: lvs. roundish. ciliate, 1/2 in. across: fls. white, in axillary or terminal clusters on short pedicels. Siberia.

rupestris (Alsine rupestris). Tufted per. to 3 in., woody at base, glandular-puberulent: lvs. stiffly subulate, obtuse: fls. pink, in 3-5-fld. cymes, petals 1½ times as long as calyx, and pedicel 2-3 times as long as calyx. Syria.

sajanénsis. A somewhat confused name which has been used for three different plants: true A. sajanensis, A. obtusiloba and A. laracylolia. The true species is compact, with filiform branches, to 5 in.: lvs. subulate, to 1½ in. long, obscurely keeled: fls. white with very narrow petals. N. Eu. and Arctic Amer. south in mts. to Aris. and Que.

saxátilis: a confused name horticulturally, much of the material so listed may be referred to A. verna.

Saxffraga. Alpine cespitose per, glandular-hirsute: lvs. in rosettes, linear-lanceolate, about ½ in. long, acute, 5-7-nerved: fis. 2-7 in a cluster. S. E. Eu., Asia Minor.

serpyllifòlia. Ann. or bien. or sometimes per. to 1 ft., upright or prostrate, much branched: lvs. ovoid, hairy: fis. white, solitary, sepals longer than petals. Eu., Asia, N. Amer.

squarròsa: A. caroliniana.

Steveniana. Per. to 10 in.: lvs. bristle-like, margins white-cartilaginous: fls. white, in panicles. Armenia.—Resembles A. Preslii, differing in its shorter lvs. and glandular pedicels and peduncles.

stricta (Sabulina stricta). Tufted per to 1 ft.: lvs. linear-awl-shaped, to ½ in. long, stiff, with fascicles of smaller lvs. in the axils: fls. white, ½ in. across, in axillary clusters, sepals mostly ovate. N. H. to S. C. and Mo.

tetraquetra. Per. to 1 in.: lvs. oval, imbricated, leathery: fls. white, solitary, sepals and petals 4. Spain, Portugal.

texana. Per, resembling A. stricta and of which it may be only a variant, differing in lys. only to 1/2 in. long, a denser infl. and lanceolate sepals. Mo. to Tex

tmôlea. Tufted, st. very short: lvs. ovate-oblong, to 1/3 in. long: fls. white, in clusters of 1-3, sepals and pedicels glandular-hairy. Asia Minor (Mt. Tmolus, etc.).

vérna. To 3 in.: lvs. flat, narrow: fls. white, on thread-like sts. Eu. and Rocky Mts. Var. aùrea is listed as a form with yellowish-green lvs. Var. pubéscens (A. æqui-caults) differs from the typical form in its glandular-pubescent to puberulent calyces and pedicels. A compact leafy form making dense moss-like masses is listed as var. cæspitòsa, it occurs in dark and yellow-green foliage forms and is best propagated by division or cuttings.

ARÉNGA. Palmacex. Several monoccious feather-palms (lvs. sometimes pinnatisect) of trop. Asia and Malaya, unarmed except for needles in the heavy lf.-sheath fibers in some species, flowering from the upper lf.-axils downwards, in some kinds the tree dying when the last spadix has fruited: trunk solitary or several: pinnæ or parts with many strong nerves beside the midrib, whitish or gray underneath, jagged, notched or cut off at apex which is sometimes broadened, and often notched on sides: spadix much branched, peduncle short, branches drooping; sexes usually separate on different spadices but sometimes a pistillate between two staminates; stamens many: fr. more or less drupe-like, obovoid to globose, 2-3-seeded. Planted in warmest parts of U. S., and in western tropics. See Palm.

Ambóng (A. mindorensis. A. tremula). Trunk short and thick, but plant becoming a tree: lvs. very large, the blade to 10 ft. long and petiole to 6 ft.; pinnæ to 2 ft. and more long, somewhat paper-like, with several deep indentations or constrictions on either side: fr. globular, about 1 in. diam. Philippines

Engleri. Handsome, dwarf, perhaps to 10 ft.: lvs. gray-tomentose or -pubescent underneath, with many pinnæ that are narrow at the base of the lf. and broad towards its top, the sides and apex variously notched and jagged: spadix short: fr. about 1 in. or less across, subglobose, 3-seeded. Formosa; reported outdoors in S. Calif.

mindorénsis: A. Ambong.

minatorensis: A. Among.

pinnata (A. saccharifera). Sugar Palm. Monocarpic large palm, dying when the last spadices have ripened their fr.; trunk solitary, to 40 ft.: lvs to 20 ft. and more long, whitened beneath; pinne to 100 or more on either side, single and fascicled, variously dentate or notched or 2-lobed at apex: fr oblong-turbinate, about 2 in. long or somewhat more, flat or depressed on top, borne on very long spadices. Malaya.—Cult. in India for sugar made from the sap and for other uses: planted in S. Fla. for other uses; planted in S. Fla.

saccharifera: A. pinnata. trémula: A. Ambona.

AREQUIPA. Cactacex. A small genus of the subtribe Echinocactanæ, composed of 2-3 species, growing in mts. of Peru and N. Chile, characterized in part by long funnelform fls. having a scaly tube and ovary, with the scale axils hairy, the dry fr. dehiscing by basal pore.

leucótricha (Echinocactus leucotrichus). Solitary or cespitose, occasionally branching, globose to subcylindric, to 2 ft. long, erect, ascending or prostrate; ribs 10-20, compact; spines 6-20, pilose on seedling and young plants, becoming glabrous with age, radials to 1½ in. long, centrals longer; fls. scarlet, to 2½ in. long, tube slender, straight. Chile.

Weingartiana: listed name of uncertain botanical standing.

Low ARETHŪSA. Orchidaceæ. terrestrial orchids, one native in bogs in E. N. Amer. and sometimes planted in cool moist protected places. A. bulbòsa. To 10 in., with small bulbs: lf. solitary, linear, to 6 in. long: fls. solitary or rarely 2, rose-purple, nearly 2 in. long; lip drooping, fringed or toothed, white spotted with purple and yellow.

ARGÂNIA. Sapotacex. One hardwooded evergreen tree to 20 ft., often with spiny branches, native in Morocco. A. Siderôxylon. lanceolate-spatulate, entire, glabrous: fis. greenish-yellow, 5-pa ted, in clusters: fr. an oblong berry, the seeds yielding oil.—May be planted in S. Calif. Propagated by layers and cuttings.

ARGEMONE. ARGEMONY. PRICKLY-POPPY. Papaveracex. American prickly herbs (1 shrubby, not in cult.) with yellow juice, pinnatifid spine-tipped lvs., and large terminal fls., sepals often horn-tipped: grown as annuals in flower-garden. They thrive in any good soil and sunny exposure. Latin name in four syllables.

alba (A. intermedia). To 3 ft. and more, with pale or glaucous foliage: fis. large, white, the sepals with only slight tips: caps. somewhat hispid. Southern states and

grandiflora. To 3 ft.: lvs. white-veined: fis. white, 2 in. across, the sepals with stout long tips: caps. not prickly or only slightly so. Mex. Var. lutea has yellow fis.

híspida: A. platyceras var.

intermèdia: A. alba.

mexicana. To 3 ft.: lvs. white-veined, glaucous: fls. yellow or orange, 2 in. across: caps. prickly. Trop. Amer.

yellow or orange, 2 in. across; caps. prickly. Irop. Amer. platyceras. Crested P. To 4 ft.; Ivs. somewhat glaucous: fls. white or rarely purple, 2 in. across, closely subtended by bract-like lvs.; caps. very spiny. N. and S. Amer.—Apparently most common garden kind. Var. gigantêa is listed as more vigorous. Var. hispida (A. hispida), Hedgethod P., is densely bristly as well as having yellow spines. Var. rôsea has brownish-purple fls.

ARGENTACER: Acer saccharinum.

ARGENTINA: Potentilla Anserina.

ARGETA: Gibbæum petrense.

ARGYRÈIA. Convolvulacex. Twining (seldom nearly erect) pubescent or tomentose shrubs or per. herbs of Asiatic origin, with alternate simple lvs. and showy purple or rose funnelform fls.; grown under glass, and in the open far S. Propagated by seeds and cuttings over heat.

speciòsa. Woolly Morning-Glory. Large climber: lvs. to 1 ft. across, ovate-cordate, white-tomentose underneath: fls. rose, 2-3 in. long, on stalks to 6 in. long. India, Java,

splendens (Convolvulus splendens). Silver Morning-Glory. Tall climber: lvs. to 7 in. long and 4 in. across, elliptic with angular or rounded never cordate base, whitesilky-hairy underneath: fls. rose, $1\frac{1}{2}$ in. long, on stalks 1-4 in. long. India.

ARGÝRODÉRMA. Aizoacex.succulents of the Mesembryanthemum association, having solitary terminal bracted sessile fls. with numerous free petals; stigma 1, circular or oval.

aureum. Lvs. about 1 in. long, upper surface somewhat rhomboid: fls. yellow or golden, seated between the diverging lvs.; petals in 6 series, obtuse, truncate or emarginate.

Braunsii (Cheiridopsis Braunsii). Lvs. in 1 or 2 pairs, keeled, shining blue-green, often with red edges and keel, 2 in. long and 12 in. wide and thick.

brévipes (M. brevipes. Roodta digitifolia). Lvs. 4-6, 2 in long and ¼ in. wide, half-cylindrical, obtuse: fls. rose or purple, ¾ in. across, petals linear.

Delaètii: A. roseum.

fissum (M. fissum). Similar to A. brevipes but lvs. grayish-white.

Lésliei: A. octophyllum.

necopinum. Plant becoming tufted: lvs. to 1 in. long, in. wide and 1/2 in. thick, obtuse: fls. bright yellow, to in. across, petals linear.

octophyllum (M. octophyllum. A. Lesliei). Lvs. about 1 in. wide, broader than long, ½ in. thick, whitish: fis. yellow, to 1½ in. across, petals somewhat spirally curved. ròseum (A. Delaetii). Lvs. united about halfway, 1½ in. long, 2 in, wide and 1 in. thick, bluish-green: fls. violetrose, 3 in. across, petals very lax.

Schlechteri. Plant of 1 pair of lvs. united about half-way, ¾ in. long and ¼ in. wide, bluish-green.

testiculare (M. testiculare). Plant consisting of pair of ovate lys. to 1½ in. long, 2 in. wide and 1 in. thick, smooth and whitish: fls. white.—The plant cult. under this name is usually A. octophyllum.

Segregate Aizoaceæ. Mesembryanthemum, differing in technical characters: corolla showy, $34-1\frac{1}{2}$ in. or more across: seeds compressed and tuberculate. S. Afr., in dry habitats. For cult. see Mesembryanthemum.

longispinula: Sphalmanthus longispinulus.

pentagona. Shrubby, with spreading branches to 6 in. long: lvs. erect or spreading, to 1 in. long and ½ in. wide and thick: fis. solitary, orange to golden-brown, about 1 in. across.

radicans. Prostrate, with rooting branches to 1 ft. long: lvs. erect or spreading, to 1 in. long and $\frac{1}{2}$ 6 in. wide and thick: fls. solitary, white or pale yellowish, $\frac{1}{2}$ 4 in. across.

spinuldsa: perhaps an error for Mesembryanthemum

spléndens (M. splendens). Somewhat woody per., branched, erect: lvs. half-cylindric, glaucous, to 1 in. long, crowded: fls. white, on short thickened peduncle, the petals dontata

ARIKURY PALM. ARIKURYRÒBA. maceæ. One small graceful monoccious featherpalm of trop. Brazil, unarmed except for the strongly spined petioles, differing from Cocos (from which it is a segregate) in the small ovate pistillate fls. with valvate petals and plicate-sulcate spathe as well as in habit and much smaller fr. which has a solid and ruminate albumen; nutlet with thin fragile wall. A. schizophýlla (Cocos schizophylla. Arikury schizophylla. Arikury roba Capanemæ.) Trunk 2–8 ft., solitary, covered for the most part with lf.-bases: pinnæ green both sides with strong midrib and faint side nerves, about 1 in. broad notched or cut at apex: spadices in the axils of lower lvs., long-peduncled and becoming declined; staminate fls. on upper part of branches: fr. ellipsoid, 1 in. or more long, in a grape-like cluster. Probably adapted to S. Fla. Butia Bonnetii has apparently been planted as Cocos schizophylla. See also Areca Alica.

ARIL: an appendage or an outer covering of a seed, inside the pericarp, growing out from the hilum or funiculus; sometimes it appears as a pulpy covering.

ARIOCÁRPUS (Anhalonium).Cactaceæ. Spineless or nearly so, making a small nearly globular or top-shaped body of which the larger part is in the ground, with spirally arranged leaf-like thick tubercles: fls. diurnal, opening wide, from axillary areoles located between the tubercles, the areoles on the apex of the tubercles being barren.

fissuratus: Roseocacius fissuratus.

furfuraceus: A. retusus.

Kotschoubevanus: Roseocactus Kotschoubevanus.

Lloydii: Roseocactus Lloydii.

McDowellii: listed name of unknown botanical standing. prismáticus: A. retusus.

retusus (A. furfuraceus. A. prismaticus). Seven Stars, Body globular or flattish, woolly in center, about 4 in. across; tubercles to 1 in. long, spreading, not grooved on upper side: fls. nearly or quite white to pink, to 2 in. or more long; stigma 6-8-lobed. Mex.

scapharóstrus. St. to nearly 4 in. thick; tubercles triangular to 2 in. long and angles acute, areoles absent: fis. purple-red. Mex.

strobiliformis. Body slightly flattened, about 1½ in. high and 2½ in. diam., bluish-green, covered with scale-like tubereles, resembling a pine cone, crown slightly sunken and with short gray wool, areoles near top with 10-12 small bristles: fls. near the crown, very small. Mex.

sulcàtus: Roseocactus Kotschoubeyanus.

trigonus. Similar to A. retusus from which it differs in its more erect tubercles to 2 in. long, its pale yellow fis. and 8-10-lobed stigma. Mex.

ARISÆMA. Aracex. Widely distributed herbs mostly with tuberous roots, palmately compound or dissected lvs., and unisexual fis. borne on a spadix which is surrounded by the tubular spathe, the limb often arching above.

A few species are sometimes transplanted from the wild into moist shady places. Propagated by tubers and seeds.

Dracontium. Dragon-Roor. To 4 ft.: lvs. pedately 5-17-parted into lfts. to 10 in. long and 4 in. wide: spathe greenish, the tall-like spadix projecting: berries reddishorange. Me. to Fla. and Tex.

Griffithii. Lvs. of 3 nearly orbicular lfts. to 10 in. long: spathes rich purple veined green, with a spreading and wrinkled limb to 8 in. across. Himalayas.

japónicum: A. serratum var. Blumei.

serratum. A. serratum var. Blumei.

serratum. Lvs. pedately 5-11-parted into slenderpointed more or less serrate lits. to 6 in. long and 2 in. wide:
spathes green or purplish, on stalks to 20 in. high. Japan.
Var. Blumei (A. japonicum) has entire lits. and pale
spathes.

speciosum. Lvs. of 3 oblong to oblong-lanceolate lfts. to 16 in. long, the petiole spotted with purple: spathes purple with striped tube and caudate-acuminate limb; spadix with dark purple tail to ½ ft. long. Himalayas.

triphfilum. Jack-in-the-Pulpit. Indian Turnip. To 3 ft.: lvs. of 3 ovate or oblong-ovate lfts. to 7 in. long and 3½ in. wide: spathes green striped with purple, arched in a broad flap over the spadix: berries red. E. N. Amer.

Wallichianum. Lvs. of 3 broad-ovate lfts. to 8 in. long: spathes striped pale and dark purple, the slightly curved limb with tail-like tip. Himalayas.

ARÍSTEA. Iridacca. African herbs with lvs. in basal rosette and blue fls. in spikes, racemes or corymbs, the perianth-tube short and segms, twisting up spirally after flowering: grown under glass or in the open in Calif. Propagated by seeds and division.

capitata. To 4 ft.: lvs. to 4 ft. long and ½ in. wide, rigid: fls. ½ in. long, in long narrow panieles. S. Afr.

compréssa. To 1½ ft.: lvs. linear, to 1 ft. long and ½ in. across, strongly ribbed: fis. green with white and brown edges, in lax panicles: pod to ½ in. long. S. Afr.

Écklonii. To 1 ft. or more: lvs. to 1½ ft. long and ½ in. wide: fls. ½ in. long, in loose panicles. S. Afr.

lùcida: name of a plant 2 ft. tall with blue fis., botanical standing not clear.

ARÍSTIDA. Graminex. Tufted per grasses, having narrow often involute lvs. and narrow 1-fld. spikelets borne in panicles; adapted to dry soil and rarely planted.

purpurea. To 16 in.: lvs. to 5 in. long, involute: panicles to 8 in. long, with slender flexuous branchlets, spikelets with awns to 1 in. long. Ark., La. to New Mex.

ARISTOLÒCHIA. BIRTHWORT. Per. shrubs and herbs, lochiaceæ. mostly climbers, with usually heart-shaped entire lvs., bent odd-shaped very irregular tubular calyx simulating a corolla, often constricted at the mouth and sometimes tailed, and fr. a caps.; native in warm and temp. regions, and grown as porch vines or in the greenhouse, and a few of them as erect garden herbs.

The tender kinds do best in a greenhouse border of rich soil. Propagated by cuttings of ripened wood over heat, layers, and seeds. A. durior, hardy North, is a rapid grower and makes good screens for porches and for covering buildings.

brasiliensis. Climbing: fis. dingy-yellow veined with purple, with 2 very unequal lips, the upper narrow and to 4 in. long, the lower to 4 in. long and 7 in. across. Brazil. Var. macrophýlla has large lvs.

californica. Climbing to 12 ft., woody, deciduous: fis. greenish-purple, with strongly bent tube about 11/2 in. long, and 2-lipped limb, the upper lip 2-lobed. Calif.

Clematitis. Erect, to 2 ft., herbaceous: fis. yellowish-green, to 1½ in. long, with straight tube, in axillary clusters. Eu.; nat. in E. U. S.

dûrior (A. macrophylla. A. Sipho). DUTCHMANS-PIPE. Woody, climbing to 30 ft.: fts. yellowish-green, with curved U-shaped tube to 3 in. long and 3-lobed brownish-purple limb to 1 in. across. Pa. to Ga. and Kans.

élegans. Calico-Flower. Slender woody climber with drooping branches: fis. with yellowish-green inflated tube to 1½ in. long and nearly circular entire limb to 3 in. across, white veined purple outside, purple-brown inside. Brazil.

fimbriata. Sts. scarcely climbing: fls. with green strongly curved tube inflated at base and one-sided cordate limb to 1 in. across, greenish-brown outside, purple-brown inside veined with yellow, edged with long hairs. Argentina.

galeata. Climber: fis. with curved tube inflated below, to 3 in. long, and 2-lobed dark purple lip, the upper to 3 in. long and lower to 5 in. long which is clawed and expanding into broad blade purple outside and whitish inside. Brazil.

Galeottii. Herbaceous climber: fls. brown, with straight tube inflated below and broad-lanceolate limb barbed within. Mex.

gigantèa: A. grandiflora var. Hookeri.

gigas: A. grandiflora.

grandiflora (A. gigas). Pelican-Flower. Climbing, woody. fis. with yellowish-green inflated tube and cordate-ovate wavy limb 6 in. and more across, venied and spotted purple, with long tail. Jamaica. Var. Hookeri (A. gigantea), fis. with short tails. Var. Stûrtevantii, fis. very large with tails to 3 ft. long.

hastata. Erect herb to 3 ft.: lvs. narrow-lanceolate or linear, hastate or sagittate: ft. S-shaped, greenish, near the ground. S. U. S.

kewénsis. Hybrid between A. trilobata and A. brasilien-RiR

macrophella: A. durior.

macroura. Herbaceous climber: fis. brownish-green, with strongly curved tube inflated below and broad-cordate dark brown lip with slender twisted tail to 1½ ft. long.

odoratissima. Sweet-scented climber: fls. purple, with inflated tube about 1 in. long and cordate-oblong limb to 3 in. long. Jamaica, Cent. Amer.

Serpentaria. Virginia Snakeroot. Erect, to 3 ft., heibaceous: fis. about 1 in. long, greenish, with curved tube and short slightly 3-lobed limb. Conn. to Fla. and La.

Sinho: A. durior.

Stúrtevantil: A. grandiflora var.

tomentosa. Climbing to 30 ft., woody: fis. about 1½ in. long, with greenish-yellow U-shaped tube and yellow reflexed 3-lobed limb ¾ in. across. N. C. to Fla. and Mo.

triangularis. Herbacous climber with triangular lvs.:
fls. bright purple, spotted and veined, about 1 in. long, with
curved tube inflated below and broad-ovate emarginate lip.
Brazil.

ARISTOLOCHIACEÆ. BIRTHWORT FAM-ILY. Five genera mostly of warm regions, herbs or shrubs with alternate lvs., bisexual fls. with corolla-like 3-lobed calyx of various forms and colors, 6–36 stamens, mostly inferior 4–6–celled ovary, and capsular frs. Aristolochia and Asarum are known to hort.

ARISTOTÈLIA. Elæocarpaceæ. Evergreen trees or shrubs native in the southern hemisphere with simple lvs. opposite or nearly so, small unisexual fls. and fr. a berry; planted in S. Calif. for ornament. Propagated by cuttings of ripe wood under glass.

Colensoi. Similar to A. racemosa but smaller with quite glabrous lvs., simple racemes and smaller berries. New Zeal.

fruticosa. Shrub to 8 ft., much branched: lvs. leathery, obovate, to 1 in long, entire or lobed or on young plants pinnatifid: fls. solitary or in 3-6-fld. cymes. New Zeal.

Macqui. Shrub to 7 ft.: lvs. oblong, about 3 in. long, toothed, shining and sometimes variegated: fis. greenish.

racemòsa. New Zealand Wineberry. Tree to 25 ft.: lvs. ovate, to 5 in. long, deeply sharp-toothed: fls. rose, in many-fld. panicles: berry dark red or nearly black, size of pea. New Zeal.

ARMATOCÈREUS. Cactaceæ. A recently segregated genus of cacti which has not been validly published and whose botanical position is difficult to ascertain. Most of the species ascribed to it are given here under Lemaireocereus, which see. Among those not referable elsewhere are A. Jujuianus and A. matucanensis, the latter said to differ from Lemaireocereus latus in its thicker body and wider fls.

ARMED: provided with any kind of strong and sharp members, as if for defense, as of thorns, spines, prickles, horbe

ARMÈRIA (Statice, in part). THRIFT. SEA-PINK. Plumbaginacew. Dwarf perennials with usually narrow persistent lvs. in tufts or basal rosettes, fls. in heads on wiry scapes blooming early spring to late autumn. For discussion of generic nomenclature, see Statice.

Thrifts are useful in the border and rock-garden, and are sometimes used as edging plants. They succeed in any soil, doing best in a well-drained location in full sun; the son, doing best in a wei-dained rotation in this sun; the true alpine forms, such as A. juniperifolia, require complete surface drainage especially during the summer months. Propagated by seed or cuttings. Many of the species and their varieties hybridize freely and much of the material in the trade represents mixtures of various trade binomials and not the species indicated.

Recent studies indicate that most of the linear-leaved forms represent variants of a single polymorphic species and not separate entities as heretofore treated.

alnina: A. maritima var.

árctica: an ambiguous name: material so listed is referable to A. maritima var. californica or var. purpurea.

argyrocéphala: A. canescens var. leucantha.

Armèria: A. maritima var. elongata, but much of the material so listed is A. maritima var. purpurea.

atrosanguinea: hort. name for dark magenta-red fld. forms of A. plantaginea var. bupleuroides, A. maritima var. purpurea and A. pseud-armeria.

bupleuroides: A. plantaginea var.

cæsalpina. Hort, hybrid between A. juniperifolia and A. maritima var. alpina, having the multicipital habit of the former and the longer lf. of the latter, with scapes 4-6 in. tall and rosettes 3-4 in. across and as high.

cæspitòsa: A. juniperifolia.

canéscens. To 18 in.: lvs. of two kinds, the outer lvs. of each rosette of clump ½ as long as inner lvs. and twice as wide or wider, inner lvs. narrowly linear, to 3 in. long or more and about ¼ in. wide: fls. rose-pink, in heads about ¾ in. across, involucral bracts subtending the head tancolored. Mts. of N. Medit. region. Var. brachyphÿlla (A. majcillensis) differs in its somewhat longer scape with shorter calyx and calyx-lobe cusp. Var. leucântha (A. argyrocephala and A. undulata) has the head subtended by pale straw-colored involucral bracts and fls. usually white. Attica Mts.. Greece. Attica Mts., Greece.

cephalòtes: A. pseud-armeria.

córsica: probably A. leucocephala var. procera; the name has no botanical standing.

diantholdes: A. plantaginea var. leucantha.

dracúncula: plants offered under this name have been determined as Gypsophila, and the name has no botanical standing

elongata: A. maritima var.

fasciculăta: A. pungens.

filicallis. To 20 in.: lvs. as in A. canescens: scapes usually stiffly erect, narrow, heads to ½ in. across, fis. white or pink. Iberian Peninsula and S. France.

formòsa: plants so listed have been determined as A. pseud-armeria, A. plantaginea and A. gaditana.

gaditàna. To 2½ ft., glabrous: lvs. broadly oblanceolate to spatulate, to 8 in. long, usually 5-7-veined, somewhat flaccid: fls. pink, in heads to 2 in. across on very stout scapes with sheaths longer than heads are wide, outer involucral bracts lanceolate, acuminate to cuspidate and usually longer than the inner, no bracts present among the calyces within the head, calyx with conspicuous elongated basal spur extending below the point of pedicel insertion. Portugal and S. W. Spain.—The largest of the thrifts and less hardy than A. cephalotes under which name it is sometimes offered in the trade and from which it differs in its possession of a calyx-spur and in the absence of interfloral bracts.

gigantèa: listed name lacking botanical standing which has been applied to plants of A. gaditana, A. mauritanica, A. plantaginea or A. pseud-armeria.

grandifiora: listed name of no botanical standing usually applied to forms of A. pseud-armeria.

Hálleri: A. maritima.

japónica: listed name without botanical standing usually applied to hort. forms. of A. maritima.

junca (A. setacea). To. 10 in.: Ivs. of two kinds, the outer ones about ½ as long and twice as wide as the inner, inner lvs. of each rosette to 1½ in. long and ¼ in. wide or less, often glaucous-blue in color: fis. white or pink, inner involucial bracts obtuse and about as long as the outer

ones, calyx-lobes abruptly aristate. Iberian Peninsula and S. France.

S. France.
juniperifòlia (A. cæspitosa). To 2 in., in dense tufts of
many rosettes: lvs. awl-shaped, to ½ in. long, triangular in
cross-section, pungently-tipped, margins cliate: fls. white
to deep pink, in many heads to ½ in. across, on stout scapes
not more than I in. long. May. Guadarrama Mts., Spain.—
Very hardy alpine adapted to rock-garden culture, thriving
in well-drained soil whose surface is covered with a fine
stony scree to prevent summer decay. Much of the material
in cult. as this species is undoubtedly of hybrid origin as is
evidenced by larger flat lvs. and longer stout scapes. Var.
spléndens (A. splendens) has flat and somewhat longer lvs.
with scape 3-4 times as long and much narrower, head
usually nodding. Sosain. usually nodding. Spain.

latifòlia: A. pseud-armeria.

Laucheana: a rose-crimson color form of typical A. maritima

martima.

leucocéphala. To 8, rarely to 18 in.: lvs. linear or narrowly linear-lanceolate, ¾-1 in. long, limp and not erect, conspicuously glandular-punctate: fis. usually white, each individual cluster or cymule of head on distinct stalk within head. Corsica—The typical form not known to be in cult. Var. procèra (A. corsica of hort. probably) has lvs. 1½-5 in. long, erect or ascending, fis. usually pale rose-pink or occasionally white in erect heads on glabrous scapes. Var. Soleirolii (A. Soleirolii) differs from var. procera in lvs. finely and densely pubescent and scape often tomentose, fis white

macrophfila. To 2 ft.: lvs. very narrowly linear, usually 6-10 in. long, stiffly ascending, canaliculate, puberulous: scape slender, erect; fls. usually pink, in heads 1-1½ in. across, involueral bracts glabrous, calyx-tube hairy on nbs only, with base projected into distinct spur, interfloral bracts absent. S. Spain and Portugal.—Probably not hardy N., and material so listed is usually a variant of A. maritma.

majellénsis: material in the trade under this name is much confused; plants with lvs. of uniform shape and size are referred to A. maritima and its variants, those with are referred to A. maritima and its variants, those with shorter and wider outer lvs. and narrowly linear inner lvs. are referred to A. canescens var. brachyphylla (fis. pink) or var. lewantha (fis. white).

shorter and wider outer Ivs. and narrowly linear inner ivs. are referred to A. canescens var. brachyphylla (fls. pink) or var. leucantha (fls. white).

marftima (A. Halleri). To 1 ft.: Ivs. similar, linear to narrowly linear-lanceolate, to 6 in. long, 1-nerved, hairy or glabrous: fls. white to deep rose-pink, in hemispherical heads to ½ in. across on glabrous to densely tomentose scapes, outer involucral bracts usually mucronate, inner ones mucronulate to obtuse. S. Greenland, Iceland and N. W. Eu. Forms having deep rose-crimson fls. on scapes to 6 in. high are Laucheana (A. Laucheana) and spléndens, those with white fls. are álba.—As noted below, there has been brought together here under a single binomial several groups of plants heretofore treated horticulturally as species whose differences were supposed to be in technical characters of the calyces and involucre; this grouping has resulted because these characters are considered to be unreliable and no better ones have been found. Var. alpha (A. alpina. A. rhenana. Statice montana). Heads to I in across on stout glabrous scapes to 8 in. tall: Ivs. usually white-scariously margined and wider than scapes. Mts. of Cent. Eu. Most of the material in the trade as A. alpina is referable to dwarf forms of typical A. maritima or forms intermediate between the latter and A. juniperifolia. Var. elongâta (A. elongata. S. Armeria). To 2 ft.: outer involucral bracts linear-lanceolate, longer than inner ones and often exceeding width of head: Ivs. usually ciliate and acute. Var. califórnica (A. arctica in part). Differs from var. elongâta (A. elongata. S. Armeria). To 2 ft.: outer involucral bracts bituse and shorter than inner ones: fls. pink to magenta-purple. N. W. and Cent. Eu., Alaska to Wash. Var. sibírica (A. sibírica) has outer involucral bracts ½ as long as inner ones or less, scapes mostly only to 6 in. long. Arctic N. Amer. and Eurasia.

mauritánica. To 2 ft.: Ivs. oblong-lanceolate to spatulate, to 7 in. long and ½ in. across, interfloral bracts mostly only to

A. pseud-armeria.

plantaginea. To 2 ft.: lvs. lanceolate-spatulate, 4-8 in. long, acute, 3-5-nerved, glabrous, flaccid: fis. white to rose, in heads ½-1 in. diam., outer involucral bracts narrowly lanceolate and much longer than inner ones. Cent. and W. Eu. Var. bupleuroides (A. bupleuroides) has outer involucral bracts shorter than inner ones with fis. pink to purplish-red and var. leucantha (A. dianthoides) differs from it only in its white fis. and paler involucre. Var. longibracteata (A. stenophylla), differs from the typical form in its head ¾-¾ in. diam. and lvs. rarely exceeding 4 in. in length. 4 in. in length.

pseud-armèria (A. cephalotes, A. formosa of hort. A. latifolia). To 2 it.: lvs. broadly lanceolate to oblong-lanceolate, to 10 in. long and 1 in. wide, acute, 5-7-nerved, margin narrowly scarious: fls. white to dark rose-pink, head to 1½ in. diam., subtended by sheath to 4 in. long, outer involucial bracts usually longer than inner ones, acute to cuspidate, calyx spurless with lobes truncate to abruptly mucronate. Portugal.—The most commonly cultivated of the broad-lvd. thrifts, but sometimes confused with A wattlemen and A marginary. with A. guditana and A. mauritanica.

púngens (A. fosciculata). To 18 in: lvs. linear, to 5 in. long, acute and harshly pungent, often canaliculate along distal half, frequently recurved and closely fasciculate, glabrous: fis. rose-pink to white, in heads to 1½ in. diam, interforal bracts rudimentary or lacking, involueral bracts cornaceous and broadly white-membranaecous along margin. N. W. Medit, region.—Not considered to be hardy N. except perhaps on Pacific coast.

purpures: A. maritima var.

rhenana: A. maritima var. alpina.

robústa: listed name of no botanical standing; plants so named have been identified as A. maritima var. purpurea and A. plantaginea.

ròsea: listed name of no botanical standing, but applied to rose-colored forms of A. maritima and its vars.

setèces: A. juncea.

sibírica: A. maritima var.

Soleirdlii: A. leucocephala var.

splendens: true A. splendens is here treated as splendens: true A. splendens is here treated as A. junipersfolia var., but most of the material so listed is the rose-magenta fld. form of A. maritima known as Laucheana.

stenophýlla: A. plantaginea var. longibracteata.

undulata: A. canescens var. leucantha.

vérna: listed name.

vulgăris: A. maritima var. purpurea.

Welwitschii. Tufted shrubby per. to 1 ft.: lvs. linear, to 4 in. long, canaliculate or flat, usually pungently acute, glabrous: fis. pink, heads to 1½ in. across, interfloral bracts present, calyx with distinct basal spur, outer involucral bracts ovate, cuspidate to acuminate. Portugal.—Not known to be in cult. and perhaps not hardy N. Plants so listed have been identified as A. maritima var. purpurea.

ARMORÀCIA. Cruciferæ. herbs in Eu. and Asia, one widely grown in the vegetable-garden and also run wild in N. Amer.; one native species in N. Amer. is considered by some to be referable to this genus: radical lvs. large and often dock-like, variously dissected: fls. white, small: fr. an ovoid or short-oblong pod or silicle. A. rusticana (Nasturtium, Radicula and Roripa Armoracia), Horse-Radish (which see), is a deep-rooted glabrous strong per.: lower lf.-blades to 15 in. long and 9 in. across, crenate-dentate or jagged and sometimes dissected into linear segms., upper st.-lvs. lanceolate to oblong: fls. in spring in a terminal panicle: seedless. S. E. Eu.

ARNEBIA. Boraginacex. Old World herbs with alternate simple lvs. and yellow or violet slender-tubed fls. in racemes or cymes, throat without scales; sometimes grown in the border or rock-garden. Of easy cult. Propagated by seeds, division or cuttings.

cornuta. Arabian-Primrose. Ann. to 2 ft.: lvs. lan-ceolate: fis. yellow spotted with black, changing to maroon, 1/4 in. across. Orient.

echioldes. Prophet-Flower. Per. to 1 ft.: lvs. obovate-oblong: fis. yellow with purple spots, changing to pure yellow. Armenia.

ARNICA. Compositæ. Herbaceous perennials with clustered root-lvs. and opposite st.-lvs. and large long-stalked heads of yellow ray- and disk-fls.; pappus of bristles; native in Eu., Asia and N. Amer.

Arnicas are grown in the rock-garden or border or colonized in woodsy places. Tincture of A. montana has medicinal uses. Propagated usually by division, seldom by seeds.

alpina. To 15 in., pubescent: lvs. lanceolate or spatulate, to 4 in. long, nearly entire: heads about 2 in. across, usually solitary; pappus white. N. N. Amer., N. Eu.

amplexicablis. To 2 ft., glabrous or somewhat viscid: basal lvs. ovate, to 3 in. long, acute, those on the st. clasping with st. leafy to top: heads 3-5, to 2 in. across; pappus brownisth. Ore, northward.

betonicæfðlia. To 6 in., nearly glabrous: lvs oval to oval-lanceolate, to 1 in. long, toothed; heads 1-3; pappus

Chamissonis. To 2 ft., soft-pubescent: lvs. oblong-lanceolate, to 6 in, long, toothed or entire; heads to 2 in. icross, corymbose; pappus white or yellowish. B. C. to Mont

chionopappa. To 15 in., white-villous: basal lvs. long-petioled, lanceolate to narrowly-ovate, base cuneate, others on lower half of st., the upper ones sessile hends 1-3, to 1½ in. across, ray-fis. 15; pappus white. Que., N. B.

Clusii: Doronicum Clusii.

cordifòlia. To 16 in , sts. villous; lvs. ova e to orbicular, basal ones cordate, to 4 in. long, dentate, petioled, pubescent: heads 1-4, ray-fls. 8-12, pappus white N. Mich., S. D. to Colo. west to Calif and north to Yukon.

foliosa. To 2 ft., stoloniferous, gray-silky lvs. many, lanceolate: heads 1 m, across N, W, U, S,

Léssingii. To 1 ft. but often only 6 in : lvs. oblong-lanceolate to spatulate, to 3 in. long, scrula e, usually about 3 pairs: heads solitary, to 1½ in. across, nodding; rays light yellow, deeply notehed or 3-toothed. Alaska.

longifòlia. To 2 ft., pubescent: lvs. linear-lanceolate, to 6 m. long, entire or toothed; beads in flat-topped panicles; pappus brownish, plumose. Wash. to Mont. and Calif. Wash. to Mont. and

móllis. To 2 ft., pubescent: lvs. oblong-kanceolate, to 6 in. long, toothed: heads 1-3; pappus brownish, plumose. B. C. to Colo.

montâna. To 2 ft.: radical lvs oblong-lanceolate, glabrous, entire: heads to 3 in. across, 3-4 in a cluster; pappus white. Eu.

nevadénsis. To 1 ft., pubescent: lvs. orbicular or ovate, to 2¼ in. long, usually entire: heads ½ in. long. Calif.

pedunculata. To 2 ft., villous or glandular: lvs. oblong to linear, to 4 m. long, mostly basal, entire, st.-lvs. few: heads solitary, ray-fls. orange. N. D to Colo. west to Wash. and Calif.

sachalinénsis. To 2 ft, nearly glabrous: lvs. oblong-lanceolate, toothed: heads few. Sachalm Isl.

unalaschénsis. To 6 in: lvs. oblong, about 3 pairs, somewhat harry: heads solitary, ray-fis. bright yellow, disk light brown. Unalaska.

AROIDEÆ, AROIDS: Araceæ.

AROMA: Carllica glomerata.

ARÒNIA. CHOKEBERRY. Rosacex. American deciduous shrubs with alternate toothed lvs., white or pinkish fls. in terminal corymbs in early spring, and fr. a small berrylike pome.

Propagated by seeds sown when ripe or stratified and by suckers, layers and cuttings of green wood under glass. Useful for colonizing in low places, showy in bloom; fruit attractive in autumn.

arbutifòlia (Pyrus arbutifolia). Red C. To 10 ft.: lvs. gray-tomentose beneath: fr. red. Mass. to Fla. and Tex. Var. brilliantissima is advertised.

atropurpurea: A prunifolia.

floribùnda: A. prumfolia.

melanocárpa (A. myra. Pyrus melanocarpa and P. nigra). Black C. To 4 ft.; lvs. nearly glabrous beneath: fr. black. N. S. to Fla. and Mich. Var. elats is taller, with larger lvs. and frs. Var. grandifolia grows to 10 ft. and has larger lys. and frs.

nigra: A. melanocarpa.

prunifolia (A. atropurpurea. A. floribunda Pyrus arbutifolia var. atropurpurea). Purple C. To 12 ft.: lvs. pubescent beneath: fr. purple-black. Newf. to Fla. and Ind.

ARONICUM: Doronicum.

ARPOPHÝLLUM. Orchidacex. Trop. American epiphytes with slender pseudobulbs bearing solitary lvs. and red or purplish fls. in thick racemes, the sepals and petals similar, the lip concave and slightly 3-lobed; do best in a temperate greenhouse. See Orchids for cult.

gigantèum. To 2 ft pseudobulbs to 8 in. high: lvs. linear, to 1 ft. long. fls small, light rosy-red with somewhat darker lip, in stiffly erect racemes to 1 ft. high. Apr.-June. Mex. Guatemala.

ARRABIDÆA. Bignoniacex. Climbing trop. vines or shrubs mostly from S. Amer., having bifoliate to triternately compound lys. whose terminal lft. is often replaced by a tendril: fls. white to pinkish-purple, campanulate to funnelform, usually in dense elongated panicle-like clusters. One species is grown in Calif.

magnifica (Binnona magnifica). Vine to 10 ft.: lvs. opposite, bifoliate, lfts. obovate, to 4 in. long, usually obtuse or abruptly blunt-acute, glabrous, leathery, short-petioled: fls. rose-pink to pale purple, tubular-campanulate, to 3 in. long, usually with 5 orbicular lobes, tube streaked purple within: fr. a linear compressed caps. Colombia.

ARRACÀCIA. Umbelliferæ. Stout per. herbs native from Mex. to Peru, with pinnately compound lys., small white or dark purple fls. in compound umbels, and compressed frs.

One species is grown in the mountains of the tropics for the thick edible roots. Propagated by the small heads which form at the bases of the leaf-stalks.

esculénta: A. xanthorrhiza.

xanthorrhiza (A esculenta). Apro. Roots branching, with starchy yellow flesh: lvs. ternate or 2-pinnate. Co-

ARRHENATHÈRUM. Gramineæ. Tall per. grasses resembling oats, the spikelets in panicles, florets awned; native in Medit. region, nat. in N. Amer.; sometimes sown as a meadow grass. See Grasses

bulbdsum: A. elatius var. tuberosum.

elatius (A ena elatior). Tall Oat-Grass. To 4 ft., tufted: lvs. to 1 ft. long and 24 in. wide, rough: pameles 1 it. or more long, shining, light green or purplish, the branches erect. Nat. in N. Amer. Var tuberosum (A. bulbosum) has a string of tubers at the ground; often with striped lvs.

ARROJADÒA. Cactacex. A small genus whose members have been referred to Cereus and to Cephalocereus, from which it differs in that its pseudocephalum does not remain terminal but forms a collar for the new joint which is projected through its center.

rhodán ha (Cereus and Cephalocereus rhodanthus), erect, becoming somewhat prostrate with age, to 7 ft. long and 1½ in. dam, 10-13-ribbed; spines brown becoming white, areoles to ½ in apart: fls. solitary, pink to red, small, diurnal. fr. red, a small berry. Brazil.

ARROWHEAD: Santtaria.

ARROWROOT: Maranta arundinacea.

ARROW-WOOD: Viburnum dentatum.

ARSENOCOCCUS: Lyonia liqustrina.

ARTÁBOTRÝS. TAIL-GRAPE. Annonaces. Trop. climbing evergreen shrubs with alternate simple lvs., hooked peduncles adapted to climbing: fls. constricted above the closely packed stamens, and fr. of separate carpels borne in clusters on the hardened receptacle; grown in greenhouses or the open far S. Require fertile soil. Propagated by seeds.

odoratissimus. CLIMBING YLANG-YLANG. Lvs. oblong to 6 in. long: fis. very fragrant, greenish or yellowish, to 2 in. long: carpels yellow, smooth, 1 in. or more long. Old World tropics.

uncinatus. Shrub with climbing branches: lvs. lanceolate to oblong-lanceolate: peduncle with a strong hook: fl. brownish-red, pubescent: frs. several together, size of a walnut. E. Indies, Madagascar.—Planted in S. Fla.

ARTEMÍSIA. WORM WOOD. Compositæ. Aromatic and bitter herbs or small shrubs with alternate mostly dissected lvs. and small numerous yellow or white heads; fls. all tubular; pappus none. They are per. unless otherwise noted.

Wormwoods are grown for ornament but mostly for the medicinal and aromatic qualities. They thrive even in poor dry soil. Usually increased by division; also by seed when obtainable.

Abrôtanum. Southernwood. Old Man. Glabrous green subshrub to 5 ft.: lvs. 1-3-pinnately divided into thread-like segms.: heads yellowish-white, ½ in. across, in a loose panicle. Eu.

Absinthium. Common W. Absinthium. Subshrub to 4 ft., white-silky: Ivs. 2-3-parted into oblong segms.. heads yellowish, ½ in. across, in many-fid. leafy panicles. Eu.

álbula. White-tomentose, to 3½ ft., with slender spreading branches: lower lvs ovate, to 2 in, long, with 3-5 short broad lobes, upper lvs. linear or nearly so: heads small and numerous in little racemes terminating the branches. Fex., Colo., S. Calif.—Hardy N. and sometimes grown as "Silver King Artemisia."

annus. Sweer W. Ann. to 5 ft., glabrous, very sweet-scented: lvs. 2-3-pinnate, the segms. deeply cut: heads vellow A in across, in a loose many-fid. paniele. Asia; nat. in N. Amer.

arboréscens. Shrubby, to 2 ft.: lvs. finely divided, silvery: heads bright yellow, in one-sided racemes. Medit.

arbúscula. Low Sage-Brush. Shrub to 1 ft., silvery-pubescent: Ivs. wedge-shaped, 3-lobed, to $\frac{1}{2}$ in. long: heads brownish, in simple panicles, often spike-like. Wash. to Calif. and Wyo.

argéntea. Shrubby, to 2 ft., white-silky: lvs. 2-pinnate into linear or lanceolate segms.: heads woolly, nodding, in raceme-like panicles. Madeira.

Baumgartenii. To 1 ft., silvery-pubescent: lvs. 3-pin-natifid: heads yellow, racemose. Alps.

Bigelovii. Per. to 1 ft., woody at base: lvs. linear-cuneate to oblong, to ½ in long, usually 3-toothed at apex, silvery: heads in leafy panicles, yellow. Utah to Tex. and Ariz.

boreàlis. Per. to 15 m, silky-pubescent: lvs. to $2\frac{1}{2}$ in long, pinnate into linear lobes: heads small, greenish, in dense terminal panicle. N. N. Amer., N. Asia. Var. Wormskibldii is taller, to $1\frac{1}{2}$ ft.

campéstris. To 2 ft, shrubby, glabrous or becoming so: lvs. pinnatifid into linear segms: heads yellow, minute,

racemose. Eu., Asia.
camphorata. Shrubby, to 2½ ft., camphor-scented: lvs.
2-3-pinnate into thread-like segms., glabrous: heads yellow, nodding, silvery-pubescent, in panicles. S. Eu.

canadensis. Nearly or quite glabrous per. to 2 ft.: lvs. mostly 2-pinnate, with very slender segms.: heads greenish, small, in long narrow panicle. Newf. to New England and far west, Eu.

diversifòlia. White-tomentose, st simple, to 4 ft. or more: lower lvs to 4 in. long, mostly pinnately cut into narrow acute lobes, upper ones linear-lanceolate: fls. in a narrow paniele. Neb. to Calif. and north.

Dracúnculus. Tarragon. Estragon. Per. to 2 ft., glabrous, green: basal lvs. 3-parted at tn; st.-lvs. linear or lanceolate, entire or small-toothed: heads whitish-green, to ½ in across, in spreading panieles. Eu.—The lvs. are used as seasoning. Var. inodòra is listed. Var. sativa may not differ from the type.

Féndleri: catalogue name.

filifolia. Substrub to 3½ ft.: lvs. filiform, entire or trifid, to 1½ in long, minutely and densely white-tomentose: heads very small and numerous in narrow leafy panicles. Neb. to Nev., south to Mex.

frigida. Fringed W. Per. to 11/2 ft., silvery-pubescent: lvs. 2-punnate into linear segms.: heads yellow, nodding, in racemes. W. N. Amer., Asia.

glaciàlis (A. laxa). Per. to 4 in, gray-pubescent: lvs. pinnatisect: heads golden-yellow, in corymbs. Alps.

globulifòlia: catalogue name.

gnaphalòdes. White-tomentose per. to 3 ft. or more: lvs. simple, oblanceolate and somewhat serrate, the upper ones linear and entire: heads many in leafy panicles, small, grayish. N. U. S. and Canda.

granaténsis. Cespitose to decumbent, densely white-tomentose: lvs. oblong-cuneate, palmate, lobes divided, petiole longer than blade: heads many, inconspicuous. Spain.

laciniata. Per. to 1½ ft.: lvs. finely divided: heads nodding, ½ in. across, in panieles. Eu., Asia.

lactiflora. White Mugwort. To 4 ft., nearly glabrous: lvs. pinnately parted or cut into large toothed or incised segms. pale beneath: heads white, about \uparrow_1 in. across, loosely panicled. China.—Much like A. rulgaris.

latifòlia. Per., glabrous: lvs. 1-2-pinnatified, segms. oblong, entire: heads globose, in axillary racemes forming an erect panicle. Russia.

láxa: A. glacialis.

longifòlia. White-tomentose per. to 3 ft. or so: lvs.

linear or linear-lanceolate, simple and entire: heads erect, in narrow panicle. Neb. northwest.

ludoviciana. Western Mugwort. Per, erect or ascending to 3 ft.: lvs. linear-oblong, white-tonientose becoming green above, lower ones toothed or lobed, to 3½ in. long: heads bell-shaped, in rather dense panieles. Mo. and Utah to Tex. and Ariz.

macedónica: catalogue name.

maritima. To 2 ft., much branched, silvery-pubescent: lvs. 2-pinnate into linear segms.: heads brownish-yellow, in erect or drooping oblong racemes. Eu.

Michauxiana. Per. to 1½ ft., woody at base: lvs. to 2½ in. long, 1- or 2-pinnate into linear or lanceolate segms., white-tomentose beneath: heads ½ in. across, in spikeike infl. B. C. to Colo.

minùta. Undershrub to 4 in.: lvs. ½ in. long, pinnatifid with 5-7 divisions, silvery-silky: heads small, in spike-like infl. to 1½ in. long. Alta.

montana: a listed name, botanical position uncertain.

Mòxa. Shrubby, gray-pubescent, lvs. 2-pinnate into linear-lanceolate segms.: heads 1/6 in. across, nodding, in panieles. China.

mutellina. To 6 in.: lvs. pinnatisect into linear-lanceolate segms., silvery-pubescent: heads yellowish-green, in raceines. Alps.

pedatifida. Woody per. to 6 in.: lvs. ternate or biternate, white-tomentose: heads small, few, brownish. Wyo., Mont., Ida.

pedemontana. Small silvery-woolly per. to 6 in.: lvs. more or less rounded in outline, cut into linear divisions: fls. pale yellow, few toward top of st., sometimes not produced. Alps, S. Eu.—Sec A. ponta.

persica. Per. or bien. to 4 ft., white-tomentose: lvs pinnatisect: heads yellow, 16 in. across, in racemes, W

póntica. Roman W. To 4 ft., shrubby: lys, heary beponuca. ROMAN W. 10 4 It., shrubby: Ivs. noary below, pinnately cut into linear segms: heads whitish-yellow, b_8 in across, nodding in long open panieles. Eu.—Often remains sterile, forming patches of low feathery shoots; has been planted as A. pedemonuana.

Purshiàna. Cudweed W. To 2 ft.: lvs. ovate to lance-olate, mostly entire, white-woolly on both sides: heads white, in spike-like panicles. B. C. to Calif. and Neb.

R6throckii. Shrub to 1½ ft., grayish: lvs. to ¾ in. long, spatulate, entire or 3-toothed at apex: heads ¼ in. long, in spikes. Wash. to Calif.

rupéstris. To 6 in.: lvs. somewhat silky, 2-pinnatisect into linear segms.: heads yellow, nodding, in panicles. Eu.

Sacròrum. Russian W. Ann. or bien., shrubby below: lvs. hoary or white-pubescent, snuately cut: heads nodding, in slender racemes. Russia, Siberia. Var. víridis. Summer-Fin. Pyramidal, to 10 ft., with rich green much dissected foliage

Schmidtiana. To 2 ft., covered with silvery-white silky hairs: lvs. bipinnatisect, segms. luciniate, long-linear, acute: heads small, in pyramidal panicles. Japan. Var. nana is listed as a dwarf form.

scopària (A. gracilis). Ann., slender, to 5 ft.: lvs. much divided into hair-like segms.: heads small, white, in broad densely packed panicles. E. Eu.

serrata. Per. to 10 ft., much branched: lvs. lanceolate. to 6 in. long, serrate, white-woolly beneath: heads greenish, in across, in panicles. Ill. to S. D.

speciosa: listed name, of unknown botanical standing. spicata. To 6 in.: lvs. pinnatisect, silvery-pubescent: heads yellow, in spikes. Alps.

spinéscens (Picrothamnus desertorum). Spiny subshrub with hairy sts. to 2 ft. high: lvs. palmately 5-parted, each segm. 3-lobed, the latter lobes spatulate, pubescent: heads solitary or in small racemes. Wyo. to Ore. south to New Mex. and E. Calif.

spléndens. Tufted per., silky-pubescent: lvs. pinnate into narrow-linear segms.: heads globose, in long loose racemes. Asia Minor.

Stellerians. Beach W. Old Woman. Dusty Miller. Per. to 2½ ft., densely white-woolly: Ivs. pinnatisect into oblong entire or toothed lobes: heads ¼ in. across, yellow, in compact many-fid. racemes. Coasts, N. E. Asia, Que. to Del.

tridentata. Sage-Brush. Shrub to 12 ft., silvery-pubescent: lvs. wedge-shaped, to 1 in. long, 3-6-toothed or lobed, tips blunt heads 1/8 in. across, many, in panicles. B. C. to Calif. and Neb.

vulgåris. Mugworr. Per. to 3½ ft., much branched, sts. often purplish: lvs. pinnatifid into oblong toothed or entire segms., fragrant, white-tomentose beneath, dark green above: heads yellow, ½ in. across, in panicled spikes. Eu., Asia; nat. in E. N. Amer.

Wormskiòldii: A. borealis var.

ARTHROCÈREUS. Cactaceæ. A small genus of 3 known species from Brazil allied to Trichocereus and Monvillea, differing from each of these in the narrower and more pubescent fl.tube, the fls. borne mostly on terminal joints and not on previous season's growth, and the plants of a dwarfer habit.

Damazidi: A. microsphæricus.

microsphéricus (Cereus microsphéricus. Cereus and Monvillea Damazioi). Prostrate, much branched, joints globose to ellipsoid, glossy green, to 1½ in. long; ribs 8-11, areoles about ½ in. long, bristly, erect, radials 10-14, white, centrals 4-12, reddish-brown: fls. white, to 5 in. long, fragrant.

rondonianus. St. slender, somewhat erect, to 20 in. long; ribs 14-18, obtuse, low, areoles 14-14 in. apart; radial spines 40-50, bristly, mostly less than 14 in. long with a few to 34 in. long contrals 1-2, to 234 in. long: fis. lilac-pink inside, about 214 in. long.

ARTHROPÒDIUM. Liliaceæ. Tufted per herbs with fleshy roots, mostly basal lys., and white or purplish fls. in racemes or panicles, the perianth-segms. distinct; grown in S. Calif. and cult. as for Anthericum.

cándidum. To 14 in.: lvs. to 10 in. long and 1/4 in. wide, grassy: fls. white, 1/4 in. across, in simple racemes. New Zeal.

cirrhatum. To 3 ft.: lvs. to 2 ft. long and 2½ in. wide: fls. white, to 1 in. across, in panicles to 1 ft. long; filaments with 2 tendril-like appendages. New Zeal.

ARTICHOKE: Cynara Scolymus. Chinese: Stachys Sieboldu. Japanese: Stachys Sieboldu. Jerusalem: Helianthus tuberosus; see Girasole.

ARTICULATE: jointed; provided with nodes or joints, or places where separation may naturally take place.

ARTILLERY PLANT: Pilea microphylla.

ARTOCÁRPUS. Moracex. Trees with milky juice, large alternate lvs., staminate fls. in stiff spikes, pistillate in heads, and fr. imbedded in the fleshy perianth forming a heavy syncarp; native in the Asian tropics and grown in tropic climates for the fr. or general interest. For cult. see Breadfruit.

Cánnonii. Purple-lvd. greenhouse plant from the S. Seas, of doubtful botanical position: lvs. 3-ribbed from base and 2 basal side lobes and other lobes farther up, all the lobes toothed, sinuses open.

communis (A. incisa). BREADFRUIT. To 60 ft.: lvs. ovate, pinnately lobed, to 2 ft. and more long, dark green, thick and leathery: staminate spikes yellow, club-shaped, to 1 ft. long: fr. round or oval, to 8 in. across, yellow when ripe, covered with prickles. Polynesia.—The seedless forms are the breadfruits and those with seeds are known as breadnuts.

incisa: A. communis.

Integra (A. integrafolia). JAKFRUIT or JACKFRUIT. To 70 ft.: lvs. elliptic or obovate, to 8 in. long, stiff and glossy, entire: staminate spikes cylindric or club-shaped, to 4 in. long: fr. oblong, to 2 ft. long, greenish-yellow turning brownish, covered with hard points. India to Malaya.

integrifòlia: A. integra.

Lakoòcha. To 60 ft.: lvs. oblong or elliptic, to 1 ft. long, entire, pubescent beneath: fr. globose, to 3 in. across, smooth or wrinkled. India to Malaya.

ARUM. Aracea. Tuberous herbs native in Eu. and Asia, having arrow-shaped lvs. and unisexual fls. borne on a spadix surrounded by a spathe which is often colored; many plants once named in Arum are now transferred to other genera.

Arums require rich soil, plenty of water, and shady positions. Grown in pots in the greenhouse or some species hardy out-of-doors. Propagated by offsets of the tubers or by seeds.

cornùtum: see Sauromatum guttatum. crinitum: Helicodiceros muscivorus. Dracunculus: Dracunculus vulgaris, guttatum: Sauromatum guttatum.

italicum. A variable species of robust habit: lvs. about 8 in. long and broad, with petioles about 1½ ft. long: spathes green, white inside with purple limb which is reflexed over opening. Eu., N. Afr.

maculatum. Cuckoo-Pint. Lords-and-Ladies. A variable species to about 1 ft. high: lvs. to 10 in. long, the petioles about twice as long: spathes erect, to 10 in. long, green margined and often spotted with purple. Eu., N. Afr.

palestinum (A. sanctum). BLACK CALLA. Lvs. to 8 in. long, the petiole about 1 ft long: spathes green with limb deep purple inside. Syria, Palestine.

pedatum: Sauromatum guttatum var.

pictum. Lvs. oblong-ovate, to 10 in. long, deeply cordate at base, the petioles to 10 in. long: spathe with green tube and purple limb; spadix dark purple, longer than spathe. Medit. region.

sanctum: A. nal stinum.

vendsum: Sauromatum guttatum var.

ARUM, ARROW-: Peltandra. Ivy-: Scindapsus. Twist-: Helicodiceros muscivorus. Water-: Calla palustris.

ARÚNCUS. GOATS-BEARD. Rosacex. erect hardy herbs with 2-3-pinnate long-stalked lvs., small white unisexual fls. in spikes forming large panicles, and fr. of separate follicles, stamens numerous; native in the north temp. zone.

These plants thrive in moist partially shady locations; attractive because of the upright astilbe-like panicles of numerous small flowers. Propagated by seeds.

sylvéster (Spira a Aruncus. S. Humboldtu). To 7 ft.: lvs. ovate to oblong-lanceolate, to 5 in long, toothed. N. Amer., Eu., Asia. Var. Kneiffli is listed as having finely dissected foliage.

ARUNDINÀRIA. Gramineæ. Large shrubby grasses differing from Bambusa in having 3 instead of 6 stamens and other technical characters of florets; native in N. Amer. and Asia. See Bamboo.

aristata: Thamnocalamus aristatus.

aureo-striata: see Pleioblastus viridi-striatus.

auricoma: Pleioblastus viridi-striatus.

chrysantha: Sasa chrysantha.

débilis. To 10 ft., much branched: lvs. to 3 in. long and 1/3 in. across, nearly glabrous. Ceylon.

erécta: Pleioblastus Hindsii.

falcata (Bambusa falcata). To 20 ft., sts., yellow-green: vs. to 6 in. long and ½ in. wide, sheaths ciliate at apex. Himalayas.

Fálconeri: Thamnocalamus Falconeri,

fastudsa: Semiarundinaria fastuosa.

Fortunei: Pleioblastus variegatus.

gigantèa (A. macrosperma). Southern Cane. Cane Reed, To 25 ft.; lvs. to 1 ft. long and 1½ in. wide, finely toothed, glabrous or pubescent. Va. to Fla. and La., in swamps and by rivers.

grácilis: Pleioblastus humilis, Hindsii: Pleioblastus Hindsii.

Hookeriana. To 30 ft., glaucous: lvs. to 6 in. long and 3/2 in. wide, glabrous, rough on edges. Himalayas.

hùmilis: Pleioblastus humilis.

japónica: Pseudosasa japonica.

jaunsarénsis. To 15 ft., sts. with yellow scales at base: lvs. to 6 in. long and ¾ in. wide, rough on edges. Himalayas. macrospérma: A. gigantea.

marmòrea: Chimonobambusa marmorea.

Maximowiczii: Pleioblastus Chino.

Metake: Pseudosasa japonica.

Murieliæ: Sinarundinaria Murieliæ. Narihira: Semiarundinaria fastuosa.

nítida: Sinarundinaria nitida.

nobilis: Thamnocalamus Falconeri.

palmata: Sasa senanensis var. nebulosa. pumila: Pleioblastus pumilus.

pygmæa: Pleioblastus viridi-striatus var. vagans.

quadrangulàris: Bambusa angulata. Ragamòwskii: Sasa tes ellata. Simonii: Pleioblastus Simonii.

tecta. Similar to A. gigantea and often treated as a

variety but smaller, to 12 ft. high. Md. and Ind. to Tex., in low grounds and swamps.

tessellàta: Sasa tessellata. variegàta: Plenoblastus variegatus.

Veltchii: Sasa Veitchii.

ARÚNDO. Gramineæ. Very tall per. grasses with large flat lvs. and spikelets borne in large terminal plume-like close panicles; native in warm parts of the Old World and planted for bold effects. See Grasses.

Dônax. GIANT REED. To 20 ft., sts. or canes rather woody: lvs. to 2 ft. long and 3 in. wide: spikelets hairy, on ascending branches in erect panicles to 2 ft. high. Medit, region; more or less escaped in warm countries, and not hardy in the northern states. Var. versícolor (var. variegata) has yellowish- or white-striped lvs.

máxima: Phragmites maxima.

ASARUM. WILD GINGER. Aristolochiaceæ. Stemless per. herbs with long-stalked heart-shaped lvs. and large purplish or brown fls. borne singly near surface of ground; native in north temp. zone and sometimes transplanted to woodsy places from the wild. They require moist rich soil.

arifòlium (Hexastylis arifolia). Lvs. arrow-shaped, to 5 in. long, on stalks to 8 in. long, usually mottled: fis. 1 in. long, contracted at throat. Apr.-June. Va. to Fla. and Ala.

canadénse. Lvs. 2, to 7 in. across, on stalks to 1 ft. long: fis. brownish-purple, 1 in. across. Apr.-May. N. B. to N. C. and Mo.

caudatum. Lvs. 2, to 6 in. across, on stalks to 7 in. long: fls. brownish-purple, with lobes prolonged into tails to 2 in. long. June. B. C. to Calif.

europæum. Lvs. 2, to 3 in. across, on stalks to 5 in. long: fls. greenish-purple or brown, 1/2 in. long. Eu.

Hartwegii. Lvs. to 5 in. across, on stalks to 8 in. long, mottled with white: fis. brownish-purple, ½ in. across, with lobes prolonged into tails to 2½ in. long. Ore., Calif.

heterophyllum. Lvs. orbicular, ovate or triangular, base cordate: fls. purplish-brown without or occasionally orange-purple, lighter within, calyx campanulate and not constricted at mouth, to 1 in. long, lobes as long as tube. Mts. of N. C., Tenn. and Va.

Lémmonii. Lvs. 3 in. across: fls. brownish-purple, 1/3 in. across. Calif.

Shuttleworthii (Hexastylis Shuttleworthii). Lvs. 1-2, to 3 in. across, on stalks to 8 in. long, usually mottled: fis. mottled violet within, to 2 in. long. May-July. Va. to Ga. and Ala.

virginicum (Hexastylis virginica). Lvs. 1-3, to 3 in. across, on stalks to 7 in. long, usually mottled: fls. purple, to 3 in. long. May-June. Va. to S. C. and Tenn.

ASCÁRINA. Chloranthaceæ. Aromatic shrubs and trees native in New Zeal. and the Pacific Isls., having opposite lvs., minute unisexual fls. in spikes, and fr. a drupe; sometimes grown in Calif.

lùcida. To 25 ft.: lvs. oblong, to 2 in. long, coarsely toothed, glossy dark green above: spikes branched and drooping. New Zeal.

ASCENDING: in an upward direction but not truly erect; produced somewhat obliquely or indirectly upward.

ASCLEPIADACEÆ. MILKWEED FAMILY. About 220 genera of herbs, shrubs, frequently vines, widely distributed over the earth, particularly in the tropics, mostly with milky juice, opposite or whorled lvs., regular fls. commonly bearing a curious internal crown, anthers adhering to the stigma and the pollen united in masses called pollinia, monadelphous stamens, and fr. of 2 follicles with the seeds usually bearing long tufts of hair; many have medicinal and poisonous properties and some are grown for ornament, as Acerates, Araujia, Asclepias, Asclepiadora, Caralluma, Ceropegia, Chlorocodon, Cryptolepis, Cryptostegia, Cynanchum, Diplocyatha, Duvalia, Echidnopsis, Gompho-

carpus, Gonolobus, Hoodia, Hoya, Huernia, Huerniopsis, Marsdenia, Morrenia, Pachycarpus, Periploca, Philibertia, Piaranthus, Raphionacme, Sarcostemma, Stapelia, Stephanotis, Strophanthus, Stultitia, Tavaresia, Trichocaulon, Vincetoxicum.

ASCLÉPIAS. MILKWEED. SILKWEED. Asclepiadaceæ. Per. summer- or autumn-blooming milky herbs with fls. in axillary or terminal umbels, the 5 parts of the corolla strongly reflexed, showing a crown of 5 horned hoods: fr. 1 or 2 soft follicles, containing seeds with long silk: mostly native in N. and S. Amer. and Afr.

Of easy cultivation in the wild-garden or border; many of them have attractive habit, showy flowers and ornamental pods. Propagated by division, and also by seeds.

amplexicaulis. Sts. decumbent, to 2 ft. long, glaucous: lvs. cordate-ovate, apex obtuse, base clasping, glabrous: fls. greenish-purple: fr. unarmed, erect on recurved pedicels. N. C. to Fla. west to Tex.

cordifòlia. PURPLE M. To 2½ ft., glabrous: lvs. ovate-lanceolate, to 4 in. long, base cordate-clasping, tinged or streaked with purplish shades: fls. dark red-purple: fr. glabrous, to 5 in. long. W. Nev. to Calif.

Cornùtii: A. syriaca.

currassávica. Blood-Flower. To 3 ft.: lvs. oblong: fis. with reddish-purple corolla and orange hoods. Trop. Amer.; nat. in S. U. S.

exaltata: name sometimes used for A. phytolaccoides.

grandifiora: a confused name which has been applied to several different plants; the material in the trade may be A. syriaca or Pachycarpus grandiflorus.

Háilii. To 16 in.: lvs. lanceolate to ovate-lanceolate: fis. greenish tinged with purple. Colo.

incarnata. Swamp M. To 4 ft.: lvs. oblong-lanceolate: fls. rose-purple, rarely white (var. 4lbs). to 1/4 in. across. Swamps, N. B. to La. and Colo. Var. pülchra (A. pulchra) has broader lvs. and is hairy.

mexicana. To 5 ft.: lvs. glabrous, whorled or opposite, linear to narrow-lanceolate, to 6 in. long: fls. greenish-white, sometimes tanged purple. One. to Mex.

phytolaccoides. To 6 ft.: lvs. oval to oblong: fis. greenish-purple with white or pink hoods. Me. to Ga. and Ark.

púlchra: A. incarnata var.

pùmila: A. verticillata var.

purpurascens. To 4 ft.: lvs. ovate to oblong, to 8 in. long, acute or obtuse, almost glabrous above: fis. pale red to purple, to ½ in. across. N. H. to N. C. west to Ont. and Ark.

rùbra. To 4 ft.: lvs. ovate to lanceolate: fis. purplish-red, to ½ in. across. N. J. to Fla. and Tex.

speciosa. To 2½ ft., white-tomentose: lvs. ovate or oval: fls. purple-green, with long hoods. Minn. to B. C. and Calif.

subulata. To 5 ft., with rush-like sts. leafless or with few thread-like lvs.: fls. yellowish-white. Desert regions of Nev., Calif., Lower Calif.

Súllivantii. To 4 ft.: lvs. lthick, oblong to ovate-oblong: fis. purplish. Ont. to Minn. and Kans.

syriaca (A. Cornuti). To 5 ft.: lvs. oblong to ovate, pubescent beneath: fis, green or purplish. N. B. to N. C. and Kans.

tuberòsa. Butterfly-Weed. Pleurisy-Root. To 3 ft., rough-hairy: lvs. lanceolate or oblong: fis. orange. Me. to Fla. and Ariz. Var. sulfùrea, fis. primrose-yellow.

verticillata. Horsetall M. To 2 ft.: lvs. narrowly linear, in 3's to 7's: fis. greenish-white. Me. to Fla. and N. Mex. Var. pumila (A. pumila). To 10 in. high: lvs. filiform and densely crowded, the plant mat-forming.

ASCLEPIODÒRA. Asclepiadaceæ. N. American per. herbs differing from Asclepias in the spreading corolla and the hoods with a crest instead of a horn; sometimes transplanted to the wild-garden.

decimbens. Sts. to 1½ ft. long, decumbent or ascending: lvs. lanceolate to linear, to 6 in. long, thick: fis. greenish with purplish hoods, in umbels 2 in. across. Ark. to N. Mex.

ASCOCENTRUM. Orchidaceæ. Short-stemmed epiphytes with many linear lvs. and fls. in lateral many-fld. short-stalked racemes, the sepals

and petals equal, lip spurred. See Orchids for cult.

ampullaceum (Saccolabium ampullaceum). Fls. ¾-1 in. across, bright rose-carmine. Mar.-June. Himalayas, Burma, China.

miniatum (Saccolabium miniatum). Fls. orange-red or clear yellow, nearly 1 in. across. Jan.-June, Oct. Java, Philippines.

ASCOTAÍNIA. Orchidaceæ. Terrestrial orchids with 1-lvd. pseudobulbs and fls. in racemes on scape arising from the rhizome, the sepals and petals similar, the lip entire or 3-lobed and usually with 3-5 keels. See Orchids for cult.

viridifúsca (Tainia viridifusca). Lvs. up to 20 in. long and 3 in. wide: fis. with brownish-olive-green sepals and petals and yellowish-white lip, the scapes 1½ ft. or more high. Feb.-Mar. Burma, China.

ASCYRUM. Hypericacew. Low herb-like shrubs with opposite entire lvs. and bright yellow 4-parted fls. in terminal few-fld. cymes; native in N. and Cent. Amer. and Himalayas; differs from Hypericum in 4 rather than 5 sepals in 2 unequal pairs and in the separate stamens. Hardy in the N. with winter protection. Propagated by division and seeds.

Crúx-Ándreæ: name sometimes applied to A. hypericoides.

hypericoldes. Sr. Andrews Cross. To 2½ ft., much branched and often decumbent: lvs. oblong to linear, to 1½ in. long: fls. ½ in. across. Mass. to Cent. Amer. and W. Indies—Evergreen S. and useful in landscape work.

stáns. St. Peterswort. To 2 ft., the branchlets 2-edged or slightly winged: lvs oblong to obovate, to $1\frac{1}{2}$ in. long, clasping: fls. 1 in. across. L. I. to Fla. and Tex.

ASEXUAL: sexless; without sex, as in propagation by means of vegetative shoots rather than by seeds, also of flowers without stamens or pistils.

ASH: Frazinus. Mountain-: Sorbus. Prickly-: Zanthox-ylum americanum.

ASÍMINA. Annonaceæ. N. American shrubs or small trees with alternate simple lvs., axillary nodding white or purplish fls., and fr. of 1 or more berries.

They thrive in rich moist soil. Propagated by seeds sown in autumn or stratified, by layers, and by root-cuttings. Only A. triloba is hardy North.

angustifòlia. Shrub to 3 ft.: lvs. linear or oblanceolate, to 8 in. long: fls. white or yellowish, to 3 in. across: fr. to 2 in. long. Ga., Fla.

speciòsa. Shrub to 4 ft.: lvs. oblong or obovate, to 6 in long, tomentose on both sides: fts. yellowish-white, 3-4 in. across, before the lvs. Ga, Fla.

triloba. Papaw. Deciduous tree to 30 ft.: lvs. obevateoblong, to 1 ft. long, drooping: fis. purple, to 2 in. across, before the lvs.: fr. fleshy, 3-5 in. long, edible. N. Y. to Fla. and Tex.

ASOKA: Saraca indica.

ASPÁRAGUS. Liliacew. Per. herbs or woody vines and shrubs with fleshy, tuberous or cord-like roots, one a common garden vegetable and others grown for the ornamental green: lvs. reduced to scales, the branchlets (cladodes) narrow, green and leaf-like: fls. small and greenish: fr. a berry.

The decorative kinds are of easy culture but most of them are tender to frost. They are commonly grown under glass or other cover. Propagated by seed and division, and woody kinds also by cuttings. See Semcle; also Asparagus, Garden.

acutifolius. Shrub to 5 ft., branching: lvs. cylindrical, 1/2 in. long, spiny-tipped: fls. yellow, diccious: berries olive-green, waxy. Medit. region.

africanus. Partially climbing, woody, spiny: lvs. cylindrical, filiform, stiff, to I in. long: fis. in umbels. S. Afr.

ālbus. Shrub to 2 ft., branches very spiny, angular, flexuous and glabrous: lvs. to ¾ in. long, linear, in axillary fascicles of 8-12: fls. white, fragrant, in axillary fascicles of 6-12. Medit. region.

asparagoldes (A. medeoloides. Myrsiphyllum asparagoides). SMILAX A. SMILAX of florists. Branching vine: loss ovate, about 1 in. long: fls. 1-2 together, greenish-white: bernes dark purple, 1/2 in. across. S. Afr. Var. myrtifolius, Baby S., is a more graceful form with smaller lys.

Broussonètii. Per., rootstocks tuberous, sts. procumbent or laxly drooping, terete, striate: stipules short-acuminate with retrorse spines at base: Ivs. alternate, ternate, arcuate, 1 in. or more long, mucronulate: fls. greenish, usually in pairs. N. Afr.

cáspius: synonym of A. officinalis.

chinénsis: listed name of unknown botanical standing.

Cooperi. Vine to 60 ft.: lvs. very dark green, to ½ in. long, making fern-like sprays: fls. white: berries red, ¼ in. across. S. Afr.

crispus (A. decumbens). Climbing or drooping, to 6 ft.: lvs. needle-like, to 3/4 in. long: fis. 1 or 2 together, white, fragrant: berries white or pink, 1/4 in. across. S. Afr.

dahûricus. Herbaceous shrub to 3 ft.: lvs. acicular, in fascicles, to 1/2 in. long: fls. inconspicuous, solitary. Dahurica.

decúmbens: A. crispus.

drepanophýllus (A. Duchesnei). Climbing to 30 ft.: lvs. linear and sickle-shaped, to 3 in. long, forming fern-like fronds: fls. in erect racemes, greenish: berries scarlet, ½ in. across. Cent. Afr.

Duchésnei: A. drepanophyllus.

elongàtus: A. wrgatus.

falcatus. Climbing to 40 ft.: lvs. linear-lanceolate and sickle-shaped, to 3 in. long, dark green: fls. in racemes, white: berries brown. Trop. Asia and Afr.

filicinus. Climbing or straggling, much-branched, spineless: lvs. to ¼ in. long: fis. axillary not in racemes. Asia.

Hatcheri. A strong-growing form, probably A. plumosus var. robustus.

larícinus. Shrub with woody much branched sts.: lvs. awl-shaped, to 1 in. long: fls. clustered; berries 1/6 in. across. S. Afr.

Lútzii: an unidentified trade name.

madagascariénsis. Shrub to I ft.: lvs. lanceolate, ¾ in. long, so arranged as to resemble a pinnate lf.: fis. creamy-white, 4 together: berries scarlet. Madagascar.

medeoloides: A. asparagoides.

myriocladus. Nearly erect shrub to 6 ft.: lvs. thread-like, 1/2 in. long: fls. in racemes to 1 in. long. Natal.

myrtifolius: A. asparagoides var.

nànus: A. plumosus var.

officinalis: see Asparagus, Garden.

plumòsus. Fern A. Tall climbing, the long fern-like strands cut for decoration: lvs. needle-like, to ¼ in. long, bright green: fls. whitish, I—4 together: berries purple-liack, ½ in. across. S. Afr. Var. comorénsis 1s a robust form. Var. compáctus is dwarf as is also var. nanus, Dwarr A. Var. robústus is a strong-growing sort. Var. tenuíssimus has wiry sts.—Popular in its various forms.

retrofráctus. Shrub to 6 ft., slightly climbing: lvs. thread-like, 1 in. long: fls. white, in umbels. S. Afr.

scandens. Climbing to 6 ft.: Ivs. linear and curved, to ½ in. long: fls. greenish-white, nodding, 1-2 together: berries scarlet, ½ in. across. S. Afr. Var. deflexus is a smaller form with deflexed branches.

schoberioldes. Erect, to 3 ft.: lvs. flat, 3-angled: berries red. China, Japan.

spindsus: listed name.

Spréngeri. Climbing to 6 ft.: lvs. linear, 1 in. long: fls. in racemes, pinkish, fragrant: berries bright red, 1/2 in. across. S. Afr. Var. compáctus is a dwarf form and variegatus had variegated lvs.

tenuíssimus: A. plumosus var.

tetragonus. Climbing to 20 ft., roots tuberous: lvs. 3-4-angled, to ½ in. long; fls. white or pink, in racemes to 3 in. long, fragrant. S. Afr.

verticillàtus. Climbing to 15 ft., somewhat woody: lvs. thread-like, to 2 in. long: fls. 1-4 together: berries red, ¼ in. across. Persia to Siberia.

virgatus (A. elongatus). Erect, to 6 ft.: lvs. needle-like, to 3/2 in. long, dark green: fls. greenish-white, solitary: berries orange-red, 1/4 in. across. S. Afr.

ASPARAGUS, GARDEN or ESCULENT (Asparagus officinalis var. altilis). A developed of ameliorated cultivated form of the native Asparagus officinalis of the seacoasts of Europe and Asia, hardy perennial, grown

for its edible spring shoots; it has somewhat run wild near habitations in places; the indigenous plant in its native countries is shortbranched and more or less prostrate at base whereas the domestic asparagus (var. altilis) is strongly erect, to 3 feet or more. The genus comprises also many ornamental subjects: see Asparagus, preceding this article.

The edible asparagus is a universal favorite in the spring and is extensively cultivated. A plantation should yield well for ten years or more, but this longevity is dependent on good land deeply and thoroughly prepared in the beginning, fertile and enriched every year with good manure or concentrated fertilizer or both. Thickly planted garden beds are likely to run out sooner by overcrowding, and also by lack of tillage and other care.

Asparagus is propagated only by seeds, which are sown in drills 18-30 inches apart depending on the value of land and the method of tillage; thin to 3 or 4 inches in the drill or row. Till frequently, to keep the plants vigorous and keep the bugs away. The following spring the plants may be set in the permanent plantation; that is, the plants are yearlings. Seedlings vary considerably, and only the strongest should be saved for planting. Varieties are several; but the size and vigor depend largely on land, tillage and general care. Mary Washington, Martha Washington, Colossal and Palmetto, are wellknown kinds.

Plants are set permanently about 18-24 inches apart in rows 3 feet or more asunder; in field culture with horse tillage and particularly when plants are to be banked, the rows are often 6-8 feet apart; 4-5 feet is a good distance for most home places. Sometimes beds are planted much thicker, but very large succulent stalks are not to be expected. In the kitchen-garden a row at one side but where tillage may be given and 75 to 100 feet long should supply the usual family. The plants should be set deep, usually 6-8 inches in a furrow but not covered more than 2 or 3 inches at first; the furrow or trench is filled as the plants grow. Cutting should not be begun to any extent, in most regions, until the plants have grown two years. At three years the bed is usually ready for a full cutting. If a knife is used for cutting asparagus, make sure that it is given a slanting direction so that younger shoots beneath the surface will not be severed.

Keep the plantation free of weeds; till in early spring before the plants are up; till after cutting ceases and continue until the tops become too large. In regions of severe freezing let the old plants stand over winter to hold the snows and thus prevent deep freezing and alternate freezing and thawing. When feasible, it is desirable to disk in the dead plants in the spring to help maintain the humus supply of the

The beetle is controlled by spraying or dusting with arsenicals after the cutting season is past; sometimes a row is allowed to grow to attract the beetles, on which they may be poisoned; hand-picking is practicable on small home plantations; let poultry run in the patch. The beetles hibernate in rubbish about the place.

Asparagus is blanched by hilling up or banking, much as is celery. The natural green shoots are of better quality. The tenderness is a question of fertile soil, rapid growth and frequent

ASPÀSIA. Orchidaceæ. Epiphytic orchids with 1-2-lvd. oblong 2-edged pseudobulbs, differing from Odontoglossum in having the lip united to the column to the middle, and re-sembling Brassia in habit. Cent. Amer. to Brazil. Cult. as for Odontoglossum, in a moist atmosphere and shady position.

epidendroides. Lvs. lanceolate usually narrowly so, rarely to 1 ft. long: fls. 2-10, about 1½ in. across, in loose racemes; sepals and petals greenish-yellow transversely streaked with brown; lip white or yellowish with purplish-brown spots. Nicaragua to Panama.

principfssa. To 17 in. high: fls. 2-7, to nearly 3 in. across, in loose racemes; sepals and petals greenish with chocolate-brown longitudinal lines; lip white tinted with rose. Costa Rica, Panama.

ASPEN: Populus.

ASPÉRULA. WOODRUFF. Rubiaceæ. Herbs with square sts., whorled lvs. and small funnel-form 4-lobed fls. in forking cymes in early summer; native in Eu., Asia and Australia.

Woodruffs are grown in borders or rock-gardens where they thrive in shady situations in moist soil, although A. orientalis does well in the open flower-garden. Propagated by seeds and by division of the roots and clumps.

Athòa: A. Gussonei.

azùrea-setòsa: A. orientalis.

ciliata. Per. to 2 ft.: lvs. usually in 4's, linear-lanceolate, to 1½ in. long, acute, margins revolute, setose-ciliate, midrib often setose beneath: fls. white, tube as long as lobes, infl. a paniculate cyme. Cent. and E. Eu.—Very similar to A. tinctoria, differing in the setose-ciliate lvs. and longer corolla-lobes.

cynánchica. Per. to 1 ft.: lvs. in 4's, linear, to 3% in. long: fls. white or pink, few in paniculate cymes, tube longer than lobes. Eu., Asia.

galioides: A. glauca.

glatca (A. galioides). Erect per to 3 ft., sts. terete, glabrous, swollen at nodes: lvs. linear-acute, in whorls of 6-10, to nearly 1 in. long, glaucous beneath, margins revolute and minutely serrulate-spiculate, apex apiculate: fis. white, about ½0 in. long, in corymbose panicles. E. Eu.

Gússonei (A. suberosa. A. Athoa). Low tufted per.: lvs. opposite, in pairs, ovate-oblong to linear-lanceolate: fls. pinkish-white, inconspicuous. Sicily.

hexaphýlla. Per. to 2 ft. or more: lvs. in 6's, linear: fls. white, tube 3 times as long as lobes. S. Eu.

hirta. Hairy per. to 8 in.: lvs. in 6's, linear: fls. pinkish, small, tube slightly longer than lobes. Pyrenees.

humifusa. Per., decumbent, much branched: lvs. in s, narrow-linear: fis. cream-colored, tube about length of lobes. S. E. Eu.

is evigata. Per. to $1\frac{1}{2}$ ft.: lvs. in 4's, oval: fis. white, very small. S. Eu.

longiflòra. To 134 ft.: lvs. in 4's, linear or linear-lanceo-late: fls. pink or white, tube 2-3 times longer than lobes.

longifòlia: Galium longifolium.

lutea. Probably per., to 3 in., woody at base, sts. erect or ascending: lvs. linear-lanceolate, in 4's, serrulate-apiculate: fls. yellowish, to ½ in. across, in small terminal clusters. Greece.

odorata. Sweet W. Per. to 8 in., spreading, herbage fragrant: lvs. in 8's, lanceolate: fls. white. Eu, Asia.

orientalis (A. azurea-setosa). Branched ann. to 1 ft.: lvs. in 8's, lanceolate: fis. blue, $\frac{\pi}{2}$ in. long, in terminal head-like clusters subtended by leafy bracts. Eu., Asia.

scutellaris. Per. to 1 ft.: lvs. filiform, covered with translucent dots, margins revolute: fls. pale yellow, solitary, axillary and terminal on short peduncles. Albania.

suberdsa: A. Gussonei.

tinctòria. Dyers W. Per. to 2 ft., with reddish roots: lvs. in 4's and 6's, linear, margins revolute, glabrous: fis. white or reddish. Eu.

ASPHODEL: Asphodelus; also Asphodeline lutea. Bog .: Narthecium.

ASPHODELINE. JACOBS-ROD. Liliacex. Herbs with fleshy roots, simple sts., and white or yellow fls. in dense long racemes. Name in five syllables.

Hardy and of easy cultivation in any soil, useful for border or wild-garden. Propagated by division, and by seeds when available.

Balánsæ. To 2 ft.: lvs. all basal, linear, to 10 in. long: fls. white, about ½ in. long. Cilicia.

brevicaùlis. To 2 ft.: lvs. 3-6 in. long, linear: fls. green-ish-yellow, in lax racemes to 8 in. long, scape leafy to one-half its length. Asia Minor.

libúrnica. To 2 ft.: lvs. to 4 in. long, sts. leafy only a third or half the way to raceme: fls. yellow, in lax racemes, bracts small, to ¼ in. long. Greece, Austria, Italy, Dalmatia.

litea (Asphodelus luteus). Asphodel of the ancients. To 4 ft., with leafy sts.: lvs. linear, to 1 ft. long: fls. yellow, fragrant, 1 in. long. Medit. region.

taûrica. To 2 ft.: lvs. 3-9 in. long, narrowly linear, erect, sharp-pointed: fls. white, in dense cylindrical racenies, leafy to base of infl. Asia Minor, Greece.

ASPHÓDELUS. ASPHODEL. Liliaceæ. Fleshyrooted herbs with basal lvs. and white funnel-shaped fls. in racemes terminating leafless scapes.

Of easy culture in the open, in the border or wild-garden. Propagated by division.

álbus (A. delphinensis). Per. to 4 ft.: lvs. 3-angled: fls. 3/4 in. long. Medit. region.

delphinénsis: A. albus.

lùteus: Asphodeline lutea.

ramòsus. Per. to 5 ft.: lvs. sword-shaped: fls. in a branching infl. Medit. region.

taúricus: Asphodeline taurica.

tenuifòlius. Per.: lvs. 3-angled: scape long, much branched or panicled, bracts pale yellow. Medit. region, Canary Isls.

ASPIDÍSTRA. Liliaceæ. Per. herbs with thick roots, stiff and shining basal lvs., and dark bell-shaped fls. borne singly at surface of ground and obscured by foliage (and therefore not often observed).

Popular florists window-box and porch plants. They withstand hard usage, dull light and poor soil. Propagated by division in early spring.

elàtior (A. lurida). Lvs. to 2½ ft., oblong-elliptic, to 4 in. across, evergreen: fls. purple-brown, 1 in. across, China. Var. punctata has larger fls. which are pale green spotted with purple inside. Var. variegàta has lvs. striped green and white.

lùrida: A. elatior.

ASPIDIUM: Cyrtomium, Dryopteris, Polystichum.

ASPIDOSPÉRMA. Apocynaceæ. Trees with hard wood, native in S. Amer. and W. Indies, having simple lvs., small fls. in many-fld. terminal panicles, and fr. of 2 roundish or oblong follicles; one species has been planted in S. Calif.

Quebrácho-blánco. Tall tree with trunk to 3 ft. thick and white wood lvs. oval-lanceolate, to 3 in. long and 1 in. wide, entire, leathery and shining: fis. white: fr. to 3 in. long. Argentina.

ASPLENIUM. SPLEENWORT. Polypodiaceæ. A large genus of ferns, some of them native in the N. and therefore hardy, but most cult. kinds are grown in the greenhouse, usually evergreen with simple, deeply cut or compound fronds; sori attached to upper side of veinlets. Some of the species are now treated under Athyrium.

They require no special handling, but under glass should not be too much exposed to strong sunshine; if kept too wet they may lose color in the slow season. See Ferns.

acrosticholdes: Athyrium thelypteroides.

angustifòlium: Athyrium pycnocarpon.

Belángeri. Fronds evergieen, long and narrow, to 1½ ft. long and 4 in. wide, 2-pinnate, pinnules ¼ in. long, entire, often bulblets at the axils. Malaya.

Brádleyi. Fronds evergreen, oblong-lanceolate, 1½-8 in, long, 1-pinnate with the pinnæ oblong-ovate, obtuse, incised or pinnatifid, ¼ to 1 in. long, stipe chestnut-brown, N. Y. to Cia. and Okla.

bulbiferum. MOTHER S. Fronds to 4 ft. long and 1 ft. broad, 2-3-pinnate, pinne to 1½ in. long, lobed or divided, with bulbs or plantlets on upper surface. New Zeal., Australia, Malaya. Var. 14xum is smaller with finer foliage.

ebenèum: A. platyneuron.

Filix-fémina: Athyrium Filix-femina. Var. califórnicum: Athyrium Filix-femina var. californicum. Var. cyclosòrum: Athyrium Filix-femina var. sitchense.

gemmiferum. Fronds to 2 ft. long and 8 in. wide, simply pinnate, pinnæ to 6 in. long, slightly toothed. Afr., Madagascar.

Goeringianum: Athyrium Goeringianum.

Hemionitis. Fronds 6 in. long and wide, hastate, with 2 lateral lobes and triangular terminal lobe. Spain, Canary Isla.

lánceum: Diplazium lanceum.

longissimum. Fronds to 8 ft. long, simply pinnate, pinnæ to 4½ in. long, slightly toothed, rooting at tips, stipes blackish, to 1 ft. long. Malaya.

lùcidum. Fronds leathery, to 3 ft. long and 14 in. wide, simply pinnate, pinnæ to 6 in. long, wavy-toothed, stipes grayish, scaly, to 1½ ft. long. New Zeal.

montànum. Fronds triangular-ovate, 1-2-pinnate into ovate toothed or cut pinnæ, on stalks dark brown at base. Conn. to Ga. and Ark.

Nidus (A. Nidus-Avis). BIRDS-NEST-FERN. Fronds simple, bright green, stiff, erect, to 4 ft. long and 8 in. wide, entire, wavy or slightly lobed. Asia, Polynesia.

Nidus-Avis: A. Nidus.

párvulum: A. resiliens.

platyneùron (A. ebeneum). Ebony S. Hardy: fronds to 15 in. long and 3 in. wide, pinnate, stipes purplish-brown. Me. to Ga., Tex., Kans., and Colo.; S. Afr.

pycnocárpon: Athyrium pycnocarpon.

ressliens (A. parvulum). Fronds linear-elliptic, to 10 in, long, simply pinnate into elliptic entire or slightly crenate pinner, the stipes blackish and shining. Pa. to Fla. and Mex.; S. Amer.

Rûta-murăria. Fronds ovate-lanceolate to deltoid, to 3 in. long, 2-3-pinnate into narrowly cuneate or roundish-obovate pinnæ, toothed at the apex, with green stipes. E. U. S. and Eurasia. (The American and Old World plants are sometimes separated as subspecies).

thelypteroides: Athyrium thelypteroides.

Trichomanes. Maidenhair S. Hardy: fronds evergreen, simply pinnate, clustered, to 8 in. long and 3/2 in. wide, pinnæ about 1/2 in long, slightly toothed. N. Amer., Eu., Asia. Var. vespertinum: A. vespertinum.

vespertinum. Tufted, evergreen with numerous fronds, to 11 in. long and 1 in. wide, pinnæ oblong, deeply crenate, stipes purplish-brown, shining. S. Calif.

viride. Fronds to 8 in. long and 1/2 in. wide, simply pinnate into ovate deeply crenate pinnæ. N. N. Amer., Eu. Asia.

vivíparum. Fronds to 2 ft. long and 8 in. wide, 2-pinnate, pinnæ about $\frac{1}{2}$ in. long, often bulb-bearing. Mauritius, Bourbon.

ASPRELLA: Hystrix.

ASPRIS: Aira.

ASSONIA: Dombeya.

ASTARTÈA. Myrtaceæ. Australian heathlike shrubs with small opposite lvs. and small pink or white fls. solitary in the axils; one species occasionally planted in S. Calif.

fasciculàris. To 10 ft.: lvs. linear, 1/4 in. long, sometimes clustered. W. Australia.

ASTÈLIA. Liliaceæ. Tufted per. herbs native in New Zeal., Australia and Pacific Isls., with linear mostly basal lvs. and small unisexual fls.; one species is grown in the open in S. Calif.

Cockaynei. Differs from A. nerrosa in lvs. 1-11/4 in. wide, silky on both sides and often villous, and fis. in smaller less branched panicles. New Zeal.

nervosa. Lvs. to 8 ft. long and 1½-4 in. wide, leathery, many-nerved, margins recurved: fis. dark green, fragrant, to ½ in. across, in much branched panicles. New Zeal.

ASTER. STARWORT. MICHAELMAS DAISY. Compositæ. Herbaceous leafy-stemmed perennials, rarely annuals, with alternate lvs. and fl.-heads usually clustered, sometimes solitary, blooming in summer and autumn; rays numerous, flattish, white, blue, red or purple; disk-fls. mostly yellow; pappus of bristles. Asters of many kinds are characteristic of the N. American

autumnal flora. Some of them, as A. novi-belgii, have been much modified under cult. The species here listed are perennials.

Most perennial asters thrive best in a medium rich soil. Most perennial asters thrive best in a medium rich soil. The named garden forms are increased usually by division or cuttings as seeds do not reproduce true to type. The more common native asters may be propagated by seed sown in spring for bloom the following year, or by division in either autumn or spring. They are adapted to rear borders, for colonizing, and for bold clumps. The China aster of flower-gardens is a different plant: see Callistephus.

acris. To 3 ft., rough-hairy: lvs. linear, entire, to 1½ in. long: heads clustered, to 1½ in. across; ray-fis. blue. S. Eu. Var. nanus is very dwarf, not over 15 in.

acuminatus. To 3 ft., slightly pubescent: lvs. broadoblong, to 6 in. long, sharp-toothed: heads clustered, to 1½ in. across; ray-fis. white or purplish. Lab. to Ga.

Alicem: probably Erigeron Alicem.

Alicese: probably Erigeron Alicese.

alpinus. Rock A. To 10 in., pubescent: lvs. spatulate to linear-lanceolate, to 2 in. long, entire: heads solitary, 1½ in. across; ray-fis. blue or violet. Mts. of Eu. Asia, W. N. Amer. Vars. in the trade are: álbus, fis. white; dolomíticus, dark lavender; gigantèus, robust with larger fis.; himalàicus, lilac; Leichtlinii, bright blue; magnificus, white, said to be larger than albus; ròseus, bright rose; rüber, rosy-purple; speciòsus, heads to 4 in across; supérbus, larger than type and more showy; Wolfii, plant taller, sparsely pubescent, fis. blue. Alps.

altàicus. To 3 ft., sts. green, grooved: lvs. linear-oblong, to 2 in. long, sessile, obtuse, entire: ray-fis. blue, 20-30, in solitary heads to ¾ in. across. Cent. Asia.

amelloides: A. Amellus.

Amélius (A. amelloides). ITALIAN A. To 2 ft., rough-hairy: lvs. oblong or oblong-lanceolate, nearly entire: heads clustered, to 1½ in. across; ray-fis. purple Eu., Asia. Var. bessarábicus (A. bessarabicus) has larger deeper purple fis. Var. élegans is lower and free-flowering. Var. ibéricus (A. ibericus) has bright dark blue fls.

amethýstinus. To 5 ft., rough-hairy: lvs. linear-lanceo-late, to 2 in. long, entire: heads clustered, to 1 in. across; ray-fis. blue or violet. Vt. to Neb.

Andersonii. To 15 in.: lvs. mostly basal, linear, to 8 in. long, entire: heads solitary, to 2 in. across; ray-fis. purple or blue. Calif.

åpricus. To 8 in., pubescent: lvs. oblong, to 2 in. long: heads usually solitary; ray-fis. purple. B. C. to Colo. Var. Pikeànus has large blue-lavender fis., to 10 in. high.

asteroides: probably Sericocarpus asteroides.

azùreus. To 4 ft., rough-hairy: lvs. ovate to lanceolate, entire, to 6 in. long, the lower cordate and long-stalked: heads numerous, ½ in. across; ray-fls. bright blue. Ont. to Ga. and Tex.

Batesii. Per. to 2 ft., much branched: lvs. linear, to 1½ in. long and about ½ in. wide, sessile, spine-tipped, hispidulous-strigose: ray-fis. sky-blue, disk-fis. flesh-colored, heads to ½ in. across, bracts bristle-tipped. Neb.

Bellidiástrum (Bellidias rum Michelii). To 1 ft.: lvs. in a basal rosette, toothed: heads single; ray-fls. white. S. Eu.

Bergerianus: Felicia Bergeriana.

bessarábicus: A. Amellus var.

Bigelovii (A. Townshendii. Machæranthera Bigelovii). Bien. to 3 ft., pubescent: lvs. oblong or lanceolate, coarsely toothed: heads clustered, to 2½ in. across; ray-fls. violet. Colo. to Ariz.

brachýtrichus. To 10 in.: lvs. obovate, to 2½ in. long: heads solitary, to 2 in. across; ray-fis. violet. China.

cabúlicus: Microglossa albescens.

cærùleus: listed name for a blue-fld. form.

Cánbyi. To 2 ft.: lvs. oblanceolate, to 8 in, long: heads clustered, to $1\frac{1}{2}$ in. across; ray-fis. red-purple or rose. Ida. to New Mex.

capensis. Shrubby per., st. woody at base: lvs. usually opposite, oblong to suborbicular, base obtuse or cuneate, hairy, margins reflexed: ray-fls. bluish, in solitary heads. S. Afr. Var. rotundifolius (A. rotundifolius) may not differ from type, although some authors consider it an ann.

carolinianus. More or less woody, diffuse or climbing, to 4 ft., soft-pubescent: lvs. elliptic to lanceolate, 2-4 in. long: heads few or solitary on branchlets; ray-fls. pink or purplish.

cassiarábicus. To 2 ft., pubescent: lvs. ovate, toothed: heads clustered; ray-fis. pink. Russia. Var. grandiflorus is listed.

caucásicus. To 2 ft.: lvs. ovate to oblong-lanceolate, to 2 in. long, slightly toothed: heads solitary, about 1½ in. across; ray-fls. purple. Caucasus.

Chamissonis: A. chilensis.

Chápmanii. To 3 ft., unbranched, glabrous: lvs. linear, to 1 ft. long, entire: heads solitary, to 1 in. across; ray-fis.

chilénsis (A. Chamssonis). To 3½ ft.: lvs. lanceolate, to 5 in. long, entire: heads clustered, to 1 in. across; ray-fis. white, lavender or bluish. Calif.

cognàtus. To 1½ ft., shrubby: lvs. elliptic or oblong, to 1½ m. long, spiny-toothed: heads solitary, to 2 m. across; ray-fls. blue or violet. Desert, Calif.

cóncolor. To 2½ ft., st. little branched: lvs. linear-oblong to ovate, to 2 m. long, acute, densely canescent on upper sides and usually so beneath: ray-fls. lilac, in numerous heads forming an elongate raceme. S. New England to Fla. and La.

conspicuus. To 2 ft., pubescent: lvs. ovate to obovate, ½ in. long, toothed: heads in corymbs, to 1 in. across; ray-fls. violet. B. C. to S. D.

corditolius. BLUE Wood A. To 5 ft., much branched: lvs. ovate to lanceolate, to 5 m. long, the basal cordate and long-stalked, pubescent: heads numerous, to % in. across; ray-fis. violet or blue. N. S. to Ga. and Mo. Var. versicolor, with light pink fls., is listed.

corymbosus: A. divaricatus.

Cúrtisii. To 5 ft., glabrous: lvs. varying from linear to ovate, toothed: heads panicled, 1 in. across; ray-fis. violetblue. N. C., Tenn. to Ga.

decurrens: A. lævis.

Delavayi. To 3 ft.: lvs. ovate-lanceolate, toothed: heads solitary, to 4 in. across; ray-fis. blue-purple, disk violet-brown. China.

delicatus: hort. name.

diffùsus: A. lateriflorus.

diplostephioides. To 3 ft., pubescent: lvs. lanceolate, to 3 in. long, entire: heads solitary, to 3 in. across; ray-fls. blue or pale purple. Himalayas. A listed name under this species is Leichtlinii, pale blue.

divaricatus (A. corymbosus). White Wood A. To 21/2 ft., glabrous: lvs. ovate-lanceolate, toothed, long-stalked: heads in corymbs, to 1 in. across; ray-fls. white. Que. to Ga. and Tenn.

Douglasii. To 4 ft.: lvs. lanceolate to linear, to 6 in. long, entire or slightly toothed: heads in panneles, ½ in. across: ray-fis. light blue. B. C. to Calif. and Wyo.

dracunculoides (Galatella dracunculoides). Much branched. very leafy: lvs. linear-lanceolate: heads in corymbs: rayfls. blue. S. Eu., W. Asia.

Drúmmondii. To 5 ft., pubescent: lvs. ovate or ovate-lanceolate, toothed, to 4 in. long, basal cordate: heads numerous, to ½ in. across; ray-fls. blue. Ohio to Minn.

dumòsus. To 3 ft.: lvs. linear or spatulate, to 3 in. long, entire: heads numerous, ½ in. across; ray-fls. blue to white. Mass. to Fla. and La.

Eatonii. To 3 ft.: lvs. linear, entire: heads numerous, ½ in. across; ray-fis. lavender to whitish. B. C. to Colo.

elongatus. To 2 ft., woody at base, rigidly hispid, much branched: lvs. oblong-lanceolate to linear, to 1¾ in. long, 1-nerved, often entire and glandular-pubescent, thin: heads on long leafless stalks. S. Afr.

ericoides. HEATH A. To 3 ft.: lvs. spatulate to linear, to Sin. long, toothed: heads numerous, 1/2 in. across; ray-fis, white or pinkish. Me. to Fla. and Mo. Var. villösus (A. pilosus) is pubescent.

Fárreri. To 11/2 ft., pubescent: lys. linear or linearlanceolate, to 6 in. long, entire: heads solitary, to 3 in. across; ray-fls. deep blue. Tibet.

Féndleri. Tufted per. to 1 ft.: lvs. linear, to 11/4 in. long, sessile: ray-fls. violet, disk yellow, heads to 1/4 in. across, bracts and peduncle glandular. Kans. to Colo. south to Tex. and New Mex.

filifòlius (Diplopappus filifolius). Shrub to 3 ft.: lvs. linear-filiform, 3-5-nerved, glandular-punctate, glabrous: heads solitary, to 1 in. across; ray-fls. purple. S. Afr. Var. elongàtus as listed is probably A. elongatus.

floribúndus: A. novi-belgii.

fluviátilis. Per. to 3½ ft.: lvs. lanceolate-linear, to 4 in. long, slightly clasping or sessile, entire to denticulate: ray-fis. purple, disk yellow, heads to 1 in. across. Ia. to Colo.

foliàceus. To 3 ft.: lvs. lanceolate, to 4 in. long, nearly entire: heads few, 1 in. across; ray-fis. violet. N. N. Amer. Var. frondeus is A. frondeus.

Forrestii. To 1 ft.: lvs. mostly basal, obovate-lanceolate, to 4 in. long, entire, dark green: heads solitary, to 3 in. across; ray-fis. purple-violet, disk rich orange. Mts., across; ray-fls. Tibet, Yunnan.

Frèmontii. To 1 ft.: lvs. oblanceolate, to 4 in. long, entire: heads in small corymbs; ray-fis. purple. B. C. to Colo.

Frikartii. Hybrid between A. Thomsonii and A. Amellus: 2 ft.: heads solitary, to 3 in. across, fragrant; ray-fis. violet-blue.

frondeus (A. foliaceus var. frondeus). To 3 ft.: lvs. oblanceolate, to 8 in. long, entire: heads solitary or few, to 1 in. across. B. C. to Colo.

fruticosus (Diplopappus fruticulosus). Shrub to 3 ft., densely branched: Ivs. broadly linear, entire: heads solitary, 1 in. across; ray-fis. purple. S. Afr.

Garibáldii is referred to A. almnus.

grácilis. To 1½ ft., corymbosely branched: lvs. ovate to linear-oblong, petioled, to 3 m. long, minutely scabrous: ray-fis. 9-15, violet, heads about ½ in. across, numerous. N. J. to Ky. and S. C.

gracfilimus: hort. name for a form with small white fis. turning blue.

grandiflorus. To 2½ ft., hairy, much branched: lvs. oblong to linear, to 2 in. long, entire: heads solitary, 2 in. across; ray-fls. deep violet. Va. to Fla.

Greatai. To 2½ ft., pubescent: lvs. obovate, to 8 in. long, toothed above middle: heads numerous; ray-fis. light purple. Calif.

Harrowianus. Shrub to 5 ft.: lvs. lanceolate, to 5 in. long, toothed: heads in corymbs; ray-fls. pale purplish-blue. China.

hespèrius. To 3 ft., somewhat hairy: lvs. lanceolate, to 4 in. long, nearly entire: heads numerous; ray-fis. white or violet. Calif.

himaldicus. To 1½ ft., pubescent: lvs. obovate or oblong, to 2 in. long, entire or toothed: heads solitary, 1½ in. across; ray-fis. lilac-blue. Himalayas.

horizontalis. Per. to 3 ft.: lvs. lanceolate-acute, to 3½ m. long, heads to ¾ in. across, very abundant, in somewhat spreading panieles; ray-fis. pink to purplish. Probably W. Medit. region.

hýbridus: hort. name of uncertain application, but often applied to a garden race of dwarf forms in a wide assortment of colors and to which many varietal names have been given. The plant known as var. lùteus is Solidater luteus.

ibéricus: A. Amellus var.

inclsus: Calimerts incisa.

japónicus. Per. to 14 in., erect, pilose: lvs. elliptic, to 2½ in. long, entire, many-nerved, margins long-ciliate: heads to 1¼ in. across; ray-fls. purplish. Japan.

Kúmleinii. To 1½ ft., st. often yellowish: lvs. oblong, 1 in. long, sessile: heads to ½ in. across; ray-fls. bluish-violet. Wis. to Tex.

làvis (A. decurrens). To 4 ft., glabrous: lvs. ovate to lanceolate, to 5 in. long, entire or toothed: heads numerous, 1 in. across; ray-fls. blue or violet. Me. to Lu.—Modified in cult., and often grown in tropics. Var. subalphus is listed as a dwarf mt. form to 2 ft.

lanceolatus: a confused name; plants so listed may usually be referred to A. paniculatus or A. salicifolius.

lateriflorus (A. dufusus). To 5 ft.: lvs. ovate to linearoblong, to 5 in. long, toothed: heads numerous, ½ in. aeross; ray-fis. white or pale purple. N. S. to N. C. and Tex. Var horizontalis hus long wide-spreading branches.

ledophyllus (Eucephalus ledophyllus). To 2½ ft.: lvs. lancolate, to 2 in. long, entire or slightly toothed, tomentose beneath: heads solitary or clustered; ray-fis. violet. B. C. to Ore.

likiangénsis. Dwarf, glandular-hairy, to 9 in., bearing 1 neud: lvs. mostly basal, lanceolate to ovate or obovate, to 1 in. or more long and ½ in. broad: heads large; ray-fls. blue-purple, about ¾ in long. Yunnan, China.

linariifolius (Ionactis linariifolius). To 2 ft, very leafy, hairy: lvs. linear, | to 1 ½ in. long, entire, stiff: heads several, 1 in across; ray-fls. violet or rarely white. Me. to Fla. and Tex.

Linosyris: Linosyris vulgaris.

Lîpskyi. Differs from A, subcaruleus in the more robust habit and larger lilac fis. Tibet.

longifòlius (A. rargineus). To 3 ft., much branched: lvs. lanceolate or linear-lanceolate, to 8 in. long, entire: heads numerous, 1 in. across; ray-fis. violet or pale purple. Lab. to Mont.

Lowrieanus. To 4 ft., glabrous or nearly so: lvs. ovate-lanceolate, to 6 in. long, base cordate, serrate or incised, petioles frequently winged: ray-fls. light blue, heads to 1½ in. across. Conn. to Ky. and to Ont.

lûteus: the material in cult. so named is probably Solidaster luteus.

Maackii. To 2 ft., hairy: lvs. lanceolate, to 2½ in. long, nearly entire: heads solitary, large; ray-fis. bluish. Japan.

macrophfilus. To 3 ft., rough: lvs. cordate-ovate to oblong, to 10 in long, toothed: heads numerous, about 1 in. across; ray-fis. lavender. Canada to Minn. and N. C.

méritus. Ascending to 1½ ft.: lvs. narrowly-elliptic to lanceolate, to 2½ in. long, acute sessile, serrulate, base of larger lvs. cuneate: ray-fis. violet, heads to 1 in. across. S. D. to B. C.

miser: ϵ name of uncertain botanical standing; the plants so named in the trade may be A. numneus.

multiflorus. To 7 ft., rough: lvs. linear or linear-oblong, to 1½ in. long, entire: heads crowded, ½ in. across; ray-fls. white. Me. to Ga. and Ariz.

nebraskénsis. Per. to 2½ ft.: lvs. oblong-lanceolate, to 3 in. long, acute, sessile, entire: heads few, to 1½ in. across; ray-fis. purple. Neb.

nemoralis. To 2 ft., slender, st. puberulent: lvs. oblong-lanceolate or narrower, acute, to 3 in. long, dentate or entire, sessile: fls. violet or purplish, to 1½ in. across. Newf. to N. J. and west.

nove-inglise. New England A. To 5 ft., very leafy, hairy: lvs. lanceolate, to 5 in. long, entire: heads crowded, to 2 in. across; ray-fls. deep purple. Que. to S. C. and Colo.—Color forms listed are albus, roseus, ruber and violàceus.

novi-belgii (A. floribundus. A. thyrsiflorus). New York A. To 3 ft., glabrous: lvs. oblong to linear-lanceolate, to 6 in. long, nearly entire: heads numerous, about 1 in. across; ray-fls. bright blue-violet. Newf. to Ga.—Many of the named hort. asters belong here, largely of Europear origin. Var. nanus is listed.

oblongifòlius. To 2 ft. or more, pubescent, much branched: lvs. oblong to lanceolate, somewhat clasping, entire, acute, to 2 in. long: fls. violet to rose-pink. Pa. south and west. Var. rigidulus has more rigid and hispidulus lvs. and is of lower stature.

occidentalis. To 3 ft.: lvs. linear-lanceolate, to 8 in. long, entire or with few teeth: heads in corymbs, ½ in. across; ray-fls. violet. Alaska to Calif.

Orcuttii. Bushy per. to 3 ft., woody at base: lvs. obovate to oblong, to 2 in. long, glabrous, spiny-toothed; heads solitary, to 2½ in. across; ray-fls. lavender. Calif.

oreganus. To 2 ft.: lvs. linear or linear-lanceolate, to 3 in. long, entire: heads clustered, 1/3 in. across; ray-fls. purplish or white. B. C. to Nev.

oreóphilus. Probably per., to 18 in., pubescent: lvs. spatulate to oblong-linear, to 2½ in. long, obtuse, sessile, pilose beneath: heads usually 3-7 in erect fastigiate corymb, to 1½ in. across; ray-fis. violet, bracts of involucre obtuse. China.

orientalis: Inula britannica.

paludòsus. To 2½ ft., scarcely branched: lvs. linear, to 6 in. long, entire: heads fcw, to 2 in. across; ray-fis. deep violet. Swamps, N. C. to Fla. and Tex.

paniculatus. To 8 ft., much branched, nearly glabrous: lvs. lanceolate to linear, to 6 in. long, slightly toothed: heads numerous, ¾ in. across; ray-fis. white or tinged violet. N. B. to Mont. and Mo.

patens. To 3 ft, rough, branched: lvs. ovate-oblong, to 3 in. long, entire: heads solitary, 1 in. across; ray-fis. purplish-blue. Me. to Fla. and Tex.

Páttersonii (Machæranthera Pattersona). To 8 in., bien., hairy: lvs. spatulate, to 2½ in. long, slightly toothed: heads solitary or few, 1 in. across; ray-fis. purple. Mts., Colo.

paucicapitâtus (Eucephalus paucicapitatus). To 1½ ft.: lvs. elliptic-oblong, 1 in. long: heads usually solitary, 1½ in. across; ray-fis. white turning pink. Wash.

peregrinus: Erigeron peregrinus.

pilòsus: A. ericoides var. villosus.

Pôrteri. To 1 ft., glabrous: lvs. linear or oblanceolate, to 4 in. long: heads numerous; ray-fis. white. Colo. Var. superbus is an improved form.

piècox: hort. form with purple rays and orange disk.

ptarmicoldes (*Unamia alba*). WHITE UPLAND A. To 2 ft.: lvs. linear-lanceolate, to 6 in. long, nearly entire: heads corymbose, to 1 in. across; ray-fis. white. Mass. to Colo.

pulchéllus: hort. name; perhaps Erigeron pulchellus.

puniceus. To 8 ft., with reddish hairy sts.: lvs. lanceolate, to 6 in. long, toothed or entire: heads numerous, to 1½ in. across; ray-fls. violet-purple to white. Swamps, Newf. to Minn. and Ga.

Púrdomii. Per. to 6 in.: lvs. mostly basal, few, ovate to obovate-elliptic, to 1½ in. long, distinctly petioled, briefly setose-pubescent on each side, margin 2-3-toothed: heads to 2½ in. across; ray-fls. pale violet. China.

pyramidalis: listed form with light blue fis. tinged rose.

pyrengus. To 1½ ft., rough-pubescent: lvs. oblong-lanceolate, toothed: heads solitary or few, 2½ in. across; ray-fis. lilac S. Eu.

Rádula. To 2 ft.: lvs. lanceolate, to 3 in. long, toothed: heads several, to 1½ in. across; ray-fis. violet. Swamps, Newf. to W. Va.

Róbinsonii: listed name.

roseus. The material so named in the trade is probably a form of A. non-belgn. True A. roseus from Caucasia is a per. to 15 in., with lvs. narrowly linear, entire and sessile.

rotundifòlius: A. capensis var.

sagitifòlius. To 5 ft.: lvs. ovate-lanceolate, to 6 in. long, toothed, the lower cordate or sagittate at base: heads crowded, ¾ in. across; ray-fis. light blue or purplish. N. C. to Ga. and Mo.

salicifòlius. To 5 ft., much branched, glabrous: lvs. lanceolate or linear-lanceolate, to 4 in. long, entire or slightly toothed: heads numerous, 1 in. across; ray-fls. violet-purple to white. Me. to Fla. and Tex.

salviæfòlius. Alpine: lvs. pubescent: fls. white, large, single. Japan.

Schrèberi. To 3 ft.: lvs. cordate-triangular to lanceolate, to 7 in. long, toothed: heads corymbose, to 1 in. across; ray-fls. white. N. Y. to Mich. and Va.

sericeus. To 2 ft, much branched: lvs. oblong, to 11/2 in. long, entire, silvery-pubescent: heads numerous, 11/2 in. across; ray-fls. violet-blue. Ill. to Tex.

Shortii. To 4 ft.: lvs. cordate-ovate to lanceolate, to 6 in. long, nearly entire, pubescent beneath: heads numerous, 1 in. across; ray-fis violet-blue. Pa. to Ga. and Tenn.

sibfricus. To 2 ft : lys. oblong to lanceolate, 1-3 in, long. N. Asia, N. Eu. Var. alaskénsis is listed.

sinénsis of lists is Callistephus chinensis.

spectabilis. To 2 ft.: lvs. oval to linear-oblong, to 5 in. long, nearly entire: heads several, 1½ in. across; ray-fis. bright violet. Mass. to Del.

Stracheyi. Stolomferous, dwarf: lvs. obovate-spatulate, to 2 in. long, toothed or cut: heads solitary, 3/4 in. across; ray-fis. lavender-blue. Himalayas.

subceruleus. To 1 ft., pubescent, unbranched: lvs. oblong, entire or toothed: heads solitary, to 2 in across; ray-fis pale blue. India. A listed form with lavender fis. is Leichtlinii.

subcordatus cærûleus: hort, form with lavender-blue

subséssilis. Erect to 3 ft. or more, much and stoutly branched: lvs. ovate-oblong, to 3 in. long, sessile, entire, acute, often clasping: heads small, many, very short-peduncled. Mo. to Ala.

supérbus: probably A. alpinus var.

surculosus. Creefing A. To 1½ ft.: lvs. linear-lanceolate, to 3 in. long, somewhat dentate, lower ones petioled: ray-fis. violet, heads to 1½ in. across. Ky. to Ga. Var. álbus is listed.

tatáricus. To 7 ft., hairy: lvs. lanceolate or ovate-lanceolate, the basal to 2 ft. long, entire: heads numerous, 1 in. or more across; ray-fls. blue or purple. Siberia.

tenuifòlius. To 2 ft.: lvs. linear, to 6 in. long, entire: heads few, to 1 in. across, ray-fls. pale purple to white. Salt marshes, Mass. to Fla.

Thomsonii. To 3 ft., hairy: lvs. broad-ovate, to 4 in, long, coarsely toothed: heads few, to 2½ in. across; ray-fls. lilac. Himalayas. Var. nânus is listed.—Plants grown under this name may be forms of A. novi-belgii.

thyrsifldrus: A. novi-belgii.

tibéticus. To 1 ft., hairy: lvs. lanceolate to oblanceolate, to ½ in long, often petioled, entire: ray-fls. bright blue, heads 1-3, to 2 in across. W. Himalayas and Tibet.

tortifòlius. To 2 ft., shrubby, white-pubescent: lvs. linear to lanceolate, to 3 in. long, spiny-toothed: head solitary, to 2 ¼ in. across; ray-fls. purple or violet. Desert,

Tównshendii: A. Bigelovii.

Tradescántii. To 5 ft., much branched: lvs. linear-lanceolate or lanceolate, to 6 in. long, toothed or entire, glabrous: heads numerous, ½ in. across; ray-fis. white. Me. to Va. and Mo.

Tránchii: hort, name for a stout late purple-fld, plant,

tricephalus. Closely allied to A. himalaicus but taller and with red instead of white pappus. Himalayas.

trinérvius. To 3 ft.: lvs. lanceolate-ovate, to 4 in. long. toothed, rough: heads corymbose, ½ in. across; ray-fis, blue or purple varying to white. Himalayas. Var. congéstus has denser corymbs. Japan.

Tripòlium. To 3 ft., glabrous: lvs. lentire: heads corymbose; ray-fis. blue. Eu. linear-lanceolate,

turbinéllus. Prairie A. To 3 ft., much branched: lvs. lanceolate, to 3 in. long, entire: heads usually solitary, 1 in. across; ray-fis. violet. Ill to Neb. and La.

umbellatus (Doellingeria umbellata). To 8 ft.: lvs. lanceolate, to 6 in. long, entire: heads corymbose, 1/2 in. across; ray-fis. white. Newf. to Ga. and Ia.

undulatus. To 31/2 ft., rough-pubescent, much branched: vs. ovate-cordate to lanceolate, to 6 in. long, entire or wavy-margined: heads numerous, ¾ in. across; ray-fls. pale blue or violet. N. B. to Fla. and La.

versicolor. To 3 ft., glabrous: lvs. oblong-lanceolate, slightly toothed: heads corymbose, 36 in. across; ray-fis. violet or white. Probably N. Amer.

vestitus. To 2 ft., densely tomentose: lvs. narrow-lanceolate, to 2 in. long; heads corymbose, small: ray-fis. white. Yunnan.

vimineus. To 5 ft.: lvs. linear-lanceolate, to 5 in. long, entire or nearly so: heads numerous, 1/2 in. across; ray-fls. white to purplish. Ont. to Fla. and Ark.

virgineus: A. longifolius.

Weinholtzii: listed name.

yunnanénsis. To 2½ ft., pubescent: lvs. obovate or lanceolate, to 8 in. long, slightly toothed: heads solitary or 2-3, to 2½ in. across; ray-fls. violet-blue. Yunnan.

ASTERAGO: Solidaeter

ASTER, BEACH: Erigeron glaucus. China: Callistephus. Golden: Chrysopsis. Stokes: Stokesia. Tree: Oleariu.

ASTILBE (Hoteia). Saxifragacex. Strong herbaceous perennials with 2-3-ternately com-Strong pound lys. having toothed or cut lfts. and bearing panicles of white or pink fls.; Cent. and E. Asia and E. U. S. Often confused with the herbaceous spirea group, especially Aruncus, but those plants have many stamens and several to many separate pistils while the astilbes have usually only 8-10 stamens, and 2-3 pistils distinct or variously united. There are many variables and hybrid astilbes offered by florists; these are sometimes forced under the name Spiræa. The name has three syllables.

Astilbes are of easy cultivation and grow best in rich soil with plenty of water. Propagated by division or by seeds. They may be grown in the open border or forced under glass. It requires from ten to fourteen weeks to bring them into bloom when forced and they will need abundant moisture.

Arendsii. A series of hybrids of A. Davidii with different species is in the trade under this collective name; fis. range in color from purplish to nearly white. Var. pyramidalis, of pyramidal habit; var. rosea magnifica is listed as having rose-colored fis. in large panieles.

astilboides (Spiræa astilboides). To 3 ft.: lvs distinctly 2-3-pinnate; lfts. ovate, rounded at base, to 2!2 in. long, sharp-toothed, hairy: fls. white, crowded in dense spikes, forming a panicle; petals very narrow. Japan.

biternata (A. decandra). To 6 ft : lvs. to 2 ft. across; lfts. ovate, cordate to rounded at base, sharp-serrate, to 5 in. long: fls. numerous, yellowish-white, the fertile ones with minute petals or none. Mts., Ky. and Va. to Ga.

chinénsis. To 2 ft.: lfts. doubly toothed, longer and narrower than in A. astilboules: fls. white, in narrow branching panicles. China. Dwarf forms are listed as pumila and hùmilis.

crispa: listed as a dwarf plant to 6 in. tall.

Davidii (A. chinensis var. Davidii). To 6 ft., hairy: primary divisions of lvs. pinnate, the lfts. elm-like, to 1½ in. long, coarsely toothed: fis. rose-pink with dark blue anthers, densely clustered in long narrow paniels to 2 ft. long. China.

decándra: A. biternata.

filipéndula: see Filipendula.

grándis. To 6 ft.: lvs. ternately pinnate or 3-pinnate; lfts. ovate, doubly toothed, to 4 in. long, somewhat hairy: fts. creamy-white, crowded in panicles to 3 ft. long, with spreading branches. Cent. China.

hùmilis: A. chinensis var.

hýbrida: a name of uncertain application for garden forms.

japónica. To 3 ft.: lvs. 2-3-ternate; líts. narrow- to lanceolate-ovate, sharp-toothed, wedge-shaped at base: small, white, in erect terminal and axillary panicles; petals broad and obtuse. Japan. Listed names are Moerheimii, an improved form, and rubens, rosy-crimson.

koreana: listed name of unknown botanical standing.

Lembinei. A race of garden hybrids in which A. astil-boides has entered, having feathery panicles of white pink-stamened fls.

lobata: see Filipendula rubra. Mderheimii; see A. japonica.

nalmàta: see Filipendula purpurea.

rivulāris. To 5 ft., with creeping rhizome: lvs. 2-ternate; lfts. ovate, toothed, to 3 in. long: fts. yellowish-white, in large panicles, the divisions spike-like. Nepal, W. China.

ròsea. Hybrid between A. chinensis and A. japonica: similar to A. japonica in habit but fis. pinkish. The best known forms are Peach Blossom with lighter pink fis., and Queen Alexandra with deeper pink fis.

rubélla. Hybrid with A. Davidu parentage, having rose-colored fls.

simplicifòlia. Not over 1 ft.: lvs. simple, ovate, deeply lobed or cut, 3 in long: panicle slender, narrow, with star-like white fis. Japan. Var. cárnea has dark red fis.: var. ròsea has rose fis.

sinancia: A changnais

supérba: listed name of a garden form.

Thinbergii. To 2 ft.: lvs. 2-3-pinnate; lfts. ovate, to 3½ in. long, toothed, hairy: fls. white often becoming pink, in spreading panieles. Japan. Var. Moerheimii is probably A papanica var.

tomentosa: probably Spiraa tomentosa.

Ulmaria: see Filipendula Ulmaria.

ASTRÁGALUS. MILK VETCH. Leguminosæ. Herbs with alternate pinnate lvs. and purple, white or yellow papilionaceous fls. mostly in spikes or racemes: pods leathery, fleshy or papery, not much swollen. Occasionally planted in the border or rock-garden for ornament. Propagated by seeds or division in spring.

aculeatus. Per., branches prostrate, numerous from woody st., forming mat to 2 it. across: lits. 5-7, linear-oblong, long-mucronate: fls. purple, to ½ in. long, usually 2-7 on a peduncle. Big Horn Mis, Wyo.—A true alpine.

adsúrgens. Per. to 1½ ft., grayish: lfts. 1 in. long: fls. bright purple, in spikes: pod 2-celled, sessile, pointed. B. C. to Kans.

alopecuroides. Per. to 5 ft., pubescent, erect: Ifts. ovate-oblong, 1 in. long, acute: fls. yellow, in dense ovate to cylindrical spikes: pod erect, inclosed in woolly calyx, ovoid, pubescent and without grooves. Siberia, Cent. Eu.

alpinus (Tuum alpinum). Per. to 15 in, often decumbent: Ifts to ½ in. long: fls. violet, in short racemes: pod 1-celled, black-pubescent. Mts. of N. Eu., Asia and N. Amer.

apilòsum (Tium Michauxii). Per. to 3½ ft., st. simple, glabrous: lvs. to 6 in. long, lfts. 15-35, oblong-elliptic, to ⁵/₈ in. long: fls. white, to % in. long, drooping, in lax racemes to 4 in. long: pod linear-falcate, to 1½ in. long, glabrous, erect or ascending. N. C. to Fla.

aristatus: A. semperwrens.

austrinus (Hamosa austrina) Ann. or bien. to 16 in., often decumbent: lfts. to ½ in. long: fls. purplish, in head-like racemes. Tex. to Mex.

bisulcatus (Diholcos bisulcatus). Per. to 2½ ft., often decumbent: lfts. to 1 in. long: fls. purple, in dense spike-like racemes: pod 1-celled, 2-grooved on upper side. Sask. to Colo

Blakei. Similar to A. alpinus but taller and more erect with whitish or bluish-purple fls.: pod pubescent, inflated, somewhat 3-sided, to 1 in. long. Me., Vt.

cæspitòsus: see A. gilviflorus.

cerámicus (A. pıctus. Phaca pıctu). Per. to 8 in., gray-pubescent: Ifts. to ¾ in. long: ffs. yellowish-white, in few-flor racemes: pod elliptic-acute, mottled, to ¾ in. long. Colo. to New Mex.

Cicer. Ann., procumbent, sts. to 1½ ft. long: lfts. to 1 in. long: fls. yellowish, in spikes: pod ovoid, inflated. bristly. Eu.

crassicarpus (Geoprumnon crassicarpum). Per. to 15 in., often decumbent, pubescent: lfts. to 14 in. long: fls. violet-purple, in short racemes: pod subglobose, to 1/4 in. thick, stipitate. Minn. to Tex.

dánicus: A. hypoglottis.

Drúmmondii (Tium Drummondii). Per. to 2½ ft., pubescent: lfts. ½ in. long: fis. cream-colored, in racemes to 4 in. long: pod 1-celled, stalked, glabrous, grooved. Sask. to Colo.

Echinus. Shrub, much branched and spiny: lfts. 5-7 pairs, oblong-lanceolate, to ¼ in. long, woolly, spiny: fis. in globose heads. Asia Minor.

falcatus. Per to 2 ft.: lfts. elliptic-oblong, 16-20 pairs, acute to mucronate: fls. greenish-yellow, in spikes; pod pendent, curved, 2-celled, appressed-pilose. Siberia.

flexuosus (Homalobus flexuosus). Per. to 1½ ft., sts. fexuous or decumbent: lits. to ½ in. long: fs. purple, in racemes: pod cylindrical, acute, strigose, to ¾ in. long. Plains Sask. to New Mex.

frigidus (Phaca frigida). Per. to 2 ft.: lfts. to 1 in or more long: fls. yellowish-white, in short racemes. Eu.

galegifórmis. Erect or prostrate per.: lfts. 12-15, elliptic: fls. in long lax racemes: pod oblong, acute, incurved. Caucasus.

curved. Caucasus. glivifibrus (Orophaca caspitosa). Tufted per. to 4 in., silvery-pubescent: lvs. trifoliate, lfts. 3/2 in. long: fls. yellowish, few in axils: podless than 3/2 in. long, oblong, acute, strigose. Man. to Wyo.

glycyphyllos. Per. to 3½ ft., sts. prostrate or ascending, glabrous: lfts. 4–6 pairs, large, oval: fls. yellow, in raceme whose peduncle is about half as long as lf.: pod cylindrical, acute, glabrous. Cent. Eu., W. Asia.

goniatus. To 10 or 12 in, zigzag and more or less de-cumbent, from a cespitose rootstock: lfts. 15-21, lnear-oblong to elliptic, sometimes retuse, about ¾ in. long, stipules lanceolate: fls. purple, in a short spike: pod ovoid, to ¾ in. long, villous, 2-celled. Minn. south and west.

hypoglóttis (A. danicus). To 6 in, ascending, from a straggling rootstock: Ifts. to 19 and more, oblong or narrower, ½ in. or less long, obtuse, stipules broad and connate: fis. blue-purple, in spikes 1 in. long: pod erect, ovoid, covered with appressed white hairs. Eu.—The plant cult. under this name may be A. gonatus.

mexicanus (Geoprumnon mexicanum). Per., spreading or decumbent: lfts. to ½ in. long: fis. yellowish-white tipped with blue, in short racemes. Ill. to Tex.

Michauxii: see A. apilosum.

missouriénsis (Xylophacos missouriensis). Per. missouriensis (Xylophacos missouriensis). Per. to 5 ft.: lvs. to 5 in. long, silky-pubescent, lifts. to ½ in. long or less: fls. violet-purple, few in short loose spikes: pod 1-celled, sessile, cylindrical-oblong, acute, leathery, to 1 in. long Sask, to Kans. and N. Mex.

monspessulanus. Per. to 10 in., sts. trailing: lfts. broadly-elliptic, 18-25 pairs, to 1/3 in. long: ffs. purple or violet, in short racemes on long ascending peduncles: pod subcylindrical, acute, almost glabrous. Eu., N. Afr.

narbonénsis. Per. to 3 ft., erect, white-villous: lfts. in 15-20 pairs, linear-oblong: fls. pale yellow, to 1 in. long: pod globose-pyramidal, villous, 2-4-seeded. France, Spain.

Onforchis. Per. to 1½ ft., sts. decumbent or ascending, gray-pubescent: Ifts. to ½ in. long: fls. bright violet, about 1 in long, in short racemes: pod oval-oblong, villous, short. Eu., W. Asia.

píctus: A. ceramicus.

Párshii. Mat-forming per., white-woolly: lvs. to 2½ in. long, lfts. 9-19, to ½ in. long: fls. white or white and blue, to 1 in. long, in clusters of 3-5: pod oblong, woolly, to ½ in. long, beak absent. Rocky Mts. Var. tinctus has purple fls.

Rûbyi. The plant offered under this name is an Oxytropis, probably O. tenella, which see.

sempérvirens (A. aristatus). Spiny procumbent subshrub: Ifts. ¼ in. long: fls. white or pinkish, in few-fld. heads: pod inclosed in calyx. S. Eu.

sericoleucus (Orophaca sericea). Broadly cespitose with prostrate branches to 3 in. long, very leafy: lvs. trifoliate, lfts. oblanceolate to cuneate-obovate, to 1/4 in. long, densely white-silky: fis. purple, about 1/4 in. long: pod ovoid, hoary. Colo. to Neb. and Wyo.

Shortianus (Xylophacos Shortianus). Per., st. to 4 in. long: lfts. to 1 in. long, silky-hairy: fls. blue or violet, in short racemes: pod sessile, lanceolate, curved and beaked. Neb. to Wyo. and Ariz.

spatulatus (Homalobus caspitosus). Tufted per.: lvs. simple or with 3-5 lfts., linear-oblanceolate, to 2 in. long, appressed silky-hairy: fis. about ½ in. long, in short racemes of 2-10 or more: pod about ½ in. long, finely strigose. Neb. to Sask. south to Colo. and Utah.

taùricus. Matted per., silky-pubescent: lfts. linear, 5-6 pairs: fls. purple, small, in loose racemes: pod about ¼ in. long, appressed-hairy, oblong-conical. S. E. Eu.

tridáctylicus (Orophaca tridactylica). To 2 in. high, densely white-silky: lvs. trifoliate, lfts. oblanceolate, to ¾ in. long and usually less: fis. purple, often becoming yellowish with age, to ⅓ in. long: pod globose-ovoid, hoary. Colo.

utahénsis (Xylophacos utahensis). PINK LADY-FINGERS. Per, st. to 4 in. long: lits. to ½ in. long: fis. violet or purple, in dense racemes: pod ovoid, to ¾ in. long, villous, sessile, 1-celled. Mont., Wyo., Utah.

ASTRÁNTIA. MASTERWORT. Umbelliferx.Herbs with palmately lobed or dissected lvs., indifferent small polygamous fls. in umbels which have leafy involucres, and nearly cylindrical frs.; a few species are sometimes planted in borders for variety. Propagated by seeds and division.

Bièbersteinii. Per. to 1 ft. or less: lvs. 3-parted, the middle section more or less 3-lobed, oblong, serrate: fls. whitish, calyx-lobes pinkish, as long as petals. Caucasus.—By some authors treated as a variety of A. major, differing in its smaller and more obtuse basal lf.-segms. and its oblanceolate involucral bracts.

carniólica. Per., similar to A. major but only 1 ft. high and the bracts subtending the umbels much shorter than fls. Eu.

gracilis. Per. to 8 in.: lvs. 5-parted: fis. whitish, the umbels subtended by whitish bracts. Eu.

mājor. Per. to 3 ft.: lvs. mostly basal, with 3-5 deep toothed lobes: fls. pınkish, rose or white, the umbels subtended by showy bracts which are longer than fls. and are often tinged purplish. Eu.—Adapted to stream-side planting.

ASTRAPÆA: Dombeya.

ASTRÍDIA. Aizoaceæ. Succulent shrubs with 3-cornered lys. and terminal short-stalked fls.. solitary or few; separated from Mesembryanthemum on characters of seed.

máxima (M. maximum). To 1 ft.: lvs. to 2 in. long, crowded, half-moon-shaped, 3-angled but flattened, clasping, obtuse, glaucous, dotted: fls. rose, 34 in. across.

ASTROCÀRYUM. Palmacex. More than 40 species of strongly armed monocious featherpalms from Mex. to Brazil, the infl. among the lvs., acaulescent to rather tall trees, trunk solitary or plant soboliferous: lvs. with more or less spiny petiole and rachis; pinnæ acuminate or obliquely truncate, mostly plicate, white or much lighter colored underneath, margins aculeate: spadix rather closely or simply branched; staminate fls. in dense spikes at end of branches, pistillate few and below: fr. drupe-like, oblong, obovoid or globose, often aculeate, 1-seeded. Probably none of the species is planted in the continental U. S. unless merely under test and not distributed. See *Palm*.

ASTRÓPHYTUM. STAR CACTUS. Cactacex. A few small Mexican species with condensed. cylindric, globular or flattened body and a few prominent ribs or wings that often give it a star-like shape: spines weak or wanting: fl. large, reddish with yellow center, soon fading, borne on the top of the plant. Treatment as for Echinocactus. See Cacti.

Astèrias (Echinocactus Asterias). Plant depressed, 1 in. high and 3 in. broad; ribs 8, areoles prominent, circular; spineless: fls. yellow, 1 in. long. N. Mex.

capric orne (Echnocactus capricornis). Plant somewhat globose to nearly cylindric, to 8 and 10 in. high; ribs 7 or 8; spines several, to 2 in. long; fls. about 2½ in. long, spreading wide open, lemon-yellow at center and orange in bottom. Listed vars. include aureum, crassispinum, major, minor, niveum and senile.

myriostigma (Echinocactus myriostigma). Bishops-Hood. Plant globose or cylindric, about 2 in. high; ribs mostly 5; spines absent: fls. about 2 in. long, outer segms. with brown tips. Listed vars. include coahuilense, columnare, potosinum, quadricostatum, tamaulipénse, tetragonum, and tulénse.

nudum: listed name.

ornatum (Echinocactus ornatus. Echinopsis Haageana). ornatum (Ecninocacus ornatus. Ecninopsis Inaugenia). Plant nearly globose to cylindric, to 1 ft. or more high, white-floccose; ribs 8; spines several or many and about 1 in. long and sharp: fls lemon-yellow, to 3½ in. broad. Listed vars. include albéscens, columnare, flavispinum, glabréscens, glaucéscens, Mirbéllii, spirale and virens.

potosinum: A. myriostigma var.

stellatum: listed name.

ASYSTÀSIA. Acanthaceæ. Herbs or shrubs native in tropics of Old World, with opposite entire lvs; and tubular 5-lobed fls. in terminal racemes, spikes or panicles; one species grown as a ground-cover in S. Fla. and the tropics.

bélla: Mackaya bella.

coremandeliàna (A. gangetica). Procumbent or clambering per. to 4 ft. and more: lvs. ovate, to 3 in. long: fls. purple to yellow or white, 1 in. or more long, in racemes to 6 in. long. Malaya to Afr.; nat. in W. Indies, clambering in bushes and on fences.

gangética: A. coromandeliana.

ATALÁNTIA. Rutacex.Trees or shrubs native from India to Australia, sometimes grown as a proposed stock for citrus fruits and for interest, having simple lvs. and petioles jointed at base of lf., 3-5-celled ovary, and fr. resembling a small orange. For cult. see Citrus Fruits.

buxifòlia: Severinia buxifolia.

citrioides. Small spiny tree: lvs. oval, emarginate, alternate: fr. about ¾ in. across, with glandular skin and pulp-vesicles. Indo-China.

ATAMOSCO: Zephyranthes.

ATHAMÁNTA. Umbelliferæ. Per. herbs from the Medit. region and Asia: lvs. pinnately parted: fls. white, in umbels subtended by linear involucral bracts: frs. linear, cylindrical and hairv.

Mattholii. To 10 in.: If.-segms, thread-like; rays of umbel 20-25, woolly. S. E. Eu.

ATHANÀSIA. Compositæ. S. African small glandular shrubs or subshrubs with small yellow-fld. heads in corymbose infl.; heads composed entirely of disk-fls. with pappus absent or of very minute scales or hairs.

ánnua: Lonas inodora.

parviflora. Shrub to 4 ft., densely leafy, young branches loosely pubescent: lvs. pinnatipartite from the middle with only few linear lobes, to 2½ in. long: heads sulfur-yellow, 3-4-fid., to nearly ½ in. across, in dense much branched corymbs.

ATHROTÁXIS. Taxodiacex. Large densely branched evergreen trees, of 3 species in Tasmania, allied to Cryptomeria, with small scalelike or lanceolate lys. and small woody globose cones. Sometimes grown in warm climates, as Calif.; cult. under Conifers.

cupressoides. Lvs. rhombic-ovate, to 1/6 in. long, obtuse: cones to 1/2 in across.

laxifòlia. Lvs. ovate-lanceolate, 1/4 in. long, acute or

obtuse: cones ¾ in across.

selaginoides. Lvs. lancolate, to ½ in. long, spinypointed: cones to 1 in. across.

ATHÝRIUM. Polypodiacex. Foliage similar to that of Asplenium, with which genus this has been united, the distinguishing characteristic being in the shape and position of the sori; widely distributed, mostly in the tropics, a few cult. See Ferns.

acrosticholdes: A. thelypteroides.

alpestre. Fronds tufted, from a short rootstock, to 3 ft. alpestre. Fronds tufted, from a short rootstock, to 3 ft. long, bipinnate, elliptic-lanceolate to ovate-lanceolate, pinnæ oblong or lanceolate, with segms, sharply toothed: sori circular, small, seemingly without an indusium; spores blackish and reticulate. Eu., Asia, Iceland, Newf. Var. americanum (A. americanum and A. alpestre var. gaspense). Differs from A. Fulix-femina in the very narrow more distant pinnæ and the lack of indusia. Alaska to Calif., Que.

americanum: A. alpestre var.

angustifòlium: A. pycnocarpon.

cyclosdrum: a variety or subspecies of A. Filix-femina.

cyclosorum: a variety or subspecies of A. Filiz-femina.

Filiz-femina (A. cyclosorum. Asplenium Filiz-femina).

Lady-Fern. Hardy, bright green: fronds to 3 ft. long, bipinnate, pinnie deeply toothed or cut. Eu., Asia, W. N. Amer.—The E. American plants represent two species or varieties (A. angustum and A. asplenioides) differing in technical characters. Geographical vars. are californicum and sitchense. Some of the hort, vars. derived from the European type are Cräigii, dwarf and crested, crispum, Frizélliæ, grandiceps, laciniatum, latifolium, multfiddum, plumòsum, pulchérrimum, setigerum, Victòriæ with pinnæ forked to base and crested at tips.

Filix-más: listed name, probably a mistake for A. Filix-femina or Dryopteris Filix-mas.

Goeringianum (Asplenium Goeringianum). Hardy:

fronds deciduous, usually drooping, to 1½ ft. long, pinnate, the pinnæ toothed or cut. Japan. Var. pictum has stipes purplish, fronds with central gray band.

pycnocárpon (A. angustifolium. Asplenium angustifolium and pycnocarpon). Fronds to 2½ ft. long, simply pinnate, the pinnato 5 in. long, nearly entire. Que. to Ga., La. and Kans.

sitchénse: a variety or subspecies of A. Filix-femina.

thelypteroides (A. acrostichoides). Asplenium acrostichoides and thelypteroides). Fronds to 3 ft. long, deeply bipinnatifid, pinnæ toothed, on long straw-colored stipes. N. S. to Ga. and Mo.; E. Asia.

ATRAGENE: Clematis.

ATRAPHÁXIS. Polygonaceæ. Deciduous subshrubs with small lvs., white or pinkish fls. in terminal racemes, and fr. an achene; native in Asia, Greece, N. Afr.

They thrive on rather dry soil in sunny positions. Propagated by seeds in spring, by layers, and by cuttings of young wood in early summer under glass.

buxifòlia. To 2 ft. or more: lvs. obovate-cuneate, obtuse, margin crisp, to nearly 1 in. long, yellowish-to brownish-green: fls. rose-pink. Cent. Russia to Caucasia.

frutéscens (A. lanceolata). To 3 ft: lvs. oblong to lanceolate, to 1½ in. long, grayish-green: fls. whitish, in racemes to 3 in. long. Aug.—Sept. S. Russia to Cent. Asia; hardy far N.

lanceolàta: A. frutescens.

ATRIPLEX. SALTBUSH. Chenopodiaceæ. Mealy or scurfy herbs or shrubs with alternate or opposite lvs. and small greenish unisexual fls. in clusters; often native in salty situations.

One species, the orach, is grown for greens. Seeds are sown in drills in early spring and the seedlings thinned out in the row. Others are grown for ornament and as forage plants in desert regions.

Brèweri. Shrub to 6 ft.: lvs. ovate-oblong, silvery-gray to 1 ½ in long. S. Calif.—Planted for hedges.

Hálimus. Shrub to 6 ft.: lvs. broad-ovate or ovateoblong, to 2½ in. long, silvery. S. Eu.

horténsis. Orach. Ann. to 6 ft: lvs, triangular-ovate or arrow-shaped, the margins toothed or wavy, varying in color from pale yellowish-green to dark red. Asia.—The following hort. vars are listed: atrosanguínea with dark red lvs; cupreáta with red foliage and dark violet stalks; rôsea with light red foliage and darker sts. and veins.

lentiformis. Quali-Bush. Shrub to 10 ft.: lvs. ovate or arrow-shaped, silvery, to 1½ in. long. Calif, Ariz.

semibaccàta. Diffuse or spreading grayish per. to 3 ft.: lvs. oblong, to 2 in. long, toothed or entire Australia; nat. in Culif. and Ariz.—Somewhat grown for forage.

ATROPA. Solanaceæ. A few Old World herbs, one economically important as the source of atropine and other drugs: lvs. alternate, entire: fls. bell- or funnel-shaped: berries purple, poisonous, in an enlarged calyx.

Belladonna. Belladonna. Per. to 3 ft.: lvs. ovate, to 6 in. long: fts. blue-purple or dull red, about 1 in. long, solitary or in pairs, nodding, axillary: berry nearly globular, 34 in long, shining black. Eu., Asia.

ATTALÈA. Palmacex. About 20 species of Attalea are known in the western hemisphere, a similar number of Orbignya, and about 40 species of Scheelea. These three genera are much alike in stature and frs. but are readily distinguished by the staminate fls.: these fls., although abundant, are seldom noted by planters, and therefore the plants in cult. may not be accurately determined. It is supposed that Attalea Cohune is planted in S. Fla., but this is doubtful. This species was founded by Martius on frs. alone and the tree at that time was not known or described. It has lately been supposed to be an Orbignya. Probably most of the trees of this group seen in plantations in the tropics are Scheeleas. The Attalea group comprises heavy pinnate monœcious or diœcious palms, producing eventually a massive single trunk

and very long erect and outwardly arching lvs.; fls. in heavy interfoliar clusters within very large woody spathes; fr. nut-like, 2-3 in. long, with fibrous covering.

AUBRIÈTA. Cruciferæ. About 15 species of choice little mat-forming perennials prized for the abundant lilac-magenta to bright purple spring bloom: pods or silicles short-oblong to globose. Native in south-central Eu. and Asia Minor. Closely allied to and resembling Arabis, but differing in the style much more slender than the ovary and often as long. The name was originally spelled Aubrieta, not Aubrietia.

Propagation is by seeds, sown a season in advance of blooming, by division of the mats or clumps, and by layers of the trailing shoots. Aubrietas thrive well in half shady exposure, the foliage covering spaces between rocks and along borders.

aurea-variegata: hort. name, probably for form of A. dellordea.

Bougainvillei: see A. deltoidea.

Cámpbellii: see A. deltoidea.

cilicica: A. Pinardii.

Colúmas. To 6 in., green, loosely hairy, not much spreading: lvs. long-spatulate, to ½ in. long: fls. pale purple, large, to 1 in. across, on short sts. not exceeding foliage: fr. to ½ in. long, ellipsodal, stellate-hairy, style as long as ovary. Italy. Var. croatica (A. croatica) has obovate- to rhombic-cuneate lvs. and infl. exceeding the foliage, style of fr. less than half as long as ovary. Northwestern Balkan Peninsula.

croática: A. Columnæ var.

deltoidea. To 6 in. or occasionally to 1 ft., spreading, bushy and compact: Ivs. thombie- to obovate-cuneate: fls. rose-lilac to purple, to ¾ in. across, calyx cylindrical, infl. usually much exceeding foliage: fr. to ¾ in. long, broadly elliptic, somewhat swollen, covered with simple and forked hairs, styles usually only to ⅓ as long as ovary. Sicily, Greece to Asia Minor. Var. græca (A. græca) is larger and more bushy than typical form with larger petals and calyces and pods with styles ⅓-¾ as long as ovary.—Many names in the trade are probably hort. variants or intervarietal hybrids of this species and include: Bouganwillei, Campbellii, Eyrei, gloriosa, grandiflora, Hendersonii, Leichlinii, Marschallii, Moerheimii, purpurea, rosea, tauricola, variegala, violacea.

Èyrei: see A. deltoidea.

gracilis (A. delioidea var.). To 4 in., sts. slender and prostrate, forming thin carpets or tufts: lvs. narrowly lanceolate, entire, to ½ in. long: fls. ½ in. across, calyx saccate: fr. narrowly linear, flat, to 1 in. long or more, finely stellate-hairy to glabrescent, style to ¼ in. long. Greece, Albania.—Variants with toothed lvs. and densely hairy frs. are known, but may not be in cult.

græca: A. deltoidea var.

grandiflòra; see A. deltoidea.

Héndersonii: see A. deltoidea.

hfbrida. True A. hybrida (A. gracilis \times A. intermedia) differs from typical A. gracilis in the lvs. toothed and the many-fid. infl. much exceeding the foliage. Material so listed in the trade, however, may be hort. forms of A. deltoides.

Leichtlínii: see A. deltoidea.

Márschallii: see A. deltoidea.

Mòerheimii: see A. deltordea.

olympica (A. deltoidea var.). To 6 in., hairless or nearly so, tufted: lvs. long-spatulate, entire or sometimes rhombic to obovate and toothed: fis. to 1 in. across: fr. broadly oblong to lanceolate, to 3/2 in. long, flat, stellate-hairy to glabrous, style about 1/4 in. long. Asia Minor.

Pinárdii (A. cilicica). To 8 in.: lvs. linear-oblong to spatulate, to 1½ in. long, entire or remotely toothed, long-petioled: fls. to 1 in. across: fr. narrowly linear, to 1½ in. long, flat, style to ½ in. long, stellate-hairy. Asia Minor.

purpurea: see A. deltoidea.

ròsea: see A. deltoidea.

taurícola: see A. deltoidea.

variegata: see A. deltoidea. violacea: see A. deltoidea.

AUCÙBA. Cornaceæ. Evergreen shrubs native in Asia, with opposite simple lvs., small purple diœcious fls. in terminal panicles, and fr.

a berry-like drupe. The name is sometimes but was not originally spelled Aukuba.

Aucubas are grown in a cool greenhouse and out-of-doors in mild climates for the ornamental foliage. They thrive in a partially shaded position in moist well-drained soil. Propagated by cuttings of half-ripened wood, seeds, or the varieties by grafting.

crotonifòlia. Lvs. croton-like, green spotted with white. Probably a var. of A. japonica.

glauca nana: catalogue name, probably for a form of

himalàica. To 15 ft.: lvs. lanceolate or broader, to 8 in. long, finely toothed: fr. orange to scarlet. Himalayas; to be planted only far S.

be planted only far S.

japónica. To 15 ft.: lvs. dark green and shining, ovate
or oblong, to 7 in. long, coarsely toothed above middle:
fr. scarlet, rarely yellow or white. Himalayas to Japan;
hardy in D. C. Var. variegata (var. maculata), Coup-Dusr
TREE, has yellow-spotted lvs. Var. dentata has smaller
coarsely toothed lvs. Var. longifòlia (var. angustifolia),
narrow lvs. to 5 in. long. Var. macrophfila, large broad
lvs. Var. picturata (var. latimaculata, var. aureo-maculata)
has a large yellow blotch in center of lf. Var. punctata is a
synonym of var. mariegata. Var. serratifòlia (A. serratifolia) has If - margins serrate.

serratifòlia; A. japonica var.

AUDIBERTIA: Salvia.

AUDIBERTELLA: Salvia carnosa.

AUDOUÍNIA. Bruniacex.One heath-like shrub in S. Afr., A. capitata (Diosma capitata), suitable for Calif. and under glass, with treatment as for Diosma: to 2 ft., branches erect and more or less whorled: lvs. small and sessile, linear, imbricate: fls. crimson, in long spike-liké terminal crowded heads.

AULIZA: Epidendrum ciliare.

AUREOLÀRIA. Scrophulariacex. N. American herbs parasitic on the roots of Quercus, with entire or bipinnatifid lvs. and yellow fls. with spreading lobes, on axillary peduncles or in a terminal leafy raceme or paniele; sometimes transferred from the wild.

flava (Gerardia and Dasistoma flava). Per. to 4 ft., gray-downy: lvs. oblong to ovate-lanceolate, to 6 in. long, sinuate-dentate to entire, rarely pinnatific: fls. vellowish-orange, to 2 in long, glabrous outside with spreading lobes. July-Aug. Me to Wis., Ga. and Miss.

pedicularia (Gerardia and Dasistoma pedicularia). Ann. or bien, to 4 ft.: Ivs. pinnathfd two-thirds to midrib; corolla to 1½ in long, pubescent outside, with spreading lobes. Aug.—Sept. Me to Fla. and Mo.

virginica (Gerardia and Dasistoma virginica). Per. to 4 ft: lvs. deeply pinnatifid, to 6 in. long, pubescent: fl. 1½ in. long, glabrous outside. June-Aug. N. H. to Fla. and La.

AURICLE: an ear-shaped part or appendage, as the projections at the base of some leaves and petals.

AURICULA. A favorite spring cool-season perennial of European fanciers, little grown in North America. It is *Primula Auricula* (which see), in many forms and colors, but some of the races may be of hybrid origin with other species. It is grown mostly in pots or boxes under frames; propagation is by seeds in general and for the production of new varieties, and by offsets or division for the perpetuation of particular varieties. Seeds sown in early spring should give blooming plants the following spring, but some of the seeds may not germinate until the second year. In the North plants may be carried over winter in a cold greenhouse.

AVĒNA. OATS. Gramine x.Mostly ann. grasses, having flat lvs. and long-pointed mostly awned and hanging spikelets in loose panicles; native in temp. regions of the world and grown for the grain, forage, hay and occasionally for ornament. The panicles may hang in all directions (all-sided) or to one side only. They are sown in early spring or sometimes in autumn in mild climates. See Grasses.

barbata. SLENDER WILD OAT. Differing from A. fatua in the more slender panicles and in technical characters of the florets. Eu.; nat. on Pacific Coast.

brèvis. To 3 ft.: panicle one-sided; spikelets with 2 awns; oat short and broad. Eu.

elation: Arrhenatherum elatius.

fátua. WILD OAT. To 4 ft., tufted: lvs. to 8 in. long and 14 in. wide: panicles to 1 ft. long, all-sided, the spikelets drooping and with awns to 1½ in. long. Eu., Asia; nat. in N. Amer.

flavéscens: Trisetum flavescens.

nades. Naked Oat. Differs from A. sativa in the grain separating from the hull; panicle close. Probably cultigen. sativa. Common Oat. To 4 ft., tufted: lvs. to 1 ft. long and ½ in. wide: panicles to 1 ft. long, the branches all-sided or from one side in the forms known as Side Oats, awns to ¾ in. long or lacking; grain of fr. permanently inclosed in hull. Cultigen.

stérilis. Animated Oat. To 3 ft.: panicles to 1 ft. long, awns to 2 in. or more long and twisted, the florets moving by hygroscopic action. Medit region.—Much of the seed planted under this name is A. fatua.

strigdsa. Much like A. satira but differing in technical floral characters: spikelets prickle-pointed. Eu.

AVENS: Geum

AVERRHÒA. Oxalidaceæ. Evergreen trees with alternate pinnate lvs., small fragrant fls., and large fleshy berry-like edible fr.; native in trop. Asia.

They can be grown only in regions free from frost, and thrive on deep rich soil in a moist climate. Propagated by seeds or by budding.

Bilimbi. BILIMBI. To 50 ft.: lfts. 24-25: fls. red-purple: fr. greenish-yellow, to 4 in. long, with 5 obscure angles. Known only in cult.

Carambòla. Carambola. To 30 ft: lfts 5-9: fls. white marked with purple: fr. yellow or golden-brown, to 5 in. long, with deep ribs. Malayan region and spread in tropics.

AVIGNON BERRY: Rhamnus infectoria.

AVOCADO. The large pear-shaped or oblong or nearly globular fruit of Persea americana (which see), a tropical or subtropical American evergreen broad-leaved tree; other species may be involved in their origin.

The avocado is of considerable importance in southern California and southern Florida as a market fruit and a special literature has developed. It is grown in orchard plantings, the trees standing 20-30 feet apart either way, on well-drained fertile open land. Spacing distance varies with the vigor of the variety and the richness of the soil. The tree reaches a height of 30 feet or more. Transplanting is commonly undertaken in spring and early summer, a ball of earth being removed with the tree. In two or three years most varieties begin to bear.

Named varieties are propagated on seedling avocado stocks by shield-budding and side or cleft-grafting in autumn or spring. required in choosing budwood at just the proper stage of maturity so that the "eyes" will not fail. Either budding or grafting the avocado is a more exacting technique than with citrus or most temperate zone fruits.

Pollination presents a special problem with the avocado because the period of pollen shedding of one group of varieties does not overlap the time of receptivity of the pistils of that group. Plantings should include several varieties chosen for their pollen value. Orchards may be grown under mulch or with cultivation and cover-crops.

For shipment the fruit is nested in excelsior in well-ventilated small crates. In California, Fuerte (December to July) is the leading commercial variety. Nabal, Taft, Queen are excellent summer and autumn varieties. Important Florida varieties are the Collinson, Lula and Trapp. Yield varies widely from year to year, depending largely on weather conditions at blooming time which is March and April. Averaging over several years, under good auspices 150 pounds to a tree is considered a conservative estimate for trees ten years old and over under California conditions. Average yields in Florida have been 80 pounds to a tree or less.

The avocado varieties are of several groups, as West Indian, Guatemalan, Mexican. The first comprises the tenderest varieties and can be grown only in the warmer parts of Florida. These kinds, as Trapp, Pollock, Simmonds, ripen late summer to early winter. The Guatemalans or their hybrids, represented by Lula, Taft, Taylor, Wagner, are hardier and can be grown in central peninsular Florida; they ripen from early winter to spring. The Mexican group is about as hardy as the sweet orange, in the varieties Puebla, San Sebastian, Gottfried; the ripening season is June to October.

AWL-SHAPED: narrow and sharp-pointed; gradually tapering from base to a slender or stiff point.

AWN: a bristle-like part or appendage.

AXIL: upper angle that a petiole or peduncle makes with the stem that bears it.

AXÓNOPUS. Graminex. Ann. and per. grasses of warm regions, having flat lvs. and small spikelets borne in narrow one-sided spike-like racemes; one species is grown in pastures, in the S. See Grasses.

compressus (Anastrophus compressus). CARPET-GRASS. Per. to 2 ft, stoloniferous: lvs. to 4 in. long and ½ in. wide: racemes to 2 in. long, in clusters of 2-5 toward top of sts. Va. to La., trop. Amer.

AYLOSTÈRA. Cactacex. A small genus of S. American cacti closely allied to Rebutia and by some authorities retained therein, but differing in the ovary bristly, styles and stamens fused to the tube.

deminùta (Rebutia deminuta). Cespitose, globose, to 2½ in. tall; tubercles in 11-13 rows; spines about ¼ in. long, usually 10-12, white or brown: fls. dark orange-red, to 1¼ in. long, stamens pink, stigma 8-lobed, white. Argentina.

Fièbrigii (Rebutia Fiebrigii). Usually solitary, depressed-globose to subcylindrical, to $2\frac{1}{2}$ in. diam.; tubercles in about 18 rows, somewhat spiralled, to $\frac{1}{4}$ in. high; radial spines 25-40, about $\frac{3}{8}$ in. long, white; centrals 2-5, to $\frac{3}{4}$ in long, what tipped brown: fls. bright yellowish-red, to $\frac{1}{2}$ in. long, stamens white, stigma pale yellow, 6-lobed. Bolivia.

Kupperiana (Rebutia Kupperiana). Sts. depressed-globose, to 4 in. high and 3½ in. diam., gray to glaucous gray; tubercles in about 20 rows, to ½ in. high, acute; radial spines about 20, brown to gray; centrals 3-4: fls. not known. Bolivia.

pseudodeminùta (Rebutia pseudodeminuta). Differs from A. deminuta in its longer brown spines and goldenorange fls. Argentina. Var. Schneideriàna is listed. Var. Schumanniàna has flexible brown spines to 1 in. long.

Spegazziniana (Rebutia Spegazziniana). Cespitose, globose to cylindrical, about 1½ in. diam., yellowish-green; tubercles in 20-25 rows, spiralled; spines about ½ in. long, radials many, centrals 1-2, yellowish-brown: fis. dark red, to nearly 1¾ in. across, stigma white. N. Argentina.

spinosissima (Rebuta spinosissima). Densely cespitose and cushion-forming, sts. depressed-globose, to 1½ in. diam., radial spines white, numerous; centrals 5-6, whitish, tipped brown: fls. pale brick-red, to 1½ in. diam., stamens and stigma white. N. Argentina.

AYO: Tetrastioma Harmandii.

AZADIRACHTA. Meliacex. Probably not planted here outside test grounds: see Melia.

AZALEA: Rhododendron. Alpine-: Loiseleuria.

AZALEASTRUM: Rhododendron arborescens.

AZÀRA. Flacourtiaceæ. Evergreen trees and shrubs native in S. Amer., with alternate simple lvs., small fragrant fls. in axillary racemes and clusters, and fr. a berry.

Grown for ornament in warm regions and sometimes under glass. Propagated by seeds or ripened cuttings.

celastrina. Much branched shrub to 9 ft.: Ivs. roundoval, to 1½ in. long, slightly toothed, shining above: fis. golden-yellow, densely tomentose. Chile.

Gilliesii. To 15 ft.: lvs. broad-ovate, to 3 in. long, with coarse spiny teeth: fls. yellow. Chile.

integrifòlia. To 20 ft.: lvs. obovate or oblong, to 1½ in. long, entire: fls. yellow, in racemes. Chile.

microphýlla. To 12 ft.: lvs. obovate, to ¾ in. long: fls. greenish: fr. orange. Chile.

AZAROLE: Cratægus Azarolus.

AZÓLLA. Salviniacex. Moss-like floating plants, with pinnately divided leaf-like sts. and minute lvs.; widely scattered. Readily propagated by self-division.

caroliniana. Plants about 1 in. long, greenish or reddish. N. Amer., trop. Amer.—Sometimes grown on the surface of aquaria and greenhouse tanks.

AZTÈKIUM. Cactaceæ. One species native in Mex. A. Rítteri (Echinocactus Ritteri). Plant 2 in. across and 1½ in. high, simple at first but forming clumps, crown sunken and filled with white wool and short spines which soon fall; ribs 7-11, deeply separated, arcoles with dirty white wool: fls. solitary in crown, white tinted rose toward tips, ½ in. long.

BABIANA. Iridaceæ. Low cormous herbs from S. Afr., the st. bearing several plicate lvs. and lilac, yellow, pink or red fls. in terminal clusters or racemes, the perianth with slender tube and equal segms. Sometimes grown in pots under glass or in the open in mild climates for spring bloom. Propagated by cormels and seeds.

álba: listed name of a white-fld. form.

disticha. To 9 in.: lvs. sword-shaped, hairy, plicate: fis. pale hlac, with slender tube to 1½ in. long and limb to 1½ in. long, the segms. clawed.

plicata. Lvs. ensiform, to 6 in. long and 1/2 in. wide: fls. lilac to red, fragrant, in spike usually not as long as lvs.

pygmæa (Gladiolus nanus). Lvs. lanceolate, to 4 in. long: fis. pale lilac, usually 2-6 in erect spike.

stricta. To 1 ft.: lvs. sword-shaped, hairy: fls. red or lilac, to 1½ in. long, the bracts hairy. Var. rùbro-cyànea has lilac lmb and red throat. Var. sulphùrea (B. sulphurea), fls. pale yellow to white.

sulphurea: B. stricta var.

BABY BLUE-EYES: Nemophila.

BABYS-BREATH: Gypsophila paniculata. False: Galum Mollugo and aristatum. -Tears: Helxine.

BÁCCHARIS. Compositæ. Shrubs with small white or yellowish diœcious heads in corymbs or panicles; florets all tubular; pappus of the fr. snow-white and showy: lvs. alternate, sometimes evergreen.

The species are sometimes transferred to grounds for their more or less persistent foliage, or the profuse white or yellowish bloom; B. halimifolia is valuable for seashore planting. Some of them require well-drained soil and a sunny position, and others are marsh plants. Propagated easily both by seed and by cuttings rooted under glass.

angustifòlia. To 8 ft.: lvs. linear, to 3 in. long, nearly entire, leathery. N. C. to Fla. and Tex., in brackish marshes.

Doúglasii. To 5 ft., sticky: lvs. lanceolate, to 4 in. long, nearly entire. Calif., in lowlands.

genistellòides. To 2½ ft.: lvs. very small and bract-like or scale-like, borne on prominently winged leaf-like branches. Peru, Brazil.

glomeruliflora. To 10 ft.: lvs. spatulate, to 2 in. long, toothed above middle or entire, leathery and light green. N. C. to Fla., swamps and lowlands.

halimifòlia. Groundel-Bush. To 12 ft.: lvs. oblong or obvate, to 3 in. long, coarsely toothed, the upper entire. Mass. to Fla. and Tex., along the coast and in marshes.

pilulàris. To 5 ft., evergreen: lvs. obovate, to 1 in. long, few-toothed or entire. Calif., Ore., on hills and dunes.

BACHELORS-BUTTON: Centaurea Cyanus.

BACKHOÙSIA. Myrtaceæ. Australian trees or shrubs with opposite lvs., fls. in cymes or umbels, and capsular frs.; planted occasionally in S. Fla.; related to Metrosideros.

citriodòra. Large tree: lvs. ovate or ovate-lanceolate, to 5 in. long, leathery, having strong citron odor when crushed: fis. small, in umbel-like clusters.

BÁCTRIS. Palmaceæ. Spiny small and mostly gregarious feather-leaf palms of the western hemisphere, many species, with small more or less succulent frs. in a close globular or oblong cluster under a broad spiny spathe. None of the species is regularly planted within the continental U.S.

BAÉCKEA. Myrtacex. Heath-like shrubs of the Melaleuca relationship with small opposite entire lvs. and small white or pink fls.; mostly Australian and one planted in S. Calif.

virgāta. To 12 ft.: lvs. linear-lanceolate or narrow-oblong, to 1 in. long: fis. in loose umbels in upper axils. Australia, New Caledonia.

BAEL FRUIT: Egle Marmelos.

BAÈRIA. GOLDFIELDS. Compositæ. California, mostly annuals with opposite lvs. and many-fld. yellow heads of ray- and disk-fls.; pappus of scales or awns or lacking. Grown in the flower-garden for spring and summer bloom, and propagated by seeds.

aristata (Actinolepis and B. coronaria. Hymenoxys californica. Shortia californica). Sts. weak, to 10 in. long: lvs. 1-2-pinnate into linear segms: heads ½ in. across.—Used for edgings and as an everlasting.

aristosa: a minor form of B. chrusostoma.

chrysóstoma (B. graculis). Much branched, 4-12 in. high: lvs. linear to thread-like, entire: heads to 1 in. across.

grácilis: B. chrysostoma.

macrántha. Sts. simple or nearly so, to 2 ft., from horizontal tuberous per roots: lvs. linear, entire, to 5 in. or more long, cliate and toothed: fls. to 1 in. across, slenderpedicelled.—Variable.

marftima. Spreading and much branched, with fleshy sts. to 1 ft. or more long: lvs. oblong-linear, about 1½ in. long, entire or with broad teeth: heads to ½ in. across. Calif. to Vancouver Isl.

BAHIA LANATA: Eriophyllum caspitosum.

BÀILEYA. Compositæ. Densely woolly herbs native in deserts and dry regions of W. N. Amer., having alternate lvs. and solitary heads of diskfls. and yellow ray-fls. which become papery with age; pappus none.

multiradiàta. To 1½ ft., ann. or per., white-woolly: lvs. pinnatifid or upper entire: heads to 1¾ in. across. Calif., Tex., Mex.

BAILLÒNIA. Verbenaceæ. Two S. American deciduous woody plants with opposite or whorled sessile lvs. and somewhat 2-lipped fls. in racemes or spikes, the corolla 5-lobed: fr. a drupe in the persisting calyx. Adapted to Calif. and under glass.

júncea (Diostea juncea). Small tree or shrub to 20 ft, with rush-like branches and small opposite remote dentate lvs.: fis. hlac, in short dense spikes, the corolla 1/2-1/4 in long. Chile, Peru.

BALAKA. Palmaceæ. Small palms of few species in the Fiji Isls., differing from Ptychosperma in very broad or half-rhomboid pinnæ, seed not furrowed and albumen not ruminate; not regularly planted in the continental U. S., the one sometimes called B. Seemannii being Ptychosperma elegans.

BALAUSTION. Myrtacex. One shrub native in W. Australia, with decumbent or prostrate sts. to 1 ft. long. B. pulchérrimum. Lvs. opposite, linear, to $\frac{1}{2}$ in. long, keeled or 3-angled, stiff, entire: fls. red, solitary in axils, petals about $\frac{1}{2}$ in. across.

BALISIER: Heliconia Bihai.

BALLOON-BERRY: see Rubus illecebrosus. -Flower: Platycodon grandiflorum. -Vine: Cardiospermum Halicacabum.

BALLÒTA. Labiatæ. Pubescent per. herbs or subshrubs with toothed lvs. and small 2-lipped fls. in axillary clusters; native in the Old World and sometimes planted for ornament. Of simple requirements.

fætida. Similar to B. nigra and perhaps a form of it, very ill-scented. Medit. region.

nigra. Black Hoarhound. To 3 ft.: lvs. ovate, to 2 in. long: fis. reddish-purple or whitish, to ¾ in. long. Eu.: nat. in E. N. Amer.

BALM: Melissa. Bee-: Monarda didyma. Canary-: Cedronella canariensis. Field-: Nepeta hederacea. Fragrant-:

Monarda diduma Horse-: Collinsonia. Molucca-: Molucella Lems. -of-Gilead: Populus candicans.

BALSA: Ochroma

BALSAM, Garden: Impatiens Balsamina. -of-Peru: Myrosylon Pereire. -Root: Balsamorhiza. -Tree: Myroxy-

BALSAMINACEÆ. BALSAM FAMILY. Two genera; one widely distributed, of ann. and per. succulent herbs with simple lvs., very irregular bisexual fls. having 3 sepals one of which is large and petal-like, 5 unequal petals or 2 pairs united forming 3 petals, 5 stamens, 5-celled ovary, and fr. a caps. or berry. The genus Impatiens is grown for ornament, the other genus, Hydrocera, with a single species from Ceylon to Java, not being in cult.

BALSAMITA VULGARIS: Chrusanthemum Balsamita.

BALSAMOCÍTRUS. Rutacex. A few African usually spiny trees with mostly 3-foliolate lvs.. sometimes grown for interest and as possible stocks for citrus fruits: stamens 10-20: fr. large and hard-shelled and often persistent. Dawei reaches 50-60 ft.: mature lvs. with 3 lanceovate stalked lfts.: fr. 4-6 in. diam., globose or nearly so, 8-celled, dropping from the pedicel when ripe.

BALSAMORHÌZA. Balsam-Root. Composita. Low per. herbs with thick roots, large mostly basal lys. and few or solitary showy yellow heads of ray- and disk-fls.; pappus none; native in W. Amer. on mts., foot-hills and sandy regions, and sometimes planted for ornament; spring and summer bloomers.

deltoidea. To 2 ft., white-tomentose: basal lvs. cordate-ovate, to 1 ft. long, entire or toothed: rays to 1½ in. long. B. C. to Calif.

hirsuta. To 2 ft., hairy: lvs. pinnately divided into toothed or cut segms.: heads to 134 m. across. B. C. to Calif. and Utah.

Hookeri. To 1½ ft., gray-pubescent: lvs. pinnately divided into toothed or cut segms.: heads to 2½ in. across. Calif. to Wash. and Utah.

macrophylla. To 2 ft., hairy: lvs. pinnately divided into entire segms.: heads to 3½ in. across. Utah, Wyo.

sagittata. To 2 ft.: lvs. cordate to sagittate, to 8 in. long, nearly entire, white-tomentose: heads 2 in. or more across. B. C. to Calif. and Colo.

terebinthàcea. To 14 in.: lvs. mostly basal, lanceolate, to 8 m. long, pinnatisect or incised-toothed, finely pubescent to glabrescent: fls. yellow. Ida., Wash., Ore.

BAMBOO. Graminex. Various giant longlived woody grasses, mostly of the genera Arundinaria, Bambusa, Cephalostachyum, Chimonobambusa, Chusquea, Dendrocalamus, Phyllostachys, Pleioblastus, Pseudosasa, Sasa, Shibatæa, Thamnocalamus, as known in this country. The species of these genera are mostly Asian, but some of the Arundinarias are plants of the western hemisphere, two of them being native as far north as Missouri and Maryland. A few of them, as Chusqueas, are climbers.

The bamboos are adapted only to the southern parts of the country, although certain small kinds are hardy as far as Philadelphia or even northward. They usually do not produce seed in this country, and propagation is by division of the clumps and cuttings of the stolons. Bamboos require fertile soil and a uniform supply of clean underground water, and some of them thrive along water-courses. With age and thorough establishing of the roots, the clumps become conspicuous or even commanding objects. The larger kinds make good shelterbelts and groves.

BAMBOO, MEXICAN -: Polygonum cuspidatum.

BAMBÙSA. BAMBOO. Graminex. Tall woody grasses, sometimes climbing, with cylindrical hollow sts., persistent lf.-sheaths, and spikelets borne in panicles, stamens 6; native mostly in tropics of Old World and not hardy in northern states. See Bamboo.

Alphónse Kárri: B. nana var.

92

angulata (B. and Arundunaria quadrangularis). To 3 ft., st. 4-angled: lvs. to 7 in. long and 1 in. wide, hairy beneath. China.

angustifalia. Pleichlastus distichus argentea: see Pleioblastus viridi-striatus.

argenteo-striata: see Pleichlastus mirula-striatus

arundinacea. To 100 ft., culms yellow, branches flexuose and spiny: lvs. to 8 in. long and ½ in. wide, nearly glabrous: infl. a large panicle produced only once after which the plant dies. India.

aurea: Phullostachus aurea.

auren-striata · soo Pleichlastus miridi-striatus

Castilloni: Phullostachus bambusoides var. chrysántha: Sasa chrysantha.

disticha: Pleioblastus distichus.

falcàta: Arundinaria falcata. fastudsa: Semiarundinaria fastuosa.

flexudsa: Phyllostachus flexuosa.

Fortunei aurea: Pleioblastus viridi-striatus, grácilis: Pleroblastus Hindsir.

Hendnis: Phyllostachys niger var. Henonis.

japónica: Pseudosasa japonica. kumasaca: Shibatwa kumasaca. Lavdéckeri: Pleioblastus Chino.

marmòrea: Chimonobambusa marmorea.

Metake: Pseudosasa japonica. mitis: Phyllostachys sulphurea.

múltiplex. Per. to 12 ft., many erect thick terete sts., long internodes: lvs. linear-lanceolate, to 6 in. long, flat, glabrous, reddish-green: fls. erect, terminal in short spikes. Cochin-China.

nana. To 10 ft., sts. yellow: lvs. to 3 in. long and ½ in. wide, rough on edges, glaucous-blue. China, Japan. Var. Alphônse Karri (B. Alphônse Karri) has sts. variegated yellow and green, lvs. mottled rose and green. Var. variegata (B. vitlati-argentea) has lvs mottled with silvery-white—Much of the material cult. as B. nana is Sasa disticha

nìgra: Phyllostachys niger.

nùtans. To 45 ft., the culms glossy-green: lvs. to 1 ft. long and 1 in. wide, rough above and on edges, glabrous or hairy beneath. India.

palmàta: Sasa senanensis var. nebulosa.

pygmæa. To 1 ft, sts. purple, slender and much branched: lvs. to 4 in. long and ½ in. across, pubescent, bright green above and glaucous beneath, margins serrate. Japan.—The smallest of the bamboos, a vigorous grower and used for

quadrangularis: B. angulata.

Ragamdwskii: Sasa tessellata.

Simonii: Pleioblastus Simonii. striata: Phullostachus sulphurea.

sulphurea: Phyllostachys sulphurea.

tessellàta: Sasa tessellata.

Thouarsii: B. vulgaris.

Túlda. To 70 ft., the culms gray-green: lvs. to 13 in. long and 1½ in. wide, rough above and on edges, paler and usually harry beneath. India.

Veitchii: Sasa Veitchii.

ventricosa: listed name of unknown botanical standing. verticillata: a name of doubtful botanical application.

Vilmorinii: Pleioblastus distichus. viminalis: Shibatæa kumasaca.

violéscens: Phyllostachys violescens,

virginiana: listed name.

víridi-glaucéscens: Phyllostachys viridi-glaucescens.

víridi-striàta: Pleioblastus virudi-struatus. vittata-argéntea: B. nana var. variegata.

vulgaris (B. Thouars:1): Feathery B. To 50 ft., with yellow longitudinally banded sts.: lvs. to 10 in. long and 1½ in. wide, glabrous. Java and perhaps elsewhere. Var. aureo-variegata is listed.

BANANA. A tropical fruit extensively grown for local use and for export to temperate regions. It is a perennial herb but the stem and leafsheaths produce a trunk-like structure and the plant may attain a height of 20-30 feet with a crown of big long leaves and a heavy cluster of fruits. The common species is of two main races (sometimes regarded as two species), Musa paradisiaca, the plantain of which the fruit is edible when cooked, and var. sapientum, the true banana which is edible raw at maturity. Another species is the dwarf or Chinese banana. Musa nana (M. Cavendishii), which may be grown commercially in warm-temperate climates, as in Bermuda, the Canaries and the Hawaiian Islands, See Musa.

A single "trunk" bears but one bunch and then dies; in the meantime suckers (one or more) have arisen from the rhizome to continue the fruiting. A vigorous sprout or new trunk should bear in ten or twelve months (or later than that if the plant is grown for curiosity under cover). A plantation continues to bear indefinitely if diseases, insects and soil defects do not intervene. As the plantation gets older the rows become irregular as offsets are formed farther away from

the original plant.

Inasmuch as the commercial bananas are seedless, propagation is by vegetative means. Pieces of the rhizome weighing 3-4 pounds, each with a bud or "eye," are used in establishing a new plantation. Rooted suckers may also be planted. Dwarf bananas (M. nana) may be set as close as 8-10 feet either way, but the ordinary large kinds should stand 14-20 feet apart in commercial plantations. The banana requires moist, deep and fertile soil but well drained, and protection from wind. Surplus suckers are removed to control the succession of fruiting and to space the fruiting trunks.

Within the continental United States the banana is infrequently a commercial fruit except the dwarf Chinese, although it is somewhat planted for home use, ornament and interest in Florida, along the Gulf Coast and clsewhere. The fruit is destroyed by frost, but new shoots arise from the crowns if the freezing is not too severe.

BANANA-SHRUB: Michelia fuscata.

BANEBÉRRY: Actaa.

BANFFYA: Gypsophila transsylvanica. BANGALAY: Eucalyptus botryoides.

BÁNKSIA. Proteaceæ. Australian evergreen trees or shrubs with alternate lvs. and yellowish fls. borne in pairs in dense terminal spikes becoming woody and cone-like in fr.; sometimes grown in S. U. S. Propagated by cuttings under a bell-jar or with difficulty by seeds. See also Pimelea.

Baxteri. Tall shrub: lvs. to 4 in. long, divided to midrib into triangular lobes 1 in. long and ¾ in. wide at base, pale beneath: spikes globular, to 3 in. across. W. Australia.

Caleyi. Low shrub: lvs. oblong-lanceolate, to 6 in. long, prickly-toothed or cut: spikes nearly globular, to 3 in. long. W. Australia.

coccinea. Shrub to 15 ft.: lvs. obovate to orbicular, to $2\frac{1}{2}$ in. long, stiff, prickly-toothed: spikes globular, 2 in. across. W. Australia.

collina. Shrub to 12 ft.: lvs. linear, to 3 in. or more long, sharply toothed, white-tomentose beneath: spikes to 6 in. long.

ericifòlia. Shrub or tree to 14 ft.: lvs. narrowly linear, about ½ in. long, with entire revolute margins, notched or truncate at end: spikes to 10 in. long. New S. Wales.

grandis. Tree to 40 ft.: lvs. to 1 ft. long, divided to midrib into triangular lobes to 2 in. long and 1 in. wide

at base, pale and tomentose beneath: spikes to 1 ft. long. W. Australia.

integrifòlia. Tree to 30 ft.: lvs. scattered, oblong to lanceolate, to 8 in. long and 1 in. wide, entire or sometimes toothed, white-tomentose beneath: spikes to 6 in. long.

littoralis. Tree to 40 ft.: lvs. linear, to 8 in. long, usually toothed, white-tomentose beneath: spikes to 10 in. long. W. Australia.

marginata. Shrub to 15 ft.: lvs. oblong-lanceolate, to 2 in. long, usually entire with recurved margins, white beneath: spikes to 3 in. long.

Meissneri. Low spreading shrub to 3 ft. across: lvs. linear, to ¼ in. long, crowded, revolute, white-hairy beneath: fts. to ¼ in. long, in ovoid spikes, style about ¾ in. long, hooked.

Ménziesii. Tree to 40 ft.: lvs. to 1 ft. long and 1 in. wide, truncate, rusty-tomentose beneath: spikes to 5 in. long. W. Australia.

nùtans. Shrub: lvs. narrow-linear, to 1 in. long, with entire revolute margins, glabrous: spikes to 2 in. long, sometimes nodding. W. Australia.

occidentalis. Shrub to 5 ft.: lvs. linear, to 4 in. long, notched or toothed at end, margins recurved, white beneath: spikes to 6 in. long. W. Australia.

pulchélla. Shrub: lvs. linear, to ½ in long, with entire revolute margins: spikes to 1½ in. long. W. Australia.

quercifòlia. Shrub to 6 ft., glabrous: lvs. oblong, to 4 in. long, truncate, deeply toothed or cut: spikes to 4 in. long. W. Australia.

rèpens. Prostrate shrub: lvs. to 1 ft. long, long-stalked, deeply pinnatifid, thick and stiff: spikes to 4 in. long. W. Australia.

serràta. Tree to 20 ft.: lvs. oblong-lanccolate, to 6 in. long and 1 in. wide, deeply toothed, tomentose beneath, leathery: spikes to 6 in. long.

speciòsa. Tall shrub, sts. dense, tomentose: lvs. pinnate, 8-12 in. long, lobes rounded to triangular, becoming larger toward base of lf., white-hairy beneath: fls. greenish, to 1 in. long, in dense oblong spikes to 5 in. long, style incurved at hange.

sphærocárpa. Shrub to 4 ft., tomentose: Ivs. linear, 1-3 in. long, with entire revolute margins: spikes globular, to 3 in. across. W. Australia.

verticillata. Small tree: lvs. in whorls, oblong-lanceolate, to 3 in. long, margins recurved, white beneath: spikes to 8 in. long W. Australia.

BANYAN: Ficus benghalensis. BAOBAB: Adansonia digitata.

BAPHIA (Bracteolaria). Leguminosx. Thirty or more simple-lvd. African trees and shrubs, one of which is intro. for ornament in S. Fla.: fls. papilionaceous, in panicles or axillary racemes: pod linear-lanceolate, flattened, narrowed to apex. B. racemòsa, Camwood, is a shrub, with oblong-lanceolate pointed entire lvs. to 2½ in. long: fls. white with purplish veins, the standard nearly ½ in. across, in short panicled leafy clusters: pods 2 in. long. Trop. and S. Afr.

BAPTÍSIA. FALSE OF WILD INDIGO. Leguminosæ. Per. herbs with mostly digitate lvs. of 3 lfts., papilionaceous fls. in racemes, and short inflated pods; native in E. N. Amer. in dry lands, adapted to borders and wild-gardens. Propagated by division or seeds.

álba. To 3 ft.: lfts. oblong to lanceolate: fls. white, to ½ in. long, in long peduncled lateral racemes. N. C., west and south, extending northward.

austràlis. To 6 ft.: lfts. to $2\frac{1}{2}$ in. long, oblanceolate to oval: fls. indigo-blue, to 1 in. long, in long terminal racemes, summer. Pa. to Ga. and Tex.

bracteàta. To 2½ ft.: lfts. to 4 in. long, oblanceolate to obovate, softly pubescent: fls. white or cream-colored, in spring. Mich. to Tex. east to Ga.

grandiflòra: trade name for B. australis.

leucántha. To 4 ft.: líts. to 2 in. long, obovate to cuneate: fis. white, to nearly 1 in. long, in lateral racemes. June-July. Ont. to Fla. and Tex.

leucophea. Probably not distinct from B. bracteata, but separated by some authors on the basis of lits. narrowly oblance-olate-spatulate and villous.

minor. Distinguished by some authors from B. australis by the divaricate branches and lfts. \%-2 in. long. S. U. S.

perfoliata. To 3 ft.: lvs. simple, orbicular, to 2 in. long, perfoliate: fls. yellow, in spring. Ga., S. C.

tinctòria. To 4 ft.: líts. to 1 in. long: fis. bright yellow, in summer. Me. to Fla. and La.

versicolor: referable to B. australis.

villosa. To 4 ft., plant pubescent throughout, especially when young: Ivs. nearly sessile, Ifts. to 4 in. long, entire, cuneate at base: fls. yellow, to 1 in. long, in lateral racemes to 1 ft long. June-July. Va. to Fls. and Ark.

BARBADOS FLOWER-FENCE: Poinciana pulcherrima.
-Nut: Jatropha Curcas. Pride: Poinciana pulcherrima.

BARBARÈA (Campe). WINTER-CRESS. UP-LAND-CRESS. Cruciferæ. A few biennials and perennials in temp. regions, some of them becoming field and roadside weeds, a few kinds more or less grown as edible cress, and sometimes for ornament: they are erect branching herbs with small yellow fls. in terminal racemes, elongated erect or spreading pods or siliques, and pinnatified or lyrate lys. See Cress.

plantaginea. Bien, similar to B, vulgaris but larger in all its parts; lvs. oblong, toothed or somewhat lyrate, the lateral lobes toothed: pods $1\frac{1}{2}$ in, long. Asia Minor.

præcox: B. verna.

rupicola. Per., forming mats or sods: st. to 1 ft.: radical lvs. with large cordate terminal segm. or part, cauline pinnatifid: fis. large, the pedicels longer than sepals. Corsica, Sardmia.—Grown for ornament.

vérna (B. præcox). Early or Belle Isle Cress. Bien., probably sometimes per., to 2 ft.: lvs. irregularly pinnatifid, the segms, of the radical ones mostly 4-8 pairs: pod at maturity 1½ in. or more long, sharply 4-angled, on pedicel nearly or quite as thick as itself, the beak or point short and thick. Eu.; sometimes run wild.—Blooms in very early spring.

vulgāris. Per, or perhaps bien, to 2 ft.: lvs. with 1–3 pairs of segns.; pod 1 in, or less long, obtusely angled, on relatively thin pedicels, the beak commonly very thin. Eu.; extensively nat. in N. Amer, and occasionally a noxious weed in new meadows and cult. land.—Blooms later. Double-fid. and variegated-lvd. forms are known.

BARBERRY: Berberis, Holly: Mahonia Aquifolium.

BARKERIA: according to recent practice treated as a well marked section of the polymorphic genus *Epidendrum*, which see.

BARKHOUSIA: Crepis.

BÁRKLYA. Leguminosæ. One tree to 60 ft. native of Queensland and intro. in S. Calif. **B. syringifòlia.** Lvs. simple, broad-cordate, to 4 in. long: fls. golden-yellow, small, regular, in dense racemes to 9 in. long forming terminal panieles.

BARLERIA. Acanthaceæ. Herbs or shrubs with opposite entire lvs. and funnelform 5-lobed fls. solitary or in spikes or heads, with large often showy bracts; native in Old World tropies and grown under glass or in the open in warm climates. Propagated by cuttings of young wood over heat.

cærûlea. To 4 ft.: lvs. ovate, to 6 in. and more long: fls. blue, to 2 in. long, in dense spikes to 3 in. long; bracts veiny, large, entire. India.

cristata. To 3 ft.: lvs. oval, to 3½ in. long: fls. blue, 2 in. long, in dense spikes; bracts with long spiny teeth. India.

strigòsa. To 3 ft.: lvs. ovate, somewhat leathery and strigose fls. blue, to 2 in. long, in terminal spikes. India.

BARLEY: Hordeum vulgare.

BARÓSMA. Rutaceæ. S. African heath-like shrubs with mostly opposite leathery lvs. and 5-parted fls. solitary or clustered; one species intro. in S. Calif. Propagated by cuttings of mature wood.

ovata. To 2 ft., much branched: lvs. ovate or obovate, to ½ in. long, shining: fls. white, ½ in. long, solitary.

pulchélla (Diosma pulchella). To 4 ft., much branched:

lvs. ovate to ovate-oblong, to $\frac{1}{2}$ in. long, scattered, glossy, margins revolute: fls. purplish-white, $\frac{1}{2}$ in. long, in racemes at ends of branches or occasionally solitary in axils.

BARRINGTÒNIA. Lecythidaceæ. Evergreen trees of the Old World tropics, having large lvs. crowded at ends of branches and white or reddish fls. with many protruding stamens, borne in spikes or racemes; the following planted in tropics and intro. in S. Calif.

speciòsa. To 50 ft.: lvs. obovate, to 15 in. long, entire, shining: fls. with white petals 2 in. long and longer purplish stamens: fr. 4-angled, 3 in. across, with 1 large seed, style and calyx-lobes persistent. India.

BARTONIA: Mentzelia.

BARTSCHÉLLA. Cactaceæ. One species from Lower Calif., distinguished from related genera by the circumscissile fr. B. Schümannii (Mammillaria Schumannii). Sts. tufted, to 2 in. high; tubercles large; radial spines 9-15, to ½ in. long, central spines usually hooked: fls. near top of plant, purple or lavender, 1½ in. across.

BARYXYLUM: Peltophorum.

BASÉLLA. MALABAR-NIGHTSHADE. Basellaceæ. Two Asian twining herbaceous vines with fleshy ovate to ovate-lanceolate lvs. and small inconspicuous fls. in clusters on long thickened stalks; grown as pot-herbs in trop. regions. In the N. seeds must be started indoors under heat.

álba. Lvs. longer than broad: fls. whitish. rùbra. Lvs. about as broad as long: fls. reddish. tuberòsa: Ullucus tuberosus.

BASELLÀCEÆ. BASELLA FAMILY. Five genera of climbing or decumbent perennials from trop. Amer. and Asia, somewhat allied to the chenopods, having alternate fleshy lvs. and small regular bisexual fls. with 2 sepals, 5 petals and stamens, superior 1-celled ovary, and fr. inclosed by the corolla. Basella and Ullucus are sometimes grown for food and Boussingaultia for ornament.

BASIL: Ocimum.

BASKET-FLOWER: Centaurea americana, Hymenocallis calathina.

BASKET-OF-GOLD: Alyssum saxatile.

BASKET PLANTS are those of a more or less viney or trailing or diffuse habit that make a good appearance in hanging baskets and pots and that are of simple cultural requirements. The term is employed for those subjects customarily grown on porches and in windows rather than regularly in greenhouses. Some of them are annuals of simple culture. Others are perennials propagated by means of cuttings, as ivy (Hedera), vinca, strawberry-geranium, nasturtium, senecio, glechoma. Sometimes oxalis and spring bulbs are included. Basket plants do not constitute a cultural group, and need not be further considered separately. In growing basket plants one must be sure that caution is taken against excessive drying out.

BASSWOOD: Tilia.

BAST, CUBAN: Hibiscus elatus.

BATEMÁNNIA. Orchidaceæ. An American genus of epiphytes with few-lvd. pseudobulbs, plicate lvs. and lateral pendulous loosely-fld. racemes, with the broad base of the petals running down the long column-foot.

Cólleyi. Pseudobulbs compressed, ovate to oblong.

obtusely 4-angled, 1-3-lvd, at summit: lvs. oblanceolate-elliptic or obovate-oblong, plicate: raceme lateral, to 6 in. long; fls. to 10; sepals and petals green without, dull brownish-purple within: lp 3-lobed, white or whitish-yellow dotted with red. Trinidad, British Guiana.

Búrtii: Huntleva Burtsi.

BATOCYDIA UNGUIS: Doxantha Unquis-cati.

BATODENDRON: Vaccinium arboreum.

BATRACHIUM: see Ranunculus.

BAUÈRA. Saxifragaceæ. Evergreen shrubs of Australia and Tasmania, often somewhat heath-like in foliage, with opposite 3-parted lvs. and white, pink or purple fls. solitary in the axils or clustered at ends of sts.

One attractive species is grown in the cool greenhouse and blooms throughout winter and spring. Propagated by cuttings of half-ripened wood in spring.

rubioldes. To 6 ft. or more, often prostrate: lfts. oblong or lanceolate, to ½ in. long, toothed: fls. pink or white, ½ in. across.

BAUHÍNIA. Leguminosæ. Warm temp. and trop. trees or shrubs, often climbing, with simple lvs. which are usually 2-lobed or -parted, fls. in terminal or axillary cymes, and long flat pods; grown for ornament in warm countries. Propagated by seeds, suckers, and cuttings over heat.

aculeata (B. Ungula). Tree-like shrub with spine-like stipules: lvs. glabrous, subcordate at base, the 2 lobes ovate and 3-nerved and parted about one-fourth the way down: petals lanceolate and crenate, stamens 9 or 10: pods narrow, flat. Colombia.

acuminata. Shrub to 6 ft.: lvs. lobed less than half way: fls. white, in racemes: pods to 5 in. long. India, Malaya, China.

álba: B. variegata var. candida.

cándicans: probably B. candida is meant (corniculata). cándida: B. corniculata, B. variegata var.

coniculata. Erect shrub: lvs. lobed nearly one-half depth of lf., lobes obtuse: fis. white, 2½-3 in. long, with narrow long-clawed petals and prominent colored stamens. Brazil, Paraguay.—The plant grown in Cahf. as B. candida apparently belongs here.

corymbòsa. Climbing: lvs. lobed nearly to middle: fls. pinkish, in loose racemes. E. Asia.

forficata. Shrub or small tree: lvs. forked into long narrow lobes: fls. white or cream-colored, 1-3 in the axils, with long narrow petals. pods to 10 in. long. Brazil.

Gálpinii. Shrub to 10 ft., half-climbing: lvs. 2-lobed: fls. brick-red, in few-fld. racemes: pods to 5 in. long. S. and trop. Afr.

grandiflora: a name often applied to B. variegata.

Kappleri: B. monandra.

mexicana. Pata-Vaca. Large shrub or small tree: lvs. forked one-half-way down, lobes spreading and acute: fls. small, in clusters, petals white, stamens very long. Mex.

monándra (B. Kappleri). Butterfly-Flower. Jerusalem Date. Shrub or small tree: lvs. broadly lobed about one-third their length: fls. pink with purple markings, in terminal racemes, having only 1 fertile stamen. pods to 9 in. long. Probably Guiana.

pícta. Erect: lvs. roundish-elliptic, the lobes nearly ovate and acutish: fis. white, in terminal racemes, petals oblong. Colombia.

purpurea (B. triandra). Tree: lvs. broadly lobed about one-third their length: fis. red or white (var. álba), with long narrow petals. India, China.

racemosa. Small bush-like tree with hanging branches: lvs. rather small, broader than long, with short very obtuse lobes: fls. yellow, small, in loose racemes. India.

tomentosa. St.-Thomas-Tree. Shrub to 15 ft.: lvs. small, broadly lobed to one- or two-thirds their length: fs. yellow with a red or chocolate blotch on one petal, 1-3 in the axils: pods to 5 in. long. India, China, Afr.

triándra: B. purpurea.

Ungula: B. aculeata.

Váhlii. Malu Creeper. Tall climber: lvs. very large, broadly lobed to one-third or one-fourth their length: fis. white becoming yellowish, in many-fld. terminal clusters: pods to 1 ft. long. Himalayas.

variegata. Mountain Ebony. Orchid-Tree. Tree: lvs. broadly lobed to about one-third their length: fla.

lavender to purple, with broad petals, few together in the axils: pods to 1 ft. long. India, China. Much planted in S. Fla. Var. cándida (B. alba) has white fis.

BAYBERRY: Murica.

BAY, BULL: Magnolia grandiflora, Persea Borbonia, Loblolly: Gordonia Lasianthus. Red: Persea Borbonia and palustris. Rose: Rhododendron. -Rum-Tree: Pimenta acris. Sweet: Laurus, Magnolia virginiana.

BEAD-PLANT: Nertera depressa.

READ-TREE: Adenanthera, Melia.

BEAM-TREE. WHITE: Sorbus Aria.

BEAN. Various species of Phaseolus are commonly known as beans, as: common field, kidney or snap bean, Phaseolus vulgaris; lima bean, P. limensis; sieva or civet bean, P. lunatus; these species are annual twiners, but with bush or dwarf varieties. White Dutch Runner and Scarlet Runner, P. coccineus, are perennial but grown as annuals, also twiners with bush forms. All these plants are tender, to be planted only after the weather is warm and settled. Broad, Windsor or horse bean, Vicia Faba, is a stiffly erect hardy annual grown in North America mostly in Canada, and especially in the maritime districts; it does not thrive in hot dry summers. Other kinds of beans are grown for ornament, for forage and special purposes. See Dolichos, Glycine, Phaseolus, Vigna.

The present statements about culture of beans apply to the phaseolus kinds mentioned above. In respect to their uses, they may be divided into three categories; viz., those used as string or snap beans, the entire pod being eaten; those used as shell beans, the full-size but immature beans being shelled from the pod and cooked; dry beans, or those eaten in their dry or winter condition. The same variety of bean may be used for all of these three purposes at different stages of its development, but there are varieties better suited to one

purpose than the other. Beans will grow in most soils, but the best results may be expected in ground well enriched and in good physical condition. Little is to be gained by planting bean seed before the soil has become warm. No vegetable seed decays quicker than beans, and the delay caused by waiting for the ground to become warm and free from excessive moisture will be more than made up by the rapidity of growth when finally they are planted. The beans may be dropped 2 inches deep in shallow drills, the seeds to lie 2 inches apart. Cover to the surface of the soil, and if the ground be dry, firm it with the foot or the back of the hoe. For the bush varieties, allow 2-21/2 feet between the drill-rows. Pole beans are given more room, and support must be provided. The bush varieties may be planted at intervals of two weeks from the first planting until about two months before the average date of the first frosts in fall. Each planting may be on ground previously occupied by some early-maturing crop. Thus, the first to third plantings may be on ground from which has been harvested a crop of spinach, early radish or lettuce; after that, on ground where early peas have been grown; and the later sowings where beets or early potatoes have grown. String beans for canning are commonly taken from the last crop. One quart of seed will plant about 100 feet of drill.

Limas are the richest of beans, but the pole varieties often fail to mature in the northern states. The land should not be very rich in

nitrogen (or stable manure), else the plants will run too much to vine and be too late. Choose a fertile sandy or gravelly soil with warm exposure, use some soluble commercial fertilizer to start them off, and give them the best of culture. Aim to have the pods set before the droughts of midsummer come. The pole limas are commonly planted in hills that are 2 to 4 feet apart in the rows; 1 quart of beans plants about 100 hills. Good trellises for beans are made by strong twine stretched between two horizontal wires, one of thich is drawn a foot above the ground and the other 6 or 7 feet high. Dwarf limas are more desirable for small gardens than the pole varieties, as they may be planted much closer, the bother of procuring poles and twine is avoided, and the garden will have a more sightly appearance; they are grown in rows that are about 2½ feet apart. But the dwarf limas and pole limas require a longer season than the common garden bush beans, and usually only one planting is made.

Beans are attacked by a good number of diseases and insects, for the control of which the grower should consult the latest bulletins

and books.

BEAN: Phascolus. Asparagus: Vuyna sesquipedalis. Black: Castanospermum australe. Broad: Vicia Faba. Castor: Ricinus communis. Goa: Prophocarpus tetragonolubus. Horse: Vicia Faba. Hyacinth: Dolichos Lablab. Indian-: Catalpia bignonioides. Jack: Canavalia ensiformis. Lyon: Stizolobium niveum. Mescal: Sophora secundiflora. Potato: Apios americana. Sarawak: Dolichos Ilose: Screw: Prosopis pubescens. Soy: see Soybean. Sword: Canavalia gladiata. -Tree: Laburnum anagyroides. Velvet: Stizolobium Wild: Apios americana. Yam: Pachyrlizus. Yard-long: Vigna sesquipedalis. Yokohoma: Stizolobium

BEARBERRY: Arctostaphylos, Arctous.

BEARD: a long awn or bristle-like hair, particularly when in tufts.

BEARD-TONGUE: Penstemon. BEARS-BREECH: Acanthus.

BEARS-TAIL, CRETAN: Celsia Arcturus.

BEAUCÀRNEA. Liliacex. Tree-like plants in dry regions of Tex. and Mex. with tall trunks somewhat swollen at base, long linear stiff lvs. and small whitish fls. in panicles; sometimes retained in the genus Nolina; suitable for outdoor planting in warm dry regions. Cult. as for Yucca.

recurvata (Nolina tuberculata). To 30 ft.: lvs. to 6 ft. long and 34 in. wide, recurving. Mex.

BEAUFORTIA. Myrtacex. Stiff heath-like shrubs of W. Australia, with small opposite lvs. and mostly red sessile fls. in dense heads or short spikes; one species intro. in S. Calif. Propagated by cuttings of hardening shoots under glass.

decussata. To 4 ft. with stiff branches: lvs. ovate, rarely to 14 in. long: fis. in spikes, the red stamens to 1 in. long, petals not exceeding calyx-lobes.

purpurea. Small shrub: lvs. ovate- to linear-lanceolate, to 1/3 in. long: fis. small, in dense heads, stamens purple.

squardsa. Differs from B. decussata in petals twice as large as calyx-lobes.

BEAUMÓNTIA. Apocynaceæ. A few woody vines from Java to E. India, with opposite lvs., very large showy funnelform fls. in terminal cymes, leafy lobed calyx, and long cylindrical fr.

One is grown in greenhouses in rich loamy soil; it should not be planted in pots; also planted out-of-doors in the South. Propagated by cuttings.

grandiflora. Heralds-Trumpet. Lvs. oval or obovate, to 8 in. long: fls. white, trumpet-shaped, to 5 in. long and as broad, fragrant, spring-blooming. Himalayas.—Sometimes a small tree.

Jerdoniàna. Differs from B. grandiflora in the corolla funnelform rather than campanulate and the calyx-lobes narrow-lanceolate, not broad-ovate. India.

BEAUTY-BERRY: Callicarpa.

BEAUTY-BUSH: Kolkwitzia amabilis.

BEDDING is a more or less technical term to denote the growing of plants in beds or masses in distinction from placing them singly or in lines or "hills." It is commonly employed to designate the close massing of plants in the open ground for the making of striking displays of color or leafage; it is ordinarily a more or less temporary recourse for spring, summer or autumn show, although the name is sometimes given to assembled effects of perennials as of grasses and even of low evergreens. Sometimes the bed is of short duration even though the plants are perennial, as with the spring bulbs. It is evident that for temporary or seasonal effects the site must be well chosen and the ground carefully prepared so that results are obtained speedily and at the desired date.

In spring bedding the plants are commonly tulips, hyacinths, crocuses or other early-flowering bulbous plants. In this case, the grouncis usually occupied later in the season by other plants. These later may be annuals, the seeds of which are sown amongst the bulbs as soon as the season is far enough advanced; or the annuals may be started in boxes and the plants transplanted amongst the bulbs as soon as the weather is fit. Heavy early over-planting of this kind, however, is likely to weaken the bulbs or

prevent their proper maturation.

Summer bedding is often made with perennial plants carried over from the preceding year, or better, propagated for that particular purpose in February and March. Such plants as geranium, coleus, alyssum, scarlet salvia, ageratum and heliotrope may be grown for these beds. It is a common practice to use geranium plants which are in bloom in winter for bedding out in the summer, but such plants are tall and ungainly in form and have expended the greater part of their energies. It is better to propagate new plants by taking cuttings or slips late in the winter and setting out young, fresh, vigorous subjects. Many of the low-growing and compact continuous-flowering annuals are also excellent

for summer bedding effects.

Bedding of another type attempts to make patterns or designs; it is carpet-bedding. Comparatively few subjects are adapted to this purpose, for the plants must be such as will stand shearing and have very strong and con-stant colors of foliage. The most popular bedding plants are coleus (particularly the yellow Golden Bedder), alternanthera, iresine, Centaurea gymnocarpa, and such succulent plants as the houseleeks. Some of the annual flowers may also be used for strong color effects, as Lobelia Erinus and sweet alyssum. Ordinarily the making of carpet-beds should be left to professional gardeners, since it requires much skill and care to make and keep the beds in perfect condition; and a ragged or imperfect carpet-bed is worse than no bed at all. Carpet-beds are really curiosities, and they have no more legitimate place in the general pictorial landscape design area than painted stones or sheared evergreens. Therefore, they should be placed by themselves at one side, where they do not interfere with the general design of the place. In public parks they

make a very useful attraction when set off by themselves, the same as topiary work or other

specialties.

Bold subtropical effects can be produced by planting in the open such subjects as palms, bananas, crotons, araucarias, caladiums and cannas as well as by castor-beans and other quick growers. Plants like bananas and palms, which are kept normally in pots, would better be left in the pots and plunged to the rims rather than turned out directly into the ground. To attain quick and continuous effects, it is advisable to set the plants rather close. As these plants are likely to be injured by strong winds, it is well to have subtropical beds in a somewhat protected place. Care must be taken to provide good water supply, for the effects are conditioned largely on luxurious growth and clean foliage.

BEDSTRAW. Galium

BEECH: Fagus. Australian: Eucalyptus polyanthemos. Blue: Carpinus caroliniana.

BEEFWOOD: Casuarina.

BEET: Beta.

BEFÀRIA (Bejaria). Ericaceæ. Evergreen shrubs with alternate entire lvs. and white, yellow or red fls. in terminal racemes or corymbs; native Fla., Mex., S. Amer. and one species sometimes planted in Fla.

racemòsa. TAR-FLOWER. To 6 ft.: lvs. oval or oblong, to 2 in long, leathery: fls. white, 2 in. across, in showy racemes to 8 in. long. S. Ga., Fla., in sandy soil and low places.

BEGGARS-TICKS: Bidens frondosa.

BEGGARWEED: Desmodium purpureum.

BEGONIA. Begoniacex. Many species and hybrids in a great trop. genus, around the world, comprising subjects ornamental for foliage, habit and bloom: sappy or succulent herbs or herb-like shrubs; a few of them are annuals: lvs. alternate, often large and colored or illustrated, usually oblique or lop-sided: fls. monœcious, white, pink, red, yellow, the ovary inferior and usually similarly colored. Begonias have given rise, under cult., to numberless forms and hybrids and many of them bear Latin names as if they were species, thus adding to the confusion of the nomenclature. Present-day florists' begonias are mostly of the B. semperflorens relationship. The following species are per. unless otherwise stated. Many kinds bearing only vernacular names are not included in this account.

names are not included in this account.

Begonias are all tender plants, impatient also of dry and droughty conditions. They are glasshouse or lathhouse or window-garden subjects, requiring protection from burning sun, although many of the kinds are useful for beddingout in protected areas. Three main hortcultural classes may be recognized: the fibrous-rooted (or rootstock very small, if any), mostly tall and branching; the rhizomatous, with the stems or rootstocks running on the surface of the ground and the plants usually without erect branching stems, comprising species with conspicuously heavy ornamental foliage; the tuberous-rooted. B. socotrana is bulbous. The lines between these divisions are often more or less indefinite. The stem-bearing fibrous-rooted kinds grow readily from cuttings of the firm half-ripened wood, and rhizomatous species by division of the rootstocks. All the species are readily raised from seeds under cover; the heavy-leaved kinds propagate from leaf-cuttings, as the rex varieties. The tuberous kinds, which are summer bloomers, are grown mostly from seeds although the tuber may be divided; the tubers rest in winter. Tubers usually produce their best bloom two years or seasons from seed, although they may be dried off when flowers are past and growth is fully mature and used over again for several years. Seeds of begonies are small and they must be covered lightly and always treated with care in a protected seed-bed. The fibrous-rooted branching kinds contain the winter bloomers although many of them also bear colored and attractive

leaves; it is well to keep fresh plants of them coming on each year.

acida (B. braziliensis of hort.). Rhizomatous: lvs. basal, nearly orbicular, to 9 in. across, rugose, bright green, hairy: fis. creamy-white to faint pink, 36 in. diam., in loose clusters hanging on erect sts. Brazil.

acuminata: B. acutifolia.

acutángula (B. acutangularis). Like B. angularis, but lvs. broader and larger, veins pale green, margins coarsely toothed.

acutangulàris: B. acutangula.

acutifolia (B. acuminata). Fibrous: subshrubby to 3 or 4 ft.: lvs. oblong to ovate-acuminate, 2-3 in. long, serrate: fis. white, about 1 in. across, 3-5 on a peduncle.

álba perfécta: trade name for a tall fibrous-rooted plant with white fis.

álba scándens: see B. scandens.

álbo-pícta. Fibrous: shrubby, branched, compact: lvs. elliptic-lanceolate, not large, glossy-green and sulvery-spotted: fis. rather small, greenish-white. Brazil.

Alleryi. Medium in size, bushy, hairy: lvs. ovate, dark green, toothed, purple-veined underneath: fis. pale pink: B. metallica × B. gigantea.

andina. Medium size, brown-scurfy, branches drooping or spreading: lvs. fleshy, ovate, pointed, dull green: fls. white. Bolivia.

angularis (B. zebrina). Fibrous: plant smooth, shrubby, to 8 ft.: lvs. long ovate-acuminate, green and glossy above with white veins, tinged reddish underneath: fls. white, 35 in across, in large clusters. Brazil.

argénteo-guttata. Fibrous: strong and branching, 2-4 ft., glabrous: lvs. ovate-acuminate, 4-6 in. long, angled or toothed, white-speckled: fls. white tinged pink, in axillary clusters. Cultigen; B. albo-picta × B. olbia.

argyrostigma: B. maculata.

ascotiénsis. Fibrous: lvs. ovate, 2 in. long, dentate, brown with green margin: fls. bright red, long-peduncled. Cultigen; supposed to be B. fuchsioides × B. semperflorens.

Bertinii: hort. name for a plant closely allied to B. boliviensis, differing in its less pendent light scarlet fis.

boliviénsis. Tuberous: st. 2-3 ft. high, somewhat hairy, becoming more or less drooping: lvs. lanceolate to narrow-ovate, acuminate, serrate, 3-5 in. long: fls. cinnabar-scarlet, fuchsia-like. Bolivia.—Has entered into some of the garden tuberous begonias (B. luberhybrida).

Bowringiana: B. laciniata.

braziliënsis: B. acida; the true brasiliensis is not in cult. Bunchii: see B. Feastii.

cálla. Lvs. variegated with white, on new growth sometimes clear white like a small calla: one of the *B. semper-florens* group.

carminata. Fibrous: rather tall, branching: lvs. ovate-acuminate, deeply toothed but not lobed, green: fis. in hanging clusters, rose-scarlet. Recorded as a cross between B. coccinea and B. Dregei.

caroliniæfòlia. Fibrous: st. thick and fleshy: lvs. palmate, divided into 6-8 long ovate stalked lfts.: fls. small and pink, on long peduncles. Mex.

Carrièrei: derivative from B. semperflorens.

cathayana. Fibrous-rooted, to 18 in., erect: lvs. hanging, large, obliquely cordate, pointed, toothed, green above with crimson nerves, mottled crimson underneath: fls. vermillon. China.

Cáthcartii of hort. is B. xanthina.

cheimantha. Group name for the B. socotrana and B. Dregei hybrids, including Gloire de Lorraine raised in 1892, Glory of Cincinnati, Lady Mac, Melior.

Clárkei. Tuberous: st. erect to 2 ft., fleshy, puberulent: lvs. cordate-ovate, serrate: fls. large and bright red, in pendulous racemes. Bolivia at high altitudes.—Has contributed to the race of hort. tuberous begonias (B. tuber-hybrida).

coccinea (B. rubra). Fibrous: sts. glabrous, becoming 3-4 ft., branching: lvs. thick, oblong to ovate, 4-6 in. long, reddish underneath: fts. large, wax-like and coral-red, in drooping clusters. Brazil.—Has given rise by variation and hybridization to many good forms, as Lucerna, President Carnot.

cómpta. Tall slender hort. begonia: lvs. long-pointed, grayish-green with gray center: fis. small, white, in large

conchefòlia (B. Warscewiczii). Rhizomatous: lvs. ovate-cordate, 4-6 in. long, basal lobes overlapping, reddish and hairy underneath: iis. pink to nearly white, fragrant, on long peduncles. Cent. Amer.

corállina. Fibrous: related to B. maculata or a form of it, very free-flowering; 8-10 ft., needing support: lvs. cordate-

lanceolate, glossy green: fls. coral-red, in drooping long clusters. Cultigen.—The name is also applied to a form of

Crédneri. Medium size, bushy, soft-hairy: lvs. ovate, olive-green, reddish underneath: fls. pink: B. Scharfjiana × B. metallica.

crisne: R. manicata var.: also a form of tuberous begonia. cristata: hort. name for a race of tuberous-100ted begonias having a crested outgrowth from the center of fl.

cvorma: a form of B. metallica.

Davisii. Tuberous, acaulescent: lvs. ovate-cordate, thin-hairy, red underneath: fls. bright red, as well as peduncles. Peru.—Has contributed to the good of the production of the good of (B. tuberhybrida).

decora: hort, name for a tall fibrous-rooted begonia, with white odorous fls.

diadèma. Fibrous: sts. 2 ft., fleshy: lvs. deeply parted, maple-like, dentate, green blotched white: fls. very small, pink. Borneo.

dichôtoma. Fibrous: upright, 2-3 ft., glabrous, st. thick lvs. nearly orbicular to ovate, 3-12 in. long, serrulate and angled, bright green: fls. white, small, in long-peduncled clusters. Venezuela.

dichroa. Low, spreading: lvs. broad-ovate, pointed, glossy green; fls. large, orange, in dense clusters. Brazil.

Digwilliana. Fibrous: nearly or quite erect, of intermediate stature: lvs. elliptic, 2-4 in. long, serrate, dark rich green: fls. rosy-scarlet, drooping. Cultigen; probably a hybrid from B. fuchsioides.

domingensis. Subshrubby but low, with hard glabrous branches and hairy branchlets: lvs. small, ovate-acute, somewhat codate and lobed, 1 in. or so long, glabrous above and hairy on nerves underneath: fis. white, small, in close cymes. Hispaniola.

dominicalis. Fibrous: sts. glabrous. to 3 ft.: lvs. ovute-cordate, to 4½ in. long, acuminate, membranous: fls. white, to ½ in. long, in much branched erect glabrous dichotomous cymes. Dominica.

Drègei (B. parvifolia). Tuberous or semi-tuberous: sts. ann. from the tuber, succulent, red, 1-3 ft.: lvs. ovate or rhombic, about 3 in. long, angled and more or less lobed, red-inbbed underneath. fis. few and white, on axillary peduncles. S. Afr. Var. Macbéthii (B. Macbethii) is mostly smaller and more slender, 1-1½ ft. high: lvs. smaller, deeply notched-lobed: fis. smaller. Probably a cultigen.

Druryi: hort. form differing from B. Haageana in its white fis. and lvs. purple beneath.

Duchártrei. Fibrous: st. branched and hairy, 2-3 ft, and more lvs. ovate-lanceolate, long-acuminate, 5-8 in. long, dentate, reddish underneath: fls. large, waxy-white and with red hairs, in long-stemmed compact clusters. Cultigen; apparently hybrid from B. Scharfiana.

echinosépala. Medium in size, hairy, sts. erect and much branched: lvs. ovate and pointed, coarsely toothed, green and glossy, purple underneath: fls. pink, hairy on outside. Brazil.

ecuadorensis. Trade name for a begonia grown from Ecuadorenn seeds: st. upright: lvs. large, nearly palmate, green with whitish markings when young: fls. white to pink. Another ecuadorensis is B. acida.

Engleri. Tall, succulent, somewhat branched: lvs. ovate, conrsely toothed, green with purplish veins: fis. clear pink. Trop. Afr.

Érfordii. Fibrous: dwarf and bushy, to 1½ ft.: fls. rose-carmine. Hybrid of B. Schmidtuana and a form of B. semperflorens.

Evansiana. Tuberous: glabrous, branching, sts. to 2 ft., deciduous: lvs. ovate, acute and subcordate, lobed and denticulate, red underneath: fls. large, flesh-color. China, Japan.—Stands some frost; propagates by axillary bublets.

Faureana. Sts. erect: lvs. palmately parted to middle into 3 or 5 main divisions which are again parted or notched, marked silvery-white and brownish. Brazil.

Réastii. Rhizomatous: lvs nearly orbicular, thick, red underneath, hairy on edges: fls. light pink, long-peduncled. Hybrid of B. manicuta and B. hydrocotylifolia.—A form with lf .- margins crested and frilled is B. Bunchii.

fimbriata: reported as a tuberous begonia with fringed petals.

floribúnda: B. multiflora.

foliosa. Fibrous: small smooth semi-shrubby very leafy plant to 1½ ft.: lvs. about ½ in. long, distichous on short shaggy branchlets, notch-lobed: fls. 1-3 together on slender axillary peduncles, white tinged rose, about ½ in. across. Colombia.—Good basket and conservatory plant.

Franconis. Ann., pubescent, erect, to 6 in.: lvs. small, unequally ovate, subcordate, to 2 in. long, crenate and chate, 7-nerved: fls. white or pinkish, axillary and few. Mex.

Froèbelii. Tuberous: lvs. cordate-acuminate, with fleshy

purplish hairs: fls. bright scarlet, large, in tall branching drooping clusters (see B. tuberhybrida). Ecuador.

frutéscens. Trade name of a begonia of low spreading habit with red sts.: lvs. strongly undulate, green above red beneath: fls. white with pedicels and peduncles red, in stiff terminal clusters.

fruticesa: trade title for a set of the Scharffiana group with leathery lvs. green to almost black on upper surface and red underneath: its. white or tinted.

fuchsioldes. Fibrous but with very short rootstock; st. slender, 2-3 ft., branchlets shaggy: lvs. ovate and lopsided, to 1½ in. long, serrulate: fls. fuchsia-like, scarlet, ½2-¾ in. across. Mex.—Good conservatory plant. Var. coccinea. Fls. transparent-scarlet.

gigantès: B. semperflorens var. Another B. gigantea is a rhizomatous plant, probably of garden origin, with st. 2-3 ft. high: lvs. long-acuminate, to 1 ft. long: fis. many and small, white or pale pink.

Gfisonii. Fibrous: st. shrubby, to 2 ft., more or less procumbent: lvs. large, lobed, pointed and somewhat fluted, dark green: fls. double or crested, light pink, on long erect peduncles. Cultigen.

glandulifera. To 2 ft., with a fleshy creeping rooting st.: lvs. obliquely cordate-ovate, to 6 in. long, serrulate, sparsely hairy underneath and on margins: fls. white, in long-stalked open clusters. W. Indies.

glaucophylla. Rhizomatous: sts. glabrous, long and drooping or climbing on rafters: lvs. ovate and wavy, 3 m. long, glaucous, white-spotted above, purple underneath: fls. brick-red, to 1 m. across, in clusters. Brazil.—Some times erroneously called B. scandens.

goegoénsis. Rhizomatous, compact: lvs. erect, ovate-orbicular, peltate, blistered or puckered green above and handsomely blotched and veined, dull red underneath: fls. small, rose-pink. Sumatra.

grácilis. Tuberous: st. erect. mostly unbranched, smooth: grācilis. Tuberous: st. erect, mostly unbranched, smooth: lvs. heart-shaped, lobed and denticulate: fls. pink, in summer, on short axillary peduncles: bulblets in the lf.-axils may be used for propagation. Mex. Var. álba, fls. white; var. compacta of the trade is B semperflorens Tausendschon; var. rôsea is listed: var. luminôsa, lvs. bronzy-red, fls. scarlet.

gunnetierona. Pidrous: tree-like but little if at all branched, sts. scaly and more or less woolly: lvs. large, to 16 in. across, nearly orbicular, dentate-notched or with small angle-lobes: fls. very small, whitish, in axillary clusters. Colombia. gunneræfòlia. Fibrous: tree-like but little if at all

Haageana: B. Scharffii.

heracleifòlia. Rhizomatous, hairy: lvs. long-stalked, orbicular, to 1 ft. or more across, with 5-9 deep narrow dentate lobes that extend to the middle of the blade or beyond: fis. white or rose, small, to 1 in. across, on peduncles 2-4 ft. high. Mex.

hiemalis. Group of hybrids between B. socotrana and Andean tuberous species, represented by varieties Emily Clibran, Flambeau, Optima, The Pearl.

hirtélla. Low and bushy, hairy: lvs. broad-ovate, green, small: fis. greenish-white. Brazil.

Houghtonii. Low and bushy, soft-hairy, resembling B. Scharffii but lvs. smaller, paler and often more strongly lobed, long-acuminate. Hort. plant, once identified with B. urophylla.

Hûgelii. Medium in size, white-hairy, erect: lvs. broadovate, large, dentate, shallowly lobed, reddish underneath: fls. white. Brazil.

humilis. Ann. to 15 in., erect and branching: lvs. thin, narrow-ovate and pointed, 2 in. long, oblique and subcordate, sparsely hairy, dentate and serrulate: fis. white, small, in open long-stalked clusters. Tranidad.

hydrocotylifòlia. Rhizomatous, hairy: lvs. roundish-cordate, repund and not lobed, short-stalked: fls. rosc-colored, small but many, on peduncle to 1½ ft. high. Mex.

illustrata: small-lvd. form of B. Rex.

imperialis. Rhizomatous very hairy condensed low plant: lvs. cordate-ovate, 2-6 in. long, serulate, green above and lighter along the venns, brown-green underneath: fls. white, about ½ in. across, on scapes or peduncles not exceeding the foliage. Mex.—Commonly grown as Otto Foerster. In var. smarágdina the lvs. are wholly bright

incana (B. pcltata of cult.). Fibrous, scurfy-tomentose on stalks and foliage: st. 1-2 ft. tall and mostly simple: lvs. broad-ovate to nearly orbicular, peltate, 4-9 in. long, entire or repand: fls. white, I in. across, in clusters on long peduncles. Brazil.

incarnata. Fibrous: st. branching, erect, 2-3 ft.: lvs. oblong to ovate, 4-10 in long and long-pointed, notched and semi-lobed, reddish-green underneath, often more or less spotted or feathered above: fls. rose-colored, to 1½ in. across, in hanging clusters. Mex.

Ingramii. Fibrous: to 3 ft., with horizontal blooming side branches: Ivs. small, lance-ovate, serrate, green, tinted red in the sun: fls. rose, large for the group, as the plant is a hybrid of B. nitida and B. juchstoides; free-blooming.

isóptera. Fibrous: st. branching, $1\frac{1}{2}-2$ ft., glabrous: lvs. ovate-oblong, to $3\frac{1}{2}$ in. long, strongly of lique, subcordate, margin undulate-dentate to denticulate: fls. pink, in cymes to 4 in. long. Java. Var. hirsúta has glandular-hairy petioles.

kewénsis. Tall, of hort. origin, sts. branching: lvs. ovate, acuminate, green: fls. greenish-white, in drooping

lacinièta (B. Bowringiana). Fibrous: sts. to 2 ft.: lvs. broad cordate-ovate, 5-8 in. long, glabrous or nearly so except on edges, angled to sharp-lobed to laciniate, purplishblack above and broad green band between margin and rib: fls. white, about 2 in. across, few on a long peduncle. China.

Lesoùdsii: reported as a form of Rex begonia.

lettônica. Rhizomatous: medium size, pubescent: lvs. large, ovate and acuminate, cordate, shallowly lobed, green above and reddish underneath, dentate and ciliate: fis. pink: B. heracletfolia × B. nelumbijoha.

Lièbmannii. Rhizomatous: low, hairy: lvs. orbicular, erect, lobed, green blotched with silver, purplish underneath: fls. white and greenish, large, in short infl. Mex.

Lindleyana. Erect, st. fleshy, red-hairy; lvs. ovate-acute, peltate, to 6 in. long, toothed and somewhat lobed; fls. in branching clusters, white. Guatemala.

Llóydii. Tuberous: drooping habit: fis. single and double, white and colored. Hort. name.

lobata. Fibrous: lvs. pointed, spotted: fis. white. Hort.

lobulata. Tall and erect, with few branches: lvs. broadovate, large, glossy green, shallowly lobed and finely toothed, brown-tomentose underneath: fls. white or pale pink, in erect clusters. Mex.

Lucerna: form of B. coccinea, or hybrid, with white-spotted foliage.

lumindsa: B. gracilis var.

luxurians. Fibrous: sts., stalks and lvs. hairy: lvs. palmately compound, lfts. 7-17, lanceolate and serrate and 3-6 in. long and about 1 in. broad, upper surface reddsh, under surface green: fls. small, cream-color, in long-peduncled clusters. Chile.

Machéthii: B. Dregei var.

macrophylla: B. nelumbiifolia.

maculata (B. argyrostigma). Fibrous: plant smooth, sts. branched, 2-5 or more ft.: lvs. oblong to oblong-ovate, thick, 4-8 in. long, obtuse or nearly so, undulate, green and with circular white dots above, red underneath: fls. pale rose to white, about 1 in across, in hanging clusters. Brazil.

magnifica: hort. name for a form of B. Rex-cultorum as well as for one of the B. semperflorens type; the true B. magnifica of Colombia, a smooth and shining suffrutescent rhizomatous species, is probably not in cult. with us.

malabárica. Low and bushy, pubescent: lvs. small, ovate, green, dentate: fis. light pink, drooping, in short clusters Malabar, India.

manicata. Rhizomatous: plant mostly glabrous except on If-margins and ribs: lvs. short-ovate, 4-8 in. long, fleshy, sinuate-dentate, shining green above, reddish underneath. fls. about ½ in. long, pink, the peduncles exceeding the foliage. Mex.—Runs into cristate and spotted forms under cult.; see also B. Feastii.

Mánnii. Low, with erect branching sts.: lvs. ovate and acute, green, reddish underneath, dentate: fis. pink, in short infl. W. Afr.

Margaritæ. Fibrous: sts. 1-2 ft. high, purple and hairy: lvs. ovate-acuminate, sinuate-dentate, green and purplish above, red underneath: fis. large, rose-colored, in clusters. Cultigen; B. metallica is said to be one parent.

Martiana: form of B. gracilis.

metállica. Fibrous: sts. erect and shaggy, to 4 ft.: lvs. ovate, to 6 in. long, angled or lobed, margins sinuate-serrate, green and metallic-tinted above, lighter underneath: fis. blush-white to light rose, to 1½ in. across, in peduncled clusters. Brazil.

multiflora (B. floribunda). Fibrous: tall, resistant; a form of B. fuchsioides or a derivative: fis. delicate pink.

narcissifiòra: hort. name for a class of tuberous begonias with fis. shaped like a single daffodil, yellow, pink and red.

nelumbiifolia (B. macrophylla). Rhizomatous: lvs. round-ovate to nearly orbicular, to 18 in. long, peltate, not lobed, serrulate and ciliate, short-pointed, green both surfaces, mostly hairy on nerves: fis. white or pinkish, 1/3 in. or less across, on tall peduncle. Mex.

nigricans (B. subpeltata nigricans of hort. lists). Fibrous: erect, branched, 2-3 ft.: lvs. ovate, acuminate, to 9 in. long,

angled-toothed, bristly-serrate, silvery-green and somewhat marked above with darker areas, red underneath, hairs often dark red: fls. rose, about 1 in. across, in peduncled clusters. Cultigen.

nítida. Fibrous: glabrous, sts. branched, 3-5 ft.: lvs. reniform-ovate, 4-6 in. long, crenate-dentate, green and glossy: fis. pink or rose, to 1½ in. across, in large peduncled clusters. Jamaica. Var. odoráta álba has smaller sweetscented fis.

odorata: B. nitida var.

6lbia. Fibrous: st. short and erect, mostly branched: lvs. ovate, to 5 in. long, dentate and somewhat angle-lobed, hairy and bronzy-green and white-dotted above, red underneath: fis. white, in short drooping axillary clusters. Brazil.

palmāris. Fibrous: much like B. olbia but lvs. not spotted and reinform-ovate, to 10 in. long and usually with about 3 triangular-acute lobes: fls. white, with serrate petals, more or less hidden in the foliage. Brazil.

palmata: hort. name for a plant with cane-like growth and large palmate silver-striped lvs.

palmifòlia: hort, name for a plant with large lobed green lys, and white fis, in clusters.

parvifòlia: B. Dregei.

Pèarcei. Tuberous: sts. branched, 1 ft. high: lvs. broadovate and cordate, acuminate, toothed, glabious and green above, tomentose and pale red underneath: fls. bright yellow, large, in axillary clusters. Bolivia.—It has intro. the yellow color into the hort. tuberous begonias (B. tuberhybrida).

peltata: B. incana.

péndula: hort. tuberous begonia with drooping branches, in colors.

phyllomaniaca. Fibrous: sts. erect, branching, producing, as do the lvs., many buds and leafy growths: lvs. narrowly cordate-ovate and long-acuminate, to 7 in. long, side-lobed and toothed, green both surfaces: fls. pale pink, ¾ in. across, in hanging clusters. Brazil.

picta: hort, name for a fibrous-rooted begonia with small narrow lvs. spotted white and white fis. (picta alba); picta rosea has rose-colored fis. and often spotted foliage: both are probably forms of B. coccinea.

Póggei. Low, with erect sts.: lvs. ovate, acute, dull green, pinnately veined: fls. greenish with red wingless ovaries, in very short clusters. Trop. Afr.

prunifolia: hort. name for a plant of the Scharfliana type, with foliage plum-colored underneath: fibrous: sts. branched, hairy: lvs. to 6 in. long, oblique-ovate, red-hairy on veins underneath: fis. white, in large pendent clusters.

Rajah. Rhizomatous: lvs. angular-orbicular, papery, serrate, smooth above and with green ribs and brown-red intermediate areas, setose on veins underneath: fls. pink, small, on peduncles about as high as folinge. Malaya.

Réx. Rhizomatous: lvs. ovate, to 12 in. long, hanging on the hairy petrole, sinuate-dentate, reddish underneath and hairy on veins, metallic-green above with silvery zone about 1 in. wide midway between margin and outside of which is purplish. fis. pale rose, about 2 in. across, above the foliage. Assam.—Little known in hort.

Réx-cultòrum. The Rex begonias of hort., with variously marked, blotched or marbled not lobed lvs. that are sometimes helix-like or spiralled in center. Derivatives from B. Rex through variation or hybridization.—Known sometimes as "beefsteak-geranium."

Richardsiana (B. Richardsonii). Tuberous: plant small and bushy: lvs. like those of B. Dregei var. Macbethii but more deeply cut: fls. small, white. S. Afr.

Richardsonii: B. Richardsiana.

ricinifòlia. Hybrid derivative from B. heracleifolia: rhizomatous: lvs. orbicular in outline, to 1 ft. and more across, the lobes usually not extending more than about one-third the depth of the blade, bronzy-green: fls. rosepink, to 1 in. across, on tall peduncles.

robústa: hort. name for a fibrous-rooted plant of intermediate growth, probably an offshoot of B. fuchsiondes: sts. red, reproduced continuously from the root: lvs. oblong-acuminate, lop-sided, to 3 in. long, dentate, reddish: fis. pink to red, the staminate to 1½ in. or more across.

rosæflora. Tuberous: lvs. orbicular or reniform, 2-6 in. across, lobed, green but red-edged; fls. rose-red, 2 in. across. Peru, at high altitudes.—Has entered into the development of garden tuberous begonias (B. tuberhybrida).

ròsea gigantèa. Fibrous-rooted, erect: lvs. large, orbicular, glossy, with red spot at petiole: fls. deep rose to red, in large clusters. Hort.

Róssii: hort. name for a fibrous-rooted plant with bronzy foliage and light pink fls.

Róxburghii. Medium size, sparsely hairy, sts. slender and branched: lvs. broad-ovate, large, glossy green, paler underneath: fls. white, fragrant, in short infl. Himalayas. rubélla: B. rubellina.

rubellina (B. rubella of hort. lists). Rhizomatous: lvs. broad-ovate, shallowly lobed and pointed, to 8 in. long, dull green sprinkled with dark brown spots, petiole shaggy: fis. pink, about 1 in. across, long-peduncled. Cultigen.

ribra: R. coccinea.

rûbro-vênia. Rhizomatous: low, with erect branching sts.: lvs. ovate, oblique, pointed, glossy green, often red or brown underneath, shallowly scalloped: fls. white and pink. Himalayas.

Sándersonii. Fibrous: st. glabrous, nearly or quite erect, the plant low and bushy: lvs. ovate-acuminate, to 3 or 4 in long, doubly serrate, dark green: fls. bright scarlet, 1 in. or less long, drooping. Cultigen; probably a hybrid derivative from B. fuchsioides.

sanguínea. Fibrous: plant smooth and shining throughout, low, sts. several, 1½ ft. or more, red, leaf-bearing toward base: lvs. cordate-ovate, slightly peltate, to 6 in. long, entire, abruptly pointed, green above and blood-red underneath: fls. small, white, staminate to ¾ in. across, mostly above the foliage. Brazil.

scábrida. Tall, rough-hairy, erect, branching: lvs. broadovate, green, dentate: fls. small and many, white, in erect clusters. Venezuela.

scándens: a name commonly applied to the more scandent forms of B. glaucophylla. The true B. scandens has crenate-dentate lvs. and small white fis. from trop. Amer; perhaps represented in the plant listed as B. alba scandens.

Schafflana. Fibrous: plant 1-3 ft., robust, hairy: lvs. broad-ovate, to 8 in. long, pointed, olive-green above and bright red underneath: fls. large, waxy-white with conspicuous red hairs, in heavy long-peduncled clusters. Brazil.

Schárffii (B. Haageana). Fibrous: plant red-hairy, st. shrubby, 2-4 ft.: lvs. ovate-cordate, to 10 in. long, wavy, nerves red above: fls. rose-pink, in large hanging showy clusters. Brazil.

Schmidtiana. Fibrous: plant usually 1 ft. or less high, sts. harry and red-tinged: lvs. ovate-acuminate, to 3 in. long, angled or shallow-lobed, dentate, reddish underneath: fts. white tinted rose, small. Brazil.

Schnitzeri: hort name for a low branching semi-tuberous plant, perhaps a form of B. Dregei; fis, orange.

plant, perhaps a form of B. Dreger; its. orange.

semperflorens. Fibrous: variable plant, glabrous and more or less succulent, sts. little brunching, to 3 ft. high: lvs. ovate to oval, 2-4 in. across, finely serrulate and ciliate, glossy-green and commonly red-tinged on ribs: fis. rose-red to nearly white, 1 in. across, in axillary clusters. Brazil.— In its vurs. and derivatives, some of them hybrids, this plant is the prevailing type of florists and bedding begonias; some of the well-known offshoots are Carrierei, Chatchaine, Cincinnati, Erfordii, Gigantea Rosea, Gloire de Louveciennes, Melor, Triomphe de Lorraine, Vernon. See also R socatrana. B. socotrana.

sempérvirens: probably an error for semperflorens.

smarágdina: B. imperialis var.

Snitcheri: apparently a B. Rex-cultorum offshoot.

snotrana. Bulbous: sts. ann, erect, to 1 ft., somewhat branched: lvs orbicular, to 6 or 7 in. across, centrally peltate, margins rolled or scalloped: fts. rose-pink, to 2 in. and more across, in a long-peduncled small forking cluster. Socotra, Indian Ocean.—It has entered into garden kinds, largely through hybridization with B. semperflorens, in such forms as Cincinnati, Gloire de Lorraine and Gloire de Sceaux. See B. cheimantha; also B. hiemalis.

speculata. Rhizomatous: lvs. broad-ovate to orbicular, acuminate, to 8 in. across, triangular-lobed to one-quarter or one-half depth of blade, dull gray, speckled gray above and reddish underneath: fls. pink-white, about 1 in. across, on long peduncle. Cultigen.

subpeltata: B. nigricans.

subvillosa. Medium size, glandular-hairy and soft, succulent: lvs. ovate, green, dentate: fis. white, hairy on outside, in drooping clusters. Brazil.

Sunderbruchii. Rhizomatous: a form of B. heracleifolia with palmate bronze-green lvs. bearing silver bands along the nerves and purple underneath: fis. pinkish.

Sútherlandii. Tuberous or semi-tuberous, 1-2 ft.: lvs. lanceolate, lobed and serrate, green red-veined and margined: fls. orange or salmon. Natal.

Témplinii. Recorded as sport from B. phyllomaniaca: lvs. with ruffled and fringed margins and blotched white, yellow and reddish: fls. pink.

Teuscheri. Fibrous: st. strong and erect, branched, to 6 ft. high: lvs. large and fleshy, ovate-lanceolate, serrate, bright green with grayish blotches or dots, red underneath: fls. large, bright red, in axillary clusters. Malaya.

Thúrstonii. Fibrous: st. 2 ft. tall, smooth and glossy: lvs. orbicular-acuminate, red underneath: fis. pink, small,

in erect clusters. Cultigen; reputed hybrid between B. metallica and B. sanguinea.

tuberhybrida: the hort, tuberous begonias, a class name, the plants of various habit and color of bloom, the issue of such species as B. boliviensis, Clarkei, Davisni, Pearcei, rosaflora, Veitchii, with perhaps B. Froebelii, gracilis and others; some of them have low branching sts. and others only scapes.

ulmifòlia. Fibrous: sts., branching, shaggy-hairy, to 3 ft.: lvs. ovate-oblong and elm-like, to 5 m. long, double-serrate, somewhat hairy: fls. small, white, ½ in. or more across, many in peduncled clusters. Colombia.

undulata. Much like B. kewensis but lvs. smaller and undulate: fls. white. Brazil.

urophýlla. Low, much like B. Scharshi: lvs. large, broadly cordate, dentate, long-pointed, green, veins chasty: fis. white tinged bluish, in large clusters. Mex.

válida: a listed name.

Védderi. Seedling of *B. compta*, smaller, lvs. broader-based and shorter and lacking gray center.

Veitchii. Tuberous, one of the elements in the garden tuberous begonias (B. tuberhybrida): st. very short or practically none: lvs. nearly orbicular, lobed and cut, green: fis. cinnabar-red, 2½ in. across. Peru, high altitudes.

venosa. Medium size, white-scurfy, sts. thick, covered by large thin stipules: lvs. reniform but not peltate, fleshy: fls. white. Brazil.

Verschaffeltiana (Verschaffeltin). Rhizomatous: lvs. very large, ovate-acuminate, lobed, green: fis. rose, in large clusters. Cultigen; reported hybrid of B. manicata and B. caroliniæfolia

vitifòlia. Fibrous: strong, to 4 ft.: lvs. large and grape-like, orbicular to reniform, lobed, serrate, pubescent, green above, rusty underneath: fls. small and white. Brazil.

Wadei. Low, with stiff erect sts. which bear foliage on upper part: lvs. fleshy, oblong-ovate, green, convex: fls. few, pink. Philippines.

Wallichiana. Fibrous: st. to 1 ft.: lvs. ovate-suborbicular, strongly oblique, to 3 m. long, obtuse or acute, dentate-serrulate, petioles sticky-pubescent: fls. pink, few in cymes to 2 in. long. India.

Warscewiczii: B. conchæfolia.

wellingtoniénsis: dark green foliage and pink fls.: B. weltoniensis?

weltoniénsis. Tuberous or semi-tuberous: st. reddish, to 3 ft.: lvs. small, ovate-acuminate, to 2 in. across, dentate, green and smooth: fls. pink, many on short peduncles. Cultigen; hybrid from B. Dregei. Vars. álba and rôsea are listed.

Wéttsteinii: hort. name for a fibrous-rooted begonia of intermediate stature, wavy green lvs. and bunches of brilliant red fls.

xánthina. Rhizomatous: habit of B. Rex: lvs. glossy-green above and purplish underneath: fis. bright yellow, tinged red outside, large. India.

zebrina: B. angularis.

BEGONIÀCEÆ. BEGONIA FAMILY. Some 500 species of per. and a few ann. herbs, sometimes shrub-like, mostly more or less succulent affording many subjects prized for ornamental foliage and bloom. Some of them are somewhat tree-form although not many ft. high, others are lopping or scandent. Many of them are tuberous and not in foliage all the year. Nearly all the species are in the great genus Begonia. The other three genera (Begoniella, Hillebrandia, Symbegonia) are of very few species and not in general cult.

BEJARIA: Befaria.

BELAMCÁNDA. Chinese and Iridaceæ. Japanese perennials with stout rootstocks: often planted in gardens and of easy cult. in sunny locations in rich sandy loam; prized for the fis. and also for the ornamental black seeds. Propagated by seeds or division.

chinénsis (B. punctata. Gemmingia chinensis. Pardanthus chinensis and sinensis). BLACKBERRY-LILY. To 4 ft.: lvs./borne on st., to 10 in. long and 1 in. wide: fis. orange spotted with red, to 2 in. across, peduncles about 1 in. long: caps. splitting in autumn, leaving a column of seeds resembling a blackberry. Nat. in U. S., and hardy N.

flabellata. Differs from B. chinensis in its lower habit,

lvs. more tightly condensed and imbricated: fls. light yellow with segms. orange spotted at base, peduncles about 1½ in. long. Japan.—May be distributed as B. umbellata.

punctata: B. chinensis.
BELIS: Cunninghamia.

BELLADONNA: Atropa Belladonna.

BELLEVALIA: Hyacinthus romanus.

BELLFLOWER: Campanula. Chilean: Lapageria rosea. Giant: Ostrowskia magnifica.

BELLIDIASTRUM MICHELII: Aster Bellidiastrum.

BÉLLIS. Compositæ. Herbaceous annuals and perennials, growing in tufts or with branching sts.: lvs. alternate or all basal: heads solitary, the rays white or rose, disk-fls. yellow; pappus mostly lacking. Native in Eu. and the Medit. region.

English daisies are easily raised from seed sown in the spring for bloom the following year. The more specual varieties are propagated by division in cool weather as the seeds do not reproduce true to type. The plants are favorites for edging and for colonizing in lawns; they should have fertile moist soil.

alpina: B. perennis.

annua. Bien. or per. to 6 in.: lvs. rhombie-ovate to spatulate, to ¾ in. long, often long-petioled, margin culate and somewhat serrate: heads to ¾ in. across, ray-fis. pure white or white tipped pink. N. W. Medit. region.—Similar in appearance to B. rotundifolia from which it differs in its pappus-less achenes.

bellidioides: Bellium bellidioides. cæruléscens: B. rotundifolia var. helichrysoides: B. perennis var.

integrifòlia. To 15 in., branched: lvs. spatulate to linear, entire: heads 1 in. across, rays usually violet. Ky. to Tex.—Much of the material so listed is referable to Brachycome.

minuta: presumably Bellium minutum.

monstrosa: B. perennis var.

perfennis (B. alpina). True or English Daisy. Per. to 6 in.: lvs. spatulate or obovate, in busal tufts: heads to 2 in. across, white or rose, in spring and early sumner. W. Eu. A double form is var. ranunculifibra. A taller form is var. stricts. Other listed forms are: álba, white; helichrysoides, pink with long incurved ray-fis.; lûtea, fis. cream-colored; monströsa, fis. large; rōsea, fis. rose-pink; tubulòsa.

rotundifòlia. Lvs. ovate or broader, often subcordate, long-stalked, coarsely toothed: heads to 1½ in. across, with mostly white or in var. cæruléscens blue rays. Algeria, Morocco.

BÉLLIUM. Compositæ. Small herbs with basal tufted lvs. and solitary heads of fls. with white rays and light yellow disk; pappus of bristles and scales; native in Medit. region and suitable for the rock-garden and similar places.

bellidioldes. Per. to 4 in., stoloniferous: lvs. spatulate or rhombic with long petiole, the latter pubescent: ray-fls. usually white, occasionally pale pink, to ½ in. across. Var. nivâle (B. nivale) is a compressed form with very short

minùtum. Ann. to 3 in.: lvs. narrow-spatulate: heads ½ in. across.—Much of the material so listed is B. belli-dioides.

nivale: B. bellidioides var.

BELLOTA: Cryptocarya.

BELL-VINE, PURPLE: Rhodochiton volubile.

BELLWORT: Uvularia.

BELOPÉRONE. Acanthaceæ. Trop. American herbs and shrubs with opposite entire lvs. and tubular 2-lipped fls. in racemes or spikes with overlapping bracts; planted out in S. U. S. and also grown under glass as pot-plants.

californica. CHUPEROSA. Low spreading shrub to 4 ft., branches often leafless and canescent: lvs. ovate, to ½ in. long, early deciduous: fls. dull scarlet, to 1½ in. long, axillary, in short 4-rowed racemes. Colo. Desert, Calif. to Lower Calif.

guttata. Shrimp-Plant. To 1½ ft.: lvs. ovate, to 2½ in. long, hairy: fis. white spotted with purple, 1½ in. long, borne beneath broad reddish-brown imbricated showy

bracts $\frac{3}{4}$ in. long, in dense spikes to $\frac{3}{4}$ in. long. Mex.—Is cult. also under the name comosa, but the true B. comosa (of Mex.) is a very different plant and apparently not grown in this country, with ovate acuminate lvs. and narrow acute floral bracts.

longispicua purpurea: listed name, probably hort. form of B. guttata, said to be of more dwarf and floriferous habit with golden-brown bracts.

tomentosa: listed as a plant 3 ft. high with drooping racemes of cream and purple fis. inclosed in rosy-copper bracts.

BELVEDERE: Kochia scoparia.

BENE: Sesamum.

BENINCASA. Cucurbitaceæ. Ann. hairy pumpkin-like tendriliferous vine grown, particularly by Chinese, for the large fr. which is used in the making of preserves and sweet pickles and said to be eaten raw in warm countries; probably only one species. Cult. as for pumpkin and squash.

cerifera: B. hisvida.

hispida (B. cerifera). Wax or White Gourd (of India). Zit-Kwa. Tunka. Chinese Watermelon and Preserving Melon. Long-running vine: Ivs. broudly cordate-ovate, angled or somewhat lobed and toothed: fis. yellow and veiny, corolla nearly rotate and to 3 in. across: fr. oblong to cylindrical, to 16 in. long, harry and white-waxy, flesh white; seeds oblong-pointed, white, ½-½ in. long. E. Asia.—The plant has been grown erroneously as Cassabanana, which is Sicona.

BENSÔNIA. Saxifragaceæ. One species, B. oregona, from S. W. Ore., similar to Mitella but differing by its much elongated styles and filaments. Per., with basal cordate lvs. to 2 in. long, 7-lobed, crenate-dentate: fls. cream-white, on leafless stalks to 10 in. high, racemes 15-20-fld.

BENTHAMIA. Cornus

BENZOIN: Lindera.

BERBERIDACEÆ. BARBERRY FAMILY. Ten genera of herbs and shrubs mostly in the north temp. zone, having alternate lvs., bisexual fls. solitary or in racemes, with sepals and petals usually imbricated in 2 rows, stamens as many as petals, superior 1-celled ovary, and fr. a berry or pod. Among the ornamental genera are Aceranthus, Achlys, Berberis, Caulophyllum, Diphylleia, Epimedium, Jeffersonia, Mahoberberis, Mahonia, Nandina, Podophyllum, Vancouveria, all plants for outdoor use.

BERBERIDÓPSIS. Flacourtiacex. One partially climbing shrub from Chile, grown out-of-doors in S. Calif. Propagated by seeds, cuttings of green wood in spring, or layers in autumn. B. corállina. Lvs. alternate, cordate-ovate, to 3 in. long, coarsely sharp-toothed: fls. crimson, ½ in. long, in terminal many-fld. racemes: fr. a berry.

BÉRBERIS. BARBERRY. Berberidaceæ. Spiny shrubs with yellow wood, simple deciduous or evergreen lvs., turning bright colors in autumn, yellow fis., and fr. a red, yellow or black berry; native in northern hemisphere and also S. Amer.; the deciduous species are mostly hardy in the northern and central states and in S. Ont.

Barberries are widely grown for hedges and as specimen bushes for their general beauty and for the attractive flowers in spring and the fruits in autumn and winter. The evergreen species are not hardy in the northern states. The evergreen kinds do best in moist well-drained light loam, but the deciduous species may have drier soils. They are all of easy cultivation. Propagated by seeds which should be separated from the pulp, sown in autumn and they should germinate the following spring; by layers, cuttings of young wood in early June planted in sand in a shaded hotbed, and rare kinds by grafting on common

stocks; sometimes suckers may be removed from the parent plant.

actinacántha. Half-evergreen, to 4 ft.: lvs. obovate to orbicular or heart-shaped, to ½ in. long, with 2-3 spiny-serrite teeth along apical margin and spine-tipped, dark glossy green, leathery; spines 3-7-palmately branched and spreading; fls. yellow on red pedicels, fragrant. Chile.

acuminata. To 6 ft.: lvs. to 7 in. long, narrowly lanceolate, minutely dentates-serrate, bright green above, paler below: fls. yellow, small, in fascicles of 8-15 on pedicels to 1½ in. long: fr. ied. W. China.—Similar to B. insignis with which it is sometimes confused.

ætnénsis. To 8 ft., spines 3-parted: lvs. to ¾ in. long, obovate, margins ciliate-serrate: fls. in erect 5-10-fld. racemes: fr. globose, red. Eu.—Differs from B. vulgaris in having erect infl.

aggregata (B. Geraldii). Salmon B. Deciduous, to 10 ft., spines 3-parted: lvs. to 1 in. long, sharp-toothed; ffs. pale yellow, in sessile panicles to 1½ in. long; fr. red, prunose. W. China. Var. Prattii (B. Prattii) has longer often entire lvs. and longer panicles. Var. recurvata has lvs. often entire and panicles to 4 in. long.

amurénsis. Deciduous, to 10 ft., spines 3-parted: lvs. to 3 m. long, densely ciliate-toothed: fls. in drooping racemes to 4 in. long: fr. bright red. N. E. Asia. Var. japónica (B. Regeluara, B. Hakodate) has broader lvs. and shorter racemes. Japan, Korea.

Aquifdlium: Mahonia Aquifolium.

aristata (B. floribunda. B. petiolaris). Deciduous, to 10 ft., spines simple or 3-parted: lvs. to 2½ in. long, spiny-toothed or entire: fls. bright yellow, in racemes to 4 in. long: fr. red or purple, pruinose. Himalayis.

asiática. Himalayan B. Evergreen, to 10 ft., with small spines: lvs to 3 in. long, toothed or entire, whitish beneath: fs. in raceines to 2 in. long; fr. purple. Himalayas; adantable far S.

atrocarpa. Evergreen, to 6 ft.: lvs. narrow, to 3 in. long, coarsely spiny-toothed, the teeth spreading divergently: fls. in clusters of 6-12: fr. jet-black. W. China.

Bèalei: Mahonia Bealei,

Beanian. To 8 ft., sts. with 3-parted spines to 1 in. long, grooved on under side: lvs. elliptic-kinceolate, usually serrate with 2-12 teeth on a side, spine-tipped, dark green above, in fascicles of 5 to 8: fls. yellow, to ½ in. across, in erect panicles to 2 in long; fr. to ½ in. long, distinctly ovoid, bright purple. W. China.

Bérgmanniæ. Evergreen, to 6 ft.: lvs. to 1½ in. long, coarsely toothed: fis. in clusters: fr. black, prumose on reddish stalks. W. China. Var. acanthophylla has longer lvs.

bidentata. To 5 ft., branchlets terete and grayish, spines 3-parted: lvs. lanceolate, apex with 2 spine-tipped teeth, glaucous beneath, margins reflexed: fls. few in corymbs which are longer than lvs.: fr. violet, about 1/2 in. long. Chile.

brach botrys: the plant in cult. under this name is probably a form of B. vulgaris.

brach poda: the plant grown under this name is B. mitifolia.

brevipaniculata. Deciduous, to 6 ft., spines 3-parted: lvs. to 1½ m. long, entire or nearly so, glaucous beneath: fls. pale yellow, in short panicles: fr. red, pruinose. W. China.

buxifòlia (B. dulcis). Magellan B. Evergreen, to 10 ft., spines 3-parted or simple: lvs. to 1 in long, entire; fls. orunge-yellow, solitary: fr. dark purple. Chile. Var. nana is dwarf and compact, and var. pygmæa dwarf, tufted, unarmed.

canadénsis (B. Fischeri). ALLEGHENY B. Deciduous, to 6 ft., spines 3-parted: lvs. to 2 in. long, toothed, grayish-white beneath: fls. bright yellow, in racemes to 134 in. long: fr. scarlet. Va. to Ga. and Mo.

candidula. Evergreen dwarf shrub: lvs. to 1¼ in. long, with few spiny teeth, white beneath: fis. solitary. China.

Chenaultii. Hybrid between B. verruculosa and B. Gagnepainn: lvs. glossy, glaucous beneath.

chilénsis. Spines brown, 3-parted: lvs. shorter than spines, stiff and thick, broad-obovate to obovate-cuneate, coarsely spiny-toothed, glaucous underneath: fls. many, in nodding racemes: fr globose, black, pruinose. Chile.

chinénsis (B. Guimpelii. B. sinensis of some. B. serotina. B. spathulata). Deciduous, to 10 ft., spines simple or 3-parted: lvs. to 1½ in. long, nearly entire, pale beneath: fts. in racemes to 3 in. long: fr. dark red. Caucasus. Var. Langeana is B. laxiflora var.

circumserrata. Deciduous, to 3½ ft., sts. yellowish-red, spines 1-5-parted, to 1 in. long: lvs. obovate, to 1½ in. long, usually spiny-toothed, often whitish beneath, base wedge-shaped, apex rounded: fls. in clusters of 1-3, on peduncles to 1 in. long: fr. yellowish-red, to ½ in. long. N. W. China.

concinna. Deciduous or semi-evergreen, to 3 ft., spines 3-parted: lvs. to 1½ in. long, spiny-toothed, white beneath: fls. bright yellow, ½ in. across, solitary or in 2's: fr. red. Humalayas.

congestiflòra var. hakeoides: B. hakeoides.

corállina: B. stenophylla var.

Còrvi: B. Wilsonix var. subcaulialata.

cratægina. To 5 ft.: lvs. to 1½ in. long, oblanceolate, deciduous, usually entire: many-fid. racemes to 2 in. long: fr. bluish-black. Asia Minor.

crética. Deciduous, to 3 ft. or procumbent, spines 3-parted: lvs. about $\frac{3}{4}$ in. long, entire: fls. in short 2-7-fld. racemes: fr. purple-black. Greece; not hardy N.

Dárwinii. Evergreen, to 10 ft., spines 3-7-parted: lvs. to 1 in. long, spiny-toothed, glossy dark green above, paler beneath: fis. orange-yellow, in drooping racemes to 4 in. long: fr. dark purple. Chile; adaptable only far S. and Calif. Vars. depréssa and nana are dwarf forms.

diáphana. Kansu B. Deciduous, to 6 ft., spines simple or 3-parted: lvs. to 1½ in. long, toothed or entire, glaucous beneath: fis. bright yellow, solitary or in clusters of 2-5: fr. red, slightly prunose. W. China.

dictyophýlla. CHALKLEAF B. Deciduous, to 6 ft., spines 3-parted: lvs. to 1 in. long, entire or toothed, white beneath. fls. pale yellow, solitary: fr. red. China.

dictydta: a form of Mahonia Aquifolium.

Dielsiana. Deciduous, to 10 ft., spines simple or 3-parted: lvs. to 2 in long, entire or toothed: fls. in racemes to 3 in. long: fr. bright red. W. China.

dúlcis: B. buxifolia; also a form of B. rulgaris.

élegans: B. Lycium.

elegantíssima: listed name.

emarginata. Hybrid between B. vulgaris and B. sibirica, with fis. in dense racemes and deep red frs.

empetrifòlia. CROW B. Evergreen, to 2 ft., branches often prostrate, spines simple or 3-parted: lvs linear, to 34 in. long, entire, spiny-pointed: fls. golden-yellow, solitary or in 2's; fr. bluish-black. Chile.

fascicularis: Mahonia pinnata.

Féndleri. Deciduous, to 4 or 5 ft., with red-brown branchlets: lvs. obovare to oblanceolate, acute, to 1½ in. long, sometimes spinulose: fls. yellow tinged red outside, 6-10 in slender racemes. Colo., New Mex.

Fischeri: B. canadensis.

floribûnda: B. aristata.

Fórtunei: Mahonia Fortunei. Frèmontii: Mahonia Fremontii.

Gagnepàinii. Evergreen, to 6 ft., spines 3-parted: lvs. narrow-lanceolate, to 4 in. long, spiny-toothed, pale beneath: fls. bright yellow, in clusters: fr. bluish-black, pruinose. W. China.

Geráldii: B. aggregata.

Gilgiàna. Deciduous, to 6 ft., spines 3-parted: lvs. to about 2 in. long, toothed, pubescent: fls. bright yellow, in racemes to 1 in. and more long: fr. deep red. China.

grácilis: the plant in the trade under this name is probably Mahoma Aquifolium var. gracilis, although there is a species in Mex. known as Mahoma gracilis.

Guímpelii: B. chinensis.

hæmatocárpa: Mahonia hæmatocarpa.

hakeoides (B. congestiflora var. hakeoides). CHILEAN B. Evergreen, to 12 ft., spines small: Ivs. nearly orbicular, to 1 in. long, spiny-toothed: fls. in dense clusters: fr. bluishblack. Chile.

Hakodate: B. amurensis var. japonica.

Henryana. Shrub to 8 ft., sts. yellowish to brown: lvs. petioled, ovate-elliptical, entire or somewhat serrate; spines absent, or if present simple to 3-parted: fis yellow, in peduncled racemes to 2½ in. long: fr. red, elliptical, to 3½ in. long. Cent. China.—Differs from B. iulgaris in having brown, rather than gray, branchlets.

heterophylla. Half-evergreen, to 5 ft., spines 3-7-parted: lvs. to 1 in. long, entire or with large spiny teeth: fis. solitary: fr. black, pruinose. Chile.

heterópoda. Turkestan B. Deciduous, to 6 ft., spines simple or 3-parted or wanting: lvs. to 2 in. long, entire or finely toothed, bluish-green: fts. orange-yellow, in short racemes, fragrant: fr. black, pruinose. Turkestan.

Hookeri. Evergreen: lvs. to 3 in. long, spiny-toothed, white beneath: fis. clustered: fr. black-purple. Himalayas. Var. víridis has lvs. green beneath.

ilicifòlia. Holly B. Evergreen, to 8 ft.: lvs. to 2 in. long, spiny-toothed at apex: fts. orange-yellow, in short-racemes. S. Chile.—The plant cult. as B. ilicifolia is usually Mahoberberis Neubertii var. latifolia.

insignis. Evergreen, to 6 ft., spines few: lvs. to 5 in. long, spiny-toothed, glossy: fis. golden-yellow, in clusters: fr. black. Himalayas; hardy only far S.

Tácquinii: B. vuloaris.

Jamesonii. Evergreen: lvs. to 3 in. long, oblong, entire or few-toothed: fls. in panicles on short pedicels. Peru.

ianónica: B. Thunbergui or Mahonia Bealei: see also Mahonia japonica.

Julianæ. Wintergreen B. Evergreen, to 6 ft., spines 3-parted: lvs. to 3 in. long, spiny-toothed: fis. in clusters: fr. bluish-black, prumose. China. Var. nana is a dwarf form.

Knightii: B. xanthoxylon.

koreana. Deciduous, to 6 ft., spines mostly simple: lvs. to 3 in. long, toothed, pale beneath: fls. in racemes 1 in. and more long: fr. bright red. Korea. Var. atropurpurea may not differ from the typical form, in which the lvs. normally turn deep red in autumn.

latifòlia: Mahoberberis Neubertii var.

laxiflora. Hybrid between B. vulgaris and probably B. chinensis, with fis, in raceines to 4 in, long. Var. Langeana has purplish branchlets becoming grayish-brown.

lèvis: synonym of B. atrocarpa; the true species is probably not cult. and differs in If. teeth fewer and pointing forward.

Liechtensteinii: B. Potaninii.

Lycium (B. elegans). Half-evergreen, to 10 ft., spines 3-parted: lvs. to 2 in. long, entire or toothed: fis. bright yellow, usually in racemes to 4 in. long: fr. purple, pruinose. Himalayas; adaptable only far S.

macracantha. Hybrid between B. aristata and B. vulgaris: to 10 ft. or more: lvs. mostly obovate, somewhat spinose-serrate: racemes with 10-20 fis.

macrophýlla: B. vulgaris var.

mentorénsis. Hybrid of B. Thunbergii and B. Juliana, growing to 3 ft., with persistent spiny-toothed lvs, ovute elliptic, about 1 in. long, mostly acute: fr. dark dull red.

minor: probably B. Thunbergii var.

mitifòlia. Deciduous, to 8 ft., spines 3-parted: lvs. to 2½ in. long, finely toothed, pubescent: fis. pale yellow, in spike-lıke racemes to 3 m. long: fr. red. China.

nepalénsis: Mahonia nepalensis.

nervosa: Mahonia nervosa.

Neubertii: Mahoberberis Neubertii.

Nevinii: Mahonia Nemnii.

notábilis. Hybrid between B. heteropoda and B. rulgaris: lvs. obovate, toothed: fr. dark red, bloomy.

nummulària. To 10 ft., twigs purple, glaucous when young, terete, spines mostly simple, to 1 in. long; lvs. broadly obovate, to 1½ in. long, entire or few-toothed: fls. yellow, to ½ in. across, in dense racemes to 2 in. long; fr. red, globose-ovoid, to ½ in. long. Turkestan, N Persia. Var. pyrocárpa has oblong-lanceolate to oblanceolate lvs. and is reported to be more commonly cult. than the type.

orthobotrys. Similar to B. vulgaris, but the fls. somewhat corymbose and differing in technical characters. Persia.

parvifòlia. Half-evergreen, low, spines 3-parted: lvs. to ½ in. long, spiny-toothed or entire, pale beneath: fis. in dense clusters: fr red, pruinose. W. China.

petiolaris: B. aristata.

pinnata: Mahonia pinnata.

Poirétii. Deciduous, to 6 ft., spines simple, small: lvs. to 1½ in. long, entire, bright green above, pale beneath: fls. bright yellow, in racemes: fr. bright red. N. China,

polyántha. Deciduous, to 12 ft., spines simple or 3-parted lvs. to 1 in. long, spiny-toothed or rarely entire, glaucous beneath: fis. deep yellow, in drooping branched panieles to 5 in. long: fr. salmon-red. W. China.

Potaninii (B. Liechtensteinii). Deciduous, spines simple or 3-parted: lvs. to $2\frac{1}{2}$ in. long, spiny-toothed, white beneath: fis. in racemes to $1\frac{1}{2}$ in. long: fr. red. W. China.

Práttii: B. aggregata var.

pruinòsa. Evergreen, to 10 ft., spines 3-parted: lvs. to 2 in. long, spiny-toothed, glossy dark green above, white beneath: fis. in clusters: fr. bluish-black, pruinose. China.

pùmila: Mahonia pumila.

Regellana: B. amurensis var. japonica.

rèpens: Mahonia repens.

replicata. Evergreen, branchlets yellowish: lvs. to 1 1/4 in. long, margins revolute: fr. scarlet, turning black. China.

rubrostilla. To 6 ft., st. with 3-parted orange spines to nearly ¾ in. long: lvs. oblanceolate, margins spinosedentate, tip briefly mucronate or obtuse: fis. rarely solitary,

usually 2-4 in lax racemes: fr. ovate, to $\frac{5}{8}$ in. long, bright red. Probably of hybrid origin.

rugidicans: listed name of unknown hotenical standing sanguinea. Closely related to B. Gagnepainii but differing in the grooved branchlets and the pedicels and outside of fis. red. W. China.

Sargentiana. Evergreen, to 6 ft., spines 3-parted: lvs. to 4 in. long, spiny-toothed, pale beneath: fis. in clusters: fr. bluish-black. China.

serbting: R chinensis.

serrata: plants under this name may be B. aristata or B. canadensis

sibírica. Deciduous, to 2 ft., spines 3-11-parted: lvs. to 1 in. long, spiny-toothed: fis. solitary or in 2's, nodding: fr. red. Siberia.

Slèboldii. Deciduous, to 5 ft., spines 3-parted: lvs. to 2½ in. long, ciliate-toothed: fis. pale yellow, in few-fid. racemes: fr. bright red. Japan.

sinénsis: B. chinensis, B. Thunbergii.

Soulieana. Evergreen: lvs. to 4 in. long, usually spinytoothed, pale beneath: fr. bloomy. Cent. China.

spathulata: B. chinensis.

Stapfiàna: B. Wilsoniæ var.

stenophýlla. Hybrid between B. Darwinii and B. empetrifota: Ivs. narrow-lanceolate, to 1 m. long, revolute at margins, dark green above, pale beneath: fis, goldenyellow, in clusters: fr. black, pruinose Var. corfellina is a form having reddish-orange fils.; var. Dárwinii is listed as a form having orange fils. and var. frwinii with yellow fis.

subcaulialàta: B. Wilsonia var.

Swasevi: Mahonia Swasevi.

Thúnbergii (B. japonica. B. sinensis of some). Japanese B. Deciduous, to 8 ft., spines mostly simple: lvs. variable, to 1½ in. long, entire: fis. solitary or in clusters: fr. bright red. Japan; hardy and popular. Var. atropurpurea has bronzy-red foliage. Var. atrosanguínea has lvs. becoming dark scarlet-red. Var. compácta is a slower growing and more densely branched form. Var. lútea has yellow frs. Var. Maximowiczii has acute rather than obtuse lvs. Vars. minor and nana are low forms. Var. pluriflora, TRUEHEDGE COLUMNBERRY, is listed as being more erect, compact and leafy than the type. Vars. tricolor and variegata are listed.

triacanthóphora. Evergreen, to 5 ft.: lvs. narrow, to 2 in. long, toothed, glaucous beneath: fls. whitish, in clusters: fr. blue-black. China.

trifoliolata: Mahonia trifoliolata.

turcománica. To 14 ft., twigs subterete, spines simple or 3-parted: lvs. obovate-oblong, to 1% in. long, entire or sparsely serrate, obtuse: fls bright yellow, in dense racemes to 3 in. long; fr. red. S. Asia Minor.

umbellata: a confused name; much of the material in the trade appears to be B. aristata, although the name is also applied to a different plant from Chile and a third plant of the Himalayan region.

Vérnse. Deciduous, to 6 ft., spines simple: lvs. variable, to 1 in. long, entire: fls. in dense racemes to 1½ in. long: fr. red. China.

verruculosa. Evergreen, to 3 ft., spines 3-parted: lvs. to 1 in. long, spiny-toothed, margins revolute, glossy dark green above, glaucous beneath: fls. golden-yellow, solitary or in 2's: fr. black, pruinose. W. China. Var. compácta is

virescens. Deciduous, to 10 ft., spines simple or 3-parted: lvs. to 1 in. long, toothed or entire, glaucous beneath: fls. pale yellow, in few-fld. racemes: fr. purple, pruinose. Himalayas.

víridis: B. vulgaris.

vulgāris (B. Jacquinii. B. viridis). European or Common B. Deciduous, to 8 ft., spines 3-parted: lvs. to 2 in. long: fls. in racemes to 2 in. long: fr. red or purple. Eu.; nat. in N. Amer.—A host of the wheat rust. Hort. vars. are: álba, fr. whitish; álbo-variegāta, lvs. variegated with white; argenteo-margināta, margins of lvs. white; aureomargināta, margins of lvs. yellow; atropurpūrea (var. purpurea), lvs. deep purple; dúlcis (B. dulcas), fr. sweet; lūtea, fr. bright yellow. Var. macrophýlla is listed.

Wallichiana. Evergreen, to 10 ft.: lvs. to 4 in. long, spiny-toothed, pale beneath: fls. in clusters: fr. black. Himalayas. Var. latifòlia is listed as a broad-lvd. form.

Wilsoniæ. Deciduous or half-evergreen, to 6 ft., spines 3-parted: Ivs. to 1 in. long, entire, glaucous beneath: fis. golden-yellow, in dense clusters or panicles: fr. salmon-red. W. China. Var. Stapfian (B. Stapfiana) has infi. of 4-7 fis. Var. subcaulialata (B. subcauliulata, B. Coryi) has Ivs. whitish beneath and sometimes with few teeth, and strongly could be broadlets. angled branchlets

xanthóxylon (B. Knightii). Evergreen, spines 3-parted: lvs. to 4 in. long, spiny-toothed: fis. in clusters: fr. black. Java; hardy only far S.

BERCHÈMIA. Rhamnaceæ. Twining deciduous shrubs bearing alternate entire lvs. having conspicuous parallel veins, small fls. in terminal panicles, and drupaceous fr.

The species thrive in any soil but are not reliable far North. Propagated by seeds and root-cuttings in spring or by layers and cuttings of ripe wood in autumn.

kulingénsis. Vine to 10 ft. high: lvs. ovate to broadly lanceolate, to 2 in. long, acute, base subcordate, glabrous: fls. greenish, in panicles 3-8 in. long. China.

racemòsa. Lvs. ovate, subcordate at base, to 2½ in. long, somewhat glaucous underneath: fls. greenish, the panieles to 6 in. long: fr. red turning black, to ¼ in. long. Japan, Formosa.

scandens (B. volubilis). Supple-Jack. Climbing to 15 ft. or more: lvs elliptic to oblong-ovate, rounded at base: fls. greenish-white, in panicles to 1½ in. long: fr. bluish-black. Low woods, Va. and Ky. to Fla. and Tex.

volùbilis: B. scandens.

BERGAMOT: Citrus Bergamia. Wild: Monarda fistu-

BERGÈNIA (Megasea). Saxifragacex. Per. herbs with thick rootstocks from which the plants develop into large low clumps or colonies: lvs. large, thick, wavy, entire or toothed and with gland-bearing pits, the petioles sheathed at base: fls. large, pink or white, in spring, on scapes. The lvs. are ornamental and more or less evergreen. Cult. as for Saxifraga.

cordifolia (Saxifraga cordifolia). To 20 in: lvs. fleshy, orbicular-cordate, margin wavy-toothed, smooth and shining: fls. clear rose, in dense nodding cymes, on thick shup scapes, partly hidden in the lvs. Siberia. Var. purpurea, panicles taller, fls. deep reddish-purple.

crassifolia (Sarafraga crassifolia). To 20 in: lvs. smooth and shining, obovate, slightly toothed or entire: fls. rose, lilac or purple, in dense panicles standing well above the lvs. Siberia, Mongolia. Var. orbiculàris (S. orbicularis) has broad lvs. and rose fls.

Delavayi (Saxıfraya Delavayı). To 1 ft.; lvs. broadly obovate, to 6 in. long, short-petioled, occasionally denticulate at apex: fls. violet-purple, to ½ in. long, campanulate, usually 6-7 in slender racemes. Yunnan.

gigantèa: catalogue name.

Leichtlinii: B. ligulata var.

ligulāta (Sartfraga ligulata). To 1 ft.: lvs. obovate or orbicular, cordate at base, margins entire, ciliate: fls. white, rose or purplish, nodding, in racemes. Himalayas. Var. Leichtlinii has crimson lvs. and rose fls. Var. ròsea, fls. rose. Var. speciòsa (M. speciosa), fls. crimson or deep rose.

rose. Var. speciosa (M. speciosa), fls. crimson or deep rose. mèdia (Saxifraga æmula). Hybrid between B. cordifolia and B. bifolia.

purpuráscens (Saxifraga purpurascens). To 1 ft.: lvs. obovate or oblong, to 3 in. long, wavy-margined: fis. purple, nodding, in few-fid. panieles on purplish scapes. India.

speciòsa: B. ligulata var.

Stracheyi (Saxifraga Stracheyi). To 1 ft.: lvs. obovate, margins ciliate: fis. pink or rose, in branching panicles. India.

BERGERÁNTHUS. Aizoaceæ. A few S. African plants formerly included in Mesembryanthemum (which see for cult.), nearly or quite stemless: lvs. standing cross-wise and more or less connate at base, somewhat glaucous and often dotted: fis. long-stalked; stigmas mostly 5.

múlticeps (M. multiceps). Tufted: lvs. flat above and keeled underneath, to 1½ in. or more long, ½ in. wide, shining green, not dotted: fls. yellow, 1-5 on a somewhat compressed scape, 2 in. across.

scapiger (M. scapigerum). Lvs. to 3 in. long, ½ in. broad and ½ in. thick, glaucous and dotted: fis. 1-3, bright yellow tinged with reddish on back, 1 in. across, on peduncles to 2½ in. long.

vespertinus (M. vespertinum). Root thick and fleshy: lvs. to 2½ in. long and ¼ in. wide, 3-angled, gray-green with darker pellucid dots: fls. 3-5, yellow, 1 in. across.

BERGEROCÁCTUS. Cactaceæ. One species in extreme S. Calif. and in Lower Calif., a segregate from Cereus: fls. with scale-bearing ovary: plant making colonies or patches, the branches cylin-

dric or columnar, closely many-ribbed, with many yellow sharp spines: fls. small, pale yellow: roots somewhat tuberous. See Cacti. B. Émoryi (Cereus and Echinocereus Emoryi). Making large colonies or patches: branches or sts. erect, to 2 ft. and 2 in. or more diam.: fls. about 34 in. long and broad, diurnal.—Sometimes planted in gardens in its native regions.

BERLANDIÈRA. Compositæ. Per. hairy herbs with alternate lvs. and heads solitary or in corymbs, of yellow ray- and disk-fls.; pappus none or of awns; native in S. U. S. and Mex.; sometimes transferred to grounds. They bloom in spring and summer.

lyrata. To 8 in., white-pubescent: lvs. lyrate-pinnatifid: heads solitary, 1 in. across. Plains, Kans. to Mex.

BERRY: pulpy, indehiscent, few- or many-seeded fruit; technically, the pulpy fruit resulting from a single pistil, containing 1 or more seeds but no true stone. Botanically, fruits of eggplant, tomato, grape are berries, but in pomology the term is commonly restricted to the bush-fruits, as currant, gooseberry, cranberry; blackberry, raspberry, strawberry, are not true berries.

BERSEEM: Trifolium alexandrinum.

BERTERÒA. Cruciferæ. A few species of ann. or per. herbs in Eu. and Asia, differing from Alyssum in the thick pods or silicles, and 2-cleft petals; one is sometimes grown in sunny places for ornament. B. incâna (Alyssum incanum) is bien., strict, to 2 ft., grayish or hoary: lvs. oblong or lanceolate, to 2 in. long: fls. white, in terminal elongating racemes. Eu.; nat. in N. Amer.

BERTHOLLÈTIA. Lecythidaceæ. Large trop. American trees furnishing commercial Brazilor Para-nuts, also called "Castanea," mostly the product of B. excélsa. To 100 ft.:lvs. oblong, leathery, to 2 ft. long, wavy-margined: fls. cream-colored, in spike-like racemes: fr. to 6 in. across, the dark brown walls thick and hard, containing 18–24 triangular nuts with single kernel. Brazil, Venezuela, Guiana.—Suited only for trop. climates, but small specimens are likely to be seen in collections of economic plants under glass. Propagated by seeds or layers.

BERTOLÒNIA. Melastomaceæ. Mostly Brazilian dwarf or creeping herbs with simple 3–9-nerved lvs., white, rose or purple fls. in racemes, and capsular fr.

Grown in greenhouses for the attractive foliage, which is purplish underneath and with various metallic colors above. They thrive in dense shade and a humid atmosphere. Propagated by cuttings over heat and by seeds.

maculata. Lvs. broadly ovate, hairy, velvety-green above, the veins bordered with purple or magenta band: fls. rose.

marmorata. Lvs. ovate-oblong, slightly hairy, streaked with white along veins: fls. purple. Var. &nea has coppery tinged lvs. only slightly spotted.

pubescens. Lvs. ovate, with long white hairs and chooolate-colored band down center. Ecuador.

Sanderiana: hort. name; probably a form of B. maculata.

BESCHORNÈRIA. Amaryllidaceæ. Small Mexican genus of evergreen subshrubs resembling Yucca and characterized by a tuberous rootstock, fleshy lanceolate \lambdavs. and green or red funnelform fls. in tall racemes.

yuccoldes. Lvs. to 2 ft. long, glaucous above and scabrous beneath: fl.-st. red, much branched, to 4 ft. high; fis. green, to 2 in. long, abundant, subtended by bright red bracts.

BÉSSERA. Liliaceæ. Small genus of Mexican bulbous plants, one of which is cult. as a showy

ornamental. B. élegans (Pharium elegans), Coral-Drops, grows 2-3 ft. tall, one plant producing several slender naked scapes: lvs. 2 or 3, to 2 ft. long: fls. about 1 in. long, brilliant red usually marked with creamy-white, scentless, 5-10 of them drooping in a more or less irregular or lop-sided umbel terminating a scape. Milla biflora, a very different plant, has been grown under this name.

BESSEYA: Synthyris.

BÈTA. BEET. Chenopodiaceæ. Herbs with alternate lvs. and small greenish or reddish fls. in panicled spikes, one widely grown for the edible roots and lvs. B. vulgaris. Beet. Beet-Root. Sugar-Beet. Mangel. Bien. or ann. to 4 ft., with thick roots of various sizes, forms and colors, and ovate to oblong-ovate lvs. Cultigen. Var. Cicla (B. chilensis), Leaf-Beet, has much larger lys. and no fleshy root, in Swiss chard the midribs much enlarged. Grown as a pot-herb and sometimes for the ornamental colored foliage.

Beets are of easy cultivation in any good garden soil. Seeds may be sown early in spring and at intervals of a few weeks throughout the summer to insure a steady crop. For very early use seeds may be sown in boxes or hotbeds in February and March and transplanted to the open when frost is out of the ground. Beets sown in late summer may be dug before cold weather and stored in the cellar in barrels packed in earth or sphagnum. The long-rooted varieties should be planted only in open welltilled soil, else they will become misshapen.

BETONICA: Stachus.

BETONY: Stachus. Wood-: Pedicularis.

BÉTULA. BIRCH. Betulaceæ. Deciduous monæcious trees and shrubs native in the northern hemisphere, with alternate toothed lvs. and unisexual fls. borne in catkins, the staminate showing in autumn and remaining naked during the winter and opening in spring, the pistillate becoming cone-like with 3-lobed scales; cult. for ornament and for the timber which is used for making furniture and other articles. They inhabit lowlands, sandy or light-soil regions and

Birches are mostly short-lived trees suitable for northern climates. They thrive on moist sandy soil or some species in drier locations. Propagated by seeds sown at once or stratified, in sandy soil which is kept moist and shady. Seedlings should be transplanted when about one year old. Other methods of propagation are by layers, greenwood cuttings under glass, and grafting or budding or seedling stocks. stocks.

alaskana: B. papyrifera var. neoalaskana.

álba: the material cult. under this name may be either B. pendula, B. pubescens, B. papyrifera or vars. of them.

sibo-sinénsis. Tree to 100 ft., bark exfoliating, orangered, the branchlets somewhat glandular, not pubescent: lvs. ovate-oblong, to 2½ in. long, apex acuminate, base obtuse truncate to subcordate, margin doubly serrate, glabrous and dark yellowish-green above, paler and somewhat pubescent at least along midrib below. China. Var. septentrionalis has brownish-orange bark, lvs. to 3½ in. long and more silky beneath. W. China.

Bhojpáthra: B. utilis.

costata. Tree to 100 ft., with flaking papery bark: lvs. ovate, to 3 in. long, long-acuminate: cones ellipsoid, ¾ in. long. N. E. Asia.

cylindrostachya. Tree to 60 ft.: lvs. ovate-oblong, to in long, slightly pubescent beneath: cones to 3½ in long. Himalayas.

davùrica. Tree to 70 ft., with flaking and peeling purplish-brown bark, branchlets pubescent and glandular: lvs. ovate, to $3\frac{1}{4}$ in. long, acute or acuminate, more or less

pubescent below and glabrous above at maturity: cones to $1\frac{1}{4}$ in. long. N. E. Asia, Japan.

Ermanii. Tree to 60 ft., bark exfoliating, grayish-white to reddish: Ivs. triangular-ovate, to 4 in. long, light green beneath, acuminate, coarsely toothed: cones oblong, about 1 in. long. N. E. Asia, Japan.

ercéles. R luter

fastigiàta: B. pendula var.

fontinalis (B. occidentalis). WATER B. Shrubby tree to 40 ft.; lys. broad-ovate, to 2 in. long; cones about 1 in. long. Alaska to Ore. and Colo.

fruticosa. Shrub to 15 ft.: lvs. ovate, to 2 in. long: cones oblong-cylindric, to 1 in. long. N. E. Asia.—Differs from B. humilis in lvs. more finely and sharply serrate and twigs less glandular as well as in the fr.

glandulòsa. Shrub to 6 ft.: lvs. nearly orbicular to obovate, to 1 in. long, pale beneath: cones cylindric, to $\frac{3}{4}$ in. long. N. Amer.

gróssa. Japanese Cherry B. Tree to 80 ft., bark dark gray to black, twigs glabrous, yellow-to chestnut-brown: lvs. ovate, to 4 in. long, acuminate, base subcordate, lower side glandular with silky veins, coarsely doubly serrate: cones to 1 in. long. Japan.

hamilis. Shrub to 10 ft., with pubescent and glandular branchlets: lvs. usually ovate to elliptical, to 1½ in. long, apex acute rarely obtuse, margin dentate-serrate to entire, glabrous above and below. Eu., N. Asia.

japónica: B. mandshurica var.

kenàica: B. papyrifera var.

laciniàta: B. pendula var. dalecarlica.

1énta. Cherry or Sweet B. Tree to 75 ft.: lvs. oblongovate, to 5 in. long, when young silky-pubescent beneath: cones ovoid-oblong, to 1½ in. long. Me. to Ala., in moist

lutea (B. excelsa). Yellow B. Tree to 90 ft., with flaking yellowish or silvery bark: lvs. ovate, to 5 in. long, glabrous or pubescent beneath: cones oblong, about 1 in. long. Newf. to Ga. and Tenn., mostly in moist woods.

macrophýlla: B. papyrifera var. grandis.

macrophylla: B. papprifera var. grandis.

mandshûrica (B. japonica var. mandshurica). Tree to 60 ft., with white bark, twigs glandular: Ivs. ovate to triangular-ovate, to 2½ in. long, apex acumunate, base mostly broadly cuneate, unequally serrate: cones cylindrical, pendulous. Manchuria, Korea. Var. japônica (B. japonica of cult.), Japanese White B., has Ivs. truncate to subcordate at base and more broadly ovate-triangular. Japan, N. China. Var. szechuánica (B. japonica var. szechuánica) has Ivs. tapering toward base, heavily glandular-punctate and glabrous to somewhat pubescent beneath, margins irregularly dentate-serrate. W. China.

Maximowicziana. Monarch B. Tree to 100 ft., the bark flaking: lvs. broad-ovate, to 6 in. long, heart-shaped at base: cones cylindric, to 3 in. long. Japan.

nana. Spreading branching shrub to 2 ft.: lvs. orbicular. to ½ in. long, when young sticky and pubescent beneath; cones ½ in. or less long. N. Asıa, N. Eu., Alaska.

neoalaskana: B. papyrifera var.

nigra (B. rubra). River or Black B. Tree to 100 ft., with flaking papery bark: lvs. rhombic-ovate, to 3 in. long, whitish below: cones oblong-cylindric, 1½ in. long. Mass. to Fla. and Kans., by streams and in bottom-lands.

occidentalis: the trade name may refer either to B. fontinalis or to B. papprifera var. occidentalis.

odorata: B. pubescens.

papyràcea: B. papyrifera.

papyrifera B. papyrifera.

papyrifera (B. alba, in part. B. papyracea). Cande or Paper B. Tree to 100 ft., with white flaking papery bark, young branchlets pubescent and somewhat glandular, becoming glabrous and less noticeably glandular with age: lvs. ovate, to 4 in. long, apex acummate, base cuneate or obtuse to heart-shaped, usually somewhat pubescent on nerves below but glabrous above, margin coarsely serrate: cones cylindrical, to 2 in. long. N. N. Amer., in light rocky lands. Var. cordifolia. Small tree or shrub: lvs. broadly ovate, margin doubly serrate, veins pubescent beneath. Lab. to Minn. Var. grandis (B. macrophylla) has large heart-shaped lvs. Var. kenâica has bark tinged orange-brown and shorter cones. Var. occidentâlis (var. Lyallana) has orange or dark brown bark. B. C. to Mont. Var. neoalaskāna (B. alaskana, B. neoalaskana) has resinous-glandular twigs. Sask. to Alaska.

péndula (B. verrucoso). EUROPEAN WHITE B. Tree to 60 ft., with white bark peeling off in layers, the branches usually drooping; lvs. rhombic-ovate, to 2½ in long: cones cylindric, about 1 in. long. Eu., Asia Minor. Some of the hort. vars. are: dalecárlica (B. laciniata), lvs. deeply lobed; fastigiàta (B. alba pyramidalis, B. pyramidalis), of columnar habit; grácilis (B. alba elegans laciniata), branches drooping, lvs. finely dissected; purpurea (B. alba atro-

purpurea), lvs. purple; tristis, branches drooping and forming a round head; Youngii (B. alba Youngii), head irregular, branches drooping and very slender.

populifòlia. Gray B. Tree to 30 ft., with chalky bark: lvs. triangular-ovate, to 3 in. long, shining above, apex acuminate, base truncate rarely cuneate: cones cylindric, about 1 in. long. N. S. to Del, on light lands. Var. laciniàta has pinnately lobed lvs., péndula drooping branches, and purpurea purple young lvs.

pubescens (B. odorala). Tree to 60 ft., with white pecling bark: lvs. ovate, to 2 in. long, usually pubescent beneath: cones cylindric, 1 in. long. Eu., Siberia. Var. urticifòlia (B. urticifòlia) has lvs. coarsely toothed or lobed. Var. variegata has variegated foliage.

pumila. Shrub to 15 ft.: lvs. orbicular to obovate, about 1 in. long, when young densely pubescent beneath: cones cylindric-oblong, 1 in. long. Newf. to N. J. and Minn.

purpùrea: B. pendula var.

pyramidalis: B. pendula var. fastigiata.

rùbra: B. nigra.

urticifòlia: B. pubescens var.

ùtilis (B. Bhojpathra). Tree to 60 ft., with flaking dark brown bark: lvs. ovate, to 3 in. long, pubescent beneath: cones cylindric, 1 in. long. Himalayas.

verrucòsa: B. vendula.

BETULACEÆ. BIRCH FAMILY. Six genera of deciduous mostly monocious trees and shrubs, in the north temp. zone, having alternate simple lvs., staminate fls. in long drooping catkins, pistillate in short catkins or clusters, 2–10 stamens in the axils of bracts, 2-celled ovary, and fr. a small nut-like body. The family furnishes many ornamental subjects, valuable timber, some edible nuts, bark used for making canoes and writing paper. Alnus, Betula, Carpinus, Corylus and Ostrya are best known to hort.

BHANG: see Cannabis.
BIANCÆA: Cæsalpinia.
BICUCULLA: Dicentra.

BIDENS. BUR-MARIGOLD. STICK-TIGHTS. TICKSEED. Compositæ. Herbaceous ann. and per. mostly weedy plants, with opposite toothed, cut or divided lvs. and solitary or clustered heads, the rays white or yellow when present, the disk yellow; pappus of stiff bristles. Some species are grown from seed for ornament in the flowergarden; they are closely allied to Cosmos. Native wild species are weedy.

astrosanguinea: Cosmos atrosanguineus.

bipinnata. Ann. to 5 ft.: lvs. 1-3-pinnate, segms. ovate to oblong, toothed or lobed, lower ones to 8 in. long: ray-fis. 3-4 or absent, yellow. R. I. to Fla. west to Neb. and Ariz.

chrysanthenfoldes: B. lævis.

coronàta (B. trichosperma. Coreopsis trichosperma). Ann. or bien. to 5 ft.: lvs. pinnately but into lanceolate or linear segms.: heads to $2\frac{1}{2}$ in. across, rays golden-yellow. Mass. to Ga. and Ky.

dahlioldes: Cosmos atrosanguineus.

ferulæfòlia. FERN-LEAVED B. Ann., branching: lvs. 2-pinnate into narrow segms.: heads corymbose, less than 1 in. across; rays and disk bright yellow. Mex.

frondosa. Beggars-Ticks. Ann. to 3 ft., st. often purplish: lvs. 3-5-pinnate, segms. lanceolate to oblong-lanceolate: ray-fis. usually absent, heads about ½ in. high, awns long. N. S. to Fla. west to B. C. and Calif.

grandifiòra: B. serrulata.

humilis. Dwarf, almost procumbent: lvs. irregularly 2-pinnately 5-parted, segms. narrow: heads yellow, solitary. Ecuador.—Probably a form of B. triplinervia, not in cult.

involucrata: B. polylepis.

làvis (B. chrysanthemoides). Ann. to 3 ft.: lvs. lanceolate, to 8 in. long, toothed: heads to 2½ in. across, rays goldenyellow. Mass. to Fla. and Mex.

leucántha: B. pilosa var. radiata.

pilòsa. Ann. to 3 ft. and more: lfts. usually 3, ovate to lanceolate, serrate: known in cult. in var. radiàta (B. leucantha), with white or yellowish rays. S. U. S. and S.

polylèpis (B. involucrata). Ann. or bien. to 3 ft.: lvs. pinnatisect to simple, segms. linear-lanceolate, incised or sharply serrate, long-acuminate: heads to 2 in. across, rayfis. orange-yellow. Swamps, Ill. to Kans. south to Ark. and Tex., also in S. E. Pa. and Del.

serulata (B. grandiflora). To 4 ft., somewhat glaucous, branched: lvs. pinnately divided into narrow segms.: heads golden-yellow. Mex.

trichospérma: B. coronata.

BIENNIALS (abbreviated bien. in this book) are plants that live two years from seed, blooming only or mostly the second year. Some of the perennials are so short-lived that they become practically biennial in cultivation and may be so listed. Examples of plants that are actually or essentially biennial are common forms of red clover, parsnip, cabbage, foxglove, Canterbury bell, hollyhock, verbascum, snapdragon, pansy. Of most ornamental kinds, bloom may be obtained from seeds sown the previous midsummer, the seedlings being handled promptly to insure continuous growth.

BIFRENARIA. Orchidaceæ. S. American epiphytes with pseudobulbs bearing 1 leathery lf. and fls. in lateral racemes, the sepals and petals similar, the lateral sepals running down the column-foot to form a' spur, the lip usually 3-lobed, with a callus or ridges. Suited to a temperate or cool greenhouse; see Orchids.

atropurpurea. Pseudobulbs to 3 in. high, bearing a linear-lanceolate If. to 10 in. long: fis. about 2 in. across, very fragrant, in 3-5-fid. racemes to 3 in. long, the sepals and petals wine-red with yellow center, the lip entire, whitish tinged with rose, with linear callus. June. Brazil.

aurantiaca (Lindleyella aurantiaca). Pseudobulbs to 2 in. high, bearing 1 plaited elliptic lf. to 10 in. long and 3 in. wide: fis. in 7-13-fid. racenes to 8 in. long, yellow spotted with purple, the lip with a brighter callus between the side lobes. Jan.-Mar. Trinidad, British Guiana.

Hárrisoniæ (Lycaste Harrisoniæ). Pseudobulbs to 3 in. high, bearing a narrow-elliptic If. to 1 ft. long: fis. about 2½ in. across, in short 1-3-fid. racemes, the sepals and petals yellowish tinged with red, the lip violet-red with yellow hairy callus, the base of the column prolonged into a spur-like part over 1 in. long. Mar.-May. Brazil.

velùtina: listed name.

vitellina. Pseudobulbs to 1½ in. high, bearing 1 lf. to 1 ft. long and 1½ in. wide: fis. 1 in. across, in 5-8-fid. racemes to 8 in. long, orange-yellow with purple spot on lip. June-July. Brazil.

Wittiana: listed name.

BIGNAY: Antidesma Bunius.

BIGNÒNIA. Bignoniaceæ. One evergreen climbing shrub with lvs. of 2 lfts. and a terminal tendril, funnelform fls. in axillary cymes, and linear flattened frs. The genus is variously understood, but is here considered to have only one species. It is grown as a wall cover in the S. and sometimes in the greenhouse. Propagated by cuttings, and by seeds when available.

æquinoctiàlis: Cydista æquinoctialis.

alliacea: Adenocalymna alliaceum.

argyrèa (B. argyreo-violescens). Greenhouse vine with narrow-ovate or ovate-lanceolate lvs. purple underneath and veined above with white; not known in fl. and fr. and genus uncertain. Supposed to be S. American.

atropurpurea, atrosanguínea: B. capreolata var.

australis: Pandorea pandorana.

buccinatòria: Phædranthus buccinatorius.

callistegioides: Clytostoma callistegioides.

capénsis: Tecomaria capensis.

capreolata (Anisostichus and Dozantha capreolata. B. crucigera). TRUMPET-FLOWER. CROSS-VINE. Climbing to 50 ft.: lits. ovate or oblong, to 6 in. long, entire: fis. vellow-red, paler within, 2 in. long: caps. to 7-in. long. Fields. Va. and Ill. to Fla. and La., but root-hardy farther N. Kinds with fis. in darker colors are known as B. atro-purpurea and B. atrosanguinea.

Chamberlaynii: Anemopægma Chamberlaynii.

Cherère: Phædranthus buccinatorius.

chinénsis: Campsis grandiflora.

grandiflòra: Campsis grandiflora.
issminoldes: Pandorea jasminoides.

laurifòlia: listed name for an evergreen vine with lavender fis.

Máckenii: Podranea Ricasoliana.
magnifica: Arrabulæa magnifica.
muricata: Pithecoctenium echinatum.
Príncei: Campsis Tagliabuana.
purpurea: Clytostoma purpureum.

purpurea: Clytostoma purpureum.
radicans: Campsis radicans.
serratifòlia: Tabebuia serratifòlia.
siderafòlia: Pithecoctenium echinatum.
speciòsa: Clytostoma callistegioides.

stáns: Stenolobium stans.

Tweediàna: Doxantha Unguis-cati. Únguis-càti: Doxantha Unguis-cati.

venústa: Pyrostegia ignea.

violacea. Lits. oval, 4 in. long: fls. violet, 1 in. long, in terminal branched panicles. Bolivia.—Undoubtedly not a true Bignonia, but genus undetermined.

BIGNONIÀCEÆ. BIGNONIA FAMILY. About 100 widely distributed genera of trees, shrubs, vines, and herbs, with mostly opposite simple or compound lvs. which are often even-pinnate, showy, more or less irregular gamopetalous fls. in racemes or panicles, having 5-lobed corollalimb, 5 stamens of which 1 or 3 are sterile, superior 1-2-celled ovary, and fr. a long caps. or pod with winged seeds. Many genera are cult. for ornament, as Adenocalymna, Amphicome, Anemopægma, Arrabidæa, Bignonia, Campsidium, Campsis, Catalpa, Chilopsis, Clytostoma, Crescentia, Cydista, Delostoma, Distictis, Dolichandra, Doxantha, Eccremocarpus, Incarvillea, Jacaranda, Kigelia, Markhamia, Oroxylon, Pandorea, Parmentiera, Phædranthus, Pithecoctenium, Podranea, Pyrostegia, Radermachia, Spathodea, Stenolobium, Tabebuia, Tecoma, Tecomaria, Tecomella, Tourretia. Most of the bignoniads are native in warm regions.

BIHAI: Heliconia.

BÍJLIA. Aizoaceæ. A monotypic genus segregated from Mesembryanthemum. B. câna (M. canum). Stemless: lvs. 3-angled, keeled on back, to $1\frac{1}{2}$ in. long, $\frac{3}{4}$ in. wide and thick near apex, whitish: fls. yellow, 1 in. across, in 1-3-fld. cymes; stigmas 5, filiform. S. Afr.

BIKUKULLA: Dicentra.
BILBERRY: Vaccinium.
BILIMBI: Averrhoa Bilimbi.

BILLARDIÈRA. Pittosporaceæ. Small Australian shrubs with twining branches, alternate lvs., and mostly yellow or purple fls. solitary or clustered; grown under glass or out-of-doors in mild climates. Propagated by cuttings under glass or by seeds.

longiflora. Lvs. varying from ovate to linear, to 1½ in. long, entire: fis. greenish-yellow or becoming purple, solitary, drooping: berries blue.

BILLBÉRGIA. Bromeliaceæ. Stemless epiphytic herbs native in trop. Amer., having stiff lvs. in rosettes or clusters, and showy mostly blue fls. in spikes or panicles; grown for ornament and as oddities under glass or as house-plants. For cult., see Bromeliaceæ.

Forgetians. Lvs. green banded with white. Of uncertain botanical standing.

iridifòlia. Stemless or nearly so: lvs. to 1½ ft. long, lanceolate, undulate, dark green above and purplish-green beneath, margin spiny: floral bracts rose-red, corolla yellowish-green. Brazil.

Lèopoldii. To 2 ft.: lvs. strap-shaped, concave, apex obtuse, margin somewhat coarsely serrate with serrations tipped with minute brown spine: fls. reddish-violet, on lax pedunele. Colombia.

Liboniana. Lvs. to 2 ft. long and 1½ in. wide, with small spiny teeth: fls. in an erect simple spike on scapes to 1 ft. long, with red sepals and blue-tipped petals. Brazil.

macrócalyx. Stemless or nearly so: lvs. to 1½ ft. long, erect or recurved, concave, dark green with scattered pale green spots, apex acute, margin somewhat spinose-serrate: floral bracts rose-red, corolla yellowish-green tipped with blue. Brazil.

Morélii. Lvs. to 2 ft. long and 2 in. wide, with small spiny teeth: fls. in drooping spikes on scapes to 1 ft. long, with long red bract-like lvs., red sepals and blue-tipped petals. Brazil.

Mùirii: listed as having bright red fis.

nóbilis. Lvs. transversely barred: petals green, curling in spirals after blossoming, bracts carmine. Brazil.

nutans. Lvs. to 1½ ft. long and ½ in. wide, finely toothed: fis. few on scapes to 1 ft. long, drooping, with bright red bracts and green petals edged with blue. Brazil.—One of the commonest in cult.

palléscens. Stemless or nearly so: lvs. to 2 ft., strapshaped, suberect, leathery, green with small white spots on both surfaces, apex cuspidate, margin with minute prickles: fis. in lax panicles, leafy bracts bright rose, corolla green tipped violet. Brazil.

nállida: B. speciosa.

Perringeana. A hybrid of B. nutans and B. Liboniana. Lvs to 2 ft. long, narrowly strap-shaped, acuminate, finely serrate: fls. few, on scapes to 1 ft. long, with pale rose-pink bracts and more or less viscid green fls.

pyramidàlis (B. thyrsoidea). Lvs. to 3 ft. long and 2½ in. wide, finely spiny-toothed: fls. in dense spikes to 4 in. long, with bright red bracts and red petals tipped with violet. Brazil.

Quintusiàna. Stemless or nearly so: lvs. to 1½ ft. long, strap-shaped, obtuse, concave, recurved, bright green with small white spots on upper side and transverse bands on reverse, margin not conspicuously toothed: fis. with rose to carmine-red bracts. Habitat not known.

rhodocyanea: Æchmea fasciata.

Sanderiàna. Lvs. leathery, about 1 ft. long, spiny-toothed: panicles loose, to 10 in. long, on nodding scapes; sepals tipped with blue; petals blue with yellowish-green claw; bracts rose. Brazil.

Saundersii. Lvs. green above, reddish beneath, with red spines and white blotches: fis. greenish tipped with blue. Brazil.

Sòari: listed name of unknown botanical standing.

speciòsa (B pallida). Lvs. to 2 ft. long, spiny-toothed, striped on back: fls. pale green tipped with blue, bracts rose, in loose drooping clusters. Brazil.

thyrsoidea: B. pyramidalis.

vittata. To 3 ft.: lvs. to 2 ft. long, transverse bands across reverse side, apex recurved obtuse and abruptly pointed with red spine: petals deep blue and recurved, bracts red. Brazil.

zebrina. Lvs. to 3 ft. long and 3 in. wide, prickly-toothed, spotted and banded with white: fts. in spikes on drooping scapes shorter than lvs., with pink or salmon bracts and green or yellowish-green fts. Brazil.

BILTIA: Rhododendron Vaseyi.

BINDWEED: Convolvulus.

BINGHAMIA. Cactaceæ. Peruvian branched cacti with many low spiny ribs: fls. nocturnal, with straight stout tube.

chosicénsis: Haageocereus chosicensis.

Húmboldtii (Borzicactus Humboldtii and plagiostoma). To 3 ft. long and 2 in. diam., dull green dotted white; ribs 12-13, about ½ in. high and notched, areoles to ½ in. apart, yellow-woolly; spines brownish-red to gray, radials to 25, about ½ in. long, straight, centrals 4-7, slightly longer: fls. pale pink to crimson, to 2 in. long. Peru.

icosagona (Borzicactus teosagonus). To 20 in. long and 2 in. diam.; ribs 18-20, angular, areoles nearly ½ in. apart; spines pale golden-yellow, numerous, to ½ in. long: fis. orange-red to red, about 3 in. long. Ecuador.

melanostèle: Haageocereus chosicensis.

pseudomelanostèle: Haageocereus pseudomelanostele.

BIOTA: Thuja orientalis.

BIRCH: Betula.

BIRD-OF-PARADISE FLOWER: Strelitzia.

BIRDS-EYES: Gilia tricolor.

BIRTHWORT: Aristolochia.

BISCHÓFIA. Euphorbiaceæ. One evergreen or somewhat deciduous tree native in trop. Asia, sometimes planted in extreme S. U. S. B. javánica (B. trifoliata). Toog. To 75 ft.: lvs. alternate, of 3 ovate-acuminate bronzy-green serrulate lfts. to 5 in. long: fls. small, greenish, diœcious, without petals, in many-fld. racemes not exceeding the lvs.: fr. berry-like, brown or reddish or blue-black, size of a pea.

BISCUTÉLLA. Cruciferæ. A few ann. and per. herbs of the Old World, one sometimes planted for ornament, interesting for the 2 circular winged lobes of the flat pods or silicles: radical lvs. large, entire, toothed or pinnatifid: sts. mostly slender-branching: fls. small, yellow. B. lævigata is per., to 2 ft., hairy in lower part: lvs. variable, the radical ones long-oblong and toothed and forming rosette: fls. in terminal racemes, in spring and summer: pods about lá in across. Cent. and S. Eu.

BISHOPS-CAP: Mitella. -Hood: Astrophytum myriostigma. -Weed: Egopodium Podagraria.

BISMÁRCKIA. Palmaceæ. One heavy fanpalm in Madagascar, allied to Latania and Hyphæne; from the former it differs in bearing staminate and pistillate fls. on similar spadices, and from Hyphæne in its trunk being columnar and unbranched as well as in fr. and seed. The name has appeared in N. American lists but the plants in cult. probably belong to other genera.

BISTORTA: Polygonum.

BITTERNUT: Carya cordiformis.

BITTER-ROOT: Lewisia rediviva.

BITTER-SWEET: Solanum Dulcamara. False: Celas-

BÍXA. Bixacex. A trop. American tree much planted in the tropics for the annatto dye which is extracted from the pulp around the seeds. B. Orellana. Annatro. To 20 ft. or more: lvs. ovate, to 7 in. long: fls. pink or rose, to 2 in. across: fr. reddish-brown, to 2 in. long, covered with soft spines.—Propagated by seeds 'and cuttings. Grown in S. Fla. and southward.

BIXACEÆ. BIXA FAMILY. Two genera of trees and shrubs having alternate simple lvs., regular bisexual fls. with 5 sepals and petals, numerous stamens, superior 1-celled ovary, and capsular fr.: native in the warm parts of Amer. and Australia. Bixa is cult. for the annatto dye. See Cochlospermaceæ.

BLACK-BEAD: Pithecellobium Unguis-cati.

BLACKBERRY. The American pomological blackberry is a native fruit, having been developed from indigenous species. The species of wild blackberry are more numerous than formerly supposed and their identities are not yet clearly understood, and the exact parentage of the named horticultural varieties is mostly yet obscure. See Rubus.

The culture of the blackberry is limited by the cold winters of the northern and plains states and by drought and dry heat in the Southwest. Elsewhere it is grown in some of its forms, although nowhere does it assume great commercial importance. Quantities of fruit are gathered from the wild throughout its natural range. Almost any good soil will grow blackberries provided it is well drained and retentive of moisture with a good humus content. The heavier clay loams are preferred.

Propagation of varieties is by suckers which come up from the roots, and for more rapid increase by root-cuttings. Roots are cut into sections 2-3 inches long, buried in soil to callus during the winter, and planted in the nursery row in early spring. Some of the trailing or lopping sorts root at the tips of the canes. Planting is done in the very early spring either in rows 7-8 feet apart, plants 2-3 feet apart in the row, or in hills 7 x 7 or 8 x 8 feet on the square.

Clean cultivation is essential for successful culture of blackberries on a large scale. Home plantings may be heavily mulched to keep down the weeds and retain moisture. Suckers outside the row or hill must be destroyed or the planting will become a thicket. Blackberries respond to the application of manure or complete fertilizer on poor soils. Care should be taken not to stimulate the plants to over-vegetative growth.

Pruning consists in cutting out the fruiting canes soon after the fruit is picked and thinning out the new canes in the early spring to space them about a foot apart in the row, or 5-6 to the hill. The canes are biennial, growing from the ground one year and fruiting the next year. Canes may be shortened back if very tall. Trailing kinds must be trained on a trellis.

For home use fruit should become soft-ripe on the plants. For market the berries should be black but still firm. Picking is by hand, the berries usually falling into the same quart berry baskets in which the fruit is marketed. A good yield is about 2,000-3,000 quarts to the acre,

the average about 1,000.

In choosing varieties, adaptation to climate is important. Varieties of more than average hardiness are Eldorado, Ancient Briton, Snyder, Hardy, Taylor, Wachusett, Minnewaski, Erie, Mersereau. Varieties adapted to regions south of New York are Nanticoke, Rathbun, Agawam, Dorchester, Early King, Lawton. Varieties for the far Southwest are Dallas, McDonald, Haupt. Varieties for the Pacific Coast include Jordan, Kittatinny, Himalaya, Erie, Mammoth, Evergreen, Lawton, Crandall. Varieties specially resistant to rust are Eldorado, Snyder, Taylor, Erie.

Care should be taken to plant only diseasefree plants. If rust is prevalent the only remedy is to plant resistant varieties. The commercial grower should give particular attention to special pest and disease problems.

BLACKBUTT: Eucalyptus pilularis.

BLACK-EYED SUSAN: Rudbeckia hirta, Thunbergia alata.

BLACKTHORN: Prunus spinosa.

BLADDER-NUT: Staphylea.

BLADDER-POD: Vesicaria. Silvery: Lesquerella argentea.

BLADDERWORT: Utricularia.

BLADE: the expanded part of a leaf or petal.

BLANDFÓRDIA. Liliaceæ. Australian fibrous-rooted herbs with lvs. mostly near base of st., large drooping 6-lobed fls. in terminal

racemes, and capsular frs. Adapted to mild climates. Propagated by seeds and sparingly by division of roots.

flammea. To 3 ft. or more: lvs. narrowly linear-lanceolate: fls. yellow to orange, suffused red at base, on pedicels 1½-2 in. long, few in loose racemes. Queensland.

marginata. To 2 ft.: lvs. narrowly lanceolate, to 1½ ft. long and 1½ in. across, rigidly suberect, margins scabrous: fl-st. green below, purple above, with fls. brick-to coppered outside and yellowish within, on pedicels to 1½ in. long, in dense racemes. Tasmania.

noblis. To 3 ft.: lvs. to 1½ ft. long and ½ in. wide, margins serrate: fls. brownish-red tipped with yellow, to 1½ in. long, on pedicels to ½ in. long. New S. Wales.—Less tender than B. marginata.

BLAZING STAR: Chamxlirium luteum, Liatris, Mentzelia lumicaulis.

BLÉCHNUM. Polypodiacex. Rather coarse ferns, with compound or deeply cut fronds; sori in a line close to midrib of segms.

A few species are cultivated in greenhouses. Propagated by spores except in the species that develop plantlets at the ends of the creeping rhizomes. They require a rather dry atmosphere but plenty of moisture at the root, and a temperature of 60-65°; good as specimen plants. See Ferns.

brasiliènse. With scaly trunk to 3 ft. high: fronds to 3 ft. long and 15 m. wide, deeply pinnatifid, pinnæ finely toothed. Brazil, Peru.

fluvisitile (Lomaria fluviatilis). Fronds to 2½ ft. long and 1½ in. wide, simply pinnate, pinnæ to ¾ in long, wavy-margined, sterile and fertile different. New Zeal., Australia.

gibbum (Lomaria gibba). With trunk to 5 ft. high: fronds to 3 ft. long and 1 ft. wide, deeply pinnatifid, pinnæ finely toothed, the sterile and fertile different. New Caledonia, Aneiteum in S. Pacific. Var. platyptera of the trade is to be referred to the species.

Modrei (Lomarus ciliata). Trunk 6 in. high: fronds to 1 ft. long, simply pinnate, toothed or lobed, the sterile and fertile different, stipes blackish. New Caledonia.

occidentale. Trunkless: fronds to 1½ ft. long, simply pinnate, pinnæ to 3 in. long, entire. Trop. Amer.

orientale. Trunk stout, erect: fronds to 5 ft. long and 3 ft. broad, simply pinnate, punne to 8 in. long. Australia, China, Himalayas.

serrulatum. Saw-Fern. Fronds to 2 ft. long and 15 in. wide, simply pinnate, pinnæ finely toothed, linear-oblong. Swamps, Fla. to Brazil.

spicant (Struthiopteris and Lomaria spicant). Deer-Fern. Sterile fronds in crown surrounding fertile fronds, evergreen, to 3½ ft. long, simply pinnate, pinnæ entire or slightly toothed. Alaska to Calif., Eu., Asia. Var. califórnica is listed in the trade.

BLEEDING-HEART: Dicentra spectabilis.

BLEPHARIGLOTTIS: Habenaria.

BLEPHILIA. Labiatæ. Per. E. N. American herbs allied to the Monardas but differing in having smaller more dilated corollas and the calyx-tube with 13 instead of 15 nerves. Adapted to the wild-garden.

ciliàta. To 2 ft., rarely branched: lvs. lanceolate to oblong-lanceolate, to 2 in. long, remotely serrate, the upper ones sessile: fls. bluish-purple, in axillary and terminal clusters. Woods of Vt. to Minn. south to Ga. and Mo.

hirsùta. To 214 ft., usually branched: lvs. ovate to ovate-lanceolate, to 4 in. long, sharply serrate, the upper ones distinctly petioled: fls. pale purple, pubescent, in axillary and terminal clusters. Que. to Minn. south to Ga. and Tex.

BLÈTIA. Orchidacex. Erect terrestrial orchids from trop. Amer., allied to Calanthe but differing in the lip not being spurred and only jointed with base of column: fis. numerous, in terminal often branched raceme on erect leafless scape that arises from side of corm.

álta (B. purpurea, B. verecunda). To 2½ ft. high or more: lvs. narrowly lanceolate, to 2½ ft. long, contracted into a sheathing petiole: fls. rosy-purple or crimson (rarely white), lateral lobes of lip broadest below and tapering toward the apex. Fla., Mex., Cent. and S. Amer., W. Indies.

flórida. To 31/2 ft.: lvs. narrowly to broadly lanceolate,

to 2 ft. long, contracted into a sheathing petiole: fls. dark purple, sometimes rose-pink with white lip, lateral lobes of lip rounded above and narrowed toward base. Jamaica, Cuba.

hyacı́nthina: Bletīlla striata.

purpùrea: B. alta. verecúnda: B. alta.

BLETÍLLA. Orchidaceæ. Terrestrial orchids with tuberous rhizomes, rather thin lvs. and fls. in terminal racemes on leafless scapes, the sepals and petals similar, the lip free and 3-lobed; confined to the Old World tropics. Sometimes planted out-of-doors: see Orchids.

hyacinthina: B. striata.

striata (Bletia and Bletilla hyacinthina). To 2 ft.: lvs. 3-5; fls. purple, about 1 in. long, in 3-7-fid. racemes longer than lvs. June. China, Japan. Var. alba is listed.

BLÌGHIA. Sapindaceæ. One tree native in W. Afr. but now cult. and nat. widely in the tropics, producing edible frs. that are scriously poisonous at certain stages or parts. B. sápida (Cupania sapida). Akee. To 40 ft.: lvs. of 6-10 obovate-oblong lfts. to 6 in. long: fls. small, greenish-white, polygamous, in axillary racemes: fr. straw-colored to magenta-red, 3 in. long, splitting into 3 parts, with 3 shining seeds having a white fleshy aril at base.— Akees withstand a few degrees of frost when well established. They succeed on moist loamy soils. Propagated usually by seeds.

BLITUM: Chenopodium capitatum.

BLOOD-FLOWER: Asclepias curassavica.

BLOOD-LEAF: Iresine.

BLOODROOT: Sanguinaria canadensis.

BLOODWOOD: Eucalyptus. Tree: Hamatoxylum campechanum.

BLOODWORT FAMILY: Hamodoracea.

BLOOMÈRIA. Liliaceæ. Herbs native in S. Calif., having corms, basal grass-like lvs., and yellow wheel-shaped fls. in umbels terminating the scapes.

Bloomerias withstand several degrees of frost. The plants thrive in sandy well-drained soil and sunny exposure. The corms should be dug after ripening and replanted in autumn; they are good summer bloomers, allied to Brodiæa. Propagated by seeds.

aurea: B. crocea.

cròcea (B. aurea). Golden-Stars. To $1\frac{1}{2}$ ft.: fls. orange-yellow striped with darker lines, $\frac{1}{2}$ in. long.

BLUEBEARD: Caryopteris.

BLUE BEDDER, CALIFORNIA: Penstemon heterophyllus var. Purdyi.

BLUEBELL: Campanula rotundifolia. California: Phacelia Whitlavia. Creeper, Australian: Sollya heterophylla. English: Scilla nonscripta. Spanish: Scilla hispanica.

BLUEBELLS: Mertensia.

BLUEBERRY. Certain North American Vacciniums are known as blueberry, but in horticultural practice the name is restricted mostly to V. corymbosum, one of the highbush species, and V. angustifolium var. levifolium (V. pensylvanicum), a lowbush species. The fruit of the latter is gathered in large quantities for canning and market from blueberry barrens in New England, particularly Maine. These barrens are given a special culture of burning over every third year, fertilization and spraying to control fruit-flies. In recent years, the highbush blueberry has been greatly improved in productiveness and size of fruit by selection and breeding; and the knowledge that it requires an acid soil has contributed to its introduction as one of the pomological products.

Common alkaline or neutral lands do not produce blueberries. An acid soil is essential, one composed of peat and sand but with good drainage and aeration. It is not necessary to plant in swamps; in fact, the plant does not thrive when the roots are permanently under water. The water-table should be at least one foot below the surface in the growing season. The permanent plantation is set about 8 feet apart each way. Surface tillage is advised but heavy mulching with peat, oak leaves, sawdust or other material is satisfactory and is well adapted to the home planting. Plants begin to bear well in three or four years after setting and they should last a lifetime. They grow to a height of 6 to 8 feet. In home gardens it is advised that plants be set in ample holes or trenches about 1 foot deep in a mixture of one part peat or half-rotted oak leaves to one part acid sand: a similar mixture is used as a top-dressing in the plantation. If the soil is not naturally acid, aluminum sulfate scattered on the surface at the rate of 1/2 pound to a square yard each year is of benefit. Chemical fertilizers that leave an acid reaction in the soil may be applied. as sulfate of ammonia, acid phosphate, sulfate or muriate of potash.

Propagation of the blueberry is by dividing the clumps or rootstocks, by layering, by cuttings and by seeds, but the seeds do not reproduce the variety or strain. Softwood cuttings are the source of most nursery-grown plants. The home gardener, if he attempts blueberries at all. will

probably purchase his plants.

Some of the varieties now in the trade are the Pioneer, Rubel, Catherine, Jersey and Chabot.

habot.

BLUE-BLOSSOM: Ceanothus thyrsoforus.

Cyanus.

Cyanus.

Dicks: Brodisa capita
Collinsia thursiflorus. -Bottle: OSSGAL.

Cyanus. --Uniss. Brodiwa cup.
llgare. --Dicks: Brodiwa cup.
---na. --Lips: Collinsia Cyare. -Dr. vulgare. -Dr. verna. Centaurea Echium vulgare Marv: Collinsia capitata. -Eved grandiflora. -Weed: Echium vulgare.

BLUET, MOUNTAIN: Centaurea montana.

BLUETS: Houstonia.

BLUMENBÁCHIA (Saloa). Loasaceæ. Ann. herbs armed with stinging hairs, native of S. Amer., having opposite lobed lvs. and odd interesting fls. solitary in the axils: caps. opening at top. Propagated by seeds sown under glass and seedlings transplanted after danger of frost is over.

Hieronymii. Bien.: lvs. ovate, palmately 5-lobed, lobes toothed: fis. white, to 1½ in. across, on peduncles to 4½ in. long. Argentina. See also Loasa vulcanica.

insignis. Ann. or grown as such, twining, the sts. to 2 ft. or more long; lvs. to 3 in. across, deeply palmately 5-lobed: fls. white, 1 in. across, hooded, with thick yellow scales spotted with red at base of petals. S. Amer.

lateritia: Caiophora lateritia.

BOCCÒNIA. Papaveraceæ. Trees, shrubs or per. herbs with yellowish juice, alternate mostly pinnately lobed or parted lvs. and small fls. without petals, borne in terminal branching panicles; native in Mex. and trop. Amer.; seldom planted in S. U. S.

cordata: Macleaya cordata.

frutéscens. Shrub or tree to 25 ft.: lvs. to 16 in. long, pinnatifid: fls. purplish, the panicles 1 ft. or more long. Cent. Amer. to Peru, W. Indies.

japónica: Macleaya cordata. microcárpa: Macleaya microcarpa.

Thunbergii: probably Macleaya microcarpa.

BŒHMÈRIA. Urticaceæ. Various herbs. shrubs or trees mostly native in warm countries, with alternate or opposite simple lvs. and very small unisexual fls. in clusters or spikes.

Grown under glass for the ornamental foliage or out-of-doors in the South, one species furnishing fiber. Propagated by division, or seeds when produced. Ramie is grown to some extent in southern United States; it requires fertile well-dramed soil, and is easily grown. Some of the Bosh-merias are weedy plants native in North America.

argéntea. Lvs. alternate, to 1 ft. long and 7 in. wide, finely toothed, spotted above with silvery-gray, veined with red-brown below: fls. in branched drooping spikes to 10 in. long. Mex.

cylindrica. Per. to 3 ft.: lvs. to 3 in. long and 1½ in. wide, coarsely toothed: fis. in spikes to 1½ in. long. N. Amer., W. Indies.

macrophylla. Shrub or small tree: lvs. opposite, lanceolate, to 1 ft. long, finely toothed, usually pubescent beneath: fis. in drooping spikes to 1 ft. long. Ilimalayas.

nives (Urtica utilis). RAMIE. CHINESE SILK-PLANT. Herb or shrub to 6 ft.: lvs alternate, broad-ovate, to 6 in. long, coarsely toothed, white-tomentose beneath: fis. in panicles to 6 in. long. China, Japan, S. Asia.

platyphélia. Shrub to 10 ft.: lvs. opposite and alternate. broad-ovate, to 9 in. long, coarsely toothed, usually pubescent: fis in long drooping spikes. Asia, Afr.—A variable poorly-defined species.

Urèra: the plant cult. far S. under this name is probably the trop. American *Urera caracasana*.

BOENNINGHAUSÈNIA. Rutacex. A monotypic genus allied to Ruta and differing from it in fls. with 4 petals, 6-8 stamens and ovary pedicelled. One species from E. Asia, B. albiflora (Ruta albiflora). Diffuse per. to 2 ft.: lvs. 2-3-pinnate, petioled, segms. obovate to obcordate to 34 in. long, glaucous beneath, the terminal one largest: fls. white, to ½ in. across, usually nodding, in leafy many-fld. cymes.

BOERHAÀVIA. Nyctaginacex.About 50 species or more of trop, herbs, having minute 5-lobed funnelform fls. in heads, umbels or panicles, differing from Oxybaphus in the absence of an involucre.

adscéndens: B. coccinea.

coccinea (B. adscendens) To 2 ft.: lvs linear-ovate to oblong, base obtuse or cordate, to 2 in long, usually white beneath, petioled: fls. red, capitate heads in slender branched panicles. Probably Ceylon, but widely distributed throughout tropics.—A very variable species having weakly prostrate and procumbent variants as well as erect and robust forms. robust forms.

BOGBEAN: Menyanthes trifoliata.

BOG PLANTS, in horticulture, differ from aquatics in the fact that they do not live permanently in deep water, but rather in wet places as about lakes and ponds and in swamps. Mostly they are native plants transferred to wet places in grounds, and sometimes colonized. For the most part they are easily grown if the natural habitat is understood and imitated. Commonly they are perennials and woody plants that take care of themselves when once established. Sedges, rushes, pickerel-weed, arrow-leaf, water plantain, spatterdock, are common bog and swamp plants, as well as some of the eupatoriums, loosestrifes and lythrum. Any region outside deserts and plains yields interesting material for the appreciative planter.

BOISDUVÀLIA. Onagracex. herbs or many-stemmed little bushes, native Ore., Calif., and Pacific S. Amer., one of which may be grown in flower-garden or border in sunny situations; propagated by seeds.

densifièra (Godetia and Enothera deneiflora). Ann., erect, 1-5 ft., hairy: lvs.\narrow-lanceolate, acute, denticulate: fis. light purple, small. ½ in. or less across, un close leafy axillary clusters that comprise a long interrupted terminal spike. Calif.

BOLÁNDRA. Saxifragacex. Herbs native in W. N. Amer. and adapted to rock-gardens; fls. purplish, in loose corvmbs.

oregana. To 1½ ft., pubescent: lvs. kidney-shaped, angularly lobed, toothed: fis. deep purple, less than ½ in. long. Ore., Wash.

BOLBOXALIS: Oxalis cernua.

BOLDO: Peumus Boldus.

BOLDOA FRAGRANS: Peumus Boldus.

BOLLEA: Zugopetalum.

BOLLWILLERIA: Sorbopyrus auricularis.

Tall erect her-BOLTÒNIA. Compositæ. baceous aster-like perennials, glabrous: lvs. alternate and entire, usually becoming vertical by a twist at the base: heads with white, purplish or violet ray-fls. Native in U. S. and E. Asia, in moist places and on prairies.

Boltonias are often planted in the border or colonized: they are of the easiest culture. Propagated by division in the spring, also by seed. They resemble wild asters.

asteroides (B. glastifolia). To 8 ft.: lvs. lanceolate, to 5 in. long, sessile: heads 34 in. across, rays white to violet and purple. Conn. to Fla. and La.

glastifòlia: B. asteroides.

lævigata: hort. name; perhaps B. asteroides.

latisquama. Differs from B. asteroides in the larger heads 1 in. across, rays blue-violet, and in the involucial bracts. Mo. to Okla. Var. nana is 2-3 ft. tall with pinkish rays.

BOLUSÁNTHUS. Leguminosæ. One African tree sometimes planted in S. Calif. B. speciðsus (Lonchocarpus speciosus). To 15 ft.: lvs. pinnate, the lfts. lanceolate: fls. papilionaceous, bright blue, in terminal often pendulous racemes: pods oblong-linear, flattened.

BOMAREA. Amaryllidaceæ. S. American twining herbs, with parallel-veined lvs. and tubular fls. borne in drooping umbels.

Bomareas may be grown out-of-doors in the South in partial shade or in a cool greenhouse. They require abundant water and liquid manure in the growing season. The roots may be left in the soil over winter, the tops being cut off. Propagated by division of the roots or by seeds

Caidasiàna. Lvs. to 6 in. long, oblong-acute, with distinct petiole, puberulent on lower side: fis. with reddishrown short outer segms. and bright yellow longer inner segms., in simple umbels on pedicels to 2 in. long. Guate-

conférta: B. patacocensis.

formosissima. Lvs. broadly lanceolate, to 10 in. long and 2 in. wide, acuminate, glabrous, petiole winged: fis. with yellow spatulate petals and red sepals, to 1½ in. long, in dense umbels of 60-80 fls., pedicels densely reddishpubescent: fr. dehiscent. Peru.

multiflora. Lvs. oblong, to 4 in. long: fls. in dense many-fld. umbels, 1 in. long, the perianth-segms. nearly equal, outer tinged red, inner reddish-yellow spotted with brown. Colombia, Venezuela.

oligantha. Lvs. oblong, to 4 in. long: fls. to 1¼ in. long, the perianth-segms. equal, the outer red, the inner yellow spotted with reddish-brown. Peru.

patacocénsis (B. conferta). Lvs. oblong-lanceolate, to 6 in. long: fis. bright red, the inner perianth-segms. to 2½ in. long and yellow-keeled. Andes of Ecuador and Colombia.

BOMBACACEÆ. BOMBAX FAMILY. Trees of about 20 genera in the tropics, mostly American, differing in technical characters from Malvaceæ, with simple or palmately compound lvs., regular bisexual fis. having 5 sepals and petals, 5 to numerous stamens, superior 2-5-celled ovary, and dry or fleshy frs. some of which contain a woolly or cottony fiber. Only Adansonia, Bombax, Ceiba, Chorisia, Durio, and Pachira are cult. on our southern borders. The American genus Ochroma, supplying balsa wood, renowned for its lightness, belongs in this family; the species are probably not planted in the U.S.

BÓMBAX. Bombacaceæ. Big trees with digitately compound lvs., large red fls. before the lvs., and capsular frs. woolly within and with woolly seeds; planted for ornament in the tropics and the lint in the pods sometimes used for fiber and the fleshy calvees eaten.

malabáricum. To 75 ft., spiny: lfts. 3-7, to 7 in. long: fis. to 4 in. long, clustered near ends of branches: fr. to 6 in. long. India to Malaya; planted in S. Fla.

BONAPARTEA HYSTRIX: Agave stricta.

BONAVIST: Dolichos Lablab. BONESET: Eupatorium.

BÓNTIA. Myoporacex. One evergreen shrub or tree to 30 ft., native in W. Indies and N. S. Amer. and sometimes grown for ornament in our southernmost areas and in the tropics; much like Myoporum but fls. deeply 2-lipped. B. daphnoides. Lvs. oblong or lanceolate, to 4 in. long, willow-like: fls. yellow spotted with purple, 34 in. long, 2-lipped, solitary or clustered: fr. yellow, pointed, ½ in. long.

BORAGE: Borago.

BORAGINACEÆ. BORAGE FAMILY. Herbs, shrubs or trees, of about 85 or more genera of wide range, prevailingly with bristly hairs having mostly alternate simple lvs. and bisexual regular fls. with 5-lobed calvx and corolla, 5 stamens, superior 2- or 4-celled ovary, and fr. commonly composed of 4 nutlets; in the herbaceous groups, the fls. are usually small but many or numerous and borne in one-sided scorpioid spikes or racemes; the colors in blue are likely to fade or change to pink; other colors abound, as yellow and orange, white, shades of red. The family furnishes medicinal plants and dyes, and also many ornamental subjects in the genera Adelocaryum, Anchusa, Arnebia, Borago, Brunnera, Caccinia, Cerinthe, Cordia, Cryptantha, Cynoglossum, Echium, Ehretia, Eritrichium, Euploca, Heliotropium, Lappula, Lindelofia, Lithodora, Lithospermum, Mertensia, Moltkia, Myosotidium, Myosotis, Omphalodes, Onosma, Onosmodium, Oreocarya, Pentaglottis, Pulmonaria, Solenanthus, Symphytum, Trachystemou.

BORÀGO. Borage. Boraginacex. Hairy Medit. herbs with alternate simple lvs. and blue saucer-shaped fls. in open leafy cymes, throat filled by scales, stamens forming a cone one or two grown in the flower-garden and B. officinalis sometimes as a pot-herb and for bees." Propagated by seeds sown in spring, by division or cuttings.

laxifiòra. Decumbent per.: lvs. oblong or ovate: fls. pale blue, drooping, on long pedicels. Corsica.—Good for the rock-garden.

officinalis. Ann. to 2 ft.: lvs. oblong or ovate: fls. blue, purple or white. Eu., N. Afr.

orientalis: Trachystemon orientale.

BORÁSSUS. Palmace x.Large heavy dicecious fan-palms of Asia and Afr., of 7 recognized species: trunk single and erect, unarmed: lvs. large and stiff, the petiole somewhat spinydentate on margins: infl. among the lvs.; staminate infl. long and much branched, the fls. under closely imbricated bracts in dense spikes 1 in. diam. and about 1 ft. long, the stamens 6; pistillate infl. smaller and little branched, the fls. fewer: fr. a large drupe-like body with 1-3 seeds, subtended by enlarged perianth-parts.

flabéllifer. Palmyra Palm. To 100 ft. and trunk to 3 ft. diam., old lvs. hanging on young trees: lvs. to 10 ft. across, many-cleft, rigid: fr. 6-8 in. diam., depressed-globular, with fibrous pulp. India and Malaya.—Much planted in S. Asia for its many uses and products; once intro. in S. Fla.

BORDER. In the horticultural sense a border is a narrow planting along a boundary or division line (as a walk or road) or against a building or wall or foot of slope, although the term is sometimes inaccurately employed for any long narrow or strip planting even though it has no relation to margins or confines. Ordinarily it is 5 feet or less broad so that it can be planted and tended from one side, but it may be broader if there is easy access from either side. A border is properly not only a place in which plants can be conveniently grown, but it has relation to the lay-out and subdivision of the home property. A good border, well placed for the growing of plants, provides an attractive receiving plot for accessions, and should afford a never-ending variety in bloom and vegetation.

The border receives different designations. depending on the kinds of plants; it may be a shrub border, a flower border, a hardy border for native and other hardy plants, a vine border. As a rule, the most effective planting is that which is thrown into masses, for one plant reinforces the other, and the flowers have a good setting or background. Very striking displays of foliage and flowers and plant forms can be made when massed. Plants are more easily grown when planted in a border, since the whole area can be kept cultivated with ease; and if a plant becomes weak or dies, its place is readily filled by the neighboring plants spreading into it. The border may be mixed,—that is, composed of a great variety of plants,-or it may be made up of one species in considerable quantity. In long and very striking borders, it is often best to have the background—that is, the back row—of one general type of plant in order to give continuity and strength to the whole group. In front of this a variety of plants may be set. Shrub borders are sometimes planted of one species only, for continuous or artistic effect.

For best results in border planting the land should be fertile. The whole area should be plowed or spaded. If the border is composed of shrubs, and is large, a horse cultivator may be run in and out between the plants for the first two or three years, since the shrubs will be set 2 to 4 feet apart. Ordinarily, however, the tillage is by hand tools. After the plants are once established and the border is filled, it is best to dig up as little as possible, for the digging disturbs the roots and breaks off the crowns. It is usually best to pull out the weeds and give the border a top-dressing each autumn of wellrotted manure. If the ground is not very rich, an application of ashes or some commercial fertilizer may be given from time to time. The border may be planted thick to allow the plants to run together, thereby giving one continuous effect. Most shrubs should be set 3 feet apart. Those as large as lilacs may go 4 feet and sometimes even more. Common herbaceous perennials, as bleeding-heart, delphiniums, bellflowers and the like, should go 12 to 18 inches. On the front edge of the border is an excellent place for annual and tender flowering plants. herbaceous plants may be planted far enough apart to allow of full development. Spring- and

summer-flowering bulbs may find good conditions in a well-made border. Into the heavy borders about the boundaries of the place the autumn leaves will drift and afford an excellent mulch. If these borders are planted with shrubs, the leaves may be left there to decay, and not all be raked off in the spring.

BORECOLE: Kale.

BORÒNIA. Rutaceæ. Australian shrubs or subshrubs with simple or compound lvs., attractive fragrant purple, red or white fls., 4parted ovary and 4 styles, and fr. of 2-4 carpels.

Grown in a cool greenhouse in well-drained soil and out-of-doors in California. Plants should be cut back after flowering to make bushy specimens, and should be replaced by new plants after two years. Propagated by seeds and cuttings of half-ripened wood.

alàta. Mostly glabrous shrub, somewhat glaucous: lvs. to 7-11 obovate or oblong obtuse lfts., entire or crenate, to ½ in. long: fls. in terminal clusters, pink, fragrant, with very sharp petals, opening wide.

elatior. To 4 ft.: lvs. of 5-13 linear lfts.: fls. rose-red or purplish, nodding, about 1/4 in. long, not wide-opening.

heterophýlla. Glabrous tall shrub to 6 ft.: lvs. sometimes simple and linear, to 2 in long, sometimes with 30 5 linear lfts.: fls. pink or searlet, drooping, solitary on axillary whorled peduncles, to ½ in. diam., not opening widely.

megastigma. To 2 ft.: lvs. of 3-5 linear lfts.: fls. purple. yellow inside, rather open.

spathulata. Glabrous and glaucous undershrub: lvs. simple, spatulate to obovate or lanceolate, but broad-ovate on young branches, mostly obtuse, to about 1 in. long: fls. small, pink, in little terminal clusters.

viminea. Glabrous small shrub: lvs. simple, linear-lanceolate, to 1 in. long; fis. solitary, axillary and terminal, the petals to ¼ in. long.

Cactaceæ. Erect or pro-BORZICÁCTUS. cumbent cacti, usually with numerous low ribs and areoles close together bearing needle-like spines: fls. solitary, orange to scarlet or white, diurnal, tube short.

acanthorus (Cereus acanthurus) Branches hanging or procumbent, to 1 ft. long and 1½ in. diam; ribs 15-18, flowering areoles with tufts of white wool; central spines to % in. long: fls. scarlet, 1 in. across. Peru. Var. ferox has longer spines.

decúmbens: Haageocereus decumbens.

eriotrichus. St. semi-prostrate, to 1½ ft. long, branching from the base; branches to 1½ in thick, 15-16-ribbed, latter straight, to ½ in. deep; areoles large, white, to ¾ in. apart; radial spines about 16 or less; central spines 3-6, to ½ in. long; fis. red: fr. yellowish-green. Peru. Var. longispinus has longer spines.

Faustianus. St. erect or prostrate, to nearly 4 ft. long and about 2 in. diam., bright green, branched from base; ribs 12, acute, narrow; spines 30 or more, to ½ in. long, yellowish. Peru.

Hümboldtii: Binghamia Humboldtii.

icosagònus: Binghamia icosagona.

Jajoianus. Cespitose, erect to decumbent, to 2 ft. tall, pale green, joints about 2½ in. thick; ribs about 12, low, obtuse; radial spines about 20, to ½ in. long; centrals 1-4, swollen at base, pale yellow: fis. orange. S. Peru.

Morleyanus. Clump-forming, branches erect or pendulous, to 214 in. diam.; ribs 13-16, rounded, tuberculate; spines 15-20, bristly or acicular, to 1 in. long; fis. to 214 in. long, perianth-segms. slightly spreading. Ecuador.

plagiostòma: Binghamia Humboldtii.

platinospinus (Cereus and Haageocereus platinospinus). Branches decumbent, ascending at tips; ribs about 13, arcoles gray-tomentose; radial spines 10-13 and 1/2 in. long; centrals 2-4 and 2 in. long. Peru.

Strausii: Cleistocactus Strausii

BOSCIA UNDULATA: Vepris lanceolata.

BÔSEA. A maranthace x.Upright shrubs with alternate entire Ivs., small fis. in terminal spikes or racemes, and ornamental crimson berries; native in Canary Isls., Cyprus and Himalayas. Hardy only in S. U. S. Propagated by seeds and cuttings.

Amherstiana (Deeringia Amherstiana). Lvs. ovate, to 7 in. long: fls. greenish, perfect, with 2-4 basal bracts, in terminal panicles: berries 1/2 in. across. Himalayas. Var. variegāta is listed.

Yervamora. Differs in its short-stalked polygamous fis. which have only 2 bracts at base. Canary Isls.

BOSSEKIA: Rubus deliciosus and others.

BOSSIÈA. Leguminosæ. Australian shrubs with simple mostly entire lvs., yellow, orange or red papilionaceous fls. solitary or in clusters, and flat pods; intro. in S. Calif.

Aquifòlium. Lvs. opposite, broad-cordate, to ¾ in. across, prickly-toothed: fls. yellow, about ½ in. long, solitary.

biloba. To 11/2 ft.: lvs. alternate, linear or broader, to 2 in. long, retuse or 2-lobed, margins revolute: fis. to 3/4 in. long.

34 in. long.

ornata. To 2 ft.: lvs. alternate, ovate to lanceolate, to 2 in. long: fls. to ¾ in. across, in clusters.

BOTANIC GARDEN. A controlled and staffed institution for the maintenance of a growing collection of plants under scientific management and control for purposes of education and research, together with such libraries, herbaria, laboratories and museums as are essential to its particular undertakings. Each botanic garden naturally develops its own special field, depending on the personnel, location, extent, available funds, as well as on the terms of its charter. It may include greenhouses, test grounds, herbary, arboretum and other departments. It maintains a scientific as well as a plant-growing staff, and publication is one of its major modes of expression.

The botanic garden may be an independent institution, or it may be connected or affiliated with a college or university. If a department of an educational institution it may have close relation with the teaching program; but in any case it exists for scientific ends and is not to be restricted or diverted by other demands. It is not a landscape or ornamental garden although it may be artistic, nor an experiment station, nor yet a park with labels on the plants. The essential element is the intention of the enterprise, which is the acquisition and dissemination

of botanical knowledge.

BOTHRIOCLINE: Erlangea tomentosa.

BO-TREE: Ficus religiosa.

BOTRÝCHIUM. GRAPE-FERN. MOONWORT. Ophioglossaceæ. Mostly somewhat fleshy ferns with short underground sts. each of which sends up a single petiole bearing a 1–3-pinnate blade and an erect panicle of sessile sporangia arranged like grapes; native chiefly of temp. regions of both hemispheres, many in the U.S.; the species are mostly not showy and they do not commonly appeal to the cultivator. See Ferns.

califórnicum; see B. multifidum.

dissectum. Hardy, to 1½ ft.: blades to 6 in. across, ternstely compound into finely dissected segms, evergreen. N. S. and Que. to S. C., Tenn. and Mo. Var. obliquum (B. obliquum, B. ternatum var. obliquum) has blades ternately divided into entire or finely toothed segms. to 1 in. long.

Lunària. Hardy, to 10 in.: blades pinnate into lunate entire or toothed segms. N. and S. Amer., Eu., Asia, Australia.

matricariæfðlium (B. ramosum). Hardy, to 1 ft.: blades seisile or short-stalked, 1-2-pinnate, segms. toothed or divided. N. Amer., Eu., Asia.

multifidum. Very variable, from 2 in. to 1½ ft.: blades thick, from ½ in. to 1 ft. wide, ternately decompound into obliquely ovate segms, entire or minutely toothed. N. Amer., Eu. Asia.—B. californicum (B. stlaifolium var. californicum), a large lax plant of Calif., and B. silaifolium

(B. ternatum var. intermedium), the common plant of the northern and western U. S. and southern Canada, with large coriaceous blade, are to be referred here as subspecies or geographical varieties.

obliquum; B. dissectum var.

ramdsum: B. matricaria folium.

silaifòlium; see B. multifidum.

ternatum: the plant cult. under this name is B. dissectum var. obliquum.

virginianum. RATTLESNAKE-FERN. Hardy: blades to 2½ ft. high, broadly triangular, ternate, the segms. pinnate and much cut. N. Amer., Eu., Asia.

BOTTIONEA. Liliaceæ. One bulbous per. herb from Chile. B. thysanoloides (Anthericum plumosum. Trichopetalum gracile). To 16 in.: lvs. to 10 in. long, linear-subulate, strongly channelled, glabrous: fls. white, to $\frac{5}{8}$ in. across, usually in 2's at end of simple glabrous scape, inner perianth-segms. fringed with many white hairs. Differs from Anthericum in having glabrous stamens, oblong caps., short straight style and fringed inner petals.

BOTTLE-BRUSH: Callistemon, Melaleuca.

BOTTLE-TREE: Brachychiton.

BOUGAINVÍLLEA. Nyctaginacex. The cult. kinds grown as woody vines but may be trained as standards, in the open far S. and in greenhouses N.: lvs. simple, alternate, ovate to elliptic-lanceolate, commonly entire: fls. inconspicuous, inclosed by showy mauve, magenta, purple or red corolla-like bracts: native in S. Amer. Many forms bear Latin names as though they were species. The generic name was originally made Buginvillæa, a Latinization of the personal name De Bougainville, and it is the correct spelling under the Rules. The international committee now proposes that the current usage Bougainvillea be adopted; this eliminates the digraph & and does not throw the entry out of accustomed alphabetic sequence.

Of easy cultivation in any soil, thriving best in full sunshine; in the North grown as pot-plants in a cool greenhouse. Propagated by cuttings, some kinds more easily than others.

brasiliénsis: B. spectabilis.

glabra. Glabrous or nearly so: lvs. slender-pointed and with narrow base: bracts purple or magenta, running into lighter shades. Brazil. Var. Cypheri is larger with deep rose bracts. Var. Sanderihan, Paper-Flower, is a florifierous form. Var. variegata has lvs. variegated with white.

Hárrisii. Lvs. dark green marbled with creamy-white; probably a form of B. glabra.

lateritia: B. spectabilis var.

Lindleyana. Hairy, with strong curved spines: lvs. acute, slightly wavy: bracts cinnabar-red.

magnifica: listed name.

prætòria. Recorded as a sport from Crimson Lake, with yellow bracts turning to golden-salmon.

refúlgens. Pubescent: bracts purple, the racemes long and drooping. Probably a form of B. spectabilis.

rdsa-catalina: a hort, form with rich rose bracts.

rosea-speciosa. Resembling B. Lindleyana but lvs. and bracts smaller.

Sanderiàna: B. glabra var.

spectábilis (B. brasiliensis). More or less pubescent or tomentose; lvs. short- or blunt-pointed and broad at base: bracts in shades of red. Brazil. Var. Crimson Lake has bright crimson bracts, and var. laterítia brick-red bracts. Yellow bracts are reported.

Thômasii. Listed as a hybrid with red bracts of deeper color than B. spectabilis var. lateritia.

BOUNCING BET: Saponaria officinalis.

BOUSSINGAÚLTIA. Basellaceæ. Trop. American per. vines with alternate fleshy lvs. and small fls. in spike-like racemes.

Grown for ornament out-of-doors in warm regions and

under glass in cold regions; also root-hardy North. Propagated by seeds, division of roots and by tubercles produced in leaf-axils.

baselloides. MADEIRA-VINE. MIGNONETTE-VINE. Tall vigorous twiner: lvs. ovate, to 3 in. long: fis. white, fragrant, the racemes sometimes 1 ft. long, in late summer or autumn.

BOUVÁRDIA. Rubiaceæ. Mostly shrubs native in Mex. and Cent. Amer., with opposite or whorled lvs., tubular 4-lobed red, yellow or white fls. in terminal cymes, sometimes solitary, and capsular fr.

Bouvardins are grown in the greenhouse and were once very popular. Many of the old florists kinds are supposed to be hybrids. They thrive in a temperature of about 55° in rich soil with abundant water. Propagated by root-cuttings and cuttings of fresh shoots taken with a heel and placed over bottom heat.

Harlandii: listed name of hort. form said to be dwarf and compact, to 3 ft. tall.

Humboldtii. Lvs. opposite, ovate: fls. white, fragrant, to 2½ in. long and 1½ in. across. Hort. form.

Tácquinii: B. ternifolia.

leiantha. Lvs. in whorls of 3-5, ovate, to 3 in. long, pubescent beneath: fis. deep red, ½ in. long, glabrous outside. Mex. to Costa Rica.

longifldra. To 5 ft.: lvs. opposite, evate or lance olate, to 2 in. long: fis. white, to $3\frac{1}{2}$ in. long, glabrous outside, solitary. Mex.

ternifòlia (B. Jacquinii. B. triphylla). To 6 ft.: lvs. in 3's and 4's, lanceolate to ovate: fls. red, to 1½ in. long, pubescent outside. Mex., W. Tex.

triphýlla: B. ternifolia.

BOWER-PLANT: Pandorea jasminoides.

BOWIEA: Schizobasopsis.

BOWKÈRIA. Scrophulariaceæ. S. African shrubs or trees with lvs. usually in 3's and 2-lipped fls.; may be grown in S. Calif.

Gerrardiana. Shrub to 10 ft.: lvs. oval-lanceolate, to 6 in. long, finely toothed, paler beneath: fls. white, upper lip to ½ in. long and ½ in. broad.

triphylla. Very similar to the above but differing in the narrow upper lip of corolla.

BOX: Buxus, Eucalyptus. Brisbane: Tristania conferta.
-Elder: Acer Negundo. -Thorn: Lycium. Victorian: Pittosporum undulatum.

BOYKÍNIA (Therofon). Saxifragaceæ. Per. American herbs with creeping rootstocks, alternate broad lvs. and white fis. in cymes or panicles; useful in the wild- or rock-garden; native mostly in woods and mts.

elàta (B. occidentalis). To 2 ft.: lvs. 1-4 in. across, deeply lobed and toothed: petals much longer than calyxlobes. Calif.

Jamesii (Telesonix Jamesii). To 4 in.: lvs. round-kidney-shaped, to $1\frac{1}{4}$ in. wide, deeply wavy-toothed; fis. reddish-purple, in contracted leafy panicle. Colo.

major. To 3 ft.: lvs. 4-8 in. across, cut and toothed: petals slightly longer than calyx-lobes. Ore., Calif. occidentalis: B. elata.

ranunculifòlia: Hemieva ranunculifolia.

rotundifòlia. To 2 ft.: lvs. 2-7 in. across, shallowly lobed and toothed: petals only slightly longer than calyx-lobes. Calif.

tellimoides (Saxifraga tellimoides). To 3 ft.: lvs. to 5 in. across, 7-0-lobed: fis. greenish, petals twice or more longer than calyx-lobes. Japan.

BOYSENBERRY. A recent offshoot of the well-known loganberry group (Rubus loganobaccus) produced in California but exact parentage unknown, named after Rudolf Boysen who was instrumental in its introduction. It is a dewberry, much like the Young but later in ripening. Berries are large, as much as 1½ inches long and three-fourths as thick, dark wine-red to almost black, juicy, soft when ripe, tart in flavor. In the northeastern country it requires or profits by winter protection, a safeguard

readily provided inasmuch as the canes may be laid down and covered with straw. It should be grown on trellis or wires, and much room should be provided; canes may grow 8-10 feet. The general culture is as for loganberry and the dewberries. The berry is established as a home and market truit in California, and has given promising results in many parts of the East.

BRACHÝCHITON. BOTTLE-TREE. Sterculiaceæ. Australian trees sometimes with swollen trunk, bearing alternate entire or palmately lobed lvs., unisexual or polygamous fls. without petals but the calyx mostly corolla-like and bell-shaped, commonly in axillary panicles, and fr. a woody follicle, tardily dehiscing; planted for ornament in southern regions, and particularly in Calif. Propagated by seeds and cuttings of ripened wood.

acerifolium (Sterculia acernfolia). FLAME-TREE. To 60 ft.: lvs. deeply 5-7-lobed, to 10 in. across, shining: fis. bright scarlet: fr. black, to 4 in. long.

Bidwillii (Sterculia Budwillii). Shrub or tree, tomentose: lys. deeply 3-lobed: fls. red.

discolor (Sterculia discolor). Lvs. irregularly 5-7-lobed or angled, white-tomentose beneath, to 6 in. across: fis. livid: fr. to 6 in. long, densely rusty-tomentose.

diversifdlium: B. populneum.

lùridum (Sterculia lurida). Lvs. palmately 5-7-lobed, pubescent on both sides: fls. lvid and variegated: fr. to 6 in. long, tomentose.

populneum (Sterculia diversifolia). Kurrajong. To 60 ft.: lvs. ovate and entire or 3-5-lobed, to 3 in. long, shining: fls. yellowish-white, reddish inside: fr. to 3 in. long. Var. occidentalis (Sterculia Greyori) has deeply 3-lobed lvs. and salmon-pink fls.

rupéstris (Sterculia rupestris). Tree with swelling trunk often contracted at top and bottom: lvs. oblong-linear, entire, to 6 m. long, or digitately compound into 5-9 linear-lanceolate lits.: fls. tomentose: fr. 1 in. long.

BRACHÝCOME. Compositæ. Herbaceous annuals and perennials with simple or branching sts., basal or alternate lvs., entire or more or less pinnately cut: heads solitary or loosely clustered at ends of branches; ray-fls. white, blue or lilae; pappus of bristles or scales or lacking. Of easy cult. in the flower-garden. Propagated by seeds.

iberidifòlia. Swan River Daist. Ann., branching, to 1½ ft: lvs. alternate, pinnate into narrow segms.: heads 1 in. across, blue, rose or white. Australia.—A good edging and border ann.

rosea: hort. name, probably for color form of B. iberidifolia.

BRACHYGLÓTTIS. Compositæ. New Zealand shrubs or small trees with large lobed lvs. and small heads borne in terminal branched panicles, with ray- and disk-fls.; pappus bristly. Grown out-of-doors in S. Calif.

Rangiòra. To 14 ft.: lvs. to 15 in. long, sinuate, white-tomentose beneath, glossy above: heads 1/6 in. long, involucral bracts purplish.

repanda. To 20 ft.: lvs. to 1 ft. long, sinuate, white-tomentose beneath, dull above: heads 1/6 in. long, involueral bracts white, shining. Var. variegata is listed.

BRACHYPÒDIUM. Gramineæ. Slender ann. or per. grasses mostly of the north temp. zone, having many-fld. flattened spikelets borne in spike-like racemes; a few sometimes grown for ornament. See Grasses.

distachyon. Ann. to 1½ ft.: lvs. to 4 in. long and ¼ in. wide, slightly hairy: racemes to 3 in. long, awns to ¼ in. long. Medit. region, S. Afr.

grácile: B. sylvaticum.

sylváticum (B. gracile). Per. to 4 ft.: lvs. to ¾ in. across, flaccid, hairy: racemes nodding, to 6 in. long, awns to ¼ in. long. Medit. region, Asia.

BRACHYSEMA. Leguminosæ. Australian shrubs with simple lvs., mostly red papilionaceous fls. solitary or clustered, and swollen pods; cult. out-of-doors in S. Calif.

acuminatum. Subshrub, often spreading: lvs. opposite, oval-elliptic, silvery-canescent beneath.

lanceolatum. To 3 ft.: lvs. usually opposite, lanceolate, to 4 in. long, silvery-canescent beneath: pods about ½ in. long.

BRACKEN: Pteridium.

BRACT: a much-reduced leaf, particularly the small or scale-like leaves in a flower-cluster or associated with the flowers and on the upper part of flowering stems.

BRACTEOLARIA: Baphia.

BRACTLET: bract borne on a secondary axis, as on the pedicel or even on a petiole.

BRADBURYA: Centrosema.

BRÀHEA. ROCK PALMS. Palmaceæ. A very few determined species of Mexican fan-lvd. palms, inhabiting calcareous hills, some of them not yet well understood and of doubtful generic position: trunks solitary or sometimes eventually sprouting from near the base, unarmed: lvs. of medium size, stiff, perhaps thinly glaucous, the petiole in most species bearing small callous teeth: spadices interfoliar, mostly exceeding the lf.-blades, the many branches not subtended by spathes; fls. sessile and more or less immersed on tomentose or pubescent branchlets of spadix, hermaphrodite: fr. small, about ½ in. long, oblong to nearly globular. The names B. calcarea and B. Pimo are sometimes mentioned but it is doubtful whether intro. to our territory and they are not true Braheas. B. armata and B. glauca are Erythea armata; B. edulis is Erythea edulis and B. filifera is Washingtonia filifera. For cult., see Palms.

for cult., see Palms.

dúlcis. The common species, probably intro. in Calif.:
trunk stout, to 20 ft., bearing sears of old lvs. or at top
covered with old lvs., naked at base: lvs. 4-5 ft. lengthwise,
green, divided to middle or beyond into about 60 rather
broad long-pointed and deeply bifid long-hanging segms,
the filaments few; petiole rather slender, coarsely retrorsespiny: spadix to 5 or 7 ft. long, pendulous; fls. partly immersed, the branchlets terete and thick and densely tomentose: fr. oblong-ellipsoid, yellow and succulent; seed
free from endocarp. Mex.

BRAKE: Pteridium, Pteris. Cliff-: Pellaa. Rock-: Cryptogramma.

BRAMBLES: Rubus.

BRASÈNIA. Nymphæaceæ (or Cabombacaceæ). One aquatic herb, often in deep water, native in N. Amer., Asia, Afr. and Australia, grown sometimes in ponds. Propagated by seed or division of roots. B. Schrèberi (B. peltata. B. purpurea). WATER-SHIELD. Lvs. floating, to 4 in. long and 2 in. wide, peltate, submerged parts coated with thick transparent jelly: fls. purple, ½ in. across, on long axillary peduncles: fr. ½ in. long, of separate carpels.

BRASSÀIA. Araliaceæ. A tree sometimes included in the genus Schefflera, now somewhat planted in S. Fla., from Australia, with stiff digitate lvs. and small involucrate fls. in dense little short-stalked globular heads that form long racemes with stout woody axis and that may become paniculate: petals 7–18, less prominent than the stamens of equal number: fr. a globose drupe. B. actinophylla, to 40 ft. with glabrous parts and glossy foliage: lfts. 7–16, long-stalked, the blades long-oblong and entire, to 1 ft. long: raceme sometimes a few ft. long.

BRASSÁVOLA. Orchidaceæ. Trop. American epiphytes having stem-like pseudobulbs, fleshy

lvs. and fls. solitary or in short racemes, the sepals and petals narrow and spreading, the lip entire and often toothed, attached to column at base. For cult. see *Orchids*.

cucullata. Pseudobulbs to 7 in. high, bearing a lf. to 9 in. long: fis. usually solitary, the sepals and petals orange, yellow or white, the lip white, toothed on edges, with long point. May-Dec. Mex. to Honduras, Venezuela, Colombia and W. Indies.

Digbyana: Lalia Digbyana.

glaŭca: Lælia glavca.

nodôsa. Pseudobulbs 1-4½ in. high, bearing 1 lf. to 9 in. long: fls. solitary and short-stalked; sepals and petals greenish-yellow or white, linear, to 3 in. long; lip white, not toothed. Jan.-Dec. W. Indies, Cent. Amer., Colombia, Venezuela. Surinam.

BRASS-BUTTONS: Cotula coronopifolia.

BRÁSSIA. Orchidaceæ. Epiphytes native in trop. Amer., with pseudobulbs bearing 1 or 3 lvs. and fls. in lateral racemes, the sepals and petals narrow and long-pointed, often tail-like, the lip entire and shorter than the sepals. Grown in an intermediate temperature; see Orchids.

antherotes. Fls. deep yellow, sepals and petals blotched with blackish-purple. Colombia, Ecuador.

brachiàta. Pseudobulbs to nearly 5 in. high, bearing 2 lmear-lanceolate lvs. to 1 ft. long: scapes to 334 ft. long, bearing a 7-10-fld. raceme; sepals about 8 in. long, yellow-ish-white marked with brown below, the petals about half as long; lip light yellow marked with green. July-Oct. Guatemala.

caudàta. Pseudobulbs to 6 in. long; lvs. oblong or oblong-elliptic, acute, to 11 in. long; infl. a racenne of 6-15 fls.; sepals and petals greenish-yellow with brown spots on basal half, the lateral sepals to 6 in. long, petals to 1 in. long; lp/light yellow with brown spots. Jan.-Aug. Fla., W. Indies, Cent. Amer.

Gircoudiana. Pseudobulbs to 5 in. high, bearing 2 oblong or elliptic-oblong lvs. to over 17 in. long and 2 in. wide: scapes to over 2 ft. long, usually 7-10-fid.; sepals linear-lanceolate, tapering, to 6 in. long, cream-color or greenish-yellow, spotted with brown on basal third; petals to 2½ in. long, yellow, spotted with brown on lower half. Dec.-May. Costa Rica, Panama.

Keiliana. Pseudobulbs much compressed, to 2 in. high, narrowly ovate, bearing 1 strap-shaped If. to 10 in. long: scapes equalling or surpassing the lvs., few-or many-fld.; bracts equalling or surpassing the pedicelled ovary; fls. yellow, spotted with brown; sepals to 3 in. long, the petals to 1% in. long; lip whitish. May-June. Colombia, Venezuela.

Lawrenceana. Pseudobulbs over 2 in. long, bearing 2 oblong or lanceolate lvs. to 8 in. long; scapes to 8 in. or more long; sepals and petals greenish or bright yellow spotted with brown, the former to almost 3 in. long, the lip bright yellow. May-June. British and Dutch Guiana, Brazil.

longissima (B. Lawrenceana var. longissima). Pseudobulbs to 5 in. high, bearing 1 or 2 lys. to 15 in. long and 2½ in. wide: scapes to 2 ft. long, with a 10-15-fd. raceme; sepals and petals golden-yellow or greenish-yellow spotted with brown at base, the lateral sepals to 12 in. long; lip acuminate, pale yellow or white spotted with red-brown. Feb.-Oct. Costa Rica.

maculata. Differs from B. longissima in lateral sepals only 2-3 in. long, smaller petals and much broader acute lip. Apr.-June, Oct. W. Indies, Cent. Amer.

verrucòsa. Pseudobulbs to 3 in. or more long, bearing 2 oblong or elliptic-oblong lvs. to 1 ft. long: scapes to about 2½ ft. long, with 4-16-fd. racemes; sepals and petals green or yellowish spotted at base with brown, the former to 5 in. long; lip warty, white spotted with dark green below. Apr.-June. Mex., Guatemala, Honduras, Venezuela.

BRÁSSICA (incl. Sinapis). Coles. Mustards. Cruciferæ. Mostly ann. and bien. herbs, sometimes per., yielding many edible plants: see Broccoli, Brussels Sprouts, Cabbage, Cauliflower, Collards, Kale (Borecole), Kohlrabi, Mustard, Pe-tsai, Rape, Rutabaga, Turnip. The species are probably 40 or more, original in the Old World, but the nativity of many of them is unknown; some of them are widespread weeds. They are erect, tall branched and for the most part glabrous often glaucous plants with

variously pinnatifid or lyrate or strongly toothed lower lvs., yellow or yellowish-white or sometimes white fls. in terminal racemes in spring and summer, pods or siliques elongated. The cult, is simple; they are essentially cool-season subjects.

acéphala: B. oleracea var.

álba: B. hirta.

alboglabra. Ann., perhaps sometimes living over winter, glabrous and very glaucous, to 3 ft.: lvs. thick, lower ones oval, sinuate, to 10 in. long, auricled or lobed at base of blade, long-stalked, upper st.-lvs long-oblong and petioled or not clasping: fts. white, large, cabbage-like: pod 2-3 in. long. Probably from Orient, there grown as pot-herb.

arvensis: B. kaber.

botrytis: B. oleracea var.

bullata: form of B. oleracea var. capitata.

campéstris. Ann, in grain fields eastward and a great weed on Pacific Coast, glaucous all over, 2-6 ft.: lvs. clasping, the lower ones variously lyrate-lobed: fis. small, bright yellow: pod 2-3 in. long.

capitàta: B. oleracea var.

cauliflora: B. oleracea var. botrutis.

caulorapa. Kohlrahi. Low bien., glabrous and glaucous: st. swelling just above ground into the "turnip" or edible part: lvs rather small, 10 in. or less long, with oval dentate blade and long petiole: fis. cream-yellow: pod 2-3 in. long, with short thick beak.

chinénsis. Pak-Choi. Ann. or bien, glabrous, somewhat glaucous at maturity: lower lvs. shining green making a rather compact crown or cluster to 20 in. high but not a head, obovate and entire or nearly so, the petiole white near, chovace and entire or nearly so, the petitie white and narrowly winged or margined but not jagged, st.-lvs. clasping: fls. pale yellow, ¾ in. long: pod to 2½ in. long. Grown as pot-herb.

fimbriata. Kitchen Kales, formerly included in B. oleraces var. acephals. Low dwarf plants producing much edible herbage for winter and spring use, then going to seed: Ivs oblong or narrower, deeply side-lobed and curled or fringed, glaucous-blue and sometimes purplish: fls. large, light yellow: seeds small, more or less angled. Dwarf Sibera and Scotch kales belong here.

gemmifera: B. oleracea var.

hirta (B. and Sinaps alba). White Mustard. Ann. to 4ft, sparsely hairy: lvs. oval to obovate, deeply divided on sides: fis. yellow, about ½ in. long; pod to 1½ in. long, spreading, lower part seed-bearing and nodulose, beak flat.

japônica: B. juncea var. crispifolia.

japonica: B. juncea var. crispifolia.
júncea (Sinapis juncea B. rugosa). Leaf Mustard.
Ann., green but st. sometimes slightly glaucous, to 4 ft.:
lower lvs. oval to obovate, rather thm, lyrate-lobed or
divided, with toothed or scalloped edges, st.-lvs. narrowed
at base but not clasping: fls. bright yellow; pod to 1½ in.
long. Sometimes run wild. The commonest form of leaf
mustard for greens, often in the var. crispifolia (B. japonica
of hort. but not botanically) known as Southern Curled.
Var. foliôsa comprises forms with very large broad lys.
grown for greens. Var. lôngdens has long narrow lys. with
prong-like large teeth. Var. multisécta has finely divided
lys.

kaber (B. and Sinapsis arvensis). CHARLOCK. Ann. to 3 ft. or more, green, commonly hispid toward base and sometimes above: lvs. ovate to oblong-ovate, variously lobed or lyrate, not clasping: fls. small, yellow: pod about 3/2 in. or less long, nodulose, beak often 3/2 in. or more long. Sometimes cult. for mustard. The naturalized plants in the New World are varieties of this species.

Napobrássica. RUTABAGA. Bien., very glaucous and thick-lvd., glabrous, the underground tuber with solid yellow or white flesh and with long neck or crown and often withstanding winter in the N.: lvs. large and long, lyratepinnatifid, those on st. with clasping base: fis. light yellow to whitish-yellow: pod much spreading on stout pedicels, the boak stout and short. Var. solidifolia has long notlobed radical lvs.

Napus. RAPE. COLZA. Ann., but late-sown plants pass the winter and bloom following spring, making thin tap-root: otherwise much like B. Napotrassica except that the pods are ascending on rather thin pedicels and the beak is slender and commonly 1/2 in. or more long.

narinosa. Stout low glabrous not glaucous bien, bearing short clusters of orbicular-ovate small puckered mostly entire lower lvs. with broad whitened petioles; st.-lvs. very broad and clasping, entire: fls. yellow: pod very thick and relatively short, ¾ in. or less long and ¾ or ¼ as broad, the beak very short and stout. Grown for pot-herb by Chinese.

nigra (Sinapis nigra). BLACK MUSTARD. Tall ann. to 6 ft. and more, mostly hispid-hairy at least below, little

if at all glaucous: lvs. pinnatifid or lobed, terminal part large, petioled, dentate: fis. yellow, in many short racemec-pod 1 in. or less long, 4-sided, appressed to raches. A widespread weed, and as a cult. plant a main source of table mustard

oleracea. Thick-lvd. glaucous per. (probably also bien.) on coasts of W. England, represented in cult. by many races: lower lvs. to 20 in. long, rounded or obovate, lobed on costs of w. Linghald, represented in curt. by many races: lower lvs. to 20 in. long, rounded or obovate, lobed at base; st.-lvs. narrow, long, sometimes clasping: fls. whitish-yellow or cream-yellow, large, to 1 in. long: pod to 4 in. long, spreading; seeds large and rounded. Not in cult. except now and then in test grounds. Var. acéphala (B. acephala) comprises forms without heads or dense rosettes: Tall or Tree Kale, Cow-Cabbage. Var. botytis (B. botytis) has whitish heads formed of thickened transformed fl.-clusters: Cauliflower, Broccoll. Var. capitata (B. capitata) has one dense head of consolidated lvs.: Cabbage (one form being Savoy, sometimes known as var. bullata or B. bullata). Var. gemmifera (B. gemmifera) has small compact buds or heads in If.-axils along the st: Brussels Sprouts, known commonly as "Sprouts." Var. itálica with thickened fl.- branches not condensed into a solid head: Sprouting, Branching or Asparagus Broccoll. Var. Tronchūda, a low cabbage-like plant without head and with broad midribs: Portuguese Cabbage or Kale. See B. fimbriata. or Kale. See B. fimbriata.

parachinénsis. FAISE PAK-CHOI. Like B. chinensis but with radical lvs. more orbicular and petiole not margined, st.-lvs. narrowed to base and not clasping. Grown by Chinese as pot-herb.

pekinénsis (B. Pe-Tsai). PE-Tsai (which see). Celery Cabbage. Ann. with green soft foliage, glabious or essentially so: basal lvs. large and very broad, with undulate or obscurely toothed margins, the petiole broad, flat and with jagged wings, st.-lvs. either stalked or clasping: fls. light yellow: pod to 2½ in. long. Grown as a cool-season vegetable, the lvs. forming a more or less solid attractive head.

perviridis. TENDERGREEN. Lower foliage abundant and tender, spatulate-oblong and nearly entire, not lobed on petiole, glossy-green both surfaces, root not tuberous. fls. large: seeds small, somewhat angled.

Pe-Tsai: B. nekinensis.

purpuraria. Purple Mustard. Ann., with sts. and ribs of lvs purple: lower lvs. lyrate-pinnatifid with broad ribs and veins: fls small, at first crowded: seeds small, somewhat angled. Planted for greens.

Råpa. Turnip. Green-lvd. bien., with white- or yellow-fleshed flat or globular tuber not bearing a long neck or crown and that does not withstand the winter in the N: lvs soft but hispid, to 20 in. long, lyrate-pinnatifid, st-lvs. clasping: fls. yellow: pod 2½ in. long or less. Vir lorifòlia, Strap-leaved T., has radical lvs. nearly or quite unlobed.

rugdsa: B. juncea.

Ruvo. TURNIP BROCCOLI. Bien. if sown in autumn, the young spring shoots eaten, ann. if sown in spring, with tap-root, $2\frac{1}{2} - 3\frac{1}{2}$ ft. at maturity, foliage dark green and often glossy, lvs. deeply lobed to petiole: fts small, in close clusters: pod small, about 2 in. long. Of recent intro. in

sépticeps (B. Rapa var septiceps). Seven-top Turnip. Bien, very leafy and floriferous, producing several tall sts. from one thick crown, foliage glaucous: lower lvs. deeply few-lobed, st.-lvs. clasping: fls. small, in short clusters: seeds small, angled or irregular. Young shoots used for food, and sometimes called broccoli. Spontaneous in Va. and south, perhaps also in milder regions northward.

BRASSOCATTLÆLIA. Orchidacex. generic hybrids between the genera Brassavola, Lælia and Cattleya, most of which have been given English or vernacular names. Those known to have Latin names are:

Máckayi (B. Digbyana X L.-C. elegans).

prevenústa (B. Digbyana X L.-C. bletchleyensis).

pulchérrima (B. Digbyana X L.-C. Canhamiana).

Truffautiana (B. -C. Leemannix X L. -C. Truffautiana). Victòria Regina (B. -L. King Edward VII $\times C$. Mossiæ).

BRASSOCÁTTLEYA. Orchidacex. A group comprising hybrids between the genera Brassavola and Cattleya.

amabalénsis (B. -C. heatonensis X C. amabilis var. alba).

Cliftonii (B.-C. Digbyano-Mossiæ \times C. Trianæi). Cliftonii var. magnifica (B. -C. Veitchii × C. Trianzei).

Fournière (B. Digbyana \times C. labiata).

fülgens (B. Digbyana X C. Mendelii).

heatonénsis (B. Digbyana \times C. Hardyana). Hólfordii (B. Digbyana X C. Forbesti).

Hyèm (B. Digbyana X C. Harrisoniana).

Jéssopii (B. Digbyana X C. Dowiana).
langleyénsis (B. Digbyana X C. Schroederiana).
Leèmannim (B. Digbyana X C. Schroederiana).
Lindleyàna (B. tuberculata X C. intermedia).
Marlm (B. Digbyana X C. Warneri).
Marònim (B. Digbyana X C. Warneri).
Marònim (B. Digbyana X C. Mendelii).
Massangeàna (B. -C. Leemannim X C. Trianmi).
mirábilis (B. -C. Leemannim X C. Mendelii).
Praètii (B. Digbyana X C. Leopoldu).
Rubyàna (B. -C. Ruby X C. Trianmi).
Sedènii (B. Digbyana X C. Trianmi).
Sedènii (B. Digbyana X C. Trianmi).
Speciòsa (B. -C. Imper. de Russie X C. Schroederiana).
Thôrntonii (B. Dybbyana X C. Gaskelliana).

Vilmoriniàna (B. -C. Mrs. J. Leemann × C. Mossiæ).

BRASSOLÈLIA. Orchidaceæ. A series of hybrids between Brassavola and Lælia.

Gratríxiæ (B. Digbyana × L. cinnabarina). Jéssopii (B. Digbyana × L. xanthina). Veltchii (B. Digbyana × L. purpurata).

Veitchii (B. Dibayana $\times C$. Mossiæ).

BRASSOLÆLIOCÁTTLEYA. Orchidaceæ. A group of trigeneric hybrids between Brassavola, Lælia and Cattleya.

Mossmaniàna (B.-C. Mrs. J. Leemann \times L.-C. Firminu). pulchérrima (B. Dygbyana \times L.-C. Canhamiana). Truffautiàna (B.-C. Mrs. J. Leemann \times L.-C. luminosa). Truffautiàna aùrea is listed as having the same parentage.

BRAUNERIA: Echinacea. BRAUNSIA: Echinus.

BRAVÒA. Amaryllidacex. About 4 species of Mexican tuberous herbs, to be grown in well-drained sandy soils of warm regions, with-standing a few degrees of freezing temperatures when given winter protection: basal lvs. linear to lanceolate, thin, st.-lvs. small: fls. whitish to red, stalked, in racemes, perianth consisting of a long tube and unequal segms.: fr. a caps. One species, B. geminiflöra, is offered. To 18 in., tuber globose: lvs. 6-8, sword-shaped, usually 12-18 in. long, mostly basal: fls. bright red, in pairs, to 1½ in. long. Cent. Mex.

 $\textbf{BRAZIL-NUT:} \ \textit{Bertholletia.}$

BRAZIL-WOOD: Casalpinia echinata.

BREADFRUIT. The great rough syncarp of Artocarpus communis (A. incisa), native probably in the Malayan Archipelago and now widely dispersed in the torrid zone; it is cooked for eating. The tree is large and heavy-leaved. The fruit is borne on small branches; it is commonly 4-8 inches in diameter when full grown, spherical or short-oblong. The tree is sometimes seen in economic collections under glass and may be set out in the open in the warmest parts of the continental United States, but its real culture is confined to low moist regions in the tropics. The usual breadfruit is seedless and is propagated by means of suckers and rootcuttings. The seed-bearing form, usually called breadnut, may be raised from seeds; this is grown for the seeds which are roasted or boiled.

BREADNUT: Brosimum Alicastrum; see Breadfruit. BREADROOT, INDIAN: Psoralea esculenta.

BREVOÓRTIA. Liliacex. One California cormous herb, grown in shady well-drained locations. B. Ida-Màia (Brodixa coccinea). FLORAL FIRE-CRACKER. To 3 ft.: lvs. basal, linear: fls. tubular, scarlet tipped with green,

1½ in. long, nodding in umbels terminating the scape.

BRÈYNIA. Euphorbiaceæ. Shrubs or trees with alternate simple lvs., monœcious apetalous fis. usually solitary in the axils, and fr. a berry; native in Old World tropics. Distinguished from Phyllanthus by the absence of a disk around the base of the gynœcium and andrœcium. Grown for ornament and hedges in the warmest parts of the country and in greenhouses in the N. Propagated by cuttings of green wood and roots.

nivôsa (Phyllanthus nivosus). Snow-Bush. Loose-growing shrub, 3-4 ft.: lvs. oval, to 2 in. long, mottled or speckled green and white: fis. small and greenish. S. Sea Isls.; more or less run wild in Fla. and tropics. Var. atropurpurea (var. purpurea) has dark purple lvs. and var. rôseo-picta has lvs. mottled with pink and red.

BRICKÉLLIA (Coleosanthus). Compositæ. American herbs or shrubs with alternate or opposite lvs. and heads in panicles or cymes, of white, yellowish or pink disk-fls.; pappus bristly; achenes 10-ribbed. One species is grown in the border where it thrives in moist shady locations. Propagated by cuttings over heat.

grandiflòra. TASSEL-FLOWER. Per. to 3 ft.: lvs. triangular-ovate, to 4 in. long, toothed: heads about ½ in. across, yellowish-white. W. N. Amer., in mts.

BRIDAL WREATH: Spira prunifolia and trichocarpa; see also Francoa ramosa.

BRIDGESIA: Ercilla spicata.

BRIER: Rosa, Smilax. Sensitive: Schrankia uncinata.

BRISTLY: bearing stiff strong hairs or bristles.

BRITÒA. Myrtaceæ. Brazilian trees allied to Pimenta, one intro. into Fla. for the edible fr.; cultural requirements similar to the guava.

ácida. Pará Guava. To 30 ft., the branchlets winged: lvs. oblong-ovate or oblong-lanceolate, to 4 in. long: fls. white, solitary in the axils: fr. sulfur-yellow, oval, to 3 in. long, with soft whitish pulp.

BRITTONÁSTRUM. Labiatæ. Per. herbs native in Ariz. and Mex., with toothed opposite lvs. and white, red or purple 2-lipped fls. in whorls in terminal spikes, stamens exserted; sometimes grown in the herb-garden but not hardy in the N. Propagated by division.

canum (Cedronella and Agastache cana). To 3 ft., woody, hoary: lvs. ovate, to 1½ in. long: fls. pink, 1 in. long.

mexicanum (Cedronella mexicana. Gardoquia betonicoides, but the plant sold under this name may not be correct). To 3 ft., with creeping roots: lvs. ovate-lanceolate, to 2½ in. long: fls. pink, 1 in. long.

BRITTONIA DAVISII: Hamatocactus hamatacanthus.

BRÌZA. QUAKING-GRASS. Gramineæ. Small ann. and per. grasses having many-fid. flattened nodding spikelets borne in panicles with hairlike branchlets; native in Old World and S. Amer., a few grown for ornament.

geniculata: Eragrostis obtusa.

grácilis: B. minor.

máxima. Ann. to 2 ft.: lvs. to 6 in. long and ¼ in. wide: spikelets ovate, ¼ in. or more long, often bronzy, in panicles to 3 in. long, decorative. Medit. region.

mèdia. Per. to 2 ft.: lvs. to 3 in. long and ½ in. wide: spikelets ovate, to ½ in. long, often purplish, in panicles to 10 in. long. Eu., Asia; nat. in N. Amer.

minor (B. gracilis). Ann. to 1½ ft.: lvs. to 5 in. long and ½ in. wide: spikelets triangular, to ½ in. long, in panicles to 5 in. long. Eu.; nat. in N. Amer.

BRIZOPYRUM: Desmazeria sicula.

BROCCOLI (Brassica oleracea var. botrytis). A form or race of the cauliflower tribe, requiring a long season and, where the climate permits,

the plants may be allowed to stand over winter and make their heads in spring. The leafage of the plant is likely to be more erect than in the cauliflower and the leaves narrow and long. A related plant, not making a large single white head but a loose more or less leafy panicle of edible flower shoots, is the asparagus or sprouting broccoli (B. oleracea var. italica). Turnip broccoli is B. Ruvo. For culture of broccoli, see Cauliflower.

BRODLAA. Liliacex. Cormous herbs mostly native in W. N. Amer., in fields and on hills and mountains, with few basal grass-like lvs. and funnel-shaped or campanulate fls. in loose umbels terminating the slender scapes.

Brodizeas are hardy in the Pacific and southern states and useful in borders; also sometimes grown in pots; spring and summer bloomers. They thrive on any soil that is not wet or heavily manured. Propagated by seeds, or by offsets if produced.

bicolor. To 1 ft. or more: fls. blue and white. Calif.

Bridgesii. To 9 in.: fls. pale lilac, about 1½ in. long, fertile stamens 6. Calif., Ore.

californica. To 1 ft.: fis. violet-purple, to 1½ in. long, fertile stamens 3. Calif.

cándida. Similar to B. laxa but with white or pale blue fla. Calif.

capitata (Dichelostemma capitatum). Blue-Dicks. To 2 ft.: fls. blue, 3% in. long, in head-like umbels, fertile stamens 6. S. Ore. to Lower Calif. Var. pauciflora has 2-10-fld. umbels of pale blue fls.

coccinea: Brevoortia Ida-Maia.

congésta: B. vulchella

coronaria (B. grandistora). To 114 ft.: fis violet-purple, to 134 in. long, fertile stamens 3. B. C. to Calif.

croces. To 1 ft.: fls. bright yellow, 34 in. long, fertile stamens 6. Calif.

Douglasii (Tritcleia grandsflora). To 2 ft.: fls. blue, to 1 in. long. B. C. to Ore. and Mont.

Eastwoodii. A recent species with umbels of pure

grandiflòra: B. coronaria.

Héndersonii. Similar to *B. Bridgesii* but with yellow fls. having purple band down center. Ore.

hyacinthina. To 2 ft.: lvs. linear: fls. white to purplish, to 1 in. long with segms equalling or exceeding perianth-tube, infl. an umbel of 10-30 fls. Calif.

ixioldes (Calliprora ixioides). PRETTY FACE. To 11/4 ft.: fls. salmon-yellow veined with dark purple, 3/4 in. long, fertile stamens 6. Ore. to S. Calif. Var. splendens has large bright yellow fls.

láctea (Hesperoscordum hyacinthinum). WILD-HYACINTH. To 1½ ft.: fis. white or hlac, ½ in. long, fertile stamens 6. B. C. to Calif.

16xa (Triteleia laxa). Grass-Nut. Triplet-Lily. To 2 ft.: fls. purple or rarely white, to 1% in. long, fertile stamens 6.

Leachiæ: listed name of unknown botanical standing.

minor (B. Purdyi. Hookera minor) To 10 in.: fls. violet-purple, 1 in. long, fertile stamens 3. Calif. multiflora. To 2 ft.: fls. light purple, \$4 in. long, in head-like umbels, fertile stamens 3. Calif., Ore.

peduncularis (Triteleia peduncularis). To 3 ft.: violet-purple or white, 34 in. long, fertile stamens 6. Calif.

puchélla (B. congesta. Dichelostemma pulchellum). To 3 ft.: fls. violet-purple, ¾ in. long, in head-like clusters, fertile stamens 3. Wash. to Calif.

Pürdyi: B. minor.

stellaris (Hookera stellaris). To 6 in.: fis. violet-purple, in. long, fertile stamens 3. Calif.

terrestris. Very low, the mostly large umbel at or near the ground: fis. purple, wide open, 34 in. long. Calif.

uniflora (Milla uniflora. Triteleia uniflora. Leucocoryne uniflora). Spring Star-Flower. To 8 in., with onion-like odor: fis. white tinged with blue, solitary, 1 in. long. Ar-gentina. Var. cerûlea has porcelain-blue fis. and violacea. violet fls.

volubilis (Dichelostemma and Stropholirion californicum). SNAKE-LILY. To 3 ft. or twining to 8 ft.: fls. rose or pink, 35 in. long, fertile stamens 3. Calif.

BROMÈLIA. Bromeliacex. Trop. American

terrestrial herbs with stiff spiny-margined lys. in basal rosettes, and fls. in heads or panicles; planted in the tropics and sometimes in greenhouses. See Bromeliacex.

fastuòsa. To 2 ft.: lvs. to 5 ft. long, rigid and arching, margins with stout recurved triangular spines: petals reddish-lavender, subtended by scarlet bracts to 1 ft. long: fr. lemon-yellow, ovoid, to 7 ± 10 long. Brazil.

Pinguin. Pinguin. Lvs. to 6 ft. long and 1½ in. wide, light green, with hooked prickles: fis. white or pinkish, in mealy panicles shorter than lvs. W. Indies, S. Amer.

rùbro-víridis is listed.

BROMELIÀCEÆ. BROMELIADS. BROMELIA or Pineapple Family. American herbs or subshrubs, of tropics or warm countries, mostly epiphytic, of about 40 genera, with usually long stiff lvs. often in rosettes, regular bisexual fls. in spikes, heads or branching panicles often with showy colored bracts and sometimes with ornamental fls., having 6 perianth-parts in 2 series, 6 stamens, 3-celled ovary and fr. a berry or caps. Several genera are grown for ornament, mostly under glass, and the pineapple for food, such as Æchmea, Ananas, Aregelia, Billbergia, Bromelia, Canistrum, Cryptanthus, Dyckia, Greigia, Guzmania, Hechtia, Hohenbergia, Nidularium, Pitcairnia, Puya, Rhodostachys, Tillandsia, Vriesia. Distinctions between the genera are mostly technically botanical and cannot be detailed here

Many of the bromeliads, in several genera, make showy and effective greenhouse and conservatory subjects. Although many of the cultivated kinds are variously epiphytic in their native habitats, they are usually grown in pots, wire baskets or wooden cribs, in a soil of infrons material. Growth is mostly in summer, when plenty of water should be supplied; bloom is usually best in the following late winter to early summer. The spikes of showy bracts and often of colored flowers made the plants unusually attractive. Most bromeliads require a night temperature in the winter of 50–75°, and plenty of light and sunshine. In winter only a light sprinkling over the foliage is necessary. Propagated by suckers or sprouts from the base of the old plants. Many of the bromeliads, in several genera, make show

BRÒMUS. BROME-GRASS. Gramineæ. Ann. and per. grasses with flat lvs. and usually drooping spikelets in open terminal panicles; mostly natives of the north temp. zone, some kinds grown for forage and others for the flowergarden. See Grasses.

brizæfórmis. Quake-Grass. Ann. to 2 ft.: lvs. to 8 in. long and 14 in. wide: spikelets ovate-oblong, flattened, to 1 in. long, awnless, in panicles to 8 in. long, the branches nodding. N. Eu., Asia; nat. in N. Amer.—Useful in dry bouquets.

eréctus. Per. to 3 ft.: lvs. to 1 ft. long and ½ in. wide: spikelets to 1½ in. long, awned, in panicles to 7 in. long, the branches erect. Eu.; nat. in E. N. Amer.

inermis. Hungarian or Awnless B. Per. to 4 ft.: lvs. to 1 ft. long and ½ in. wide: spikelets oblong, to 1 in long, awnless, in panicles to 10 in. long, the branches ascending. Eu.; grown in pastures and sometimes escaped.

intermedius (Serrafalcus Hughii). Ann. or bien. to 1½ ft.: spikelets 1 in. long, greenish or yellowish, in panicles to 4 in. long. Medit. region.

japónicus (B. patulus). Ann. to 2 ft.: lvs. to 8 in. long and $\frac{1}{2}$ in. wide: spikelets lanceolate, to 1 in. long, awned, in panicles to 8 in. long, the branches nodding. Eu., Asia; sparingly nat. in N. Amer.

macróstachys. Ann. to 2 ft.: lvs. to 6 in. long and ½ in. wide: spikelets to 1½ in. long, flattened, with awns to ¾ in. long, in panicles to 4 in. long, the branches erect. Eu., W. Asia.—Grown for ornament. Var. lanuginosus has lvs. and spikelets pubescent.

madritensis. Ann. to 2½ ft.: lvs. to 8 in. long and ¼ in. wide: spikelets to 2 in. long, with awns to ¾ in. long, in dense panieles to 6 in. long, the branches erect. Eu.; escaped in N. Amer.—Grown for ornament.

pátulus: B. japonicus.

pendulinus. Per. to 3 ft.: lvs. to 6 in. long and 1/4 in. wide: spikelets to 3/4 in. long, awned, in panicles to 6 in. long. Mex.

unioloides (Ceratochloa pendula). Rescue-Grass. Ann. or bien. to 3 ft.: lvs. to 1 ft. long and 1/2 in. wide: spikelets to 1 in. long, much flattened, awnless, in panicles to 10 in. long, the branches ascending. S. U. S. to S. Amer.—Grown for forage in the S.

BROOKLIME, EUROPEAN: Veronica Beccabunga.

BROOM: Cytisus, Genista, Notospartium, Spartium. Butchers: Ruscus aculeatus. Climbing Butchers: Semcle androgyna. Turpentine: Thamnosoma montana.

BRÓSIMUM. Moracex. Trop. American milky-juiced trees with alternate entire leathery lvs., staminate fls. of a single stamen, pistillate fls. and frs. immersed in the fleshy receptacle; grown in trop, regions for the nuts, and for the lvs. which are used for fodder. Propagated by cuttings over heat.

Alicastrum. Breadnut. To 100 ft.: lvs. oblong, to 7 in. long and 2½ in. wide: fr. globose, about 1 in. across, yellow, with a single large seed which is eaten and roasted. Mex., Cent. Amer., W. Indies.

BROUGHTÒNIA. Orchidacex. A small genus of W. Indian epiphytic orchids differing from Epidendrum in that the free lip is produced below into an adnate spur and the ovary is produced into a long hollow neck. The species are sometimes cult. under glass; treat as Epidendrum

domingénsis. Pseudobulbs crowded, to 2 in. long: lvs. 1-2, oblong, mucronate, to 8 in. long, leathery: peduncle to nearly 2 ft. long, terminating in short lax raceme: fls. rose-lilac, to 1½ in. long, lip with nerves densely bearded. Dec.-May. Bahamas, Cuba, Jamaica, Santo Domingo.

sanguinea. Differs from B. domingensis in its fls. crimson-scarlet and usually $\frac{1}{2}$ - $\frac{1}{8}$ in. long and in having a lip with smooth nerves. Jan.-May, Sept. Cuba, Jamaica.

BROUSSONÈTIA. PAPER-MULBERRY. Moracex. Deciduous trees or shrubs with milky juice, alternate toothed often lobed lvs., staminate fls. in drooping catkins, pistillate in globose heads, and fr. a small syncarp composed of orange-red drupelets; native in E. Asia, where the bark is used for making paper.

Propagated by seeds, suckers, cuttings of green or ripe wood in a cool greenhouse, root-cuttings over slight heat, and by layers. Varieties may also be grafted in spring in the greenhouse on roots of the type or budded in summer.

papyrifera (Papyrius papyrifera). To 50 ft. Ivs. ovate, to 8 in. long, usually deeply lobed, grayish-pubescent beneath: syncarp tomentose, 34 in. across. China, Japan; much planted as a street tree and nat. N. Y. to Fla. and Mo. Var. laciniata, Ivs. finely dissected. Var. leucocárpa, fr. white. Var. variegata, Ivs. variegated white or yellow.—Hardy in central states, and farther north in protected

secundifidra: Sophora secundiflora.

BROWÁLLIA. Solanacex. Annuals grown in the garden or greenhouse for the blue, violet or white tubular fls. with spreading 5-lobed limb, which are solitary and axillary or in more or less one-sided racemes; lvs. usually simple; native in trop. Amer. and of the simplest cult.

americana (B. demissa. B. elata). To 2 ft., glabrous or somewhat pubescent, not viscid: lvs. ovate, to 2½ in. long: fis. blue or violet, tube ½ in. long and limb ½ in. across, segms. 2-lobed, calyx hairy. Trop. Amer. Var. 4lba has white fis., cæridea pale blue fis., and nana is dwarf.

Czerwiakowskii: B. viscosa.

demissa: B. americana.

elàta: B. americana.

grandifiora (B. Roezlii). Similar to B. americana, with white or pale blue broader fis. and glabrous calyx. Peru.

Jamesonii: Streptosolen Jamesonii.

majora B. speciosa.

pulchélla: B. viscosa.

Roézlii: B. grandiflora.

speciosa (B. major). To 5 ft., shrubby at base: lvs. ovate: fls. with tube 1 in. long, limb dark purple, pale lilac beneath, varying to blue, violet and white, to 2 in. across, segms. entire. Colombia.

viscòsa (B. Czerwiakowskii, B. pulchella), To 1 ft... sticky-hairy, at least on young parts; lvs. ovate: fis. dark blue with white eye, or white, to \$\frac{3}{4}\$ in. long, the segms. short and 2-lobed. S. Amer. Var. compacta is listed.—Some of the stock otherwise named belongs here.

BROWNEA (I'ermesias). Leguminosæ. Small trees native in trop. Amer., with leathery pinnate lvs. and very showy red fls. in racemes or dense heads; sometimes planted in the warmest parts of the country.

capitélla. Lfts. 9 in. or more long, long-acuminate: fls. in dense heads about 11 in. across, the stamens long-exserted. Venezuela.

grandiceps. Lits. about 7 in. long, caudate: fis. in dense heads about 9 in. across. S. Amer.

latifòlia. Litts. to 4 in. long and 2 in. wide, pointed: heads small, stamens slightly protruding. Trinidad, Venezuela.

macrophýlla. Partially climbing shrub to 18 ft.: Ifts. tomentose beneath: heads to 6 in. across, borne near base of trunk. Panama, Colombia.

Ròsa-de-mônte (B. rosea). Líts. 3-4 in. long, abruptly acuminate: fis. in heads. S. Amer.

ròsea: B. Rosa-de-monte.

BROWN-EYED SUSAN: Rudbeckia triloba.

BROWNÍNGIA. Cactaceæ. One species native in S. Peru and N. Chile. B. candelàris (Cereus candelaris). To 15 ft., with simple trunk branching at top, very spiny when young; ribs 30-34. low, areoles ½ in. apart, becoming much elevated; spines on trunks 20-50, the longest to 6 in.: fls. brown or rose to white, to 5 in. long, nocturnal.

BRUCKENTHÀLIA. Ericaceæ. One evergreen heath-like shrub to 10 in. high, adapted to the rock-garden and hardy N. Propagated by Seeds and cuttings. B. spiculifòlia. SPIKE-HEATH. Lvs. crowded, linear, about 15 in. long: fls. pink, very small, bell-shaped, in racemes to 34 in. long, the style exserted, in summer. S. Eu., Asia Minor. Var. alba is listed as a white-fld.

BRUGMANSIA: Datura.

BRUNELLA: Prunella.

BRUNFÉLSIA (Franciscea). Solanaceæ. Shrubs and trees usually winter blooming, with mostly large showy often fragrant funnel-shaped fls. in loose or dense terminal cymes or sometimes solitary: lvs. alternate, simple and entire. Native in trop. Amer., a few grown in conservatories and in the open in Fla. and S. Calif. Linnæus, in 1753, spelled the name Brunsfelsia, but in Genera, 1754, Brunfelsia, apparently a correction.

Brunfelsias need a rich loose compost and liberal feeding during their growing season, blooming best if pot-bound. They should have a night temperature of 50°. Propagated by cuttings from the new growth in spring or in autumn from pieces of ripened wood.

americana. Lady-of-the-Night. Shrub to 8 ft.: lvs. oval to obovate, to 4 in. long: fls. white fading to yellow, mostly solitary, the slender tube to 4 in. long and limb to 2 in. across, very fragrant at night; calyx short: fr. a yellow berry 3/4 in. diam. W. Indies.

berry % in diam. W. Indies.

calfeina. Erect or spreading: lvs. ovate-oblong, to 4 in. long, dark green above, lighter below: fis. rich dark purple, limb 2 in. across, in few-fid. mostly terminal cymes; calyx with tube to 1 in. long, half or more length of corolla-tube. Brazil. Var. eximia, fis. rich purple soon fading to almost white. Var. floribinda (B. floribinda), dwarf, fis. rich violet with small white eye. Var. macrántha (B. grandiflora, B. Lindeniana, B. macrantha), lvs. rich dark green, to 8 in. long, fis. rich deep purple with lavender-blue ring around white eye at mouth of tube. Peru.

capitâta. Shrub: lvs. obovate-oblong, to 9 in. long: fls. in many-fld. cymes, corolla-tube slightly longer than calyx which is 1 in. long. Brazil.

floribunda: B. calycina var.

grandiflòra: B. calycina var. macrantha.

Hopeana. Slender branching shrub: lvs. lanceolate-oblong, to 3 in. long, rich dark green: fls. small, solitary or in

pairs along the leafy growths, limb light violet-blue changing to nearly white, tube nearly white, 1 in. long; calyx ¾ in. long. Brazil, W. Indies.

latifolia. Rather dwarf: lvs. oval, to 4 in. long: fis. nearly white to lavender and purple with lighter center, solitary or in few-fid. clusters, tube 1 in. long, lmb 1½ in. across; calyx short. Trop. Amer.

Lindeniana: B. calucina var. macrantha.

macrántha: B. calycina var.

macrophfila. Shrub: lvs. oblong, to 9 in. or more long: fls. in loose many-fld. cymes, corolla-tube twice as long as calyx. Brazil.

BRUNIACEÆ. BRUNIA FAMILY. About a dozen genera of heath-like subshrubs, mostly in S. Afr. but extending to S. Australia, placed in the sequence near Hamamelidaceæ and Saxifragaceæ. The family is characterized by small bisexual and regular fls., with the parts mostly 4 or 5, and a dry fr. with commonly 2 parts. Only Audouinia appears to be cult. in N. Amer., and this is likely to be listed under Diosma, which is one of the Rutaceæ.

BRUNNÈRA. Boraginaceæ. A small herbaceous genus of W. Siberia and E. Medit. region, usually referred to Anchusa, but of different habit, broad netted-veined lvs. and naked infl

macrophfila (Anchusa myosotidiflora). Per. to 1½ ft.: lvs. ovate, heart-shaped at base: fis. blue, ¼ in. across, in summer. Siberia, Caucasus.

BRUNÒNIA. Goodeniacex. A monotypic Australian genus having nearly regular fls. in headlike clusters, with a superior 1-celled ovary containing a single basal ovule, the seeds without endosperm and in a small nut. B. australis. Blue Pincushion. Per. to 1 ft.: lvs. basal, obovate to spatulate, to 3 in. long, cuneate. entire: fl.-heads blue.

BRUNSDÓNNA. Hybrids between Amaryllis Belladonna and Brunsvigia Josephinix. Such hybrids have been produced crossing either way, those with Amaryllis seed parent apparently being more satisfactory horticulturally.

BRUNSFELSIA: see Brunfelsia.

BRUNSVÍGIA. Amaryllidaceæ. S. African summer- and autumn-flowering bulbs having basal lvs. and red or pink funnelform fls. in umbels terminating the scape.

Brunsvigias require rich sandy soil together with heat and hight. After flowering the bulbs should be rested. sunlight. After flower Propagated by offsets.

Josephine (Amaryllis Josephina), Josephines-Lily To 1/4 it.: lvs. to 3 it. long and 2 in. wide, ribbed: fis. bright red, 3 in. long, the tube about 1/4 in. long.

BRUSSELS SPROUTS (Brassica oleracea var. gemmifera). Biennial, the first year from seed producing little heads or "sprouts" in the leaf-axils, and the second year bearing seeds. The culture is essentially that for kale except that it is always a fall crop, the seed being sown in spring in a seed-bed and the young plants set in the field in late spring or summer, 18-30 inches apart in rows 30-36 inches apart. The "sprouts" attain a diameter of 1 or 2 inches; they are gathered as they mature from the bottom upwards, and a good plant should yield about one quart. As the sprouts attain form and considerable size, the subtending leaf is removed, the terminal crown of foliage maintaining the vigor of the plant. The crop is desired after frosty weather comes. The little sprouts or buttons are amongst the most delicate products

of the cabbage tribes; they are best when not too large, say an inch or even less in diameter. The insects and diseases are those of the cabbage.

RRYANTHIIS Phullodoce Bremeri

BRYÒNIA. BRYONY. Cucurbitaceæ. Herbs with per. more or less fleshy or tuberous root, mostly diœcious, one of them seldom grown in this country as an ornamental or arbor vine: fis. not large, the staminate in racemes, the pistillate few or solitary in axils: species 7 or more, in temp. Eu. and W. Asia.

diolca. To 10 or 12 ft, from fleshy tuber or strands: lvs. palmately 5-lobed, rough: fls. greenish, to 34 in across: fr. a smooth red berry 14 in. diam. Eu., W. Asia, N. Afr.

BRYONÓPSIS. Cucurbitaceæ. Two ann. tendril-climbing herbs, Asia, Afr. and Pacific Isls., one of which may be grown as an ornamental vine: plant monœcious: fls. small and greenish, fascicled and mostly in the axils.

laciniòsa. Sts. slender, glabrous, tall-climbing: lvs. deeply 3-5-lobed, with obtuse sinuses; fr. yellow-green to reddish and striate, nearly 34 in. diam.

BRYONY: Bruonia. Black: Tamus communis.

BRYOPHYLLUM: Kalanchoé.

BUCARE: Eruthrina Poeppiaiana

BIICHII: Dicema ericoidee

BUCIDA. Combretaceæ. Trop. American trees and shrubs with entire leathery lvs. clustered at ends of twigs, small fls. without petals borne in spikes, and fr. a small drupe.

Bucèras. Black Olive. Tree to 75 ft.: lvs. spatulate or elliptic, to 3½ in. long, obtuse or notched: fls greenishyellow, in spikes to 4 in long, stamens exserted: fr. ½ in. long. Fla., W. Indies, Panama.

BUCKBEAN: Menuanthes trifoliata.

BUCKBERRY. Gaulussacia ursina.

BUCK-BRUSH: Ceanothus cuneatus.

BUCKEYE: Æsculus, Ungnadia.

BUCKLEÝA. Santalacex. Deciduous parasitic shrubs with opposite entire lvs., staminate fls. in umbels, pistillate solitary, and drupaceous frs.: 3 species in China, Japan, and N. Amer.

As the cultivated species is parasitic on the roots of Tsuga, seeds must be sown in a pot with the host plant and set out with the hemlock. Hardy in New England.

distichophflla. To 12 ft: lvs. ovate to ovate-lanceolate, to 2½ in. long, sessile: fis greenish, small fr yellowishgreen, about ½ in. long. N. C., Tenn.—A graceful shrub.

BUCKTHORN: Rhamnus. False: Bumelia lanuginosa. Sea -: Hippophae.

BUCKWHEAT: Fagopyrum. -Tre phylla. Wild: Errogonum fasciculatum. -Tree: Cliftonia mono-

BUDDING: see Graftage.

BUDDLÈJA (Buddleia) BUTTERFLY-BUSH. Loganiacex. Shrubs or rarely herbs, deciduous or evergreen, bearing stellate, glandular or scaly pubescence, with mostly opposite lanceolate lvs., 4-lobed fls. in heads, panicles or spikes, and fr. a 2-valved caps.; several showy species are grown for ornament.—Spelled Buddleja by Linnaus, but the i and j have the same phonetic value.

Even when buddlejas are not hardy North, the roots may survive with winter protection, but some of the species stand the winter in New York. They thrive in sunny locations in rich well-drained soil. Propagated by seeds sown over heat in spring, by cuttings of green wood, and by cuttings of ripe wood kept over winter in a frost-proof room.

alnifòlia: listed name.

alternifòlia. To 12 ft. or more, branches droaping or arching: lvs. alternate, to 4 in. long, gray-tomentose be-

neath: fis. lilac-purple, in dense clusters to $\frac{1}{2}$ in. long. June. China.

amplissima: hort, name.

asiática. Lvs. to 8 in. long, entire or fine-toothed, white-or yellow-tomentose beneath: fis. white, fragrant, in droop-ing spikes to 9 in. long, in winter and spring. China to India.—Grown under glass; in the open adaptable only in southernmost parts.

brasiliënsis. Erect shrub to 10 ft. or more: lvs. oblong-lanceolate, to 8 in. long, dentate-crenate, white-tomentose beneath: fts. yellow-orange to reddish-orange, in many-fid. verticillate leafy racemes. Brazil; not hardy N.

caryopteridifòlia. To 6 ft.: lvs. ovate to oblong, to 2½ in. long, with large irregular teeth, tomentose: fis. lavender, in narrow panicles to 3 in. long. China; not hardy N. but in Calif.

Cólvilei. To 30 ft.: lvs. to 7 in. long, toothed, pubescent: fls. purple or crimson with white eye, in drooping panicles to 1½ ft. long. Himalayas; to be grown far S.

crispa (B. paniculata). To 15 ft.: Ivs. to 5 in. long, coarsely toothed, pubescent above, white or yellow-tomentose beneath: fis. lilac with white eye, fragrant, in panicles to 4 in. long, in summer. Himalayas.

curviflòra: B. japonica.

Curvifiora: B. japonica.

Dàvidii (B. variabilis). Summer Lilac. To 15 ft.: lvs. to 10 in. long, finely toothed, dark green above, white-tomentose beneath: fls. llac with orange eye, fragrant, in spikes to 10 in. long, in late summer. China.—One of the hardlest and probably commonest. Var. magnifica has larger rose-purple fls. in dense spikes. Var. nanhoénsis grows to 5 ft. high with lvs. to 4½ in. long. Var. supérba resembles magnifica but has larger panicles. Var. Witsonii has rose-lulac fls. in drooping spikes to 2 ft. long.

**Efaquater!* Hybrid between R. officingles and R. assintica:

Fárquhari. Hybrid between B. officinalis and B. asiatica: lvs. yellow-tomentose beneath: fls. pale pink, in spikes; adaptable S.

Fórrestii: plants grown under this name are confused. Fortunei: hort. name.

globosa. To 15 ft.: lvs. to 10 in. long, wavy-toothed, yellow-tomentose beneath, wrinkled above: fis. orange, fragrant, in dense long-stalked heads ¾ in. across. June. Peru: planted in Calif.

Hártwegii: hort. name.

intermèdia. Hybrid between B. Lindleyana and B. japonica: lvs. to 6 in. long: fis. violet, in drooping panicles to 8 in. long. Var. insignis has rosy-violet fis. in erect

japónica (B. curviflora). To 6 ft., with 4-winged branch-lets: lvs. to 8 in. long, slightly toothed, tomentose beneath when young: fis. lilac, in drooping panicles to 8 in. long, in summer. Japan.

Lindleyana. To 6 ft, with 4-angled branchlets: lvs. to 4 in. long, slightly toothed, nearly glabrous beneath: ffs. purplish-violet, in erect spikes to 8 in. long, in summer. China; not hardy N.

madagascariénsis. To 20 ft.: lvs. to 5 in. long, dark green above, white- or yellow-tomentose beneath: fis. orange, in panicles, in winter. Madagascar; stands in Calif. and other mild climates.

magnifica: B. Davidii var.

nanhoénsis: B. Davidu var.

nívea. To 10 ft.: lvs. to 10 in. long, coarsely! toothed, dark green above, white-tomentose beneath: fls. lilac or purple, in dense spikes to 6 in long, corolla tonentose outside, in late summer. China. Var. yunnanénsis has lvs. pubescent above and yellow-tomentose beneath.

officinalis. To 10 ft.: lvs. to 6 in. long, entire or fine-toothed, gray-pubescent above, white- or yellow-tomentose beneath: fls. lilac with orange eye, fragrant, in panicles 6 in. long, in winter and spring. China; adapted only far S.

paniculàta: B. crispa.

salvifòlia. To 10 ft.: lvs. to 6 in. long, finely toothed, rusty-tomentose beneath, pubescent above: fis. yellowishwhite with orange throat, in panicles to 6 in. long. Trop. and S. Afr.

supérba: B. Davidii var.

variábilis: B. Davidii.

Veitchiàna: B. Davidii var.

BUFFALO-BERRY: Shepherdia argentea.

BUGBANE: Cimicifuga.

BUGINVILLÆA: Bougainvillea.

BUGLE-WEED: Ajuga.

BUGLOSS: Anchusa. Vipers -: Echium.

BULBINE. Liliacex. Herbs from Australia and Afr., having bulbs or tuberous roots, linear

or lanceolate lvs., and usually yellow fls. in racemes; seldom grown under glass or in the open in warm regions; bloom in spring and summer. The name is pronounced in three syllahleg

alooldes. Stemless per. with tuberous rootstock: lvs. to 9 in. long; fis. bright yellow, ½ in. long, in racemes to 1 ft. long. S. Afr.

annua. Stemless ann. without rootstock or bulb: lvs. to 1 ft. long: fis. bright yellow, 1/4 in. long, in racemes to 6 in. long on scapes. S. Afr.

bulbòsa. Stemless or essentially so, per. to 1½ ft.: lvs. narrowly lanceolate to linear, grooved above, often fleshy: fis. yellow, all filaments bearded: caps. 1-2-seeded. Australia.

cauléscens. To 2 ft. or more, distinct st. to 1 ft. high, simple or branched: lvs. terete, to 1 ft. long, crowded above: fls. bright yellow, in dense racemes to 1 ft. long. S. Afr.

semibarbāta (Bulbinella sembarbata of hort.). Stemless or essentially so, per. to 2 ft., tuberless: fls. yellow, the 3 outer stamens with short beardless filaments; caps. 3-4-seeded. Australia.—By some authorities formerly considered inseparable from B. bulbosa.

BULBINELLA. Liliacex. Per. herbs with fleshy tuberous roots, linear basal lvs. and vellow or white fls. in a dense raceme terminating the naked scape; native in S. Afr. and New Zeal. Grown in the border where they do best in rich moist soil; useful in warm regions. Propagated by division or seed.

Hookeri (Chrysobactron Hookeri). To 3 ft: fls. bright yellow, ½ in. across, in racemes to 10 in. long. New Zeal. robústa. To 1½ ft.: fls bright yellow, ½ in. long, in racemes to 4 in. long. S. Afr.

semibarbata: Bulbine semibarbata.

BULBOCODIUM. Liliaceæ. One crocus-like cormous herb native in Eu. and Asia. B. vérnum. Lvs. radical, narrow: fls. violet-purple, funnelform, 1-3 from each bulb and borne close to the ground in very early spring in advance of full leafage, the narrow segms. 2 in. long. A recent treatment has combined this genus with Colchicum, from which it may be distinguished by the distinctly clawed perianth-segms, and the entire single 3-lobed style. For cult. see *Crocus*.

BULBOPHÝLLUM. Orchidacex. Epiphytes having more or less prominent pseudobulbs which bear 1 or 2 lys. and from the base a raceme of fls. or sometimes solitary fls., having petals smaller than the sepals and a commonly fleshy strap-shaped lip. Grown in a warm greenhouse; see Orchids.

appendiculatum (Cirrhopetalum appendiculatum). Fls. about 3 in. long, solitary, with petals and dorsal sepal pale yellow lined with purple and tipped with purple fringe, and thick bright purple lip. India, Burma.

barbigerum. Pseudobulbs to 1 in. long, with 1 lf. to 3 in long and 1 in wide: fls. in many-fld. racemes to 4 in. long, the sepals dull purple, the lip green with yellow markings, hairy and tipped with long purple hairs. June-July. Trop. Afr.

Careyanum. Pseudobulbs to 2½ in. high, with 1 lf. to 10 in. long and 1½ in. wide: fis. in dense nodding racemes to 3 in. long, yellow thickly spotted with red-brown. Oct.—Dec. Himalayas.

caricinum: listed name of plant said to differ from B. Careyanum in its more open fl

Cóllettii (Cirrhopetalum Collettii). Pseudobulbs 4-lobed, ellipsoidal: lvs. ovate to elliptic-oblong, to about 4 in. long, acutish, fleshy: scapes pendulous, to 6 in. long, umbellate infl. of 5-7 fls.; fls. 4-5 m. long, sepals long-attenuate, pale orange with crimson stripes, dorsal sepal and petals conspicuously fringed, lip bright carmine-crimson to magenta, column orange. Burma.

 ${\bf comosum}.$ Pseudobulbs to 11% in. high, with 2 broad lvs to 8 in. long; fls. small, yellowish-white, in dense racemes on scapes to 10 in. high, the lip yellow. Jan. Burma.

congolanum. Pseudobulbs about 1 in. high, with 2 lvs. to 3½ in. long and ½ in. wide: fis. pale yellow, in racemes on flattened red scapes. W. Afr.

Cúmingii (Currhopetalum Cumingii). Lvs. to 7 in. long: fls. purple, in 9-12-fld. umbels, with yellow fringed petals and dorsal sepal, and fleshy lip. Philippines.

cupreum. Differing from B. Careyanum in the copperyellow fis. and the red lip. Nov.-May. Cochin-China, Burma.

cylindraceum: listed name.

DayAnum. Pseudobulbs about 1 in. high, with 1 oblongelliptic lf. to 4 in. long: fls. about 1 in. across, in 2-3-fld. clusters, the sepals yellow-green spotted with red and hairy, the petals half as long and purple-red edged with yellow, the lip green with red ridges. May-July. Burma.

Dêarei. Pseudobulbs up to 1½ in. high, with 1 strapshaped If. to 6 in. long: fls. solitary, large, the sepals brownish-yellow spotted with red, the petals shorter, yellow marked with red, the lip white finely dotted with purple. May-June. Philippines, Borneo.

densifièrum. Pseudobulbs ovoid-oblong, to 1¼ in. long, 2-lvd.: lvs. oblong-lanceolate, about 4 in. long, acute, pale green: scape suberect, about 5 in. tall, terminated by a densely fid. raceme; fis. small, greenish-yellow, malodorous, the lip deeper yellow than sepals and petals. Himalayas.

Ericssonii. Pseudobulbs cylindrical, to 5 in. high, 1-lvd.: If. elliptic-oblong, acute, about 5-6 in. long; scape to 7 in. long, usually 10-15-fid.; fis. umbellate; sepals lanceolate, long-acuminate, deep yellow-green spotted with brown, up to 3 in. long; petals similarly colored, smaller. Oct. Probably from Molucca Isls.

falcatum (Meyaclinium falcatum). Pseudobulbs to 2 in. high, with 2 lvs. to 3 in. long and ½ in. wide: fis. green and yellow or dark reddish-purple and orange. Apr.-June, Oct. W. Afr.

gibbosum. Rhizome creeping, with very small pseudobulbs: lvs. lanceolate, to 7 in. or more long and 1 1/4 in. wide, leathery: fls. pale brownish, sepals tipped with yellow, lip small and yellow or orange, in erect spikes about 6 in. or more high. Java, Sumatra.

grandiflorum. Pseudobulbs 1½ in. or more high, with 1 lf. to 10 in. long and 2 in. wide: fls. solitary on scapes about 6 in long, very large, the sepals brownish-green with light spots, the petals very small, the lip small, greenish dotted with red-brown, hairy at base. Oct. New Guinea.

guttulatum: B. umbellatum.

iliacinum. Pseudobulbs to 2 in. long, ovoid or oblongcylindric: If. oblong or oblong-elliptic, to 8 in. long, fleshy: fls. in dense racemes on short peduncle, sepals and petals lilac spotted with pink to purple. Siam, Malaya.

Lobbii. Pseudobulbs to 2 in. high, with 1 lf. to 8 in. long and 2 in. or more wide: fls. solitary, 2-4 in. across, the sepals and petals yellow spotted or lined outside with red, the lip golden-yellow. May-June, Nov. Borneo, Java to Sumatra, Burma.

longiflorum (Cirrhopetalum Thouarsii). Lvs. to 7 in. long and 1½ in. wide: fls. whitish or pale yellow to reddishbrown, almost 2 in. long, in several-fld. umbels, the dorsal sepal and petals with a thread-like tail. Dec.—Apr., Aug. Mauritius, Pacific Isls.

Medûsæ (Cirrhopetalum Medusæ). Lvs. to 6 in. long and 2 in. wide: fls. pale yellow spotted at base with red, in manyfld. umbels, the lateral sepals prolonged into tails to 6 in. long. Jan.-Feb. Malaya, Siam, Borneo.

odoratissimum. Pseudobulbs to 1½ in. high, with 1 linear-oblong if. to 3 in. long: fis. small, in dense globose heads, yellow, fragrant. India to China.

ornatissimum (Cirrhopetalum ornatissimum). Pseudobulbs ovoid, to 2 in. tall: If. leathery, to 6 in. long: fls. umbellate, yellowish, greenish or pale purplish-brown with dark purple stripes and reticulations, to 4 in. long, lip crimson-purple, on stout scape surpassing the lvs. Himalayas, Philippines.

picturatum (Cirrhopetalum picturatum). Lvs. to 6 in. long and 1½ in. wide: fis. about 2 in. long, in 10-fid. umbels, sepals and petals green spotted with red, the upper sepal with a terminal red thread, the lip dark red. Oct., Nov., Apr. Burma.

pülchrum (Cirrhopetalum pulchrum). Fls. purple, in 5-7-fid. umbels, the lateral sepals yellow spotted with purple, over 1 in. long. Malaya.

refráctum (Cirrhopetalum refractum). WINDMILL ORCHID. Lvs. 2, lanceolate, to 5 in. long: fis. yellow, 2½ in. long, the lip spotted with red. Himalayas, Java.

Reinwardtii: B. uniflorum.

rigidum. Pseudobulbs indistinct: lvs. oblong, to 10 in. long, obtuse: scape not exceeding lvs.; fls. laxly racemose, 8-14, yellowish tinged with green and streaked with red, sepals lanceolate, petals oblong, lip dull orange-yellow, finely speckled and streaked with purple. Himalayas.

Rôxburghii (Cirrhopetalum Roxburghii). Lvs. oblong to elliptic-oblong, to 4 in. long: fis. umbellate, lateral sepals yellow, petals and dorsal sepal yellow striped with red, lip red-purple. India.

saurocéphalum. Pseudobulbs bearing 1 oblong lf.: fls. in many-fid. racemes with a bright red rachis, the sepals light ochre lined with brown, petals small and white bordered with reddish, lip ochre, deep purple at base. Philippines.

suavissimum. Pseudobulbs 1 in. high, with 1 lanceolate if. to 4 in. long: fis. bright rose or whitish, the lip yellow, in many-fid. arching racemes to 10 in. long. Feb. Burma.

Thouarsii: B. longiflorum.

umbellātum (Cirrhopetalum guttulatum). Pseudobulbs ovoid, to 2 in. high, with lf. to 6 in. long: scape greenishyellow speckled with purple, to 10 in. tall; fis. in umbels, yellow-green with bright purple dots, to nearly 1 in. across, lip purple, the lower sepals twisted and spreading. India.

uniflorum (B. Reinwardtii). Pseudobulbs to 4 in. high, with 1 elliptic If. to 9 in. long; fls. about 4 in. long, yellowish tinged with brownish-red. Java, Malaya.

viréscens. Pseudobulbs about 5 in. high, with 1 lf. to 8 in. long and almost 4 in. wide: fis large, in umbels, the sepals and petals greenish-yellow, the lip greenish-yellow spotted with purple near base. June. Java, Amboina.

BULBS, when defined as a horticultural class, are ornamental partial-season mostly simple-stemmed plants arising from bulbs, corms, tubers or thickened rootstocks that may be cured and dried off and stored over winter. The term is incapable of close definition: it includes crocuses, tulips, hyacinths, narcissi, squills, lilies, amaryllids and similar groups. It specially denotes spring-blooming subjects. Because of their quick growth and showy bloom, bulbs are unceasing favorites with cultivators.

The outdoor culture of the common bulbs is simple. The plants care for themselves throughout a greater part of the year, many of them flowering very early when no other kinds are able to grow and bloom out-of-doors. Success, depends to a large degree on good stock to begin with. Not only should the varieties be good and true to name, but the bulbs themselves should be well ripened and firm although it is not necessary to choose the biggest ones. While the so-called Holland bulbs thrive in any kind of soil, all do better in deep sandy ground well enriched with well-rotted manure; but do not let the manure come into direct contact with the bulb. Even heavy clay may be fitted for the growing of bulbs by the addition of sharp sand, either worked into the soil or placed directly under the bulb when planted.

To make a bulb bed, choose, if possible, a loose or loamy soil and throw out the top earth to the depth of 6 inches. Put into the bottom of the bed about 2 inches of well-rotted (not fresh) manure and spade it into the soil. Throw back half of the top soil, level it off nicely, set the bulbs firmly on this bed and then cover them with the remainder of the soil; in this way one will have the bulbs from 3 to 4 inches below the surface and of uniform depth. When the weather is cold enough to freeze a hard crust the bed should have its winter covering. This may be straw, hay, cornstalks or leaves spread over the bed to the depth of 6 inches if the material is coarse; but if leaves are used, 3 inches will be enough, because the leaves lie close together and may smother out the frost that is in the ground and let the bulbs start. If they start too early the hard freezes of March and early April will spoil their beauty if the leaves or flowers are near or above the surface. Early in April, in New York, the covering may be removed gradually, and should all be off the beds before the leaves show above the ground. Some of the bulbs may be readily naturalized in grassy and untilled areas, as grape-hyacinth, crocus, jonquil, daffodil. lily-of-the-valley, tulip. The plants

are usually massed irregularly for pleasing and striking effect. The area may be fertilized in

autumn with top-dressing.

The growing of flowering bulbs in winter adds to the list of house plants a charming variety. Hyacinths, narcissi, tulips, and crocus can be made to flower in the winter without difficulty. Pot the bulbs by the middle or last of October, or if earlier all the better. The soil should be rich sandy loam, if possible; if not, the best one can get, to which add about one-fourth the bulk of sand and mix thoroughly. If ordinary flower-pots are to be used, put in the bottom a few pieces of broken pots, charcoal or small stones for drainage, then fill the pot with earth so that when the bulbs are set on it the top of the bulb is even with the rim of the pot. Fill around it with soil, leaving just the tip of the bulb showing. If the soil is heavy, a good plan is to sprinkle a small handful of sand under the bulb to carry off the water, the same as is in beds outdoors. If one does not have pots, boxes may be used; and excellent flowers are sometimes obtained from bulbs planted in old tomato cans. If boxes or cans are used, care must be taken to have holes in the bottoms for drainage. A large size hyacinth bulb will do well in a 5-inch pot. The same size pot will do for three or four narcissi or eight to twelve crocuses. After the bulbs are planted they should be placed in a cold pit or cellar, or on the shady side of a building, or, better yet, plunged or buried up to the rim of the pot in a shady border. This is to force the roots to grow before the top appears, as only the bulbs with good roots will give good flowers. When the weather is so cold that a crust is frozen on the soil, the pots should be covered with a little straw, and as the weather becomes colder more straw must be added. In six to eight weeks after planting the bulbs, they should have made roots enough to grow the plant, and the pots may be taken up and placed in a cool room for a week or so, after which, if plants have started into growth, they may be taken into a warmer room where they have plenty of light. They will grow very rapidly now and will want much water. When just coming into bloom the plants may have full sunlight part of the time to help bring out the color of the flowers. Crocuses and tulips open only in sunlight. After blooming in the house, the bulbs are usually discarded and new ones purchased for the following year, although it is possible to grow them on for future blooming.

BULLACE, DAMSON: Prunus domestica var. institua.

BULLATE: the surface blistered or puckered, as the leaf of a Savoy cabbage.

BULLOCKS-HEART: Annona reticulata.

BULRUSH: Scirpus.

BUMÈLIA. Sapotacex. Evergreen or deciduous often thorny shrubs and trees in S. U. S. and southward with very hard wood, one sometimes transferred to grounds in its region: lvs. mostly fascicled or crowded on short spurs: fls. small, white, fascicled in axils: fr. small, black, drupe-like.

lanuginosa. Chittamwood. False Buckthorn. Deciduous tree to 25 ft., but the oblong-obovate thick lvs. persisting late, tomentose underneath, entire, 2-3 in. long: fr. about ½ in. long. Woods and copses, Va. to Fla. and west to Kans. and Tex.

BUNCHBERRY: Cornus canadensis. BUNCH-FLOWER: Melanthium. **BUNIAS.** Cruciferæ. Coarse bien. or infrequently per. herbs of E. and S. Eu., one species nat. throughout most of Eu. and locally in N. Amer.

orientalis. To 4 ft., coarsely branched above: basal rosette lvs. lyrate-pinnatifid, oblong-elliptic, to 1 ft. long, acute; st.-lvs. lanceolate-elliptic, becoming only toothed above: fis. yellow, about ½ in. across, in dense branched racemes: fr. ovoid-apiculate, scarcely ½ in. long, on stout ascending pedicels about ½ in. long, cotyledons accumbent and somewhat contorted.—Often of a weedy nature when well established.

BUNYA-BUNYA: Araucaria Bidwillii.

BUPHTHÁLMUM. Ox-Eye. Compositæ. Showy herbaceous perennials with large yellow heads of disk- and ray-fls. and alternate entire or toothed lys.; pappus of scales united into a crown. Native in Eu. and W. Asia. Of easy cult. in the border, and mostly hardy N. Propagated by division; also by seeds and sometimes blooming first year.

cordifòlium: B. speciosum.

grandiflorum. Perhaps synonymous with B. salicifolium but with long-acuminate nearly glabrous lys. S. Eu.

salicifolium. To 2 ft.: lvs. oblong-lanceolate, toothed, white-hairy: heads solitary and terminal, to 2 in. across. S. Eu.—Spreads rapidly by underground parts.

speciosissimum (Telekia speciosissima). To 5 ft.: lvs. oval-cordate, clasping, toothed, hairy only on midrib below: heads solitary and terminal. S. Eu.

speciosum (B. cordifolium. Telekia speciosa). To 4 ft., pubescent: lvs. cordate-ovate, coarsely toothed, very large: heads 2-5, large. S. Eu., W. Asia.

BUPLEÙRUM. THOROUGH-WAX. Umbelliferæ. Old World herbs or shrubs with simple entire lvs., yellow fls. in compound umbels, and compressed frs.; suitable for dry sterile soils in warm climates, being grown for ornament.

fruticosum. Subshrub to 6 ft., evergreen or partially so: lvs. oblong, to 3½ in. long, leathery: umbels to 4 in. across, subtended by deflexed bracts. S. Eu.

ranunculoides. Per. to 2 ft. with flexuous sts.: lvs. lanceolate or linear, 3-7-nerved: involucels with 5-6 oval bracts, not deflexed. Cent. and S. W. Eu.

rotundifolium. Ann. to 2 ft., with stiff glabrous branching sts.: lvs. broadly ovate or oval, to 1½ in. long, obtuse or mucronate, perfoliate: umbels to 1 in. across with large yellowish involueral bracts. Eu.; nat. in cult. fields of U. S.

BUR, BUTTER-: Petasites. New Zealand: Acxna microphylla.

BURDOCK: Arctium.

BURLINGTONIA FRAGRANS: Rodriguezia venusta. BURNET: Sanguisorba.

BURNING-BUSH: Dictamnus albus, Euonymus atropurpureus.

BURSARIA. Pittosporaceæ. Shrubs or trees with alternate simple lvs., small fls. in terminal panicles, and fr. a flat caps.; one species grown in S. Calif. for ornament.

spinosa. Spiny shrub or small tree: lvs. to 1 in. long: fls. white: caps. about 1/4 in. across. Australia.

BURST-WORT: Ilerniaria.

BUSH: shrub, particularly when dense and much branched.

BUSHMANS-POISON: Acokanthera venenata.

BUTEA. Leguminosæ. Small Asiatic genus of trees and climbing shrubby vines, having large and showy papilionaceous (pea-like) fls., with nodes of racemes swollen, stamens diadelphous, the style beardless and pods 1-seeded.

frondosa. FLAME-OF-THE-FOREST. Tree to 50 ft., twigs gray or brown silky-pubescent: lvs. trifoliolate on petioles to 6 in. long, letts. rhombic with terminal one more rounded, to 8 in. long, leathery, silky beneath: fls. bright orange-red, corolla silvery-tomentose outside, to 1 in. across or more, in racemes to 6 in. long; pods silvery-canescent, to 8 in. long and 2 in. wide. India to Burma.—A trop. tree of which seeds are offered in the S.

BÙTIA. YATAY PALMS. Palmacex. Species of Cocos segregates but without the aspect of Cocos. Arecastrum, Rhyticocos or Syagrus, of warmtemp. Brazil to Uruguay, Paraguay and Argentina: short stocky monocious feather-lyd. palms, trunk solitary and covered with lf.-bases or their scars and 3-15 ft. high, plant unarmed except for the spine-margined hard flattened or thin-edged petiole: lvs. stiffish, decurved beyond the middle, grayish- or glaucous-green; pinnæ standing well up from the rachis then curving, strongly conduplicate toward base, long and narrow: spadix from axils of lower lvs., the spathe not plicate or grooved outside; stamens 6, borne on upper part of spadix branches: fr. globose, ovoid or ovoid-conic, yellow or reddish, 1 in, long more or less, with a pulpy-fibrous or rather soft yellowish exterior, 3-celled but 1 or 2 seeds sometimes aborted; albumen not ruminate. The Butias are hardy palms, hardly regarded as real trees by planters, thriving in S. Calif., on the Gulf Coast and southward, and on coast to N. C. See Palm.

Bonnètii (Cocos Bonnetii, C. Gaertneri). Low palm, the bonnein (cocos Bonnein: C. daerner). Low paint, the trunk 1-4 ft., small in all parts: pinne equally spaced, not aggregate, narrow: spadux 2 ft. or so, the spathe glabrous on outside; fis. and fr. small, the latter about ¾ in. long and four-fifths as broad, ovoid-conic and acute and held for a third or half its length in the enlarging perianth. Brazil.— See note under Arikururoba.

capitata (Cocos capitata. C. australis and C. coronata of hort. not of botanists). Variable in arrangement of pinne and character of fr.: trunk stout, to 12-20 ft. or more and 1½ ft. diam., becoming bare of lf-bases at the bottom: lvs. long and gracefully curving; pinnæ many, to 2½ ft., whitish beneath, often 2-3 together; petiole glabrous, spiny at base: spadix 4-5 ft. long, spathe generally glaucescent: fr. ovoid, about 1 in. long or a little more at maturity and four-fifths as broad; nutlet elliptic, more or less acute; and four-nitin as broad; nutiet emptic, more or less acute; perianth deeply cup-like at base of fr. Brazii, commonly planted in S. Calif. and elsewhere. Var. Nehrlingiana (Cocos Nehrlingiana) has violet-red fis. and frs. Var. odorata (Cocos violenta). Fr. (lepressed-globose, about %-1 in lengthwise, at maturity broader than long; nutlet nearly in lengthwise, at integrity orosider than long; intelet nearly spherical; fruiting perianth not cup-like, flattened and expanded under base of fr. Var. pulposa (Cocos pulposa). Fr. globose, only lightly depressed, very pulpy, $1\frac{1}{2}-1\frac{1}{2}$ in. lengthwise; nutlet and seed spherical; fruiting perianth cup-like but not deep. Var. strictior. Upright close grower, all the lvs strongly ascending. Var. viréscens. Lvs. brilliant green, not glaucous.

eriospatha (Cocos criospatha). Trunk stout, 4-10 ft., becoming naked below: spathe densely brown-tomentose on outside: pinnæ equally distant, not assembled unless at on outside: pinne equally distant, not assembled unless at base of rachis, green above and somewhat glaucous underneath, petiole tomentose on margin at base: fr. small, nearly globular, %-34 in. either way, with a short abrupt point; nutlet globose; fruiting perianth shallowly cup-like. B Brazil.—Cocos Blumenavia, planted in Calif., apparently belongs here.

Nehrlingiana: B. capitata var.

Yathy (Cocos Yatay). Stout palm, trunk to 8 or 10 ft. and about 1½ ft. dam.: petiole glabrous and armed on margin; pinnæ numerous, about equally placed or somewhat aggregate near the base, glaucescent underneath: fr. ovoid-come and acummate, 1½-2 in long and 1 in. or more thick; cup-like fruiting perianth ½-½ length of fr. Uruguay, Argentina.

BUTNERIA: Calycanthus.

BUTOMACEÆ. BUTOMUS FAMILY. Four genera of aquatic per. herbs with basal lvs., bisexual fls. solitary or in umbels, having 3 sepals and petals, 9 or more stamens, and 6 or more ovaries. By some writers the genera have been placed in Alismaceæ. Butomus, Hydrocleis and Limnocharis may be grown in ponds and aguaria.

BUTOMUS. Butomacex. One erect aquatic herb native in Eu. and Asia, B. umbellatus. FLOWERING-RUSH. Lvs. linear, to 3 ft. long: fls. rose-colored. 1 in. across, in many-fld. umbels on naked rush-like scapes to 4 ft. high. Easily grown in ponds, hardy N. Propagated by division.

BUTTER-AND-EGGS: Linaria vulgaris.

BUTTERCUP: Ranunculus, Bermuda: Oralis cernua.

BUTTERFLY-BUSH: Buddleia.

BUTTERFLY-FLOWER: Schizanthus. Bauhinia monarda

BUTTERFLY-WEED: Asclepias tuberosa.

BUTTERNUT: Juglans cinerea. BUTTERWORT: Pinguicula. BUTTON-BUSH: Cephalanthus. BUTTONWOOD: Platanus occidentalis.

BUXÀCEÆ. Box Family. Herbs, shrubs or trees, with persistent foliage, of about 6 widely distributed genera, with simple lvs., monecious fls. without petals, superior usually 3-celled ovary, and capsular or drupaceous fr. The ornamental genera Buxus, Pachysandra, Sarcocca and Simmondsia are cult.

BÚXUS. Box. Buxacex. Evergreen shrubs with small opposite entire stiff lys., very small fls. in little axillary clusters or spikes, and fr. a

Extensively used for hedges and edgings, as the plants stand pruning and shearing well. Box is suited to any well-drained soil and thrives in partial shade. Plants may be set out in spring or in August and September Propagated by hardwood cuttings, suckers or division, or layering. Seeds may be sown but the plants grow very slowly. Dwarf varieties may also be propagated by division. In protected or favored places both common species stand in parts of New York and central New England.

arboréscens: B. sempervirens var.

baleárica. To 30 ft.: lvs. larger and not so shining as B. sempervirens. Spain, Balearic Isls.

Fortunei: B. microphylla var. japonica.

Hárlandii. Differs from B. microphylla in lvs. oblanceolate to oblong, to $\frac{3}{4}$ in. long, somewhat narrowed toward base. China.

japónica: B. microphylla var.

koriénsis: probably B. microphylla var. koreana.

microphylla. To 3 ft. or often prostrate, branches conspicuously winged, mostly glabrous: lvs. somewhat obovate, broadest above middle. Japan Var. japónica (B. japonica. B. Fortunet). To 6 ft.: runs into several forms, as angustifòlia with long narrow lvs., aùrea with yellowish foliage, latifòlia with broad lvs., rotundifòlia with large bluish-green lvs. Var. koreana, to 2 ft. Korea. Var. sinica, twigs briefly pilose, lvs. usually emarginate and orbicular to ovate-lanceolate. China.

nana: dwarf forms of B. sempervirens.

sempérvirens. Common B. Sempervirens.

sempérvirens. Common B. To 25 ft., with 4-angled or slightly winged branches, mostly somewhat pubescent: lvs. elliptic, broadest about or below the middle Eu., N. Afr., W. Asia. There are many forms in cult., such as: angustifòlia (vars. longifolia and salictfolia) with long narrow lvs; arboréscens which grows to a small tree; argénteo-variegàta (var. argentea), the lvs. edged with silvery-white; aûreo-variegàta (var. aurea), lvs. yellow or variegated with yellow; bullàta, lvs. bullate, large; élegans, a variegated form with oblong lvs.; Hándsworthi; a bushy type with large broad lvs.: marginàta, lvs. edged a bushy type with large broad lvs.; marginata, its deed with yellow; myrtifòlia, a dwarf form with narrow lvs.; pyramidata (var. conica), of erect conical habit; rosmarinifòlia, a low kind with narrow lvs.; rotundifòlia (var. latifolia) has broadly oval lvs.; suffruitoòsa, a dwarf form with small lvs. Other listed forms include: fastignata, globosa and olexfolia.

suffruticosa: B. sempervirens var.

BYRNESIA: Graptopetaium.

CABBAGE (Brassica oleracea var. capitata). One of the standard garden vegetables and truck crops, essentially a cool-season plant but growing continuously through the summer; in all stages it withstands considerable frost, although young plants from hotbeds must be hardened off. Soil should be deep and fertile, and it should be capable of holding abundant moisture to supply the heavy demands in growth. The cabbages of many kinds have been developed through centuries apparently from Brassica oleracea of coasts of western Europe. The varieties differ in season, in color and size and shape of head. The Savoy cabbages, which are of excellent quality, are a race with puckered or blistered (bullate) leaves. It is usual to classify by season into three groups, early, midseason, late or winter. Consult experiment station and government bulletins, and dealers catalogues, for current varieties.

For very early and early crops, as of Wake-field, Golden Acre, and Copenhagen Market, seeds are usually sown in a hotbed or indoors a month at least before hard frosts are expected to cease. The seedlings may be transplanted into flats or into other frames, to keep them stocky. They should be given plenty of air, with reduction of temperature, to harden them for the field. In the field the plants are placed in rows 30-36 inches apart, and about 18 inches in the row.

For later and midseason crop, as of Glory, Succession, and All Season, seeds are commonly sown in the open in seed-beds six to eight weeks before time for planting in the field in rows 3 inches or more apart; from these rows they are usually transplanted directly to the field, the plants having been well thinned in the meantime if they begin to crowd. These later or main summer kinds are commonly given more room in the field, both because they grow larger and to allow for horse tillage.

Of the autumn and winter kinds, as Ballhead, Drumheads, and Flat Dutch, seeds are some-times placed in hills where the plants are to stand, all plants but one being removed as they grow. A much better procedure, however, is to grow in seed-beds, transplanting to the field in July in the North. The plants usually stand 2 feet apart in rows with 3 feet space between. For winter storage only the long-keeping varieties should be employed; the heads should be mature and solid, free from injury and disease, internally moist and plump, but the center of the head should be free of water. They may be buried, usually heads down to keep them clear of water, or placed on racks in a building kept near freezing yet warm enough so that the heads do not freeze. When buried, care must be taken to choose a well-drained place, and if any quantity is stored provision should be made for ventilation; they are covered deeply enough to keep them cool in warm spells and also to protect from hard freezing in cold weather. If too warm they may rot. Usually 3 or 4 inches of earth are first placed on the pit or trench, and more added, or a straw covering applied, as cold weather advances. The heads are usually not more than two tiers deep.

In the midsouthern parts of the United States. cabbage plants are often started in autumn and carried over winter in the field; they are then ready for growth in earliest spring. Far South cabbage is treated as a winter or early spring crop, being grown continuously in the cool season.

Allowing for losses, 4 to 6 ounces of seed are generally required to produce sufficient plants

for an acre.

Many insects and fungi attack cabbages. The grower should keep in touch each year with the new advice issuing from the experiment stations and departments of government. The root-maggot is often a serious pest; young plants in seed-beds may be protected from the adult fly by covering securely with cheese-cloth, or by soaking the soil of the bed with a solution of corrosive sublimate 1 ounce to 8 or 10 gallons of water. In the field early cabbage plants can be protected by applying about ¼ pint of corrosive sublimate solution around each plant when the fly appears and making two additional The club-root applications a week apart. fungus is controlled by long rotations in which related plants (crucifers) are not grown; also by liming to bring the soil reaction to neutral (pH 7) or slightly alkaline. Cabbage-worms can be kept in check by dusting or spraying with poisons such as arsenate of lead, rotenone or pyrethrum; it is not safe to apply arsenates after the heads begin to form but the other poisons are safe as they are not poisonous to humans. Aphis or louse is controlled by spraying or dusting with preparations of nicotine sulfate.

CABBAGE, DEER .: Lupinus diffusus. Squaw: Caulanus inflatus. Wild: Caulanthus. thus inflatus.

CABBAGE, SKUNK -: Symplocarpus fætidus. Yellow: Lysichitum.

CABBAGE-TREE: Andira inermis, Sabal Palmetto, and other palms in the tropics.

CABÓMBA. FANWORT. WATER-SHIELD. Nymphæaceæ (or Cabombacaceæ). Aquatics of the western hemisphere, sometimes grown in ponds and aquaria: floating lvs. entire, submerged lvs. finely divided: fls. very small, with 3 sepals and petals. Grown from cuttings set in the earth in 1-2 ft. of water, by division of the plants, and by seeds.

aquática of some authors: C. caroliniana.

aquatica of some authors: C. carotimana.

caroliniana (C. aquatica. C. virulfolia). Washington
Plant. Fish-Grass. Floating lvs. green, very narrow, to
¾ in. long: fis. axillary, ½ in. broad, white with 2 yellow
spots at base of each petal. Ponds and slow streams, S. Ill.
to Fla. and Tex. Var. pulchérrima, sts. reddish-purple,
lvs. darker with narrow segms, petals bright purple. Ga.
Var. rossefoliaj has reddish lvs. and is more difficult to
propagate than the type.

viridifòlia: C. carolimana.

CACALIA: Emilia, Kleinia repens.

CACAO: Theobroma Cacao.

CACCÍNIA. Boraginacex. Per. W. Asiatic herbs allied to Borago. One species, C. glaûca, is cult. To 3 ft. tall, somewhat branched, scabrous and bearing tubercles or small prickles and depressed wart-like glands: lvs. ellipticoblong, to 8 in. long, very pale green, margins dentate-spiny, midrib somewhat enlarged and fleshy: fls. violet-blue turning red, the ovatelanceolate lobes about ½ in. long, exserted beyond calyx and rotate to recurved. Persia, Afghanistan.

CACTI. CACTACEÆ. CACTUS FAMILY. Over 1,300 species of cacti are known, now arranged in more than 100 genera. They are American plants, the few that occur wild in other parts of the world being probably spread from the west-ern hemisphere. They are plants of varied habit, but in most kinds (with marked exception in Pereskia) the leaves are minute and indistinguishable to the general observer, or are very early deciduous, and the vital functions are performed by the green plant body. For the most part the cacti are spiny, the spines arising from cushions or areoles; often, as in Opuntia, the spines are accompanied by small easily detached barbed bristles or glochidia that penetrate the skin. In many or most cases some of the spines at the areole are spreading or radial and others more or less erect and central. The flowers are bisexual, mostly without welldefined distinction between calyx and corolla; they are often very showy, in white, yellow and shades of red. The fruit is mostly a fleshy berrylike body, sometimes edible. Cacti are grown for the odd shape of the plant body as well as for the flowers; sometimes the plant is rigidly columnar, or barrel-shaped or even globular; but there are slender climbing and trailing forms and massive tree-like structures. Cacti are fascinating to lovers of oddities and novelties. and any number of kinds may be brought into cultivation from the wild; in fact, much of the stock has been collected rather than propagated plants. In this book obviously only the more generally cultivated or mentioned species can be included. The genera represented in cultivation are Acanthocalycium, Acanthocereus. Ancistrocactus, Aporocactus, Arequipa, Ariocarpus, Arrojadoa, Arthrocereus, Astrophytum, m, Bartschella, Bergerocactus, Bing-Borzicactus, Browningia, Carnegiea, Aztekium. Cephalocereus, Cereus (now divided into many genera), Chamæcereus, Chilenia, Cleistocactus, Cochemica, Copiapoa, Corryocactus, Coryphantha, Deamia, Dendrocereus, Denmoza, Discocactus, Disocactus, Dolichothele, Echinocactus, Echinocereus, Echinofossulocactus, Echinomastus, Echinopsis, Epiphyllanthus, Epiphyllum, Epithelantha, Erdisia, Eriosyce, Escobaria, Escontria, Espostoa, Eulychnia, Facheiroa, Ferocactus, Frailea, Grusonia, Gymnocalycium, Haageocereus, Hamatocactus, Har-risia, Hatiora, Heliocereus, Homalocephala, Hylocereus, Lemaireocereus, Lepismium, Leptocereus, Leuchtenbergia, Lobivia, Lophocereus, Lophophora, Machærocereus, Malacocarpus, Mamillopsis, Mammillaria, Matucana, Medio-Machærocereus, Malacocarpus, cactus, Mediolobivia, Melocactus, Mila, Mon-villea, Myrtillocactus, Neobesseya, Neolloydia, Neoporteria, Neoraimondia, Neowerdermannia, Nopalea, Nopalxochia, Notocactus, Nyctocereus, Obregonia, Opuntia, Oreocereus, Oroya, Pachycereus, Parodia, Pediocactus, Pelecyphora, Peniocereus, Pereskia, Pereskiopsis, Pfeiffera, Phellosperma, Phyllocactus, Pilocereus, Porfiria, Pyrrhocactus, Rathbunia, Rhipsalis, Roseocactus, Schlumbergera, Sclerocactus, Selenicereus, Solisia, Spegazzinia, Stenocactus, Stetsonia, Strombocactus, Thelocactus, Toumeya, Trichocereus, Weberocereus, Wilcoxia, Wilmattea, Zehntnerella, Zygocactus. See Succulents. The Cactus and Succulent Society of America publishes a journal in Los Angeles.

The Cactacese or Cactus Family divides it-

self into two rather marked groups, one of which is characterized by regular foliage leaves as in other plants and not looking much like cacti to the general observer, and the flowers are more or less stalked: to this group belongs the single genus Pereskia with about a score of species. The other group has no true foliage leaves, except in the anomalous genus Pereskiopsis, such leaves as appear being small or rudimentary and often falling early, and the flowers are without stalks. The second group divides itself into two tribes, the opuntia-like plants mostly bearing glochids on the areoles, the vegetative parts having small and short-lived leaves and the flowers rotate (wheel-shaped, without definite tube), and the cereus-like plants without glochids and leaves and the flowers mostly with definite and often very long tubes. To the Opuntia tribe belong seven genera, as now treated, only Opuntia and perhaps Nopalea being much known horticulturally. To the Cercus tribe belong all the other genera of the Cactacea, of which some of the most prominent horticulturally are Cereus, Cephalocereus, Echinocactus, Echinocereus, Echinopsis, Epipphyllum, Harrisia, Hylocereus, Mammillaria, Nyctocereus, Rhipsalis, Selenicereus, Zygocactus.
In the recent studies of cacti many new

In the recent studies of eacti many new names have been introduced, but the familiar old names are given here as synonyms (in parentheses) so that the identities and relationships may be traced; and these synonyms also suggest the cultural requirements of plants under

strange appellations.

Although most of the cacti are desert or dry-country plants, they need liberal supply of water in their growing period. For the most part they are summer bloomers and are more or less dormant in winter, when care should be taken not to over-water them, but they soon suffer in pots if allowed to be dry for any length of time, and they should not be grown close to hot pipes. Soils should be open in texture to insure proper drainage; sand and sometimes pounded brick are often added to the soil, and care should be taken not to have much fresh organic material in it. In summer, if placed out-of-doors, the plants are usually plunged rather than turned out of the pots.

Propagation is by offsets in the species that produce them, and most kinds grow readily from cuttings made of the stems or joints. The severed or cut surface should be allowed to dry in the air for several days, until it is seared or a corky layer has formed; the cutting is then inserted shallowly in sand in a pot or pan. Cacti start quickly from seeds, when they are available, and seed-grown plants commonly are more amenable under glass than those transplanted directly from the wild. Seeds should be sown only in sterilized soil. Seeds of some cacti, as of opuntias and echinocacti, germinate in a few days. The seedlings may remain in their pots or pans for several months or more before transplanting. When large enough they are transplanted to other pots or pans; and the shifting may then proceed as required, being careful not to use too large pots.

The cacti are easily grafted on other stocks. This practice is employed in order to provide weeping kinds with straight stout stems or standards, and also to propagate the many crested and contorted forms, and sometimes to

elevate small globular kinds. Pereskia stocks are often employed, and also some of the strong columnar kinds of the Cereus group. The cacti graft rather indiscriminately. Any method of applying the cut surfaces of stock and cion together is satisfactory if the surfaces are held firmly in place by cords or thongs. Wax is not employed. The cleft-graft is perhaps most commonly used, but when small globular forms are grafted on columnar stocks it is necessary only to cut off squarely the top of the stock and the base of the cion and to set one on the other, and tie the parts firmly together.

And the the parts firmly together.

CACTUS (as a genus): see Melocactus. CACTUS (as a popular name): Button: Epithelantha. Christmas: Zygocactus truncatus. Grab: Zygocactus truncatus. Deerhorn: Pennocereus Gregory. Easter: Schlumbergera Gaertneri. Fishhook: Ancistrocactus Scheer: Giant: Carnegica gigantea. Hair-brush: Pachycereus pecten-aboriynum. Hatchet: Pelecyphora. Hook: Ancistrocactus. Misiletoe: Rhysalus cassutha. Mountain: Oreocereus. Old-Man: Cephalocereus senths. Organ-Pipe: Lemaireocereus marginatus. Rainbow: Echinocereus rigidissimus. Rai-tail: Aporocactus flapelliformis. Redbird-: Pedilanthus tithymaloides. Sea Urchin: Echinopsis. Snowball: Pediocactus Simpsonu. Star. Astrophytum. Turks-Cap or -Head: Melocactus communis. Vine-: Fouquieria splendens.

CÆSALPÌNIA. Leguminosæ. Armed or unarmed trees and shrubs, sometimes climbing, native in warm regions of both hemispheres, with 2-pinnate lvs., yellow or red fls., not papilionaceous, in racemes, and mostly flattened pods; planted for ornament in tropical and subtropical countries.

Propagated by seeds which will germinate more readily if soaked in warm water some hours before sowing. Transplant into pots as soon as seedlings show the first true leaf. In frostless regions the plants may soon be set permanently out-of-doors.

Bónduc (Guilandina and C. Crista of hort. and authors). NICKER-NUT. Straggling more or less climbing prickly shrub: Ifts. numerous, ovute: fls. yellow: pods oval, prickly, 2½ in. long. Trop. Amer.

coriària (Libidia coriana). Divi-Divi. To 30 ft.: lfts. numerous and small: fls. yellow: pods oblong, curved, about 1 in. long. Trop. Amer.

Crista (C. Nuga. Ticanto Nuga). Woon-Gossip. Prickly climbing shrub: lfts. ovate: fls bright yellow: pods ovoid-oblong, 2 in long. Malay Archipelago to S. China and Australia.—Recent studies have shown the name of this smooth-fruited plant to be the true C. Crista of Linnæus and the prickly-fruited C. Crista of the trade to be C. Bonduc.

echināta. Brazil.-Wood. Tree with prickly trunk: Ifts. numerous, rhombic-oblong: fis. yellow: pods oblong, 3 in. long. Brazil.

Gilliesii: Poinciana Gilliesii.

japónica. Thorny shrub to 8 ft.: lfts. oblong: fls. canary-yellow with bright red stamens: pods 3 in. long. Japan.

mexicana. Shrub or small tree to 18 ft., unarmed: lfts, oblong to nearly orbicular: fls. yellow: pods 2½ in. long. Mex.

Nùga: C. Crista.

pulchérrima: Poinciana pulcherrima.

règia: Delonix regia.

Sappán (Biancæa Sappan). Prickly tree to 15 ft.: Ifts, rhombic-oblong: fls. yellow: pods oblong, 3 in. long, beaked. India, Malaya.

sepiària (Biancæa sepiaria). Mysore Thorn. Prickly sembling shrub: lits. oblong: fls. yellow: pods 3 in. long, beaked. Indua.

spinosa (C. tinctoria. Coulteria tinctoria. Tara spinosa). Tree or large shrub, the trunk covered with short sharp tubercles: [its. oblong: fis. yellow, in dense racemes to 8 in. long: pods to 4½ in. long and 1 in. wide. Cuba, S. Amer.

tinctòria: C. spinosa.

CÆSALPINIACEÆ: Leguminosæ.

CAFTA: Catha edulis.

CAILLIÈA (Dichrostachys). Leguminosæ. Shrubs with finely divided acacia-like lvs., fls. in spikes, the upper ones bisexual and those

on the lower half of spike with long slender staminodia, and flattened twisted pods; one species sometimes planted out-of-doors in S. Fla. and S. Calif. for ornament.

glomerata (Dichrostachys nutans). Spiny hard-wooded shrub or small tree: fis. sulfur-yellow on upper part of spike, rosy or lilae on lower part: pods in heads. Trop. Afr.—A serious pest in Cuba, where it is known as Aroma.

CAIÓPHORA (spelled also Cajophora). Loasaceæ. S. American herbs usually with stinging hairs, opposite lvs., yellow, white or red fls., and capsular twisted frs.; one species cult. in the flower-garden. Propagated by seeds and cuttings.

lateritia (Blumenbachia lateritia, Loasa lateritia, L. aurantiaca). Ann., twining to 20 ft.; lvs. pinnate: fis. orange-red, to 2 in. across, on very long stalks.

CAJANUS. Leguminosæ. One shrub native probably in the old World. C. Caján (C. indicus). PIGEON-PEA. CAJAN. Much cult. in trop. countries for the edible small truncate-orbicular somewhat flattened seeds which often are known simply as "peas." To 10 ft.: lvs. of 3 lanceolste soft-hairy lfts. to 4 in. long: fls. yellow or orange, papilionaceous, in axillary racemes: pods to 3 in. long, hairy, constricted between the seeds, slender pointed.—Often grown as an ann. from seeds; in greenhouses propagated by cuttings. It thrives in the open in S. Fla.

CAJEPUT-TREE: Melaleuca Leucadendra.

CAJOPHORA: Caiophora.

CALABASH GOURD: Lagenaria.

CALABASH-TREE: Crescentia Cujete.

CALACINUM: Muehlenbeckia.

CALÀDIUM. Araceæ. Trop. American herbs with tubers or rhizomes, usually peltate arrowshaped lvs. mostly beautifully marked in many colors and patterns, and unisexual fls. on spadices slightly shorter than the spathes which have boat-shaped limbs; popular foliage plants in the S. and under glass in the N., often improperly called Colocasias.

Tubers may be planted in the open in well-worked soil to which bone-meal has been added. In the greenhouse tubers may be started in boxes of moss in a temperature varying from 70° to 85°; when roots are formed they should be put in pots and shifted as they grow. Propagation may also be effected by seeds.

argyrites: C. Humboldtii.

bicolor. I.vs. ovate, variously colored above, giving rise to many named forms, glaucescent beneath, the petioles 3-7 times longer than blades: spathes green, violet at throat, the limb tipped white. Trop. Amer.—The usual species in cult.

bulbdsum: hort. name.

cándidum: unidentified trade name.

esculentum: Colocasia esculenta.

Húmboldtii (C. argyrites). Lvs. ovate-oblong or oblong, green, spotted between veins with large transparent white markings, the petioles 2-3 times longer than blades. Brazil.

picturatum. Lvs. lanceolate, variously colored above, pale beneath, the petioles variegated below: spathes green, purplish inside, the limb white. Brazil, Peru.

Schómburgkii. Lvs. obliquely elliptic-ovate, midrib and veins silvery or red, slightly spotted above, petioles 4 times longer than blades. Guiana, Brazil.

CALAMINTHA: Satureja.

CALAMONDIN: Citrus mitis; see Citrus Fruits (page 183).

CALAMPELIS: Eccremocarpus.

CÁLAMUS. CANE and RATTAN PALMS. Palmacex. The largest genus of palms, with more than 300 species in trop. and subtrop.

Asia and Afr. to the Philippines, New Guinea and Australia; some of them have been tried in S. Fla., but are not sufficiently hardy; Dæmonorops is a similar genus. The calami are mostly climbing plants with hooks on the midrib or the upper pinnæ transformed into hooked spines or the rachis perhaps prolonged and whip-like and making very long reed-like sts.; feather-palms, polygamo-diocious, with axillary branched spadices: fr. globose or ellipsoid, clothed with close scales. See Palm.

ciliaris. Very slender, covering a trellis or other support, climbing by means of long leafless branches with hooked spines: If -blade 1 ½-2½ ft. long, petiole very short, pinnæ 40-50 pairs and hairy: fr. globose, about ½ in. diam. Java,

Rôtang. One of the species that yield rattan: very slender clumber: lvs. 1½-2 ft. long, without whip-like prolongation; petiole very short; pinnes very many and ½ in. or less broad, setose on ribs and margins: ft. subglobose, ½ in. diam. India.

CALANDRINIA. Portulacacex. Rather fleshy low herbs of the western side of the Americas, with narrow alternate or basal lvs., red or rose ephemeral fls. in racemes or panieles, and capsular frs.; suitable for borders or rock-gardens. Cult. as annuals and propagated by seeds or cuttings

Bùrridgei. Ann. to 1 ft.: lvs. linear-lanceolate: fls. copper-rose or brick-red, small. S. Amer.

cauléscens: C. ciliata.

ciliàta (C. caulescens). Ann. to 1 ft.: lvs. linear-spatulate, chata (C. cataescens). Ann. to 11: 198, mean-spatulate, to 1½ in. long, margins usually glabrous or chiate: fls. purple or white fading to purple, to ½ in. across, solitary, axillary Peru, Ecuador. Var. Ménziesii (C. Menziesii, C. Menziesii, C. Menziesii, C. specusa). Rep Maide Ann. diffuse or erect, sts. to 2 ft. long: 198, oblanceolnet to lineur, to 2 in. long: fls. crimson or rose-red, about ½ in. long. W. N. Amer.

grandiflora. Per light purple. Chile Per. to 3 ft.: lvs. oval, to 8 in, long: fls.

Ménziesii: C. ciliata var.

speciòsa: C. ciliata var. Menziesii.

umbellata. Per. to 6 in.; lvs. linear, basal; fis. bright crimson-magenta. Peru.

CALÁNTHE. Orchidacex. Terrestrial or epiphytic orchids, sometimes having pseudobulbs, with broad plaited lvs. and white, rose or yellow fls. on erect or nodding scapes, the sepals and petals similar, the lip with the claw united to the column, usually 3-lobed and spurred. They require hothouse conditions, are mostly deciduous, and require rest after fls. are past in winter. See Orchids.

bélla (C. Harrisiu). Hybrid between C. Veitchii and Turneri (the latter a form of C. vestuta with crimsonblotched lip).

discolor. Lvs. 2-3, broadly lanceolate-elliptic, to 12 in. long, strongly strate, acute: scape erect, to 16 in. high; infl. about 6-12-fid; sepals and petals wine-red, lanceolate-elliptic; lip white suffused or dotted with pale pink, 3-lobed, the center lobe bifid. Japan — Varieties of this species have yellow or green sepals and petals.

furchta (C. verurnfolia). Lvs. to about 2 ft. long, lanceolate-elliptic: fls. snow-white often with yellow at base of lip. to almost 2 in. across, in many-fld. racemes on scapes to 3 ft. or more high, lip 4-lobed, spur slender. Jan.—Dec. In in. Pacific Irls., Australia.

Hárrisii: C. bella.

Lasselliana. Hybrid.

Múrrayi: hort. form having white fis. with wine-colored center.

Orpetiana: fls. white with dark pink center.

Regnièri: C. vestita var.

Sanderiana. Lvs. elliptic-lanceolate, to 1 ft. long: fls. in many-fld. racemes, the sepals and petals rose-colored, the lip bright rosy-crimson. Trop. Afr.

Sandhurstiana: C. Veitchii var.

Vánderbiltii: fls. cream with purple center.

Veitchii. Hybrid between C. rosea and C. restita, having rose-colored fis. with a white spot at base of lip. Var.

Sandhurstiana (C. Sandhurstiana) has crimson fis. Other listed forms are rosea and summiténsis.

veratrifòlia: C. furcata.

vestita. Pseudobulbs 3 in. high; lvs. broad-lanceolate, to 1½ ft. long: fls, white or creamy, 2½ in. across, in 6-12-fld. racemes on scapes to 2½ ft. long, the 4-lobed lip marked with orange-yellow at base and with slender spur. Nov.-Dec. Burma, Malaya. Var. Regnièri has less deeply lobed rose-colored lip marked with purple in throat. Var. Williamsii has white sepals and petals bordered with rose and deep rose lin.

Whittiana. Hybrid.

Williamsii: C. vestita var.

CALATHÈA. Marantacex. Trop. American or African per, herbs with attractively colored basal tufted lvs. and fls. in heads or cones borne on scapes among the lvs.; commonly known as Marantas, but Maranta is a separate genus distinguished by technical characters. These distinguished by technical characters. plants, in both genera, are difficult to determine as to species without inflorescence, and foliage should be had from normally grown and developed subjects. Leaf-blades are intended in the subjoined dimensions of lvs.

Calatheas should be grown in a moist close greenhouse with a night temperature not below 65°. They require good drainage and loam soil mixed with leaf-mold and sand. They should be shaded from the direct rays of the sum. In subtropical climates calatheas may be grown out-of-doors with winter protection. Leaf colors are likely to differ between young and old plants. Propagated by dividing the crowns, by tubers or by cuttings in spring.

Alloùia. To 4 ft, with edible tubers: lvs. to 24 in. long and 6 in. broad, light green above, silvery beneath. Trop. Amer.—Tubers edible.

Bachemiana (Maranta Kegeliana). To 16 in.: lvs. to 10 in long and 2½ in. wide, unequal-sided, silvery-green above with white lines along nerves, purplish or greenish beneath. Brazil.

bélla. Stemless: lvs. to 6 in. long and 3 in. broad, whitishgreen above, pale purple beneath. Habitat unknown.

bicolor: Maranta becolor.

Chantrièri. To 7 ft.: lvs. to 1½ ft. long, rich dark green but in juvenile stages pale yellowish-green with dark green band around margins and midrib, purplish-red beneath.

eximia. To 1½ ft.: lvs. to 15 in. long, striped above with olive-green and silver, wine-red and pubescent beneath. Cent. Amer.

fasciàta. To 1 ft.: lvs. to 9 in. long and 7 in. broad, dark ohve-green above transversely barred with silvery-white, dull grayish-green below. Brazil.

Goùletii: C. Vandenheckei,

illústris. To 9 in.: lvs. to 6 in. long and 5 in. wide, shining olive-green with metallic luster above having white marginal zone, dull red beneath. Ecuador.

imperialis: a variant of C. ornata.

insignis. To 6 ft.: lvs. to 11/2 ft. long and 10 in. broad, pale yellowish-green above margined and blotched with olive-green, dark maroon-red beneath. Brazil.

Legrelliana. To 1 ft.: lvs. to 8 in. long and 3 % in. wide, shining green above with broad white central band and white transverse lines, whitish-green marked with red and green beneath. Colombia, Ecuador.

leopardina. To 1½ ft.: lvs. to 8 in. long and 3½ in. broad, rich green but in juvenile stage dark ohve-green in center surrounded by band of paler green. Brazil.

Liètzei (Maranta conspicua). To 2 ft.: lvs. to 9 in. long and 2½ in. broad, velvety green above striped between side veins with olive-green and splashed with yellowishgreen, purplish-red underneath. Brazil.

Lindeniàna (Maranta Lindenii). To 3 ft.: lvs. to 1 ft. long, dark green above with olive-green zone either side the midrib and then darker zone, purplish zone beneath. Brazil.—Probably Phrynium Lindenii, Hort. belongs here.

Louisæ. To 3 ft.: lvs. to 1 ft. long, light green above feathered with white along midrib, tinted with purple-red below. Habitat unknown.

Luciana. To 3 ft.: lvs. to 1 ft. long, light green above with zone of greenish-white near margin and feathered along midrib, grayish-green beneath. Trop. Amer.

Makoyana. To 4 ft.: lvs. olive-green or cream-colored beneath blotched with dark green, red beneath. Brazil.

mèdio-picta. To 20 in.: lvs. to 8 in. long and 3½ in. wide, dark green above feathered with white along the midrib, pale green beneath. Brazil.

micans. To 8 in.; lvs. to 4 in. long and 1 in. broad, shining green above feathered with white, pale green beneath. Brazil.

musaica. Dwarf: lvs. cordate-ovate, to 6 in. long, pale shining green above transversely lined with lighter green. Brazil.

Oppenheimiana: Ctenanthe Oppenheimiana.

ornata. To 3 ft.: Ivs. to 3 ft. long, rich green above, dull purple-red beneath, in juvenile forms often striped with pink and white. Guiana, Colombia, Ecuador. Var. roseolineata is listed.

Payônii (C. tubispatha). To 2 ft.: lvs. to 10 in. long and 5½ in. wide, bright green above spotted with light green and brown. Peru.—The plant cult. as Maranta tubispatha may be a form of M. bicolor.

princeps. Lvs. to 30 in. long and 10 in. wide, light green above with broad central band of black-green, violet-purple below. Amazon.

pulchélla. Lvs. to 4 in. long and 2 in. wide, light green with transverse green bands, purple beneath. Brazil.

ròseo-pícta. To 8 in.: lvs. to 9 in. long and 6 in. broad, dark green above with red mudrib and zone of bright red near margin, purple beneath. Brazil.

Sanderiàna: a variant of C. ornata.

smarágdina: Monotagma smaragdinum.

spléndida. To 1½ ft.: lvs. to 14 in. long and 10 in. wide, shining dark green above transversely barred with pale green, purple beneath. Brazil.

tubispatha: C. Pavonii.

undulata. To 8 in.: lvs. to 4 in. long and 2 in. broad, wavy, shining dark green above with a central white stripe, purplish beneath. Peru.

Vandenhêckei (C. and Maranta Gouletii). To 2½ ft.: lvs. to 9 in. long, dark green above marbled with silvery-white along midnb and band along margin, purplish-red beneath. Brazil.

Veitchiàna. To 4 ft.: lvs. to 1 ft. long and 6 in. wide, shining dark green above with irregular pale green band on either side midrib having brownish blotches, reddish underneath. Peru.

vittåta. To 3 ft.:lvs.to 1½ ft. long and 9 in. broad, light green above transversely striped with white, tinted yellow-ish-green beneath. Colombia.

Wallisii. To 4 ft.: lvs. to 1 ft. long, light green above with a row of olive-green blotches on either side midrib, grayish-green beneath. Peru.

Warscewiczii. To 3 ft.: lvs. 1 ft. long and 5 in. broad, velvety green above and midrib feathered with yellow-green, purple beneath. Costa Rica.

zebrina. Zebra Plant. To 3 ft.: lvs. to 2 ft. long and 1 ft. across, velvety green above with transverse bands of pale yellow-green and olive-green, purplish-red beneath. Brazil. Var. Binòtii is a large form with darker colored lvs.

CALCEOLÀRIA (Fagelia). SLIPPERWORT. Scrophulariaceæ. Herbaceous and shrubby plants cult. in greenhouses in the N. and in the open in warmer 'regions, having irregular cymes of showy saccate fis., the upper part of the fl. small and more or less pouched, the lower lip, in the cult. forms, very large and inflated and somewhat slipper-like, usually yellow, sometimes purple, often spotted; mostly native from Mex. to Chile.

The herbaceous calceolarias are grown from seed sown from late spring to early autumn for plants for the next winter and spring. Finely sifted soil should be provided, preferably one containing leaf-mold, and care should be exercised in watering as the seed is very small; sub-irrigation is the best method. A temperature of 60° is recommended and no direct sun till the plants are rather large.

The shrubby types are grown from seed or from cuttings. The latter are usually taken when the plants are trimmed in late summer or early autumn, choosing firm wood and cutting down to two joints, giving a temperature of 45–50° and protection from the sun.

álba. Shrubby, to 2 ft.: lvs. linear, to 2 in. long, remotely toothed: fls. white, ½ in. long and ½ in. across. Chile.

angustifòlia: C. integrifolia var.

biflora. Per. to 1 ft.: lvs. in basal rosettes, ovate or spatulate, to 2½ in. long, toothed: fls. yellow, ½ in. long and ¼ in. wide. Chile, Argentina.

chelidonioldes. Ann. to 3 ft.: lvs. to 8 in. long, pinnate into toothed segms.: fis. yellow, ½ in. long and 2 in. wide. Ecuador, Peru, Chile.

Clibranii: C. profusa.

crenatiflora. Per. to 2½ ft., pubescent: lvs. ovate, to 8 in. long, coarsely toothed: fis. drooping, to 1 in. long and broad, yellow with orange-brown spots on the inflated wavy lower lip. Chile.—Much grown by florists in many colors and large fis.

Dârwinii. Low cespitose nearly stemless per.: lvs. oblong, to 3 in. long, margin minutely toothed and wavy, glabrous: fis. yellow with large reddish-brown spots, to 1 in. wide, on scapes to 6 in. tall. Patagonia.—Said to be hardy on Pacific Coast, north to Vancouver.

Rothergillii. Stemless per. to 6 in.: lvs. spatulate, to 1½ in. long, margin densely hairy: fis. sulfur-yellow spotted red, to ½ in. wide. Patagonia.—Hardy to Vancouver.

fruticohybrida. A group of shrubby cultigens with yellow, orange or dull red spotted fis.; to be considered as forms of C. untegrafolia.

grácilis. Ann. to 1½ ft., sticky-pubescent: lvs. pinnate, the lobes toothed, white beneath: fls. pale yellow, ½ in. long and ¼ in. wide. Peru, Ecuador.

grandiflora tigrina. A group with very large yellow, orange or dull red spotted fls.; probably forms of *C. crenatuliona*.

herbacea: see C. herbeohubrida.

herbeohfbrida (C. herbacea, C. hybrida, C. Youngii). A group of herbaceous cultigens, usually dwarf or small, 2 ft. or less, with inflated pouches, in many colors; to be regarded as forms of C. crenatylora.

hýbrida: see C. herbeohybrida.

integrifòlia (C. rugosa). Sts. woody, to 6 ft.: lvs. oblong or oval, to 3 in. long, rugose, toothed: fls. ½ in. across, yellow to red-brown, not spotted. Chile.—Much used by gardeners. Var. angustifòlia (C. angustifòlia) has lanceolate lvs. Var. viscosíssima (C. viscosissima) is a sticky-hairy form.

lignosa: a hort. form adapted for bedding, 1 ft. high, with golden-vellow fis.

Lymanii: a hort, shrubby form with bronzy-red fls.

Médfordii: a hort, form with velvety-maroon fis.

mexicana. Ann. to 1 ft., glandular-hairy: lower lvs. 3-parted or -lobed, the upper pinnate into ovate toothed segms., to 2½ in. long: fls. pale yellow, ½ in. long and ½ in. wide. Mex., Cent. Amer.

multiflora. Low shrub: lvs. ovate, to ½ in. long, opposite, margin toothed: fls. yellow, to 3s in. long, 3-4 in terminal clusters. Peru.—The material listed in trade as C. multiflora nana is probably a small-fld. floriferous form of C. creatiflora.

pinnāta. Ann. to 3 ft., pubescent: lvs. pinnate, to 3 in. long: fls. pale yellow, ½ in. long and broad. Chile, Peru, Bolivia.

polyrrhiza. Dwarf tufted per. to 2 in.: lvs. lanceolate, to 214 in long: fls. yellow spotted purple, 1 in. long and 14 in. wide, solitary on scapes to 4 in. long. Chile.—One of the hardiest species, grown with protection in N. Y.

profusa (C. Clibranii). A garden form, to 3 ft., very free-flowering: fis. light and graceful, rich golden-yellow.

racemòsa. Per to 20 in.: lvs. oblong-acute, to 5 in long, villous, margin toothed: fls. sulfur-yellow, remotely spotted red inside the sac, to 1/2 in. long. Chile.

rugdsa: C. integrifolia.

scabiosæfolia. Pubescent ann. to 2 ft.: lvs. pinnate, to 8 in. long, the bases of the petioles united across the sts., lfts. toothed or cut: fls. pale yellow, ½ in. long and ⅓ in. across. Ecuador to Chile.

Stèwartii: a hort. shrubby form with yellow fls.

tenélla. Low creeping subshrub to 8 in. tall: lvs. broadly ovate, to ½ in. long or less, margin remotely toothed: fls. yellow, spotted within, to ½ in. long, usually 2-3 on peduncles to 6 in. long. Chile.—Hardy, if protected, on Pacific Coast.

umbellàta. Cespitose herb, mostly with very short st.: lvs all nearly or quite radical, oblong, lanceolate or somewhat ovate, obtuse, entire, slightly hairy underneath: fls. yellow, 2-8 terminating a scape-like peduncle, the lip ½ in. or less across. Bolivia.

Veltchii. Hybrid with C. alba as one parent, to 5 ft.: fis. rather small, pale lemon-yellow.

violacea: Jovellana violacea.

viscosissima: C. integrifolia var.

Youngii: C. herbeohybrida.

CALÉNDULA. Compositæ. Herbaceous annuals and perennials with simple alternate lvs. and usually large yellow or orange heads of ray- and disk-fls.; pappus none: fr. large, flattened or curved. Native from Canary Isls. to Persia, one a garden favorite.

Calendulas are of easy culture in the greenhouse as well as in the garden, growing quickly from seeds. Also propagated by cuttings, of special colors.

egyptiaca. Ann. to 20 in, sticky-harry: lvs. linear to linear-lanceolate: heads to nearly ½ in. across, few-fid. with very short ray-fis.: achenes ending in a beak as long as or longer than seed. Asia Minor to Egypt.

arvénsis (C. bicolor). Ann. to 1 ft., sts. ascending, pubescent: lvs. oblong-lanceolate, sessile, mucronate, dentate or entire: ray-fls. yellow, heads solitary, to 1½ in. across. Medit. region.

bicolor: C. arnensis.

chrysántha: C. officinalis var.

eriocárpa. Branching ann.: lvs. lanceolate, partly clasping, nearly glabrous: heads vellow, about I in across. Country unknown.

htbrida: Dimorphotheca hubrida.

maderénsis. Per. to 2 ft.: lvs. oblong-spatulate, attenuate at base, rough, nearly entire: heads yellow. Madeira.

marítima. Ann., sticky-pubescent: lvs. obovate to lanceolate, entire, the upper partly clasping: heads yellow, about 1½ in. across. Sicily.—Probably only a race of C. officinalis.

maroccana. Similar to C. suffruticosa, differing in its much narrower lys, which are entire or somewhat repandatedentate. Morocco.

officinalis. Por-Marioold. Hardy branching ann. to 2 ft., hairy: lvs. thickish, oblong to oblong-ovate, entire or minutely toothed, partly clasping: heads to 4 in. across, rays white-yellow to deep orange, closing at night, blooming for the entire season; sometimes proliferous from the involucre S. Eu.—A favorite flower-garden plant and growth of cut-flowers in winter. Var chrysfantha (C. chrysantha), a strain with chrysanthemum-like double fls. of buttercupvellow

pluvialis: Dimorphotheca annua.

Pongei: Dimorphotheca annua var. ligulosa.

sícula. Probably only a race of *C. officinalis* distinguished by being almost glabrous and heads only about 1 in. across. S. Italy.

stellata. Ann. to 1 ft., rough: lvs. ovate-oblong, the upper artly clasping, wavy-toothed: heads yellow, 1-2 in. across. Medit. region.

suffruticosa. Ann., woody at base, pubescent: lvs. lanceolate, somewhat toothed: heads bright yellow, very numerous, about 1 m. across. Medit. region.

Tragus: Dimorphotheca aurantiaca.

CALICO-BUSH: Kalmia latifolia.

CALICO-FLOWER: Aristolochia elegans.

CALÍMERIS. Compositæ. Hardy per. asterlike herbs, differing from Aster in the character of the involucre; native in Asia. One is cult. in the border and requires the same treatment as the perennial asters.

inclsa (C. incisæfolia. Aster incisus). To 2 ft.: lvs. oblong-lanceolate, cut-toothed, the upper narrower and entire: heads solitary, 1 in. across, rays purple or almost white, disk yellow. Siberia. Var. rosea has pink fis.

CÁLLA. Araceæ. One herb growing in bogs in the north temp. zone, sometimes transplanted to pond-margins and wet places. callas of gardens belong to the genus Zante-deschia. C. palústris. WATER-ARUM. WILD deschia. C. palústris. WATER-ARUM. WILD CALLA. Lvs. ovate-cordate, to 6 in. long and broad, the petioles to 10 in. long: spathes green outside, white inside, about 2 in. long and 1½ in. wide; berries red, in dense cluster.—C. pícta is Aglaonema pictum.

CALLA, BLACK: Arum palæstinum. Red: Sauromatum outtatum.

CALLIÁNDRA (Anneslia). Leguminosæ. Trop. shrubs and trees with 2-pinnate lvs., fls. in heads or clusters having long conspicuous stamens, and flat pods with thickened margins; grown out-of-doors in trop. and subtrop. regions and in greenhouses N. Propagated by cuttings over bottom heat, when seeds are not available.

californica. To 4 ft.: weak slender spines at base of petioles: lfts. 1/2 in. long: fis. purple with long purple stamens. Lower Calif.

eriophfila. Low woody shrub to 1½ ft.: usually 1-4 pair of lifts. to ½ in. long or less, pubescent beneath and glabrous above: fls. purple, pubescent, in few-fld. heads. glabrous acc... W. Tex. to Ariz.

Guildingii. Small tree: lfts. to 2½ in. long: fls. greenish-white with crimson stamens to 3 in. long. Trinidad.

Houstoniana. To 20 ft.: Ifts. to 1/4 in. long: fls. brown-tomentose with long purple stamens, the heads in terminal racemes. Mex., Cent. Amer.

portoricénsis. To 25 ft.: lfts. 3/6 in. long: fls. white with long white stamens. W. Indies.

Tweèdii (Inga pulcherrima). To 6 ft.: lfts. linear: fls. purple with long purple stamens. Brazil.

CALLICÁRPA. BEAUTY-BERRY. Verbenacex. Shrubs and trees with opposite simple lvs., small pink, bluish or white fis. in axillary clusters. and attractive berry-like frs.

Callicarpas can be grown in a light airy place in the greenhouse in a compost of loam and peat. Propagated by cuttings, layers and seeds. They are raised for both the ornamental flowers and colored fruits in clusters. Some of them are fairly hardy in the North and if the tops kill, new shoots usually bloom and fruit.

americana. Frencii-Mulberry. Strub to 6 ft.: lvs. to 6 in. long, toothed, white- or rusty-tomentose beneath: fls. bluish, May-July: fr. violet or white in var. lactea (var. alba). Va. to Tex., W. Indies; not hardy N.

Arnoldiàna: C. japonica.

Bodinièri (C. Gradhiana var. subcanescens). To 10 ft.: lvs elliptic to oblong-elliptic, to 4 in. long, toothed, pubescent beneath: fis. pmk, in dense cymes to 1½ m. across, July-Sept.; fr. violet. China; stands N. Var. Girâldii (C. Giraldiana) is a glabrescent form.

cana (C. sinensis). To 12 ft.: lvs. to 6 in. long, toothed, gray- or white-pubescent beneath: fts. lavender: fr lavender. Malaya.

dichôtoma (C. purpurea. C. koreana). Shrub to 4 ft.: lvs. to 3 in. long, toothed above middle: fis. pink, Aug.: fr. lilac-violet. Japan, China; stands well N.

Giraldiana: C. Bodinieri var. Giraldii.

japónica (C. Mimurazakii. C. Arnoldiana). Shrub to 5 ft.: lvs. to 5 in. long, finely-toothed: fis. pink or whitish, Aug.: fr. violet or white in var. leucocárpa. Japan; stands N.

koreana: C. dichotoma.

longifòlia. Shrub: lvs to 5 in. long, lanceolate, pubescent beneath: fls. pink or purple: fr. white. Himalayas, China.

Mimurazákii: C. japonica. purpurea: C. dichotoma.

sinénsis: C. cana.

CALLICHROA: Lavia.

A few small CALLÍCOMA. Cunoniacex. trees of Australia having opposite leathery lvs. and small fls. in heads, without petals; one species planted in S. Calif.

serratifòlia. To 40 ft.: lvs. oblong to ovate-lanceolate, to 4 in. long, coarsely toothed, shining above, tomentose beneath: heads globular, dense, stamens much exserted.

CALLICORE ROSEA: Amaryllis Belladonna.

CALLIGLOSSA: Layia Calliglossa.

CALLIOPSIS: Coreonsis.

CALLIPRORA: Brodiza ixioides.

CALLÍRHOË. Poppy-Mallow. N. American herbs, root often tuberous, with alternate lobed or dissected lvs. (as if compound) and showy pink or red-purple fls.; some of them are attractive flower-garden subjects.

Seeds should be sown where the plants are to stand. Perennial kinds may also be propagated by cuttings and division of the roots.

digitata. Per. to 1½ ft.: Ns. deeply parted into linear lobes or sometimes entire: fls. reddish-purple to violet, to 2 in. across, with small calyx. Mo. to Tex.

involucrata (C. nerticillata). Per. to 1 ft., hirsute to hispid: lvs. deeply 5-7-parted: fls. red-purple or paler, to 2½ in. across, with leafy calyx. Minn. to Tex. Var. lineariloba (C. lineariloba) is less hairy with smaller lvs., the upper ones linear lobed. Tex., Mex.

linearfloha: C. innolucrata var

Papaver. Per., main st. 1 ft. or more, peduncle-like branches 8-12 in. long and solitary or somewhat clustered: lvs. 3-5-parted into narrow divisions: fis. rose or purple, 2 in. across. Ga., Fla. to Tex.

pedata. Ann. to 3 ft.: lower lvs. 5-7-lobed, the upper ones 3-5-parted: fis. red-purple to lilac, 1 in. long, with small calyx. Mo. to Tex.

triangulata. Per. to 3½ (t.: lvs. mostly basal, triangular-hastate, to 2 in. long, upper ones usually 7-lobed, the segms. coarsely toothed to pinnatifid: fis. deep purple, few to several on each peduncle. N. C. to Tex., north to Minn.

verticillàta: C. involucrata. CALLISTACHYS. Orallabium CALLISTEMMA: Callistenhus.

CALLISTÈMON. BOTTLE-BRUSH. Myrtacex. Australian shrubs or small trees with scattered linear or lanceolate entire simple leathery lvs., showy yellow or red fls. in dense spikes resembling a bottle-brush due to the long exserted stamens (which are not united with each other) and capsular frs.: suitable for cult. in warmtemp, regions, particularly in Calif.

They are not particular as to soil. Propagated by seeds or cuttings of ripened wood. Seeds are gathered in summer by allowing the capsules to open in boxes or sheets of paper and are sown the next spring.

brachyándrus. Shrub: lvs. stiff and needle-like, to 11/2 in. long: fis. with dark red stamens and yellow anthers, in spikes to 3 in. long.

citrinus: C. lanceolatus.
coccineus. To 30 ft.: lvs. lanceolate, to 1½ in. long:
fls with red stamens and yellow anthers, the spikes not

Cunninghamii. Branches yellowish: lvs. elliptic, pale, reddish when young.

hybridus: a name of uncertain application.

lanceolatus (C. citrinus. Metrosideros floribunda. M. semperflorens M. citrina). To 30 ft.: lvs. lanceolate, to 3 in long: fis. with bright red stamens, the spikes not very dense.

lateritius: listed as of drooping habit, with bright scarlet Яa

linearis. Lvs. narrowly linear, to 5 in. long: fls. with red stamens, the spikes dense.

paludòsus: C. salıgnus var. australis.

phoeniceus. Lvs. narrowly lanceolate, to 4 in. long: fis. with rich red stamens, the spikes not dense.

pinifòlius. Tall shrub: lvs. stiff and terete, linear, to 4 in. long: fls. with yellowish-green stamens.

rigidus. Lvs linear or narrowly lanceolate, to 5 in. long: fls. with red stamens, the spikes very dense

ruguldsus: name of uncertain application.

salignus. To 40 ft.: lvs. lanceolate, to 3 in. long: fls. with yellow or light pink stamens, the spikes not very dense. Var. australis (C. palulosus) has lvs. to 2 in. long. Var. viridiflorus has greenish-yellow stamens and shorter lvs.

speciosus. To 40 ft.: lvs. lanceolate, to 4 in. long: fls. with rich red stamens and yellow anthers, the spikes very

viminalis. Tree of pendulous habit: lvs. linear-oblong: fis. with bright red stamens, infl. a dense spike. Var. péndulus is probably not distinct from type and this species may be only a form of C. speciosus.

CALLÍSTEPHUS. CHINA ASTER. Compositæ. Erect branching plants with herbage of strong odor, large terminal heads bearing prominent rays; pappus of bristles. A single species from Asia which has resulted in many races of wellknown and adaptable garden annuals. Grown from seed; for early bloom the seed is sown indoors in late spring, but the main crop may be sown directly in the open. The distance at which the plants are to stand is governed by the stature of the particular variety, ranging from 6 in. to 2 ft.

chinensis. Erect, hairy, to 2½ ft.: lvs. alternate, ovate, deeply toothed or lobed: heads terminal, in the wild plant with 1-2 series of ray-fls. and yellow disk-fls., but under cult. the rays are numerous and vary in color from violet, purple, blue, rose to white but no true yellow, and 5 in. and more across; there are dwarf and condensed forms. China, Japan.—Known also as Callistemma chinense and

CALLITRIS. Cypress-Pine. Cupressacex. Evergreen trees with scale-like lvs. and jointed mostly angled branchlets, staminate fls. in ovoid or cylindrical catkins and cones usually of 6 unequal scales; native in Australia and New Caledonia. Grown in warm regions, as Fla. and Calif.; for cult. see *Conifers*.

Actinostrobus: Actinostrobus pyramidalis.

arborea: Widdringtonia juniperoides.

australis: C. oblonga.

calcarata. Tree to 60 ft. and more: cones ovoid, 1/2 in. across. Australia.

cupressifórmis (C. rhomboulea). Tree to 50 ft.: cones nearly globose, ½ in. across, often clustered. Australia.

Drúmmondii. Shrub or small tree: cones globose, 16 in. across. Australia.

glaŭca: C. robusta.

Mûelleri. Tree to 30 ft.: cones globular to 1 in across. Australia.

oblonga (C. australis). Tree to 25 ft.: cones ovoid or oblong, to 1 in. long, usually clustered. Tasmania.

quadriválvis: Tetraclinis articulata.

rhomboidea: C. cupressiformis. robústa (C. glauca. C. verrucosa). Tree to 100 ft.: cones subglobose, 3/4-1 in. or more across. Australia.

verrucdsa: C. robusta.

Whytei: Widdringtonia Whytei.

CALLUNA. HEATHER. Ericaceæ. One hardy evergreen shrub native in Eu. and Asia Minor (also in a few localities in E. N. Amer., but probably intro.), cult. as for Erica and differing in having a colored calyx longer than the corolla.

C. vulgaris (*Erica vulgaris*). To 3 ft.: lvs. scale-like and overlapping: fls. natively mostly purplish, 1/8 in. long, in racemes to 10 in. long, blooming profusely in late summer. There are numerous hort. vars., as: alba, fls. white and its forms elata, minima, minor, multiflora, pilosa, pumila, rigida, tenella; Alportii, tall and vigorous, fls. carmine; argéntea, lvs. pale; atrorubens, fls. crimson; aurea, dwarf, lvs. golden; carnea, fls. pink; coccinea, fls. deep red; compacta, of compact habit; cuprea, lvs. golden turning bronze; erécta, tall, fls. white; Fóxii, dwarf and matted; **Hammondii**, fls. white, taller and with brighter green lvs. than var. alba; hirsúta (var. tomentosa), lvs. gray-tomentose; hamilis, low, fls. white; hypnoides, to 1 ft., fls. deep pink; monstrosa; nana (var. pygmæa), to 4 in., fls. purple; plena (var. multiplex), fls. double, pink; purpurea (var. rubra), fls. dark purple; rosea, fls. pink; Searlei, fls. white, late; sericea, fls. white, late; spicata, fls. deep pink; ténuis, dwarf, fls. purple; variegata, lvs. somewhat variegated with white.

CALLUS: a hard prominence or protuberance; in a cutting or on a severed or injured part, the roll of new covering tissue.

CALOCARPUM: Achras.

CALOCÉPHALUS. Compositx.Australian ann, herbs or small shrubs with mostly alternate entire lvs. and fl.-heads in terminal clusters, fls. all tubular; pappus of scales or plumose bristles. One species is grown in Calif. as a foliage edging. Propagated by cuttings.

Brownii (Leucophyta Brownii). To 1 ft., white-woolly: Ivs. linear, ¼ in. long: heads ½ in. across, subtended by a few floral lvs.

CALOCHÓRTUS. MARIPOSA-LILY. GLOBE-TULIP. Liliacex. Cormous herbs native in W. N. Amer., with linear-lanceolate lvs. borne on the st. and broadly campanulate yellow, white or lilac interesting fls. solitary or in terminal clusters, usually with a somewhat flattened gland on the inner basal third of the petals. blooming in spring and summer, mostly showy.

Calochortuses should have a light porous soil, not too stimulating, with perfect drainage, such as equal parts of light loam and spent tan-bark, with a little broken charcoal. They withstand much cold but not alternate thawing and freezing. Winter protection of leaves should be provided. Planting should be late in autumn and builbs litted after ripening the following season. They are useful in borders and frames and are sometimes bloomed indoors. Propagated by natural increase and by seeds tainable.

álbus. To 2 ft.: fis. white, purplish at base, 11/4 in. long, nodding, petals arched. Calif. Var. rubéllus has fis. tinged with rose

amábilis. Golden G. To $1\frac{1}{2}$ ft.: fls. golden-yellow, $1\frac{1}{2}$ in. long, nodding. Calif.

amènus. Purple G. To 1½ ft.: fls. rose-purple, 1¼ in. long, nodding. Calif. Var. major is listed as a large form.

apiculatus. Giant Star G. To 1½ ft : lvs. to 12 in. long and ¾ in. wide, linear, flat, glossy: fls. white to straw-colored, 1-9 from single bulb. B. C. to N. Ida.

aureus. To 6 or rarely 14 in. high: fls. pale yellow, to 4 in. long. S. Calif. to S. Utah.—Frequently confused 11/2 in. long. S. C. with C. Kennedyr.

barbatus (C. flavus. Cyclobothra flava). To 2 ft.: fls. yellow, 3/4 in. long. Mex.

Bénthamii: C. monophyllus.

cærùleus. Cats-Ear. To 6 in.: fls. blue, 1/2 in. long, hairy, erect. Calif.

catalinae. To 21/2 ft.: fls. white to lilac-purple, maroon at base, 2 in. long. S. Calif., Catalina Isl.

citrinus: C. luteus var.

clavatus. To 3 ft.: fis. rich yellow lined with brown, having club-shaped hairs at base, 2 in. long. Calif.

Davidsonianus. To 2 ft.: fls. lilac-purole, to 11/4 in. long.

eurycarpus. To 1½ ft.: fls. white to lavender, with deep blue spot in center of petals, to 1½ in. long. Ore. to Nev. excavatus. To 11/2 ft.: fis. white streaked and suffused with purple. Calif.

flavus: C. barbatus.

flexuosus. Sts. decumbent or ascending and flexuose: fis. purple or white with yellowish base, 1 in. long. Nev., Utah, Ariz.

Greenei. To 1½ ft.: fls. lilac marked below with yellow, to 1½ in. long. Calif.
Gúnnisonii. To 1½ ft.: fls. white streaked with purple, 1¾ in long. S. D. to New Mex.

Howellii. To 11/2 ft.: fls. white, 1 in. long. Ore.

Kénnedyi. To 6 or rarely 14 in. high: fls. orange-red or vermillion, to 1½ in. long. Calif., Nev., Ariz.

Leichtlínii. To 1 ft: fls. white tinged with purple, yellow at base with dark spot, 1½ in. long. Ore. to S. D. and Calif. lilacinus: C. uniflorus.

lùteus. To 2 ft: fis yellow or orange lined with brown, to 2 in. long. Calif. Var. citrinus has lemon-yellow petals with dark brown spot near base. Var. oculàtus has white or lilae petals, the brown spot bordered with yellow.

Lyallii: listed name of undetermined botanical standing. macrocárpus. Green-Banded M. To 2 ft.: fls. purple with green band down middle, 2 in. long. B. C. to Calif.

Maweanus. To 8 in.: fls. white or tinged with purple, I in long Ore. to Calif. Var. grandiflorus is listed. Var. major is a larger form. Var. purpurascens, larger form with fls tinged deeper purple. Var. roseus, fls. tinged with rose.

monophilius (C. Benthamii). Yellow Star-Tulip. 7 10 in.: fis. yellow with brown at base, 34 in. long. Calif.

nftidus. To 1½ ft.: fls. lilac or purple with dark purple spot, 1½ in. long. Wash., Mont., Ore.

Núttallii. Sego-Lily. To 1½ ft.: fls. white lined with purple spot at base, to 1¾ in. long. Wash. to Calif. and New Mex.

obispoénsis. To 2 ft.: fls. deep orange tinged brown, in long, fringed on margins. Calif., San Luis Obispo Co.

oculàtus: C venustus var. Plummeræ. To 2 ft.: fis. purple with orange-colored hairs, 1½ in. long Calif.

pulchéllus. To 2 ft.: fls. golden-yellow, ciliate on margin, 11/2 in. long, nodding. Calif.

Púrdyi. To 1 ft.: fls. creamy-white tinged with purple, hairy, 3/2 in. long. Wash., Ore.

purpuráscens: C renustus var.

spléndens. Lilac M. To 2 ft.: fis. lilac, 2 in. long. Calif. Var. rùbra has reddish-lilac fis.

superbus: name given to a tall hort strain reported to have very large fis. white inside with a maroon eye, lavender outside; probably $C.\ venustus.$

Tôlmei. Erect or ascending, to 18 in., usually branched: fis. creamy-white tinged purple, to 34 in. long, usually 2several ()re

uniflorus (C. lilacinus). To 10 in.: fls. lilac, 1 in. long.

venústus. White M. To 10 in. or more: fls. pale lilac with reddish-brown spot, 2 in. long. Calif. Var. citrinus, fls. deep yellow with black eye. Var. oculatus (C. oculatus), fls. cream-white, tinted purple with dark eye. Var. purpuráscens has darker fls. and var. rôseus a rose-colored spot at apex. Var. supérbus is an improved form.

Vésta. Form of C. venustus with larger fls. having across the center a reddish or brown band.

Weedii. To 2½ ft.: fis. yellow dotted with orange-brown, 1½ in. long. Calif.

CALODÉNDRUM. Rutaceæ. One S. African evergreen tree adapted to cult. in warm regions (as S. Fla.) for interest and beauty, for its dark green foliage and profusion of showy bloom. C. capénse. Cape-Chestnut. To 70 ft.: lvs. simple, ovate, the veins parallel, to 5 in. long: fls. 1½ in. long, light rose-lilac with purple dots, in large terminal panicles: frs. nearly spherical, woody, covered with tubercles.—Propagated by cuttings of young wood over heat.

CALONÝCTION. MOONFLOWER. Convolvulacex. American twining herbs of tropics and subtropics, with heart-shaped to arrow-shaped lvs., large fragrant white or purple fls. blooming at night, having long tube, flat limb and exserted stamens and style; grown rarely as a greenhouse vine in the N. and out-of-doors in the S. Propagated by seeds, which are often notched to hasten germination. Per., but often grown as

aculeatum (Ipomaa Bona-Nox. I. noctiflora I. mexicana grantifora). Juice milky: sts. more or less prickly: lvs. broad-ovate, to 8 m. long, sometimes 3-lobed: fls white, often banded with green, with tube to 6 in. long and limb 6 in. across. Tropics, Fla.—The common moonflower.

muricatum. Similar to C. aculeatum but with smaller purple fls. to 3 in. across. Tropics.

Tuba (Ipomæa Tuba). Differs from C. aculeatum in thick cordate ovate not lobed lys. and very broad obtuse rather than narrow-acuminate calyx-lobes: fls. white, 5 or 6 in. long. S. Fla., W. Indies.

Leguminos x.CALÓPHACA. Low shrubs or herbs with alternate pinnate lvs., yellow or violet papilionaceous fls. in racemes or solitary, and cylindrical pods. Grown in borders or on rocky slopes in well-drained soil. Propagated by seeds and sometimes grafted high on Laburnum.

wolgàrica. To 3 ft.: lfts. ½ in. long: fls. bright yellow, 1 in. long, in racemes: pods to 1¼ in. long. S. Russia, Turkestan.

CALOPHANES: Dyschoriste.

CALOPHÝLLUM. Guttiferæ. Trees of trop. Asia and Amer., with opposite leathery lvs. which have numerous parallel cross veins, polygamous fis. in racemes or panicles, and fr. a drupe. Several species yield oil and gum; sometimes planted for ornament in tropics.

antillanum (C. Calaba of some authors). MARIA. To 90 ft. or more: lvs. to 6 in. long: fis. white, fragrant, in axillary few-fid. racemes: fr. about 1 in. across. W. Indies.

Calàba: C. antillanum.

inophfilum. KAMANI. To 60 ft. or more: lvs. to 8 in. long and 4 in. wide, shining: fis. white, fragrant, in axillary racemes to 7 in. long: fr. to 1½ in. across. Trop. Asia.

CALOPÒGON. Orchidaceæ. N. American terrestrial orchids with grass-like lvs. and fls. borne in racemes on naked scapes, the sepals and petals similar, the lip long-clawed and hairy

above; sometimes planted in bog- or rock-gardens.

pulchéllus (C. tuberosus. Limodorum tuberosum). Grass-Pink Orchid. To about 19 in.: lvs. linear, to 10 in. long: fls. violet-rose, 1½ in. across, in 1-11-fld. racemes, the lip bearded with golden-yellow hairs. June-Aug. Swamps, E. N. Amer.

tuberdsus: C. pulchellus.

CALOTHÁMNUS. Myrtaceæ. Australian shrubs with narrow scattered lvs., usually showy red fls. in clusters or spikes, the stamens long-exserted and united into bundles, and capsular fr. For cult. see Callistemon.

asper. Pubescent: lvs. crowded, linear, to 1 in. long, stiff and rough: fls. in short dense clusters.

coccineus: a hort, name for C. quadrifidus.

homalophfilus. To 6 ft.: lvs. oblong to nearly linear, very obtuse, 1-2 in. long: fis. rich crimson, to 1 in. long, in spikes.

longissimus. Low shrub: lvs. terete, 6 in. to 1 ft. or more long; fis. 1 in. long, in few-fid. spikes.

quadrifidus. To 8 ft.: lvs. needle-like, to 1 in. long: fls. rich crimson, to 1 in. long, in clusters.

rupéstris. Low evergreen shrub: lvs. needle-like, densely covering branches: fls. with bright red filaments and golden-yellow anthers, in clusters on previous seasons growth

sanguineus. Tall shrub: lvs. terete, to 1½ in. long: fis. rich red, 1 in. long, in clusters or short spikes.

CALPIDISCA: see Utricularia.

CALPÚRNIA. Leguminosæ. Trees or shrubs with pinnate lvs., yellow papilionaceous fls. in racemes, and rather flat slightly winged pods; native in Afr. Grown out-of-doors in subtrop. climates, and sometimes in greenhouses, for ornament; propagated by cuttings under glass or by seeds.

aurea (C. lasiogyne). To 15 ft.: lfts. oval, to 1 ¾ in. long: fls. about ¼ in. long: pods linear, to 3 in. long. S. Afr.

lasiógyne: C. aurea.

CÂLTHA. Ranunculaceæ. Per. small herbs growing in marshes in the north temp. zone, having simple usually heart-shaped lvs. and yellow, white or pink fls. without petals but with petal-like sepals; grown in moist and boggy situations. Propagated by division of roots in autumn and by seed.

asarifòlia: C. palustris.

bifldra. To 10 in.: lvs. to 3 in. wide, broader than long; fis. white, to 1½ in. across, solitary or 2. June-Aug. Alaska to Calif.

Chelidònii (C. uniflora). To 3 in.: lvs. broad-cordate or ovate, to 1 in. long: fis. white, 1 in. across. July-Aug. B. C. to Mont.

leptosépala (C. rotundifolia). To 1 ft.: lvs. oval, to 4 in. long: fls. white tinged blue outside, about 1 in. across, solitary. June-Aug. Alaska to New Mex.

paliatris (C. asarifolia C. parnassifolia). Marsh-Marigold. To 2 ft.: lvs. cordate, to 7 in. wide: fis. bright yellow, to 2 in. across, several together, Apr.-June, malignasses of yellow. Newf. to 8. C. and Neb.—The young lvs. are eaten as greens under the name "cowslip." Var. Alba, a white-fld. form. Var. monstrosa-plèno (var. flore-pleno) has large double fis.

parnassifòlia: C. palustris.

polypétala. To 2 ft.: lvs. to 1 ft. across: fls. golden-yellow, to 3 in. across, in spring. Caucasus, W. Asia.

rotundifòlia: C. leptosepala.

unifldra: C. Chelidonii.

CALTROP FAMILY: Zygophyllacex.

CALYCANTHÀCEÆ. CALYCANTHUS FAMILY. Two or three genera of deciduous shrubs having aromatic bark, opposite entire lvs., bisexual solitary fls. with many similar sepals and petals, many stamens, and fr. of many 1-seeded achenes inclosed in the receptacle; native in N. Amer.

and E. Asia. Calycanthus and Chimonanthus are cult.

CALYCANTHUS (Butneria). SWEET-SCENTED SHRUB. SWEET-SHRUB. Calycanthaceæ. Deciduous N. American shrubs with large fragrant brownish fls. borne at the tips of short branchlets; hardy in the N. except C. occidentalis. They do best in rich well-drained soil. Propagated by seeds, layers, suckers, and division.

elongatus: C. fertilis var. ferax.

fértilis (C. glaucus). To 10 ft.: lvs. ovate to oblong, to 6 in. long, glaucous and nearly glabrous beneath: fis. reddish-brown, to 2 in. across: fr. contracted at mouth. Pa. to Ga. and Ala Var. fèrax (C. lavugatus, C. elongatus) has lvs. green beneath.

floridus. CAROLINA ALLSPICE. To 10 ft.: lvs. ovate or elliptic, to 5 in. long, densely pubescent and pale beneath: fls. dark reddish-brown, 2 in. across: fr. contracted at mouth. Va. to Fla. Var. ovatus, lvs. ovate. Var. rûber is listed as having more reddish fls.

glaucus: C. fertilis.

lævigatus: C. fertilis var. ferax.

macrophyllus: C. occidentalis.

occidentalis (C. macrophyllus). To 12 ft.: lvs. ovate to oblong-lanceolate, to 8 in. long, green and nearly glabrous beneath: fls light brown, to 3 in. across: fr. not contracted at mouth. Calif.

præcox: Chimonanthus præcox.

CALYCÓTOME. Leguminosæ. Spiny deciduous shrubs with lvs. of 3 lfts., yellow papilionaceous fls. solitary or in clusters, and linear-oblong pods with thickened or winged margin; native in the Medit. region. Sometimes grown in mild climates for ornament. Cult. as for Cytisus.

spinòsa. To 5 ft.: lfts. ½ in. long: fls. in clusters of 1-4, ½ in. long: pods about 1 in. long. S. Eu.

CALÝPSO (Cytherea). Orchidacex. One terrestrial orchid native in cool bogs in N. Amer., Eu. and Asia, and sometimes planted in similar places. C. bulbòsa (C. borealis). To 9 in., with small bulbs: If. solitary, round-ovate, to 2½ in. long: fls. solitary, variegated purple, pink and vellow, with large saccate lip.

CALYPTRIDIUM: see Spraguea umbellata.

CALYSTEGIA PUBESCENS: Convolvulus japonicus.

CALYTRIX. Myrtaceæ. Heath-like Australian shrubs with small scattered entire lvs. and yellow, pink, lilac or white fls., stamens commonly numerous; one species intro. in Calif.

Sallivanii. Shrub, glabrous or nearly so: lvs. linear-3-angled, to ¼ in. long: fls. probably white, in heads or short spikes terminal or lateral on branchlets; calyx-lobes awned.

CALYX: the outer circle of floral envelopes whose individual parts are termed sepals. The sepals may be separate or marginally coherent, in the latter case forming a saucer, cup, bell or tube.

CAMARŌTIS. Orchidaceæ. Epiphytes with narrow distichous lvs. and fls. in erect or stiffly spreading racemes, the sepals and petals similar, the lip consisting of a thick-walled sac or spur which is more or less 3-lobed, the column with an upright beak. Suitable for hothouse cult.; see Orchids.

Hartmannii: listed name of a plant said to have white fis. spotted with red.

Mānnii. Lvs. linear, very thick, to 4 in. long and 3% in. wide: fls. 1/4 in. across, of pale color, in short racemes. India. purpurea: C. rostrata.

rostrata (C. purpurea). St. to 3 ft. long; lvs. to 4 in. long and ½ in. across; fis. about ½ in. across, in 5-20-fid. spreading racemes about length of lvs., sepals and petals pale purple, lip somewhat saccate, deeper purple. Mar.-May. India.

CAMÁSSIA (Quamasia). Camass. Liliaceæ. N. American bulbous herbs with linear basal lvs. and blue or nearly white fls. in bracted racemes terminating scapes, the perianth-segms. distinct

Camassias are hardy and do well in loamy soils. Bulbs should be planted 3-4 inches apart in early autumn and not disturbed; also propagated by seeds. Useful in borders.

azurea: C. Leichtlinin.

Cusickii. To 3 ft.: lvs. 1 in wide or more: scapes few to several; fls. pale blue, 3/4 in. long, perianth-segms. not twisted over ovary after pollination. Ore

esculénta (C. Fraseri. Q. hyacınthına). To 2 ft.: fls. light blue or rarely white, 1_2 in. long: caps. globose, to 1_3 in. high. Pa. to Ga. and Tex.

Fraseri: C. esculenta.

Howellii. To 20 in: basal lvs. linear, keeled, shorter than scape: fls. pale blue, the segms twisted together over ovary after pollmation: caps. to 1/3 in. long. Vancouver lsl. to Utah and N. Calif.

hyacinthina: C. esculenta.

hýbrida: hort. name.

Leichtlinii (Q. azurea). To 2 ft: fls. dark blue to creamywhite, 1 in long, the segms twisted over overy after pollination: caps. ½ in. long or more. B. C to Calif. Var. álba has white fls. Var. cærûlea has blue fls.

Quámash (C. esculenta of some authors) To 3 ft.: lvs. to \$4 in. wide: scapes usually solntary; fls. dark blue to nearly white, 1 in. long, seguns not twisted over ovary after pollination. B. C. to Calif.

CAMEL-HAY: Cymbopogon Schwnanthus. -Thorn: Acacia Girafiw.

CAMÉLLIA. CAMELIA. Theaceæ or Ternstramiaceæ. Evergreen trees and shrubs native in E. Asia, having alternate simple toothed lvs., white to red showy sessile fls. with deciduous sepals, and capsular frs. Sometimes classified under Thea but that genus has smaller pedicelled fls. with persistent sepals.

Camellius are popular ornamentals for the greenhouse and out-of-doors in the South and on the Pacific Coast, blooming in winter and spring. When grown in the greenhouse a temperature of 50-55° F. is required during the flowering season. They are among the finest shrubs for growing in shaded locations. Usually grown from cuttings of the current seasons growth taken in summer; also propagated by grafting on stocks secured from seeds or from cuttings of easily rooted sorts.

cuspidata: Thea cuspidata.

japónica (Thea caspadia).

japónica (Thea caspadia).

japónica (Thea japonica). Common C. Japonica. To 40 ft.: lvs. to 4 in. long, dark green and shining above: fis. red, pink, white, or variegated, to 5 in. across, single, partly or completely double. China, Japan.—Popular ornamental out-of-doors S, from N. C. along the Gulf of Mexico and on the Pacific Coast. Latin-named hort vars. are: álba-plèna, white, self, imbricated, regular double, early; álba-plèna fimbriàta, identical with above except outer petals fimbriated; althæsflòra, semi-double, dark crimson; amábilis, single white; americana, pale pink with darker stripes; Bèalli rôsea, fis. samall, deep pink, regular double; Bonomiana, variegated white with red, irregular double; Candidssima, white self, regular tiered; Carswelliana, double, deep crimson; Cliviàna, large. rose-pink, white stripes, ocasional irregular double; Collettii maculàta, semi-double, very dark red marked with white; Derbyàna, fis. large, deep pink to red, semi-double; Donklaàri, large, cherry-red, variegated, splotched white; élegans Chándleri, variegated, erise-red splashed white, irregular double, numerous small petals, large; Fèastii, double, pink and white; gigantèa, large red fis; grandiflòra rôsea, very large, semi-double, rose-madder with darker markings; Gunéllii, semi-double, rose-pink; imbricàta rùbra-plèna, double, deep carmine; Leàna supérba, semi-double, red; Lflyi, small, white with small phlox-pink markings; magnoliæfiòra, medium, white flushed light pink, semi-double; Mathotiana, large, carmine-pink, regular double and its forms álba, white and rùbra red to purplish-ted; nobilfssima, medium. white, irregular double, outer petals large. inner small: trfcolor Sièboldii, medium, semi-double, white and ribra red to purplish-led; nobilfssima, large, carmine self or with scattered white splashes; Gloire de Nantes, medium to large, petals curved, cerise-red, irregular double; Hermes, medium irregular double, variegated, white ground with rose-madder; Jarvis Red, medium to lar

or variegated with white splashes; Mme. de Strekaloff, medium, blush-pink with darker markings, irregular double; Mrs. Abby Wılder, medium, white with occasional phloxpink markings, irregular double, center elevated of many twisted whorled petals; Mrs. Fred Sanders, medium, white, single; Pink Perfection, small, phlox-pink, regular double; Prince Eugene Napoleon, medium, self carmine, regular imbricated double; Prof. C. S. Sargent, medium, self crimson, white fleckings toward center occasional, double with center of many small elevated petals; Sarah Frost, medium, pink to lighter shade at center, double; Semi Double Blush, medium, pale neyron-rose, semi-double; Snowdrift, medium, semi-double, white; T. K. Variegated, medium, pink ground, with deeper shadings, semi-double.

reticulata. Shrub: lvs. to 5 in. long, dull green, veins prominent: fis. large, to 7 in. across, crimson-rose, single (semi-double to double in cult. forms). China.

Sasánqua (Thea Sasanqua). Shrub: lvs. to 2 in. long, dark green, shining above: fls white to red, to 2 in. across, single (double in some forms). China, Japan.—Important English-named forms are: Apple Blossom, medium, white shaded pink, single; Blanchette, medium, self white, single; Briar Rose, medium, clear pink, single; Cleopatra, large, cherry-red, petals creped, single to double; Hebe, medium, deep rose-pink, single; Judith, medium, clear pink, funnel-form, single; Mino-no-yuki, large, self white, irregular double; Tanya, medium, deep rose, single.

Thèa: Thea sinensis.

CAMOÉNSIA. Leguminosæ. Trop. African woody climbers with digitately 3-parted lvs., papilionaceous fls., and flattened pods; one species planted in tropics and intro. in S. Calif.

máxima. Líts. obovate, to 6 in. long, shining: fis. white, to 4 in. across, petals frilled and edged with gold: pods to 8 in. long.

CAMPÁNULA. Bellflower. Campanulaceæ. Many herbs, ann., bien., per., prized for the erect, declined or drooping bright fls. which are usually in shades of violet although commonly called blue: lvs. alternate or sometimes only radical, of various shapes and sizes: corolla gamopetalous, mostly bell-shaped but sometimes rotate, lobes normally 5 or sometimes more numerous in cult.; stamens 5 on appressed broad-based filaments, soon collapsing, much exceeded by the style which is 3- or 5-lobed: fr. a caps. opening at bottom or top. Species perhaps 300, mostly in northern hemisphere from low lands to mts. and far northwards.

Bellflowers are popular for the flower-garden, rock-garden and borders, and C. Rapunculus is known as a vegetable, the roots and leaves being eaten as a salad. The perennial species are propagated by seeds under glass and transplanted to the open after danger of frost is over, and by cuttings and division; seeds are sometimes sown in summer to produce blooming plants the following season, and this is the procedure with the bennials as Canterbury bells. A covering of leaves is good winter protection in the North. Many choice montane species well adapted to rock-gardening are not yet in circulation in North America The annuals are propagated by seed sown out-of-doors or under glass. In the following account, the species are perennal unless otherwise stated. In this enumeration the flowers may be called "blue," as is the custom, but are probably prevailingly in tones of violet. abietina. Diffuse but essentially erect, to 2 ft., glabrous.

abietina. Diffuse but essentially erect, to 2 ft., glabrous, not very leafy: lvs. elliptic to lanceolate, crenate to entire: fls. toward top of st., erect or ascending, 1 in. or more long, deeply lobed, light violet. E. Eu.

acaulis: dwarf form of C. glomerata.

acutángula: C. arvatica.

Adria. Recently proposed name for the cult. garganica-fenestrellata complex, assumed to be hybrids. Another view, supported by European authors, is that the native plants of this group sometimes separated under binomials are only variables of a single widespread species. See C. Elatines.

affinis: listed name of garden plants that may not be the C. affinis of botanists which is probably not in regular cult. here.

Aizoón. Small, about 1 ft., with basal rosette, glabrous: radical lvs. spatulate and obtuse, st.-lvs. triangular-lanceolate: fls. pale blue, erect, in a panicle, long-bell-shaped. Mts., Greece.

alaskana: C. rotundifolia var.

alhéacens: listed name.

alliariæfòlia (C. lamiifolia). Erect, to 3 ft. and more. pubescent: lvs. soft-pubescent, cordate-ovate to almost reniform: fls. white, in long raceme-like spikes, about 1 in. long, calyx-lobes auricled. Caucasus, Asia Minor.

Allionii (C. alpestris). Very dwarf, usually only 2-3 in. high: lvs. linear to very narrowly oblong: fls. single on each st., erect or declined, blue or white, the broad corolla about 1¾ in. long. Mts., S. France, Italy.

alpéstris: C. Allionii.

alpina. Dwarf, usually not exceeding 6 in.: lvs. linear to narrowly oblance olate, hairy: fls. few to each st., deep blue, declined or nodding, about ¾ in. long. Eu., in Alps and Carpathian Mts.

amábilis: C. phyctidocalux.

americana. Tall, even sometimes to 6 ft., glabrous or hairy: lvs. ovate-lanceolate, 3-4 in. long, serrate: fls. small, ½-¾ in. long, blue or white. E. N. Amer. in shady places; ann, or bien.

ardonénsis. Small and slender, with grass-like foliage, cespitose: lvs. linear or filiform, sparsely serrate: fls. deep blue, solitary on st. scarcely surpassing radical lvs. Cau-

arvática (C. acutangula). Low, with partly prostrate leafy sts. that rise only 2 or 3 in.; basal lvs. small, about 18 few to a st., violet to light purple, 1 in or more across. Mts., N. Spain.—Once confused with Wahlenbergua hed-

asiática: garden name.

áttica: C. drabifolia.

Aûcheri. Small, pubescent, in clumps, 4-5 in. tall: lvs. lanceolate to narrowly spatulate, dentate, 2-3 in. long: fls. mostly solitary, large, violet-purple, about 1 in. across, erect or spreading. Mts., Armenia, Caucasus, Persia.

azurea: C. rhombordalis.

barbata. Low hairy plant, but sometimes reaching 18 in., the st. nearly or quite simple: basal lvs. narrow-lanceolate to oblanceolate, to 5 in. long: fis. near top of st., light lilac, about 1 in. long. Mts., Eu. Var. álba is listed.

Bárbeyi: C. Elatines var.

bavárica: C. Portenschlagiana.

Bellárdii: apparently not in cult., the plants so named probably being C. cxspitosa or C. cochlearifolia.

bellidifòlia: confused name; the plant intended in cult. is probably C. patula or C. Aucheri.

betonicæfólia. Bien. to 2½ ft., soft-pubescent: lvs. ovate-oblong, to 1 in. or more, crenate: fls. blue or bluish, about 1 in. long, narrow-bell-shaped. Mts., Greece.

bononiénsis. Erect, glabrous to canescent, often 3 ft. tall: lvs. broad-lanceolate to long-ovate, light colored underneath, 2-3 in. long: fls light purplish, spreading or drooping, 1 in. or less long, in long racemes. E. Eu., S. W.

cæspitosa. Low, tutted, 3-6 in., erect, foliage glabrous and mostly basal and low down on st. lvs. nearly or quite linear, radical ones ovate or broader and tapering to a short petiole: fls. ascending or declined, narrow-bell-shaped, lobes very short, blue, or var. **álba** white. Eu.—Often confused with *C. cochlearifolia*. cæspitòsa. Low, tufted, 3-6 in., erect, foliage glabrous

calaminthifolia. Pubescent, 6-10 in, sts. simple and bearing 3-5 fls.: lvs. thickish, the radical ones oblong-spatulate and obtuse and nearly entire, the cauline ones ovate-orbicular: fls. about ½ in. long, blue, corolla narrow and tomentose. Greece.

calveánthema: race of C. Medium.

canarina: listed name; perhaps Canarina campanulata.

cárnica. Low, slender, glabrous, 6-8 in.: early lower lvs. broad and obtuse and long-petioled with crenate margin, other lvs. linear and entire or remotely notched: fls. solitary or very few to each st., mostly upright but sometimes declined, blue, bell-shaped, lobes very short, very narrow calyx-lobes reflexed. S. Eu.—Plants grown under this name are likely to be C. rotundifolia.

carpática. Tussock B. Glabrous, making leafy clumps or tussocks above which are borne the fis., few to a st. or solitary, that stand erect, broad-bell-shaped to almost saucer-shaped, about 1½ in. long, dentate. E. Eu.—Common hardy summer-blooming plant in cult., in several statures and tints, as vars. álba, cærdlea, cœlestina, grandiflora, nana, pállida, turbinata, the last with more decumbent sts. and top-shaped fis.

cashmiriàna. Sts. zigzag or flexuous: lvs. oblong, entire or nearly so, hairy: fls. bright blue, to 1 in. across. India.

Cécilii: C. propinqua var. grandiflora.

celtidifòlia: C. lactiflora.

cenísia. To 2 in., tuíted: lvs. obovate, $\frac{1}{2}$ in. long, entire and ciliate: fis. deep blue, to $\frac{1}{2}$ in. long, solitary, erect. Alps.

Cervicaria. Bien. to 30 in., hairy: lvs. linear-lanceolate to linear, to 6 in. long, toothed: fis. blue, ½ in. long, in axillary and terminal bracted heads. Eu.

cochlearifolia (C. pusilla). Little nearly or quite glabrous open-growing plant 2-8 in. high: radical lvs. cordate-ovate to nearly reniform, not tapering to the very long petiole: fls. solitary or several on a st., mostly inclined or nodding, about ½ in. long, blue; also var. álba is listed. Mts., Eu.—Tractable rock-garden plant; often confused with C. cæspitosa.

collina. Lightly hairy, 6-12 in.: lvs. oblong to lanceolate, the lower long-stalked: fis. several on a st., deep blue, in few-fid. one-sided racemes. Caucasus.

cristallócalyx. Glabrous, stout, to 3 ft.: lvs. in rosette, shining, broadly spatulate-oblong, crenate, those on st. lanceolate or linear: fis. many in long racemes, blue, broad-bell-shaped, lobed 1/4 the length. S. E. Eu.—Probably a form of C. persicifolia.

dahurica: C. glomerata var.

dasvántha: C. pilosa.

dichroántha: listed.

divaricata (C. flexuosa). Much branched, to 3 ft., glabrous: lvs. ovate-lanceolate, sharp-toothed, to 3 in. long: fls. pale blue, ¼ in. long, nodding, in compact panicles. Va. to Ga. and Tenn.

drabifòlia (C. attica). Ann. to 6 in., hairy: lvs. ovaloblong, to ½ in. long, toothed: fls. blue with white tube, to ½ in. long, solitary. Greece, Asia Minor.

Elatines. Plant slender, spreading, more or less vine-like, sts. ascending at ends to 6 or 8 in. and somewhat hairy to almost glabrous: lower lvs. cordate-ovate, very sharply long-toothed: fls. several or many, azure, nearly rotate (wide open). ½ in. or more across. S. Eu.—Variable group in the Adriatic region and eastward. The garden plants representing this species are not closely definable, although botanical varieties are distinguished; if the grower does not care to separate these vars he may call the gult. group Campanula Adria. The species itself. C. Elatines, may not be much in cult. Var. Bárbeyi (C. Barbeyi). Plant very green and glabrous: corolla violet-blue, lobed % or more to the bottom; calyx-lobes ½ or more length of corolla. Var. elatinoides (C. elatinoides). Plant white-tomentose, compact in growth, lvs. thickish. Var. fenestrellata (C. fenestrellata) Plant glabrous and shiny: corolla violet-blue, the recurved lobes comprising % the length of fl.; style longer than corolla; calyx-lobes ½ or less as long as corolla. Var. gargánica (C. striaca). Plant gray-pubescent; corolla light violet-blue, spreading, with long lobes; style not much exserted; calyx-lobes ½ or less length of corolla. Var. istriaca (C. istriaca). Plant gray-pubescent or woolly: corolla lobed nearly to base, lobes spreading or recurved; style much exserted; calyx-lobes ½ or less length of corolla.

elatinoides: C. Elatines var.

élegans. St. pubescent, 1 ft. or more, simple: lvs. linear-lanceolate, entire, sessile, the lower ones broader and subpetiolate: fis. interruptedly spicate; calyx-lobes very narrow and as long as corolla. Siberia.—Plants cult. under this name are likely to be *C. rapunculoides*.

ephèsia. Erect, 1-2 ft.: lvs. ovate to oblong, sinuate, silvery-tomentose: fls. urn-shaped, pale lilac, lobes short and blunt. Ephesus, Asia Minor.

Erinus. The name appears in hort lists, probably in confusion with C. Elatines. The true Erinus is perhaps not in cult.: it is a thinly hairy ann. of S. Eu., erect, 6-15 in: lvs. oblong and crenate-dentate: fis. very small and sessile in clusters

excisa. Slender little plant 4-6 in. tall, sts. glabrous: lvs. linear, and some of the lower ones narrow-spatulate and toothed: fis. solitary or 2-3 to a st., nearly or quite erect, violet, bell-shaped, about ¾ in. long, lobes sharp, calyx-lobes very narrow, shorter than corolla-tube. S. Eu.

exigua. Diffuse, 2-6 in. high, more or less hispid: lvs. obovate to linear: fls. erect, few or several, light blue, ½ in. or less long; calyx-lobes very narrow, prominent. Coast ranges, Calif.

fenestrellata: C. Elatines var.

flexuosa of Amer.: C. divaricata.

floridana (Rotantha floridana). Sts. weak, branched and interlocking to make a ground-cover, 8-16 in. long, glabrous: lvs. elliptic to oblanceolate, shallowly crenate, about 1 in. or less long: fls. rotate, violet, 1/2 in. across, lobes very narrow. Low lands, Fla., and has been brought into cult.

Formanekiana. Erect to 2 ft. or so but a dwarf form does not develop the main st., dying after blooming which may be the second year from seed or later: lower lys. in a rosette, silvery, long and narrow, cauline lvs. much smaller and nearly covered by the white horizontal or ascending tubular-bell-shaped large showy fis. with short reflexed lobes. Macedonia.

frágilis. Large-fid., vine-like, late-blooming, to 6 in., with trailing sts. to 16 in.: lvs. round-cordate to ovate-lanceolate, toothed, the lower long-stalked: fis. purplishblue with white center, 1½ in. across, in corymbs. Italy.

Prenchatiis listed name

gargánica: C. Elatines var.

glomerata. To 2 ft.: Ivs. ovate, to 5 in. long, toothed, the basal long-stalked: fls. blue or white, to 1 in. long, often double, in dense clusters. Eu., Asia. Var. acailis (nana) has sts. to 5 in. high. Var. darbrica has clusters 3 in. across. Var. supérba has deep violet fls. in large clusters.

grandiflòra: C. persicifolia var.

grándis: C. latiloba.

Gròssekii. To 2½ ft., stiff-hairy: lvs. ovate, basal ones very broad and coarsely toothed: fls. violet, large, in long racemes, with appendages or wings and stiff hairs on calyx-tube. S. Eu.—See C. Trachelum.

havlogénsis: listed name.

Hostii: C. rotundifolia var.

imeretina. To 6 in., branching: lvs. obovate, narrowed into winged petiole, 1 in. long: fis. violet-blue, 1/2 in. long. Caucasus

imperialis ròsea: hort, name,

inchnar hated

incurva. Erect, 12-18 in, pubescent, dying after seeding: lvs in rosette cordate or reniform, crenate, those on st. cordate-ovate: fis. pale blue, erect, 2 in. long, stigmas 3.

isophfila. Sts. trailing, making good basket-plant: lvs. cordate-ovate, to 1½ in. long, the lower long-stalked: fls. pale blue, saucer-shaped, 1 in. across, solitary, numerous. Italy. Var. álba has white fis. Var. Mayi has larger white-Italy. Var. álba has whi hairy lys. and bigger fls.

istriaca: C. Elatines var.

kewénsis. Hybrid between C. arvatica and C. 3-4 in., glabrous or nearly so: lvs. small, narrow, the lower ones notched: fis single terminating branches, not nodding. about 1/2 in. across, deep violet.

Kladniàna. Small plant with look of C. rotundifolia but st.-lvs. broader, radical lvs. oblong or elliptic rather than rounded, sts. 3-10 in. high; fis. large for size of plant, about 1 in. across, dark violet. E. Eu.

kolenatiana. To 9 in.: lvs. ovate, toothed, 1 in. long: fls. bluish-violet, 1 in. long, nodding, in racemes. Caucasus.

lactiflora (C. celtidifolia). To 4 ft. or more: lvs. ovaloblong, to 3 in long, toothed: fis. milk-white (var. álba) or pale blue (var. cærûlea), 1 in. long, in terminal panicles.

lamiifòlia: C. alliarizfolia.

lanata. Erect to 2 or even 3 ft., leafy: lvs. pubescent and silky-hairy, lower ones cordate, upper ones broadly ovate: fls. large, white or pale yellow, terminal and axillary, narrow-bell-shaped, more than 1 in. long, not drooping. S. E. Eu.—Probably C. velutina is a form of this species.

lasiocárpa. Small, 3-6 in , nearly glabrous: lvs. spatulate, obovate to linear, to 134 in. long, sharp-toothed: fls. blue, to 1 in. long, solitary, fragrant, calyx-lobes toothed. N. N. Amer., N. Asia.

latifòlia. To 4 ft., hairy: lvs. oblong-ovate, to 6 in. long, toothed, the lower long-stalked: fls. purplish-blue, 1½ in. long, solitary Eu., Asia. Var. álba has white fls.; var. cærûlea blue; var. eriocárpa, calyx hairy; var. macrantha (C. macrantha), fls to 2½ in. long.

latfloba (C. grandis). To 4 ft., glabrous: lvs. lanceolate, to 5 in. long, toothed: fls. blue, to 2 in. across, solitary or clustered, with 3 long styles. Caucasus. Var. álba has white

Laurii (Loreyi): C. ramosissima.

Leûtweinii. The true species, from Greece, appears not to be in cult. here. C. incurat has been mistaken for it, and C. Grossekii and C. rapunculoides have been grown under the name.

lingulata. Bien. to 15 in., bristly-hairy: lvs. oblong-spatulate, wavy-toothed: fis. violet, in sessile terminal and axillary strongly bracted heads. S. E. Eu.

linifolia. Erect, to 18 in., lightly pubescent to nearly glabrous: st.-lvs. abundant, linear to linear-lanceolate, 2 in. or less long, more or less crenate: fis. several to many, violet, ¾-1 in. across. Fu.

longéstyla. To 234 ft., hairy: lvs. oval to oblong, the basal lobed and with winged petiole: fls. blue-purple, constricted below middle, nodding. Caucasus. Var. parviflòra has smaller fls.

longifòlia: C. speciosa.

Ldreyi: C. ramosissima.

macrántha: C. latifolia var.

macrorrhiza. Tufted, with thick rootstocks: lvs. ovate to linear, toothed; fis. blue, solitary, erect. S. Eu.

macróstyla. Ann. to 2 ft., hairy: lvs. ovate-oblong, to 2 in. long, nearly entire: fis. purple, broad-bell-shaped, to 2½ in. across, solitary, erect, stigma to 1 in. long. Asia Minor.

Marcheséttii. Of the *C. rotundifolia* kind, and some of the cult. stock may be that species: radical lvs. less broad, st-lvs. very narrow-lnear, erect: fls. few or several, not hanging, narrow-bell-shaped, nearly 1 in. long. E. Eu.

Mêdium. Canterbury Bells. Popular bien. to 4 ft., hairy: Ivs. oblanceolate, to 10 in. long, toothed and wavy: fls. violet-blue, 1 in. across, 1-2 together and forming open raceines. S. Eu. Color forms are vars. álba, cærilea and rôsea. Var. calycánthema has calyx resembling the corolla in the Hose-in-Hose or Dupler race, and in the Cup-and-Saucer race spreading or wheel-shaped.—All forms are excellent for late spring and early summer bloom.

michauxioldes. To 4 ft., hairy: lvs. ovate-cordate to oblong, coarsely toothed, the lower long-stalked: fis. pale blue, nodding, in panicles. Asia Minor.

mirábilis. To 1 ft.: lvs. obovate, to 6 in. long, coarsely toothed, with winged petioles: fls. pale lilac, 2 in. across, erect, numerous. Caucasus.

Mderheimii: C. persicifolia var.

móllis (C. velutina in part). Silvery-silky, 3-12 in. high: lvs. in the rosette spatulate and crenate, those on st. erect and usually entire: fls. blue, wide open, about ½ in. across, stigmas 5. S. Eu.—C. vncurva has been grown under this name; also C. sarmatica and Symphyandra pendula.

Morettiana. A very dwarf alpine in Eu., probably not planted with us; plants grown under this name are similar to C. hnifolia.

muralis: C. Portenschlagiana.

nítida: listed name, application uncertain.

nobilis: C. punctata.

olýmpica. Bien, slightly pubescent, sts. slender and simple: rudical lvs. slender, obovate, lightly crenate, cauline ones narrow-oblong to lanceolate: fls. solitary or in short racemes, pale blue. Mt. Olympus, Greece.—Other plants are grown under this name: see C. rotundifolia var. olympica.

Pallasiana: C. pilosa.

Párryi. Erect, 3-10 in., glabrous: lvs narrow-lanceolate or spatulate, upper ones linear, entire or slightly denticulate: fls. usually single, erect, broad, about 1 in across, violet. Rocky Mts., subalpine.—This is the C. planiflora of American botanists.

pátula. Erect, to 2 ft., much forking, sts. hispid on angles: lys in rosette spatulate or oblanceolate, crenate, cauline lys. lanceolate to linear, sessile: fls. terminating slender branches, very broad, sometimes 1½ in. across, blue, celyx-lobes very long and spreading. S. Eu.

pentagònia: Specularia pentagonia.

persicifòlia. Willow B. Strong-growing, erect, stiffish, usually unbrunched, to 3 ft. and more, glabrous: lvs. long, narrowly oblanceolate to linear, entire, 4-8 in: fls. large, 1½ in. long and broad (larger in hort. vars.), blue. Eu. Vars. álba fls. white, Báckhousei white, cærùlea blue, flòreplèno double, gigantèa, grandiflora very large, humòsa double, macrántha very large, Mòerheimii double white, Pfítzeri, spléndida.—Favorite species.

petiolata. Slender, erect, glabrous, to 18 in.: lvs. very narrow, ascending, the radical ones broad-ovate: fls. several on a st, blue, about 1 in. or less long. W. N. Amer.—Plant so named in gardens may be incorrect.

petræa. Bien. to 1 ft.: lvs. lanceolate to ovate, toothed, gray-hairy beneath: fis. pale yellow, ½ in. long, in dense heads. S. Eu.

phyctidócalyx (C. amabilis). Small plant, 1 ft. in its native region, otherwise much resembling C. persicifolia (which may be grown under this name) but calyx-teeth much longer and acuminate, corolla smaller and short-bell-shaped. S. W. Asia.

pilòsa (C. dasyantha. C. Pallasiana). Little rock-garden pilose subject 3-9 in. high: lvs. oblanceolate to narrow-oblong, those on st. sessile: fl. single, large, I in. long, violet, narrow-bell-shaped, lobes acute. N. Asia, Alaska.

Piperi. Small, tutted, 1-4 in. high in its native mts., glabrous, leafy: lvs. short, more or less spatulate, serrate: fls. 1-several, bright blue, corolla opening broadly. Olympics, Wash.

planiflora: probably C. versicolor is meant; the American planiflora is C. Parryi.

Portenschlagiana (C. muralis. C. bararica). Related to the Adria belliflowers and may be compared with the many forms of C. Elatines: corolla bell-shaped, longer than broad, to 1 in. long, lobes about 1/2 length and outwardly curved. Dalmatia.

Poscharskyana. Allied to the Adria bellflowers, larger, corolla cut % or more to base, broader than long, lobes sharp and erect: fis. twice larger than in the C. Elatines group. Dalmatia.

prenantholdes. Erect and slender, 1-3 ft., glabrous or puberulent, not branched: lvs. lance-ovate to lanceolate, 1½ in. or less long, dentate: fls. remotely racemose, corolla ½-½ in. long, very narrow, style long-exserted. Calif., Ore.

primulæfòlia. Erect, to 3 ft., hairy: lvs. lanceolate to oblong, coarsely toothed: fis. violet or purple, tomentose at bottom, wheel-shaped, in close racemes. Portugal.

profinqua. Ann., hispid, 1 ft., forked: lvs. oblong and obtuse, entire or nearly so, upper ones sessile: fls. violet and mauve, broad-campanulate. Var. grandiflora (C. Ceculu) has large fls. 1½ in. long and somewhat broader. Armenia, Parsia

pseudo-Raineri: name in hort. for a dwarf form of C. carpatica.

pulchérrima. Erect, nearly glabrous, 1-2 ft.: radical lvs. cordate-ovate, st.-lvs. lanceolate, all dentate: fls. violet, sharply lobed half way down, in an axial raceme. Apparently one of the C. rapunculoides variants.

ptilla. Alpine, 2-6 in. high, erect, glabrous: lvs. many ovate, blunt, crenate, 1 in. or less long: fis. solitary, dark purple, bell-shaped, lobes short, nodding. S. E. Eu.—Other species are grown under this name.

pulloides. Supposed hybrid between C. pulla and C. carpatica var. turbinata: plants to 8 in. tall: fis. blue-purple, very large and broad.

Pulsatîlla: listed name.

punctata (C. nobilis). To 2 ft., hairy, showy: lvs. ovate, to 5 in. long, coarsely toothed, the lower long-stalked and cordate: fls. many, white spotted inside or lılac-blue in "Marian Gehring," 2 in. long, nodding, solitary. Asia.

pusílla; C. cochlearifolia.

pyramidàlis. Chimney B. Strict, to 5 ft., glabrous: lvs. ovate, 2 in. long, toothed, the lower long-stalked and cordate: fis. pale blue, 1 in. or more long, saucer-shaped, in narrow racemose panicles. S. Eu. Var. álba has white fis., compácta a dwarf dense large-fld. form.

pyravérsi. Hybrid between C. pyramidalis and C. versicolor (as the name suggests), shown in France in 1912, with habit of the former: fis. close together in long spike-like raceines, wide open and parted nearly to base, light violet with dark ring in center. It does not follow that stock now raised from seeds maintains the hybrid characteristics.

pyrenàica. Sts. simple, to 1 ft., soft-hairy: radical lvs. rounded and crenate, st.-lvs. lanceolate: fl. terminal, about ½ in. long, corolla blue, scarcely longer than calyx-lobes. Pyrenees, Baleane Isls.

Raddeana. To 1 ft., glabrous: lvs. ovate, toothed, the lower deeply cordate and long-stalked: fls. hanging, dark purple, 3/4 in. long, solitary in axils. Caucasus.

Råineri. Small, to 3 or 4 in., leafy, lightly hirsute: lvs. spatulate to oblanceolate, obtuse, crenate: fl. solitary, creet, deep violet, 1-1½ in. long, broad, lobes short. Alps, N. Italy.—Plant bearing this name in cult is a dwarf compact form of C. carpatica, and to this the var. alba also probably belongs.

rádula. Low, 1 ft. or less, hispid, erect and stiffish: lvs. ovate, denticulate, the upper ones small and sessile: fts. 1-3 on branches of panicle, blue, corolla densely roughpubescent. S. W. Asia.

ramosissima (C. Loreyi). Ann. to 1 ft., nearly glabrous: lvs. obovate to lanceolate, to 2 in. long, toothed: fls. violet, whitish at base, 1 in. across, saucer-shaped, solitary, erect. S. E. Eu. Var. alba has white fls.

rapunculoides. ROVER B. Vigorous persistent invading plant often occupying the place in gardens of other bell-flowers that have died out, and if roots or seeds are distributed confusion in names results: erect, to 3 ft., mostly very lightly pubescent: radical lvs. long-petioled, cordate-ovate, acuminate, dentate, st.-lvs narrow-ovate to lanceolate and upper ones sessile: fls. many in a long raceme, hanging or declined, 1 in. and more long, violet-purple, lobed about half way down, calyx not hispid but perhaps thinly pubescent. Eurasia; nat. about properties and along road-sides, making large colonies; variable; spreading by stolons.

Rapúnculus. RAMPION. To 3 ft., with thick tap-root, usually bien.: basal lvs. oval, to 8 in. long, long-stalked, wavy-toothed, st.-lvs. linear-lanceolate: fis. lilac, ½ in. long, in narrow racemes. Eu.—First-year roots and radical lvs. sometimes used as salad.

rhcmboidàlis (C. azurea). Erect, to 2 ft., nearly glabrous: lvs. ovate, to 2 in. long, toothed: fls. purplish-blue, to 1 in. long, nodding, in racemes, calyx glabrous. Eu. Var. álba has white fls.

Róbsonii. Described as a hybrid between C. carpatica var. turbinata and C. Scheuchzeri, with deep blue fls.

rotundifòlia. HAREBELL. Erect, or spreading at base,

simple or branched, mostly glabrous, to 1½ ft., slender: basal lvs. ovate or orbicular, 1 in. across, long-stalked, st.-lvs. lnear or lanceolate, to 3 in. long; fis. bright blue, to 1 in. long, in loose racemes or in some forms solitary. Eu., Asia, N. Amer. Var. alaskana (C. alaskana) is leafy to top, corolla 1 in. or more long, bright violet. Var. acticia, a stiffer or rigid little plant with 1 or few fis. to st., in high N. Var. Hostii has larger fis. Var. soldanellæffora has fis. partially double and the corolla split into shreds. Other listed garden vars. are álba, arcuata, Baumgartenii, cœlestina, grandiflora, Marchesiana, olýmpica (not C. olympica), Róbsonii (see C. Robsonii), supérba.

rupéstris: confused name in the trade; perhaps the true plant of Greece is not cult, with us.

salicifòlia: dubious name in hort., probably not a Campanula.

sarmática. Soft-hairy and grayish, 1-2 ft., erect, mostly not branched: radical lvs. hastate-lanceolate, 3 in. long, unequally dentate, st-lvs. oblong: fis. nodding in raceme, violet, about 1 in. long, lobes curving. Caucasus. Var. Wátkinsii is listed.—Sometimes labelled C. mollts.

Sartòri. Velutinous, 6-10 in., st. somewhat fleshy: lvs. very small, orbicular: fls. white, narrow-bell-shaped, hairy outside, much like those of *C. Portenschlagiana*. Greece.

saxátilis. Bien., tufted, to 6 in.: basal lvs. in rosettes, oblong-spatulate, to 2 in. long, toothed: fls. lilac, ¾ in. long, in 2-5-fld. racemes. Crete.—C. alliariæfolia has been distributed under this name.

Saxífraga. To 6 in.: lvs. linear or linear-lanceolate, nearly entire, ciliate: fls. violet, to 1 in. long, solitary. Caucasus.

scabrélla. Sts. many, 2-4-fid. and 2-5 in. tall, puberulent to glabrous: radical lvs. spatulate, upper ones linear: fls. blue, more erect than in C. uniflora, to which it may be referred, and larger. Mts., Calif. northward.

Scheüchzeri. Low, to 6 or 12 in., usually thinly pubescent: lower lvs. lance-linear, upper ones very narrow: fis. large, to 1 in. long, bell-shaped, blue. Mts., Eu., Asia.

Scouleri. Low soft plant, 3-12 in., making offshoots at base, leafy, glabrous or nearly so: lvs. ovate to oblong, upper ones linear, serrate: fls. small, ½ in. long, drooping, pale blue. Woods, Calif. northward.

sibfrica. Bien. or per to 1½ ft., bristly-hairy: lvs. obovate and crenulate, those on st. lance-acuminate: fis. violet, 25 or more in a panicle, drooping. Eu., Asia. Var. álba is listed.—Variable.

spathulata: name of doubtful botanical meaning.

speciòsa (C. longifolia). To 1 ft., very hairy: lvs. oblongto linear-lanceolate, toothed: fls. blue, 1 m. long, solitary in the axils and forming a pyramidal raceme. S. Eu.

spectábilis: hort. name.

Spéculum: Specularia Speculum-Veneris.

spicata. Bien. to 2 ft., hairy: lvs. linear-lanceolate, nearly entire: fls. blue, in a long interrupted spike. Eu.

Spruneriana (C. Spruneri). Sts. erect and slender, 8-14 in., usually long-forked, glabrous: lvs. obovate, the upper ones lanceolate or narrower, sessile: fls. terminal bell-shaped, nearly or quite 1 in. long, blue, corolla lobed ½ way down, calyx-lobes slender and long. S. E. Eu.

Stánsfieldii. Supposed hybrid, perhaps between C. carpataa and C. Waldsteiniana; described as a creeper with deep purple fis.

stenocòdon. Similar to *C. rotundifolia* but more slender, with narrower st.-lvs. and tubular rich lilac-purple fis. Alps.

Stèvenii. Low, in clumps or mats, with ascending sts.: lvs. oblong-spatulate, entire or crenate, those on sts. linear: fls. purple-blue, 1-4 on a st. Caucasus, Siberia, in mts. Var. 41ba is listed.

strigòsa. Ann., white-setose, erect, forking above: lvs. oblong to oblong-lanceolate, entire, sessile: corolla glabrous, twice or more as long as calyx. S. W. Asia.

subpyrenaica. Per.: lvs. long and narrow, curving outward: fis. blue or white, in racemes, larger than *C. persici-tolia* and having a bigger hairy calyx. Montserrat, N. E. Spain.

thessala. Decumbent, gray-pubescent: basal lvs. oblong, pinnate or pinnately lobed, st.-lvs. toothed: fis. pale violet, 1 in. long, in loose racemes. Thessaly.

thessálica, thessalónica: listed; probably C. thessala.

thyrsoldes. Erect unbranched very leafy bien., 6-30 in., histy: lvs. long-lanceolate or narrower, ascending, sessile: fis. creamy or yellowish, in a dense bracted spike. Eu. Vars. carniólica and lûtea are listed.

Tommasiniana. Sts. 6-15 in. long, strict at first, becoming diffuse or lopping over rocks, glabrous: lvs. lanceolate or narrower, about ¾ in. long, tapering both ways, crenate: fis. violet, ¾ in. long, mostly drooping, narrow, lobes blunt and very short. Istria.—It has been confused

with C. Waldsteiniana of Croatia but that plant has fls. sharply lobed half way down and the lower lvs. are obtuse and apparently not in cult. with us.

Trachèlium. To 3 ft., rough-hairy: lvs. ovate-lanceolate, to 3 in. long, coarsely toothed, the lower long-stalked: fls. blue-purple, to 1 in. long, sometimes double, nodding, in loose racenes. Eu., Asia; escaped in N. Amer. Var. álba has white fls—Sometimes grown as C. Grossekii, but it has no appendages on calyx-tube.

tridentâta. To 5 in.: lvs. oblong to linear, ciliate, entire except the 3-toothed apex: fls. deep blue, solitary. Asia Minor.

tubulòsa. Bien., soft-pubescent, 1 ft. or less, sparsely branched: radical lvs. ovate-oblong and dentate, those on stowate-lanceolate: fls. 1-3, corolla tubular and pubescent outside Crete.

turbinàta: C. carpatica var.

uliginosa. Very weak branching plant, sts. 1-2 ft. long: lvs. linear or linear-lanceolate, pointed, 1-2 in. long: fls. blue, about ½ in. across, deeply lobed. Moist land, Ind. and Neb. northward.

uniflora. St. simple, nearly or quite glabrous, 1-fld., 6 in. or less high: lvs. linear-oblong, blunt, practically entire: fls. erect, calyx turbinate, corolla about ½ in. long, blue. High N. and on mts., Eu. and N. Amer.

Van Hoùttei. Garden plant described in France in 1878 with aspect of *C. nobilis (punctuta)* of which it may be a hybrid: radical lvs. usually more or less lobed, st.-lvs. oval-lanceolate, toothed: fis. blue or violet, more than 2 in. long.

velùtina: probably C. lanata is usually meant.

versicolor. To 4 ft., glabrous: lvs. ovate to ovate-lanceolate, toothed, the lower long-stalked: fis pale blue with violet throat, in long spike-like racemes. Greece.

villicaùlis: plants grown under this name may be C. punctala.

Vidálii. To 2 ft., glabrous and clammy: lvs. oblong, to 4 in. long, coarsely toothed: fls. white with yellow base, 2 in. long, nodding, in short racemes. Azores.

Waldsteiniana: see under C. Tommasiniana.

warleyénsis and var. álba; garden forms.

Wôckii. Dwarf, 2-5 in., glabrous: lvs. ½ in. long more or less, oblong and tapering both ways, crenate: fis. lavender, erect, small, deeply lobed.

Zóysii. To 4 in., tufted, the sts. few-fid.: lvs. ovate or obovate, entire, those on st. becoming oblanceolate: fls. pale blue, mostly terminal on 1-fid. peduncles, the corolla cylindrical and constricted at apex. Austria, alpine.

CAMPANULACEÆ. BELLFLOWER FAMILY. Probably 40 genera of widely distributed herbs, shrubs or trees, with usually alternate simple lvs., bisexual mostly showy fls. prevailingly in blue, and having gamopetalous 5-lobed corolla, 5 stamens, mostly inferior 1-5-celled ovary, and fr. a dehiscent caps. or sometimes berry-like. Several herbaceous genera are flower-garden subjects, as Adenophora, Campanula, Canarina, Codonopsis, Cyananthus, Edraianthus, Jasione, Michauxia, Ostrowskia, Phyteuma, Platycodon, Specularia, Symphyandra, Trachelium, Wahlenbergia. For the most part they are of simple cultural requirements.

CAMPANULATE: bell-shaped.

CAMPE: Barbarea.

CAMPHORA OFFICINARUM: Cinnamomum Camphora,

camphorosma. Chenopodiaceæ. Small shrubs or herbs with camphor-like odor, native in Eu., Asia and Afr., having needle-like lvs. and small fls. in dense spikes toward ends of branches; intro. in Calif.

monspellaca. Hairy subshrub to 2 ft.: lvs. clustered: fis whitish, solitary in the axils and forming leafy spikes. Medit. region.

CAMPHOR-TREE: Cinnamomum Camphora.

CAMPION: Lychnis, Silene.

CAMPSIDIUM. Bignoniacex. Evergreen climbing shrubs with pinnate lvs., orange tubular 5-lobed fls. in terminal racemes, and

narrow capsular frs.; grown out-of-doors in S. U. S. Propagated by cuttings of green wood under glass.

valdiviànum. Lvs. of 11-13 oval-oblong sessile lfts. to 1½ in. long, toothed at tip: fis. 1½ in. long, the racemes drooping: caps. to 4 in. long. Chile.

CÁMPSIS. TRUMPET-CREEPER. Bignoniaceæ. Two shrubs climbing by aërial rootlets, having deciduous pinnate lvs. with toothed lfts., orange or scarlet funnelform fls. in late summer with spreading 5-lobed limb, and fr. a long dehiscent cads.

The trumpet-creepers thrive in fertile soil in sunny locations. *C. radicans* is fairly hardy North and both species do well in southern United States. Propagated by seeds, cuttings of green wood under glass, layers, and cuttings of mature wood or roots.

chinénsis: C. grandiflora.

grandiflora (C. chinensis. Bignonia chinensis. Tecoma and Bignonia grandiflora). CHINESE T. Lvs. of 7-9 ovate or ovate-lanceolate glabrous lits. to 2½ in. long: fls. scarlet, to 3 in. across, the tube only slightly longer than the deeply 5-lobed calyx. China.

hýbrida: C. Tagliabuana.

radicans (Bygnonia and Tecoma radicans). Trumpet-Vine. Lvs. of 9-11 oval lits. to 2½ in. long, pubescent at least on midrib beneath: fls. orange with scarlet limb 2 in. across, the tube 3 in. long, about 3 times as long as shorttoothed calyx. Pa. to Fla. and Tex. Var. flava (var. aurea), fls. orange-yellow.

Tagliabuana (C. hybrida. Bignonia and Tecoma Princei). Hybrid between C. grandyflora and C. radicans with fis. to 3 in. long and 2 in. across.

CAMPTOSÒRUS. WALKING-FERN. Polypodiaceæ. Hardy small ferns with simple long-pointed fronds that root at the tip and therefore are called "walking fern" or "walking leaf"; sori linear or oblong, irregularly scattered; 2 species, the native one, growing usually on lime-bearing rocks, used somewhat in rock- and wild-gardens; the other is N. Asian.

rhizophýllus. Fronds evergreen, to 9 in. long, heart-shaped at base, tapering to a long often thread-like point. Que. to Ga., Ala. and Okla.

CAMPTOTHÈCA. Nyssacex. One decidous tree native in China and intro. into S. Calif. C. acuminăta. To 75 ft., quick-growing, with pale gray smooth bark: lvs. alternate, ovate, to 6 in. long: fls. small, polygamous, in heads which are solitary or racemose, the white stamens long-exserted: fr. a samara about 1 in. long, brown and shining.

CAMPYLÁNTHUS. Scrophulariacex. Small shrubs of semi-trop. regions, having alternate fleshy lvs. and tubular fls. in terminal racemes. About 8 species are known of which one from the Canary Isls., C. salsoloides is cult. Lvs. oblanceolate to lanceolate, to 1 in. long, entire, glabrous: fls. in racemes to 4 in. long, sticky-pubescent, on recurved pedicels. Var. péndulus is listed, but may not differ from type.

CAMPYLOBOTRYS: Hoffmannia Ghiesbreghtii. CAMPYLONEURON: Polypodium Phyllitidis.

CAMPYLÓTROPIS. Leguminosæ. Deciduous shrubs and subshrubs of Asia distinguished from Lespedeza by the pedicels mostly solitary in the axils of usually deciduous bracts and jointed below the calyx rather than usually 2 in the axils of persistent bracts and not jointed.

macrocárpa (Lespedeza macrocarpa. L. chinensis. L. cihiala). To 3 ft.: lits. 3, oblong, to 2 in. long, not pointed, silky underneath: fis. purple, about 1/2 in. long, in attractive racemes. China; hardy N.

CAMWOOD: Baphia racemosa.

CANAIGRE: Rumex hymenosepalus.

CANALICULATE: channelled, with a longitudinal

CANÁNGA (Canangium). Annonaceæ. Malavan trees with alternate simple lys., large fls. in axillary clusters, and fr. of many oblong fleshy carpels; one species is grown for ornament and for the perfume derived from the fls. It requires a warm or trop. climate.

odoràta. Ylang-Ylang To 80 ft.: lvs. oblong-ovate, to 8 in. long: fls. greenish or yellowish, drooping, very fragrant, with narrow petals to 2 in. long: fr. greenish, 1 in. long.

CANANGIUM: Cananga.

CANARÎNA. Campanulaceæ. Bellflower-like per. herbs that differ from Campanula in producing a berry rather than a dry caps. and fl. parts in 6's; native in Canary Isls. and Afr. They may be grown in a cool greenhouse or in the S. perhaps with protection.

Campánula: C. campanulata.

campanulate C. Campanulata.

campanulata (C. Campanula). St. slender, 6-8 ft., semi-scandent, nearly or quite glabrous, arising from a tuber: lvs. opposite or ternate, petioled, narrowly ovate-oblong, lobed at base and notched on margins, blade about 3 in. long: fls. solitary on axis and branches, open-bell-shaped, about 2 in. long, yellowish overlaid with brick-red or purplish-brown. Canaries.

Emínii. Lvs. ovate, about 2 in. or less long, not decidedly lobed at base but notched: fis. 2½ in. long and broad, open-bell-shaped, orange-yellow with red lengthwise nerves. Trop. E. Afr.

CANARY-BIRD-FLOWER: Tropwolum peregrinum.

CANAVALIA. Leguminosæ. Trop. herbs or sts. somewhat woody, twining or nearly erect, with pinnate lvs. of 3 lfts., papilionaceous fls. in axillary racemes, and large flat woody pods strongly ribbed near upper margin.

Sometimes grown for ornament in warm countries, as stock feed, a green-manure crop, and the beans for human stock feed, a green-manure crop, and the beans for numan food. Adapted to about the same climatic conditions as cotton and require a long season. Seeds should be planted 6 to 12 inches apart in rows 3 feet apart.

ensiférmis. Jack Bean. Ann., partially erect, to 4 ft.: fts. purple: pods to 14 in. long, with white seeds. W. Indies.

gladiata. Sword Bean. Twining: pods to 12 in. long, with seeds usually red, pink or brown. Tropics of Old World.

CANDELILLA: Euphorbia antisyphilitica.

CANDLE-BERRY-TREE: CANDLE-BERRY-TREE: Aleurites molucoa -Plant; Kleinia articulata. -Tree: Parmentiera cereifera. molucoana. CANDLENUT: Aleurites moluccana.

CANDOLLEA. Dilleniacex. Shrubs or herbs with alternate simple lvs. and mostly yellow fls. few or solitary at ends of branches, the parts mostly in 5's; grown in S. Calif. or sometimes under glass.

cuneiformis (Hibbertia cuneiformis). Shrub to 6 ft.: lvs. oblong, 1 in. long, toothed at apex: fls. ½ in. or more long, solitary and sessile. Australia.

CANDYTUFT: Iberis.

CANE, DUMB: Dieffenbachia Sequine. Southern: Arundinaria gigantea.

CANÉLLA. Canellacex. One evergreen tree of S. Fla. and W. Indies. C. Winterana (C. alba). WILD CINNAMON. To 45 ft., often shrubby, with gray aromatic bark: lvs. oblanceolate or spatulate, to 4 in. long, obtuse, shining above: fls. purple, red or violet, to 3/4 in. long, in corymbs, anthers yellow: fr. a crimson berry 1/4 in. across.

CANELLACEÆ. CANELLA FAMILY. genera of aromatic trees or shrubs native in trop. Amer. and Afr., having alternate entire lvs., bisexual fls. of 3 sepals, 4-12 or no petals, many stamens with filaments united in tube, superior 1-celled ovary, and fr. a berry. Canella may be grown in S. Fla. or S. Calif.

CANESCENT: gray-pubescent and hoary, or becoming •^

CANISTEL: Lucuma nervosa.

CANÍSTRUM. Bromeliacex. Brazilian terrestrial or epiphytic herbs with lvs. in a basal rosette and green, yellow or blue fls. in heads or spikes subtended by colored bract-lvs.; occasionally cult, in the greenhouse. Cult, as for Bromelia.

amazonicum (Nidularium amazonicum). Lvs. to 11/2 ft. long and 3 in. wide, finely toothed, brownish: fls. greenish-white, in dense heads.

aurantiacum. Lvs. to 2 ft. long and 2 in. wide, finely toothed, spotted with dark green when young: fis. orange-yellow, in dense heads, the inner bract-lvs. bright red.

Lindenii (Nidularium Lindenii). Lvs. to 2 ft. long and 3 in. wide, finely toothed, green spotted with darker green: fls. pure white, in dense heads.

CÁNNA. Cannaceæ. Striking tall erect tender per. herbs with thick branching rootstocks and mostly simple main sts., grown usually in masses and lines for foliage effect and the showy terminal fl.-clusters; botanical characters of the family (Cannaceae); native in tropics and subtropics. They reach 2½ to 10 ft. in height, bearing large simple lvs. that are sometimes bronzy. Few of the original species are in common cult., those known to hort, being hybrid or other derivatives.

hort. being hybrid or other derivatives.

Of easy cultivation in fertile moist deeply-prepared soil; in the North, cannas should not be planted out until all danger of frost is past. In spring, old roots should be divided before planting; for mass effects, plants may stand 12-24 inches apart. In autumn the roots should be dug and stored over winter in a warm dry place. The usual method of rapid multiplication is by division of the roots, each piece having a bud. These pieces should be started in heat in early April, covering them 2 or 3 inches in loose soil. Also propagated by seed sown in flats or pots in February and March and grown over heat; the seedlings usually bloom the first year; new varieties are obtained this way. To hasten germination, seeds may be soaked in warm water before sowing, or the seed-coat notched or filed.

edulis. Edible C. Bearing edible tubers which are cult. under the name "Tous-les-mois": to 10 ft., st. purple: lvs. to 2 ft. long, purplish beneath: fls. bright red, 3 upper staminodia varying to orange and 2½ in long. W. Indies, S. Amer.

fláccida. To 5 ft., st. green: lvs. to 2 ft. long and 5 in. wide: fls. tubular at base, yellow, the petals strongly reflexed and the 3 staminodia to 3 in. long. S. C. to Fla.—The most important parent of the orchid-fid. cannas.

generalis. Common Garben C Varying in height and color of foliage but usually glaucous: fis. not tubular at base, in many colors, to 4 in. across, with commonly 4 erect staminodes, and petals not reflexing. Of garden origin.—The original Crozy or French cannas are incorporated in this group. this group.

glauca. To 6 ft., st. glaucous: lvs. 1½ ft. long and 4 in. wide, white-edged: fls. yellow, sometimes spotted or tinged with red in hort. forms, the 3 upper staminodia to 3 in. long. Trop. Amer.

Indica. Indian Shot. To 4 ft., st. green: lvs. to 1½ in. long and 8 in. wide: fls. bright red, the lip orange spotted with red, 3 upper staminodia 2 in. long. Trop. Amer.; spontaneous in S. U. S.

iridifiòra. To 10 ft., st. green: lvs. to 4 ft. long and 1½ ft. wide: fis. rose, drooping, the corolla-tube 2½ in. long.

orchiddes. Orchid-flowered C. Foliage green or bronzy: fis. tubular at base, yellow to red, striped and splashed, to 6 in. across, with soft flowing outlines, the petals reflexed after first day, having 5 staminodes. Of garden origin.—To this group belong such varieties as Italia and Austria.

Warscewiczii. To 5 ft., st. purplish or brown-purple: lvs. about twice as long as broad: fls. scarlet often tinged with blue, the 2 or 3 upper staminodia to 3 in. long. Costa Rica, S. Amer.

CÁNNABIS. Moracex. One variable_ann. herb native in temp. Asia and nat. in E. N. Amer., grown for the fiber obtained from the inner bark and used for cordage. C. sativa (C. gigantea). HEMP. To 12 ft.: lvs. alternate, digitately divided into 3-7 narrow toothed lfts. to 9 in. long: staminate fls. in panicled racemes to 1 ft. or more long; pistillate spikes short and leafy: fr. a small achene.

The dried leaves and flowers of the hemp plant have been used as a narcotic in this country and abroad and have been used as a narcotte in this country and abroad and have received considerable publicity under the names of mari-juana, hashish, and bhang. The dried flowering tops of the pistiliate plants are very rich in the narcotte drug mari-juana which, for medicinal purposes, is extracted with alcohol and in the illicit narcotte trade pulverized and made alcohol and in the illicit narcotic trade pulverized and made into the form of cigarettes or mixed with tobacco for the same use. Three active ingredients, cannabinene, tenanocannabinene and cannabinol have been obtained from the resinous exudate of the plant; the first two are alkaloids, the last a dangerous narcotic glucoside. The principal effects of the smoking of marijuana are due to changes in the central nervous system in which it produces a mixture of depression and stimulation, the latter accompanied by irrational hallucinations and incoordination of the locomotor muscular system of the body during which period the subject is not responsible for his actions. Continual use of the narcotic causes deterioration of the nervous system. system.

Under the Federal Marihuana Tax Act (passed in 1937) any person in the United States who cultivates the plants or deals in them or their parts must register with the Federal Bureau of Narcotics and pay a tax.

CANNACEÆ. CANNA FAMILY. One trop. or subtrop, genus of some 30 species, having alternate entire lvs. with sheathing petioles and red or yellow fls. in terminal spikes, racemes or panicles, of peculiar structure: sepals 3, small; petals 3 and sepal-like, remaining erect or reflexing; showy part of fls. represented by 2-5 petal-like staminodia, one reflexed and forming the lip; ovary inferior, 3-celled: fr. a dry caps.

CANNON-BALL TREE: Couroupita quanensis. CANTALOUPE: Cucumis Melo; see Melon. CANTERBURY BELLS: Campanula Medium.

CÁNTUA. Polemoniacex. S. American shrubs or small trees with opposite simple lvs. and red, violet or white long-tubular fls. in terminal clusters; grown in a cool greenhouse or out-ofdoors in mild climates. Propagated by cuttings under glass.

bicolor. Similar to C. burnfolia but with shorter lvs. and solitary fis. with a short yellow tube Peru.

buxifòlia. Shrub to 10 ft: lvs. 1 m or less long, entire: fls. narrow, pinkish-red striped with yellow, to 3 m. or somewhat more long, handsome. Peru, Bohvia, N. Chile.

CAOUTCHOUC TREE: Hevea brasiliensis; see Cryptostegia

CAPER-BUSH: Capparis spinosa.

CAPILLARY: hair-like; very slender.

CAPITATE: headed; in heads; formed like a head; aggregated into a very dense or compact cluster.

CAPNOIDES: Corydalis. CAPOLLIN: Prunus Capuli.

CAPPARIDACEÆ. CAPER FAMILY. About 35 trop., subtrop. and temp. genera of herbs and shrubs, sometimes trees, with simple or palmately compound lvs., mostly bisexual irregular fls. with 4–8 sepals and petals or rarely petals lacking, 6 to many stamens, superior sessile or stalked 1-celled ovary, and fr. a caps. or berry. Capparis, Cleome and Polanisia are known to hort.

CAPPARIS. Capparidacex. Shrubs or trees with simple lvs., large white fls. in corymbs, the ovary long-stalked, and berry-like frs.; one species grown for the flower-buds which are pickled and sold as capers. Propagated by cuttings in heat or by seeds. Not hardy N., but may be grown as annual.

rupéstris: C. spinosa.

spinòsa (C. spinosa.
spinòsa (C. rupestris). Caper-Bush. Spiny shrub to 3 ft.: lvs. roundish, to 2 in. long; fts. about 1 in. long, solitary on thick stalks. Medit, region. Var. inérmis is unarmed.

CAPRIFOLIÀCEÆ. HONEYSUCKLE FAMILY. Thirteen widely distributed genera consisting mainly of shrubby plants: lvs. opposite, simple or pinnate: fls. bisexual, with 4-5-toothed calyx, gamopetalous 4-5-lobed corolla, 4-5 stamens, and inferior usually 1-5-celled ovary: fr. a berry, drupe, achene or caps. The family furnishes many very attractive ornamental plants in the genera Abelia, Alseuosmia, Diervilla, Dipelta, Kolkwitzia, Leycesteria, Linnæa, Lonicera, Sambucus, Symphoricarpos, Triosteum, Viburnum, Weigela.

CAPRIOLA: Cunodon.

CÁPSICUM. RED-PEPPER. Solanacex. Shrubs but grown mostly as herbaceous annuals in the N., much branching and glabrous: lvs. simple and entire: fls. small, white or greenish-white sometimes tinged violet, corolla wheel-shaped: fr. a pod-like many-seeded fleshy indehiscent berry varying widely in size, shape, color and pungency under cult. For cult. see *Pepper*.

abbreviatum: C. frutescens var.

annuum: C. frutescens.

baccàtum: C. frutescens.

baccatum: C. frutescens.

frutéscens (C. annuum. C. baccatum). Shrub to 8 ft., trunk becoming 3 in. through: Ivs. from 1-5 in. long: fls. about ½ in across: fr. vanable, erect, declined or drooping. Native in warm countries. The type of C. frutescens is the Bird Pepper, with erect spherical or oblong fr. to 34 in long, usually red. The races with developed frs. may be grouped as follows: Var. abbreviātum (C. abbreviātum). Fr. ovoid, to 2 in long or less, usually rugose; grown for ornament or piekling. Var. cerasiforme. Cherry P. Fr. erect or declined, spherical, to 1 in across, yellow or purplish, very pungent. Var. conoides. Cone P. Fr. conical or oblong-cylindrical, to 2 in. long, usually erect. Var. fasciculātum. Red Cluster P. Fr. erect, fasciceled, very slender, to 3 in. long, red, very pungent. Var. gróssum. Bell. or Sweet P. Tall, stout: fr. large and puffy with depression at base, sides usually furrowed, oblong, bell-shaped or apple-shaped, red or yellow, mild in flavor. Var. lóngum. Long P. Fr. mostly drooping, elongated to 1 ft long, usually tapering to apex, often 2 in. across at base; includes Long Red, Long Yellow, Chilli, Cayenne and others.

CAPSULE: a dry fruit of more than one carpel, usually opening at maturity; compound pod.

CARAGÀNA. PEA-TREE. PEA-SHRUB. guminosx. Shrubs or small trees mostly from Cent. Asia, with deciduous pinnate lvs., papilionaceous mostly yellow fls. borne singly or in few-fld. clusters, and linear cylindrical 1-celled pods; grown for ornament, hardy in central and northern states.

Pea-trees should be planted in sunny positions in sandy soil. Propagated by seeds sown in fall, or in spring after being soaked in warm water; by root-cuttings, layers, or grafting on C. arborescens.

Altagàna: C. microphylla.

arboréscens. To 20 ft.: lfts. 4-6 pairs, the stipules spiny arborescens. To 20 it.: Its. 4-0 pairs, the stipules spiny and much shorter than petioles: fls. yellow, calyx-teeth very short: pod 1½-2 in long. May-June. Siberia, Manchuria. Var. albéscens has lighter green and more glaucous foliage. Var. Lérbergii (C. Lorbergii) has Its. narrower than type, also standard and wings of fls. Var. nana is smaller than type and with twisted branches. Var. péndula has pendulous branches.

aurantiaca. To 4 ft.: Ifts. of 2 pairs, the stipules spiny: fis. orange-yellow. May-June. Cent. Asia.—Differs from C. pygmæa in its persistent rachis and broad calyx.

Bolsii. To 6 ft.: Ifts. 5-6 pairs, to 3/4 in. long, somewhat pubescent beneath, stipules spiny, to 3/4 in. long; fis. yellow, solitary, calyx-teeth not spiny, W. China.

brevispina. To 8 ft.: Ifts. 5-7 pairs, rachis and stipules spiny: fis. yellow, usually 3-4 on a peduncle. June. Himalayas.

Chámlagu. To 4 ft.: lfts. of 2 pairs, not close together, obovate, the lf.-stalk spine-tipped: fls. reddish-yellow. May. N. China.

decorticans. Lits. 3-6 pairs, to $\frac{3}{3}$ in long, hot pubescent beneath, stipules spiny: fis. yellow, to 1 in. long, calyxteeth spiny. June. Afghanistan.

fèrex: C. spinosa.

frutéscens: C. frutex.

frûtex (C. frutescens). To 10 ft.: lfts. of 2 pairs close together, obovate: fis. bright yellow. May. S. Russia to Japan. Var. macrántha (var. granliflora) has larger fis.

Lorbergii: C. arborescens var.

Maximowicziana. To 6 ft.: Ifts. of 2-3 pairs, the stipules spiny: fls. bronzy-yellow. W. China.

microphfila (C. Altagana). To 10 ft.: lfts. of 6-9 pairs, the lf.-stalk with short deciduous spine: fls. yellow. May-June. Siberia, China.

pygmèa. To 4 ft. or sometimes prostrate: Ifts. of 2 pairs, rachis deciduous, the If.-stalk spine-tipped: fls. yellow, calyx narrow-campanulate. May-June. Caucasus to Tibet. Var. aurantiaca erecta is C. aurantiaca.

sophoræfòlia. A hort. hybrid between C. arborescens and C. microphylla, differing from the former in its pod about ¾ in. long and somewhat shorter lfts.

spindsa (C. ferox). To 6 ft. or sometimes prostrate, the branches spiny: Ifts. of 2-4 pairs, those of spurs with 2 pairs. Siberia.

CARALLŪMA. Asclepiadacex. Succulent leafless herbs with angled sts., allied to Stapelia and of similar cult.: fls. usually in clusters, with 5-lobed corolla and crown of 2 series.

Bürchardii. Similar to *C. europya*, with very irregular star, corolla unmarked inside and covered with white hairs. Canary Isls

caudata. Sts. with 4 rounded toothed angles: fis. near base of sts., 3½ in. across, yellow mottled with purple, corolla-lobes tapering into long narrow tails. Cent. Afr.

europæa. Sts. erect or prostrate, 4-angled, with blunt teeth and rudimentary lys: fls. at tips of sts., ½ in. across, greenish-yellow with transverse brown lines and brown hairs, tips of corolla-lobes red-brown. Medit. region.

Leendértziæ: C. melanantha.

lûtea. Sts. to 4 in high, 4-angled, with sharp teeth, mottled with purple: fls near middle of sts, to 2½ in. across, yellow, corolla-lobes chiate with purple hairs. S. Afr.

melanántha (C. Leendertzia). Sts. to 4 in., 4-angled, with sharp teeth: fls. at sides of sts, 2 in. across, purpleblack, corolla rough inside, ciliate with long hairs. S. Afr.

Nebrownii. Sts to 7 in., 4-angled, with promunent teeth having small side stipules: fls in large clusters, 4 in. across, dark red-brown, ciliate with purple hairs. S. Afr.

pseudo-Nebrownii. Simlar to C Nebrownii but fis. in smaller clusters and marked with yellow. S. Afr.

ramosa. To 1 ft., with many slender 4-angled branches: fls. purplish, small, in clusters along grooves near branch tips. S. Afr.

Spréngeri. To 5 in., sts. branched, 4-angled, angles coarsely toothed, dark green mottled purple: fls. purple, to ¾ in. across, annular and inner corona reddish. Ethiopia.

CARAMBOLA: Averrhoa Carambola.

CARARA CORONOPUS: Coronopus procumbens. CARÁWAY: Carum Carvi.

CARDÁMINE. BITTER-CRESS. Cruciferæ. Erect ann., bien. or per. herbs with fibrous roots or bulbiferous rootstocks, entire or dissected lvs., white to purple fls. and elongate flat dehiscent siliques. The genus is confined to temp. regions of both hemispheres, has about 150 species some of which are showy, but they appear not to be in general cult.

angulata. Per. to 2 ft.: lvs. of 3 or rarely 5 rhombic lfts. which are 3-lobed or -toothed; fis. white, ½ in. long. B. C. to Ore. and Wyo.

cordifòlia. Per to 2 ft.: lvs. cordate, to 2 in. long, wavy-toothed: fls. white, about ½ in. long. Wyo. to New Mex.

pratensis (Dentaria digitata). Ladies-Smock of Cuckoo-Flower. Per. to 1½ ft.: lvs. lanceolate to oblong, pinnately divided, segms. of 3-7 pairs, or if unlobed entire or toothed: fls. white to rose-colored, often double. Eu., Asia and N. N. Amer.—Adapted to rock-gardens and cool moist borders or to bog-margins. In parts of Eu. the lvs are said to be used as a cress. Propagated usually by offsets, but may be started from seed.

CARDAMON: Elettaria.

CARDIÁNDRA. Saxifragacex. Japanese and Chinese subshrubs, sometimes essentially herbaceous, with alternate lvs. and small fls. sur-

rounded by large sterile fis. borne in summer in terminal corymbs; not hardy N. Propagated by cuttings of young wood under glass.

alternifòlia. To 3 ft.: lvs. elliptic, to 7 in. long, coarsely toothed: fls. pink, lilac or white. Japan.

CARDINAL-CLIMBER: Quamoclit Sloteri. -Flower: Lobelia cardinalis.

CARDIOSPÉRMUM. HEART-SEED. Sapindaceæ. Herbaceous vines with alternate bipinnate coarsely toothed lvs., small irregular polygamous or diœcious fis. in axillary corymbs which have two opposite tendrils, and fr. an attractive inflated caps.

These vines are grown for ornament and for covering trellises and bushes. Propagated by seeds sown where plants are to grow and treated as annuals; in mild regions they may self-sow.

grandiflorum. Slender essentially glabrous vine, probably ann. or bien., with white fis. about ½ in. across and oblong pods to 2 in. long. W. Indies, S. Amer.

Halicácabum. Balloon-Vine. Ann. or bien., perhaps sometimes per., climbing to 10 ft.: fls. white, very small: fr. much inflated, nearly globular but 3-angled, about 1 in. long and broad. Bermuda, Fla., Tex., trop. Amer. but nat. in many parts of world and commonly cult.

hirsutum. Probably ann. or bien, perhaps per., with densely hairy st.: fis. white: fr. much inflated, 3-angled, pubescent, to 2 in. long and much narrower. Afr.

CARDOON: Cynara Cardunculus.

CÁRDUUS. Plumeless Thistle. Compositæ. Stout herbs with sessile spiny-toothed or lobed lvs. and spiny heads, solitary or in panicles, the fls. all tubular; pappus bristly but not plumose (see Cirsium); native from the Canary Isls. to Japan.

The plumeless thistles grow well in ordinary soil, and are easily propagated by seeds or division. They are employed for bold effects of herbage and bloom.

arábicus: C. pycnocephalus; see also Silybum eburneum. benedictus: Cnicus benedictus.

Kérneri. Bien. or per., much branched, to 3 ft., sts. with spiny wings: lvs punnately lobed; heads solitary or in pairs, rose-purple, to 2½ in. across. Probably Balkans.

Marianus: Silybum Marianum.

pycnocéphalus (C. arabicus). Ann. to 3 ft. or more, spiny: lvs. pinnatifid: heads 2-5, purple. Medit. region.

CAREX. Sedge. Cyperacex. Per. grass-like herbs of about 900 widely distributed species, having inconspicuous unisexual fls. borne in dense spikes, and achenes inclosed in a sac (perigynium); mostly monoccious.

Sedges are sometimes planted for edgings in the greenhouse or as pot-plants; many of the native species, with pendent spikes, are useful for colonizing in bogs and along pond borders; some of them make attractive clumps. Propagated by division of the clumps or rhizomes, or by seeds sown in autumn.

comans. Densely tufted: lvs. thread-like, to $1\frac{1}{2}$ ft. long. New Zeal.

crinîta. To 5 ft.: lvs. several ft. long and to 1% in. wide: spikes hanging. Newf. to Fla. and Tex.

elegantissima: listed name.

Fraseri (Cymophyllus Fraseri). Lvs. evergreen, flat, to 1½ ft. long and 2 in. wide, without midnerve. Va. to N. C. japônica: C. Morrowii.

Morrowii (C. japonica). Tufted: lvs. evergreen, flat, to 1 ft. long and 1/2 in. wide, often white-striped. Japan.

péndula. More or less tufted: lvs. to 3 ft. long, glabrous. Eu., W. Asia and N. Afr., in moist dense woods.

plantaginea. Woods plant with flat persistent strongly ribbed lvs. to 1 in. broad and 1 ft. or more long, and early culms with red-brown sheaths and 3 or 4 fertile spikes. N. B. south and west.—Useful for colonizing and in rockgardens.

CARICA. Caricaceæ. More or less succulent trees, commonly directions or often imperfectly so, with straight trunks bearing at summit a crown of palmately lobed lvs., and fr. a fleshy

berry resembling a melon; one species is widely grown in the tropics for the edible fr. Commercial papain is also extracted from the fr.

and other parts of the plant.

And other parts of the plant.

Papayas require tropical temperatures but withstand a few degrees of frost. They do best on rich well-drained loam. Trees bear within a few months after planting but are short-lived. For orchard cultivation they should be set about 10 feet apart. Care must be taken to have both staminate and pushliate plants, although some varieties have bisexual flowers. Propagated by seeds although sometimes cuttings or grafts are employed.

Papaya. Papaya. Pawpaw. To 25 ft.: lvs. to 2 ft. across, deeply 7-lobed, the lobes themselves pinnately lobed: fis. yellow, the staminate siender and long-tubed, to 1 in. or more long, in racemest to 3 ft. long, pustillate much broader, solutary or few together; staminate plant sometimes bearing a few pistillate fis.: fr. yellow or orange, to 20 in. long, with thick yellow flesh. Trop. Amer.

CARICÀCEÆ. PAWPAW FAMILY. Two genera of trees with milky juice, Carica grown for the edible fr. The family is characterized by palmately lobed lvs. in terminal clusters, mostly diceious fls. having 5-lobed calyx and corolla, 10 stamens, superior 1-celled ovary, and fr. a

CARINATE: keeled: provided with a projecting central longitudinal line or ridge on the lower or under surface, like the keel of a boat.

CARÍSSA. A pocynacex. Spiny much branched evergreen shrubs of the tropics of Afr., Asia and Australia, with opposite leathery lvs., milky juice, white or pink mostly fragrant fls. in terminal cymes, and berry-like often showy fr.; grown as popular hedge plants and for the edible frs.

Carissas are grown on almost any soil in regions having only a few degrees of frost. Propagated by cuttings, layers and shield-budding.

acuminata: C. Arduina.

Arduina (C. acuminata, C. bispinosa), Hedge-Thorn. To 10 ft.: lvs. ovate to oblong, to 3 in. long: fls. white, 1/2 in. across: fr. bright red, 1/2 in. long. S. Afr.

bispinòsa: C. Arduina.

Carándas. Karanda. Lvs. ovate or oblong, to 3 in. long: fis. white or pink, fragrant: fr. red but becoming black, to 1 in. long. India.

edulis. Straggling much branched shrub: lvs. ovate, to 2 in. long: fls. white or purple, ¾ in. long: fr. purple to black, ¼ in. across, edible. Egypt.

grandiflora. NATAL-Plum. AMATUNGULA. To 18 ft.: lvs ovate, to 3 in. long: fls. white, fragrant, about 2 in. across: fr. scarlet, 1-2 in. long, edible. S. Afr. Var. nana compâcta is listed as a low dense form.

ovata. To 4 ft.: lvs. ovate, usually ¾ in. long: fls. ¼ in. long: fr. to ¾ in. long, edible. Australia.

spinarum. Lvs ovate, to 1½ in. long: fls. white, ½ in. long: fr. black, ¼ in. across. India, Ceylon.

Compositæ. Herbs with spiny usually pinnately cut lvs. and large heads of tubular fls.; involucre with outer row leaf-like, inner often ray-like; pappus with plumose branches; native in Eu. and Asia. Sometimes grown in the rock-garden or similar places.

acanthifòlia. Stemless per.: outer lvs. pinnatifid, inner entire, white-tomentose beneath: heads white, solitary, 4 in. across. S. Eu. to W. Asia.

acaulis (Cirsium acaule. Cnicus acaulis). Stemless per. to 9 in.: lvs. pinnatifid, glabrous or pubescent beneath: heads white, solitary, to 6 in. across. S. Eu.

CARLUDOVICA. Cyclanthacex. Shrubby or herbaceous plants with palm-like lvs. and unisexual fls. borne in a dense spadix subtended by bract-like spathes, as in many aroids; about 40 trop. American species.

Carludovicas are grown in greenhouses and require abundant water and good drainage after the manner of palms. Propagated by division or by seeds sown on surface of finely chopped sphagnum, after the pulp has been washed

atróvirens. Stemless: lvs. 2-lobed to below the middle, glabrous, very dark green. N. S. Amer.

humilis. Dwarf, nearly stemless: lvs. angular, 2-lobed and jagged at tip. Colombia.

Laucheàna (Ludoria Laucheana). St. very short: lvs. to 12 in. long, 2-lobed to middle or below, the segms. linear-oblong, acuminate, 5- to 7-ribbed. Colombia.

palmata. Stemless: lvs. fan-shaped, 4-lobed nearly to base and the lobes cut, ends drooping. Peru.—The lvs. furnish fiber from which Panama hats are made; frequent in greenhouses.

plicata. Sts. to 1 ft.: lvs. deeply 2-lobed, the segms. 1nerved. Colombia.

CARMICHÆLIA. Leguminosæ. New Zealand shrubs with flattened or cylindrical green branches functioning as lvs., simple or pinnate lvs. which soon fall and leave the plants with bare odd twigs, small papilionaceous fls. in lateral racemes, and small leathery pods; oc-casionally cult. in warm regions for ornament and interest, as in Calif.

austrâlis. To 12 ft., much branched: lvs. to 2 in. long, of 1-5 lfts.: fls. pale purple, to ½ in. long, in 3-12-fld. racemes: pods to ½ in. long.

Enysii. Much branched, forming dense patches 2 in. high: fis. reddish, to 1/4 in. long, solitary or in 3-6-fid. racemes: pods to 1/4 in. long.

flagelliformis. To 8 ft., much branched: lvs. to 1½ in. long, of 3-5-lfts.: fls. minute, in 3-7-fld. racemes: pods to 1/3 in. long.

grandiflora. To 6 ft., much branched: lvs of 3-5 lfts: fls. purplish veined with violet, 1/4 in. long, in 5-12-fld. racemes: pods to 1/2 in. long.

odorâta. To 10 ft, with pendulous branchlets: lvs. to ¾ in. long, pinnately 3-7-parted: fls. white or hlac, ¼ in. long, in 10-20-fld. racemes: pods to ¼ in. long.

uniflora. Matted, sts. to 2 in. high: fts. purplish-red, in. long, solitary: pods to ½ in. long.

Williamsii. To 12 ft. or more, much branched: lvs. of 1-3 lfts.: fis. pale yellow marked with purple, to 1 in. long, solitary or in 2-6-fid. racemes: pods to 1½ in. long.

CARNATION (Dianthus Caryophyllus). ennial herbaceous fragrant pinks or dianthus of many forms, some of which are hardy with protection in the northern states and parts of Canada. In North America the name carnation is ordinarily understood to mean the florists plant, grown under glass for cut-flowers, but it rightly belongs to all the forms of the species. The highly developed large-flowered forms are of two general groups, the border or outdoor carnations and the glasshouse or florists carnations: these are commonly propagated by means of cuttings to perpetuate particular varieties and sometimes by means of layers. The border carnations are little raised or fancied in North America although they are charming plants when well grown. The interest in this general group of plants is represented in the American Carnation Society.

Another group comprises the marguerite carnations, mostly propagated from seeds and that usually bloom the first year, although unspent plants may be carried over winter in the open outside the severer parts of the country and should flower freely the second year. The marguerites make attractive house plants if potted in autumn. The seeds of these carnations may be sown in boxes in March and the young plants set out as early as possible, pinching out the center of the plant to make it branch freely. Give the same space as for other garden pinks, 8-15 inches apart.

The winter-flowering or perpetual carnations have long been favorites although in the commercial field demands change from year to year. They may be considered either as house plants or as florists stock grown in glass ranges. The propagation and general cultural requirements are the same in either case, although the extent of the operations may be very different.

Propagation of carnations for window-garden and greenhouse is by means of cuttings taken from the strong shoots that arise at the base, the side shoots of the flowering stem, or the main shoots before they show flower-buds. The cuttings from the base make the best plants in most cases, or from the middle of strong flower-stems.

For window-garden use, the cuttings may be taken at any time in autumn or winter, rooted in sand and potted up, to be held in pots until planting out time in spring, usually in April, or any time when the ground is ready to handle. Care should be taken to pinch out the tops of young plants while growing in the pot, and later while in the ground, causing them to grow stocky and send out new growths along the stem. The young plants should be grown cool, a temperature of about 50° suiting them well. Attention should be given to syringing the cuttings each day while in the house to keep down red-spider. In summer, the plants are grown in the field, and not in pots. The soil in which they are to be planted should be moderately rich and loose. Clean cultivation should be given throughout the summer. Frequently pinch out the tops. The plants are taken up in September and potted firmly, and well watered; then set in a cool partially shaded situation until root growth has started. They are then taken to the residence. on approach of cold weather, to bloom. The usual living-room conditions as to moisture and heat are not such as the carnation demands, and care must be taken to overcome the heat and dryness. Pick off most or all the side buds, to add to the size of the leading flowers. It is probably advisable in most cases to purchase plants from a florist, and after blooming either throw them away or store them for planting in the spring, when they will bloom in the summer. Be sure that plants and cuttings are free from

For commercial or florists work cuttings are preferred from good flowering stems, not choosing either the soft tip or the hardened base. They are cut midway between the joints and inserted a half inch or so in sand, the lower leaves having been removed. The illustration in Fig. 15, (Propagation), shows a good carnation cutting. The cuttings are set close together in a well-prepared sand bed on a bench. Cuttings are usually taken December to March, for the following winter bloom. When well struck the cuttings are potted, to make ready for planting out in summer.

The plants grow thereafter in the field, being set in late spring when the weather has become settled, and turned out of the pots; the soil should be deep and in a good state of cultivation. They are set 8–10 inches apart in the row. The space between rows is determined by the ground available, and by the method of tillage; it varies from 16–24 inches or even more. Late in summer or at least before freezing weather the plants are dug and removed to greenhouse benches for winter bloom. The exact date of digging must depend somewhat on the strength of the plants and also on the time at which bloom is required. In some cases plants are grown continuously in the house for summer or very early bloom.

Blooms may be expected in a month or six weeks after benching.

Benches are refilled with good soil in summer or autumn, the house being thoroughly cleaned. Plants are spaced regularly about 9 by 12 inches on the benches. The beds should be kept uniformly moist until the plants are well rooted. The field stock is assorted before it is brought to the house, and all weak and diseased plants discarded. If plants are dug early, the weak ones may be left for later digging if they are healthy.

Carnations are cool-temperature plants. If the house is too warm the growth becomes soft and the flowers are fewer and of poor quality. About 50° F. night temperature is commonly advised; it may run 10° higher by day; it should be steadily maintained. The house should be well ventilated but cold currents should not strike the plants.

The varieties of florists carnation are many, and new ones are continuously introduced. The intending grower will need to keep informed on them. The character of bloom depends on the skill in growing as well as on the particular variety. For cut-flowers, the plants are grown to single long stems by pinching out side shoots. The usual blooming season is September or October to May or June, and in this period a plant should yield 18–24 good flowers.

Red-spider is combatted by fumigation with proprietary materials. Similar treatment may be given for thrips, under glass. Aphis is controlled by rotenone sprays. Rust and other diseases are controlled by propagating only from healthy stock, by disease-free soil, by keeping benches clean and sterile, by maintaining uniform temperature and plenty of fresh air and general good growing conditions with care not to keep the plants wet, by removal of affected plants, and then by dusting with sulfur or by other fungicide.

CARNÈGIEA. Cactacex. One great desert cactus of Ariz., S. E. Calif. and Sonora, Mex., with an erect columnar trunk sometimes with a few akimbo branches, many ribs and strong spines: fls. at or near top of plant. See Cacti. C. gigantèa (Cereus and Pilocereus giganteus). Sahuaro. Giant Cactus. Post-like, 20-60 ft., sometimes 2 ft. diam., tapering to either end; ribs 18-21 in mature plants; spines different on fertile and sterile arcoles: fls. white, diurnal, 4 in. long or somewhat more: fr. 2-3 in. long, pale red, edible.—Sometimes transplanted from the wild in its native regions or similar climates, but does not thrive under cult.

CARO: Enterolobium cyclocarpum. CAROB: Ceratonia Siliqua.

CAROLINEA PRINCEPS: Pachira aquatica.

CAROSELLA: Fæniculum vulgare var. piperitum.

CARPÁNTHEA. Aizoacex. One S. African plant separated from Mesembryanthemum (which see for cult.): stigmas and cells of fr. 12-20; expanding keels of caps. terminating in awns. C. pomeridiana (M. pomeridianum). Ann., with ascending branches to 1 ft.: lvs. spatulate or somewhat narrower, to 4 in. long, flat, narrowed to petiole: fls. yellow, to 2 in. across, on peduncles to 5 in. long, opening in the afternoon.

CARPEL: one of the units of a compound pistil; a simple pistil is one carpel.

CARPENTÈRIA. Saxifragacex. One evergreen shrub native in the southern parts of the Sierra Nevada Mts., Calif. C. californica. To 10 ft.: lvs. opposite, oblong to lanceolate, to 4 in. long, bright green above, whitish-tomentose beneath: fls. pure white, 2-3 in. across, fragrant, showy, single or few in a cluster, June-July.—Hardy only in warm-temp. regions. It requires a well-drained light and sandy soil, and a sunny sheltered position; the excess of water in winter is especially harmful, probably more than the cold. Propagated by greenwood cuttings under glass in summer, by suckers which are freely produced, and by seeds sown in spring.

CARPET-WEED FAMILY: Arzoacen.

CARPHÉPHORUS. Compositæ. Simple per. herbs with narrow alternate lvs. and rose-purple fls. in terminal cymose infl. Two species are offered.

bellidifòlius. To 20 in., sts. glabrous or glabrescent: lvs. linear-spatulate, to 3 in. long: heads in open slenderly branched cymes. Coastal plain, N. C. to Fla.

corymbòsus. To 3 ft., pubescent: lvs. spatulate to elliptic-ovate: heads in compact cymes. N. C. to Fla.

CARPÌNUS. HORNBEAM. Betulaceæ. Northern hemisphere deciduous monorcious trees of medium or small size, with smooth gray bark, alternate toothed lvs., unisexual fls. in catkins, and fr. a small achene-like nut subtended by a 3-lobed leafy bract; planted for hedges and specimen plants.

Hornbeams are hardy North and thrive in most soils. Propagated by seeds in fall; if seeds do not germinate the next spring the bed should be covered with moss and kept moist until the remaining seed sprout. Varieties may be grafted or budded on seedling stocks.

americana: C. caroliniana.

Bétulus. European II. To 70 ft.: lvs. ovate or ovateoblong, to 4 in. long: fruiting eatkins to 5 in long, bracts
to 2 in. long, the middle lobe much larger. Eu. to Persia.
Some of the hort vars. are. Carpinizza, lvs. smaller and
often cordate; columnaris, of slender pyramidal habit;
fastigiata (var. pyramidah.), of pyramidal form; incisa,
lvs. deeply lobed; péndula, branches drooping; purpurea,
young lvs. purple; quercifòlia, lvs. with deep toothed lobes.

caroliniana (C. americana). American H. Blue Beech. To 40 ft., but usually small: lvs. ovate-oblong, to 4 in. long: fruiting catkurs to 4 in. long, bracts about 1 in. long, the middle lobe largest. Que. to Fla. and Tex.

cordata. To 50 ft.: lvs. ovate or oblong-ovate, cordate, to 5 in long: fruiting catkins to 3 in. long, the bracts overlapping. N. Asia.

japónica. To 50 ft.: lvs. oblong-ovate or oblong-lanceolate, to 4 m. long: fruiting catkins to 2½ in. long, the ovate bracts ¾ in. long and overlapping. Japan.

laxiflora. Tree to 50 ft.: lvs. usually ovate, to 234 in. long, pubescent only in axils of veins beneath, base heartshaped. catkins loose, to 234 in. long. Japan.

populifolia: listed name of unknown botanical standing.

Tschonóskii (C. yedoensis). To 50 ft., young branches densely pubescent: Ivs. ovate or oblong-ovate, to 3½ in. long: fruiting catkins to 3 in. long, bracts lobed on one side. N. Asia.

yedoénsis: C. Tschonoskii.

CARPOBRŌTUS. Aizoacex. A widely dispersed group separated from Mesembryanthemum on the mostly 10-16 stigmas and fleshy fr.: per. with sts. trailing or decumbent: lvs. opposite, sharply 3-angled and very fleshy: fis. large, showy in sunlight, yellow to reddish and purple: fr. indehiscent, edible. S. Afr., Australia, New Zeal., Calif., Chile. For cult. see Mesembryanthemum.

acinacifórmis (M. acinaciforme). Sts. angled, to 4 ft.: lvs. scimitar-shaped (incurved, acinaciform), widely keeled, to 3 in. long: fis. very large, purple, on 2-bracted peduncle; stigmas 14. S. Afr.

æquilaterus: see C. chilensis.

chilénsis (M. chilense). Trailing several ft.: lvs. fleshytriangular, 2½ in. or less long: fls. rose-purple, diurnal, 2 in. or less broad, the petals 1 in. or less long, anthers yellow or yellowish. Coasts Ore., Calif., Chile, making a good sand-cover.—Heretofore known in N. Amer. as M. aquilaterale, but that name is properly a synonym of C. aquilaterus, an Australian plant not native in N. Amer. nor in cult.

edùlis (M. edule). Hottentot-Fig. Much like C. chilensis but parts larger: lvs. to 3 in. and more long: fls. yellow varying to rose-purple, opening wide, to 3 in. across, petals about 1½ in. long: fr. very large. S. Afr., planted and somewhat escaped in Calif.—Usually seen with yellow fls.: frequently grown under glass.

glaucéscens (M. glaucescens). Similar to the other species: stouter than C. chilensis, with smoky-brown anthers: plant more or less glaucous: sts stout, $\frac{1}{2}$ in. thick: lys. 2 in. or less long and $\frac{1}{2}$ in. to nearly $\frac{1}{2}$ in. thick near tip: fls. rose-purple. Australia.

CARPOCERAS: Thluspi cilicicum.

CARPÓDETUS. Saxifragacex. One New Zeal. shrub or small tree to 30 ft., intro. to cult. in Calif. C. serratus. Lvs. alternate, ovate-oblong, to 2 in. long, coarsely toothed, often lobed when young: fls. white, ½ in. across, in many-fld. panieles: caps. black and shining, globose, to ¼ in. diam.

CARRIÈREA. Flacourtiacex. One or 2 deciduous trees native in Cent. China; one is planted in Calif. and has been fairly hardy in the S. E.; attractive for its foliage. Propagated by seeds and by cuttings of green wood and roots.

calfeina. To 30 ft: lvs. alternate, oval or ovate, to 6 in. long, toothed, shining: fls. diocious, with white sepals ¾ in. long and no petals, in corymbs or racemes: fr. a caps. to 21½ in. long.

CARRION-FLOWER: Stapelia, Smilax herbacea.

CARROT (Daucus Carota var. sativa). Biennial or sometimes annual plant, grown for the thick edible root. It is an esteemed garden vegetable and also a farm crop raised for stock feed.

Carrots require deep friable soil for the largest and most shapely roots. They are hardy and easily grown. The extra-early varieties may be forced in a hotbed, or seed may be sown as soon as the ground is fit to work in the spring. The as the ground is not to work in the spring. The stump-rooted, or half-long varieties, are sown for the early garden crop. Well-enriched mellow loam, deeply dug or plowed, is best suited to the requirements of carrots. The time of planting of the seed for the main crop is determined by the appearance of the several broods of carrot rust-fly maggots. In the North, plantings made after the first week of June will avoid the early These carrots can be harvested in September before the late brood of maggots does much damage. Sow thickly, thinning to 3-4 inches in the row. The rows, if in a garden that is hand-worked, may be 12 inches apart. If the cultivation is by horse, the rows should be 2 to 3 feet apart. One ounce will sow 100 feet of drill. Seeds germinate slowly, and they should not be placed in land that is likely to become hard and crusted.

CARRUÁNTHUS. Aizoacex. One S. African succulent similar to Bergeranthus. C. caninus (Mesembryanthemum caninum). Short-stemmed, much branched: lvs. clustered, 3-angled, to 2 inlong and ¾ in. wide, toothed toward tip, grayishgreen: fls. usually solitary, yellow, reddish outside, 2 in. across, petals linear.

CARTHAMUS (Kentrophyllum). Compositæ. Stiff spiny-lvd. annuals with yellow, purple or

whitish heads of disk-fls. subtended by leafy spiny involucres; pappus scale-like or lacking; native from the Canary Isls. to Cent. Asia. Cult. for ornament and for the dye obtained from the fls. of one species. Propagated by seeds.

lanatus. Ann. or bien. to 3 ft. high, sometimes cobwebby: root-lvs. lyrate, st.-lvs. lanceolate and spiny pinnatifid: heads yellow, 1 in. long. Medit. region.

leucocaùlos. Glabrous: lvs. pinnatifid into lanceolate spiny segms., shining: heads pale rose. Greece.

tinctorius. Safflower. False Saffron. To 3 ft., glabrous: lvs. broadly ovate, minutely spiny-toothed: heads orange, 1 in. long, with broad short lower bracts.

CARUM. Umbelliferæ. Thick-rooted herbs with pinnately or ternately compound lvs., small white or yellow fls. in compound umbels, and somewhat compressed frs. Of easy cult. in any garden soil. Propagated by seeds sown in spring.

Carv. Caraway. Ann. or bien. to 2 ft.: lvs. pinnately cut into linear or thread-like segms.: fis. white. Eu.; nat. in N. Amer.—Grown for its seeds which are used as flavoring.

Gàirdneri. Squaw-Root. To 4 ft., with tuberous root: lvs. pinnate into linear lfts., upper lvs. usually simple: fls. white. Calif. to B. C.

oreganum. Differs from C. Gairdneri in its more divided lvs. with shorter lfts. B. C. to Ore.

CARUMBIUM: Homalanthus populifolius.

CARYA (Hicoria). HICKORY. Juglandaceæ. Deciduous monœcious trees, all but one native in N. Amer., with alternate odd-pinnate lvs., unisexual fls., the staminate borne in drooping catkins, and fr. a nut inclosed in a thick green husk which splits into 4 valves; grown for ornament, the edible nuts, and for the strong hard wood.

Any of the native hickories may be transferred to parks and private grounds. Hickories are of slow growth and not readily transplanted. Propagated by seeds stratified and sown in spring, by root-sprouts, or special varieties by grafting. For cultural details see *Hickory-Nut* and *Pecan*.

álba: C. tomentosa.

aquática. Bitter Pecan. To 90 ft.: lvs. of 7-13 lanceolate lfts. to 5 in long, yellow-tomentose when young: nut broad-obovoid, compressed and 4-angled, reddish-brown. Va. to Fla. and Tex.

cathayénsis. Chinese H. To 60 ft.: lvs. of 5-7 ovate to ovate-lanceolate lfts. to 6 in. long, yellowish beneath: nut ovoid, slightly angled. China.

cordiformis. BITTERNUT. To 90 ft.: lvs. of 5-9 ovate-lanceolate to lanceolate lifts. to 6 in. long: nut almost globose, nearly smooth, gray. Que. to Fla. and La.

glabra (C. porcina). Pignut. Tree to 40 ft., with close not shaggy bark: lfts. mostly 5, oblong or somewhat oblanceolate, acuminate, serrate, to 6 in. long; nut obovoid and somewhat ridged, to 1 in. long, the kernel astringent. Me. and Ont. to Fla.

laciniòsa (C. sulcata). Big Shellbark H. To 120 ft.: lvs. of 7-9 oblong-lanceolate lits. to 8 in. long, pubescent beneath: nut nearly globose, compressed and angled, yellow or reddish. N. Y. to Okla.

olivæfórmis: C. Pecan.

ovata. Shagbark H. To 120 ft.: lvs. of usually 5 elliptic lfts. to 6 m. long: nut ellipsoid, slightly angled, white. Que. to Fla. and Tex.

Pecan (C. oliveformis). Pecan. To 150 ft.: lvs. of 11-17 oblong-lanceolate lfts. to 7 in. long: nut ovoid or oblong, smooth, light brown. Ind. to Mex.

porcina: C. glabra.

sulcata: C. laciniosa.

tomentòsa (C. alba). Mockernut. To 90 ft.: lvs. of 7-9 oblong lits. to 7 in. long, tomentose beneath: nut nearly globose, angled, light brown. Mass. to Fla. and Tex.

CARYOLOPHA: Pentaglottis.

CARYOPHYLLACE. PINK FAMILY. Herbs or sometimes subshrubs, of about 75 widely distributed genera, with sts. usually swollen at the joints, opposite entire lvs. with parallel

veins, regular mostly bright colored fls. having 4-5 sepals, commonly 4-5 petals, 8-10 stamens, superior 1-celled ovary with 2-5 styles, and fr. a caps. or rarely a berry. The family furnishes many ornamental subjects, such as Acanthophyllum, Agrostemma, Arenaria, Cerastium, Dianthus, Gypsophila, Lychnis, Petrocoptis, Sagina, Saponaria, Silene, Spergula, Spergularia, Stellaria, Telephium, Tunica.

Most of the species are outdoor plants, but the carnation (Dianthus Caryophyllus) is extensively grown under glass for cut-flowers. Some of them are annuals, others essentially biennials, and many are good low perennials for borders. They are plants of simple culture, grown from seeds, cuttings and sometimes from layers and division of the stools. They require

open sunny situations.

CARYOPHYLLUS: Eugenia.

CARYÓPTERIS. BLUEBEARD. Verbenacex. Asian deciduous shrubs or herbs with opposite toothed lvs. and lavender or white fls. in cymes, the stamens exserted.

Grown in pots in the greenhouse in a compost of peat and loam. Not fully hardy out-doors in the North, but in the southern states may bloom from root shoots. Propagated by seeds in spring or by cuttings in autumn under

incana (C. Mastacanthus. C. tangutica). Shrub to 5 ft. but often dying back and treated essentially as a per. herb: lvs. ovate, to 3 in. long, gravish-tomentose beneath: fls. violet or lavender-blue, ½ in. long, in autumn. China, Japan.—Sometimes called "blue spirea." Var. cândida has white fls. Var. nâna is a dwarf form. Var. supérba is listed.

Mastacánthus: C. incana.

monghólica. Shrub: lvs. linear-lanceolate, to 2 in. long, nearly entire: fls. ½ in. long. N. China, Mongoha.

tangutica: C. incana.

CARYÒTA. FISH-TAIL PALMS. Palmacex. Irregularly pinnate monocious unarmed often soboliferous palms, perhaps 20 species, trop. Asia, Malaya to Australia, monocarpic (dying after fruiting): lvs. 2-pinnate or -pinnatisect, the pinnæ or lfts. broadly cuneate and widening upwards and variously jagged or lobed at apex and many-veined: spadices axillary, long and narrowly branched and mostly hanging, the staminate and pistillate blooming alternately from the top of the tree downward and the tree perishing when the bottom infl. has fruited; stamens many: fr. globose or short-oblong, 1½-3¼ in. diam. Attractive as tub specimens, and grown in the open in S. Fla. See Palm.

mitis (C. soboli/era). Soboliferous, trunks ringed, to 25 or 40 ft.: lvs. 4-9 ft. long and light green; pinne rather thin and with many light ribs or nerves, the toothed edge or end usually not occupying more than half the length and the outer margin produced into a short point: spadix not greatly elongated, the stamens 15-25. Burma.

Rumphiana. Trunk solitary, 60 ft. or more: lvs to 20 ft. long; pinnæ very oblique and about half-fan-shaped, as much as 1 ft. and more long, rigid, obtusely toothed, the lower margin sometimes extended into a long obtuse lobe: spadix to 2 ft. and more; stamens more than 30. Malaya, Australia.

sobolifera: C. mitis.

abrons. Wine Paim. Trunk solitary, to 60 ft.: lvs. to 20 ft. long and 10-15 ft. broad, dark green; pinne thick and rigid, strongly ribbed, lateral ones long-oblique so that the prominently toothed edge commonly occupies more than half the length, the outer margin mostly produced into a long finger-like lobe: spadix 10-12 ft. long, pendent; stamens 40 or more. India, Malaya.

CASCARA SAGRADA: Rhamnus Purshiana.

CASHEW: Anacardium occidentale.

CASIMÍROA. Rutacex. Trop. American trees with leathery digitate lvs., small fls. in

axillary panicles or corymbs, and fr. a large 2-5-seeded drupe; one species is grown in warm countries for its edible fruit.

The white sapote thrives on any well-drained soil. Propagated by seeds sown in flats or pots. Seedlings should not be planted out until about 3 feet high and should then receive liberal watering. The terminal bud should be pinched off to induce branching. For quick results and to reproduce special varieties, shield-budding should be

edùlis. White Sapote. To 50 ft.: lvs. of 3-7 ovate to lanceolate lfts. to 5 in. long: fis. greenish: fr. 3-4 in. across, globular, smooth, yellowish-green, with soft cream-colored edible pulp bearing 3 or 4 seeds.

tetramèria. Similar to C. edulis but lfts. densely pubescent beneath.

CASSABANANA: Sicana odorifera.

CASSANDRA: Chamædaphne calyculata.

CASSAVA: Manihot esculenta.

CASSENA: Ilex vomitoria,

CASSIA. SENNA. Leguminosæ. Very large genus as here accepted but by some authors divided into several, comprising herbs, shrubs and trees native in trop. and temp. regions, having pinnate lvs., showy nearly regular fls. often in large racemes, and flattened or cylindrical sometimes winged pods; grown for ornament, and many species of medicinal value for the senna lvs. used as a cathartic.

The woody species require a tropical climate and can be grown only under glass in the North. Propagated by division and cuttings. The herbaceous kinds may be grown in the border from seeds or division.

abyssínica: see Acacia abyssinica.

alata (Herpetica alata). Ringworm C. Shrub to 8 ft.: latv. very large, of 12-28 oblong lits. to 2½ in. long: fis. yellow, in spike-like racemes: pods winged, to 6 in. long. Tropics.

artemisioldes. Wormwood S. Shrub covered with sulky gray pubescence: Ivs of 6-8 linear needle-like lfts. to 1 in. long: fls. sulfur-yellow, in axillary racemes: pods flattened, to 3 in. long. Australia.

australis. Tall shrub: lvs. of 12-24 oblong-lanceolate to linear lfts. to 1 in. long: fls. yellow, in clusters of 2-6; pods to 4 in. long, often curved. Australia.

Beareana. Tree to 30 ft.: lvs. of 16-20 elliptic lfts. to 2 in. long fts. canary-yellow, veined with red or brown, in short racemes: pods cylindrical, to 2½ ft. long. Trop. Afr.

bicapsulāris (Adipera bicapsularis). Shrub to 10 ft.: lvs. thickish, lfts. 3-5 pairs and oblong or obovate to nearly orbicular; fls. yellow, not large; pods slender, to 6 in. long, nearly terete. W. Indies and continental tropics; planted in S. Fla.

Chamecrista. Per., sts often woody at base, prostrate or ascending, rarely erect, to 1 ft. long; lvs. of 5-10 pairs of linear lfts.: fls. to 1/2 in. long, stamens 5-7; pods linear, to 1/2 in. long. W. Indies, probably not planted in U.S.—For the ann. plant escaped or cult. here see C. fasciculata.

cinèrea (Chamæcrista cinerea). Shrub with ascending or prostrate ets to 6 in. long: lvs. of 12-15 linear lfts. to 1/2 in. long: fls. yellow, solitary or clustered: pods to 2 in. long.

corymbosa (Adipera corymbosa). Shrub to 10 ft.: lvs. of 6 oblong-lanceolate lfts. that are nearly or quite obtuse and not much more than ½ in. broad: fls. yellow, in axillary corymbs, blooming under glass from spring to autumn: pods cylindrical, 3 in. long. Argentina; nat. in southern states and frequent in cult. Var. plurjuga (C. foribunda) has broader more acute lfts. and larger fls. S. Amer.; often planted.

didymobotrya (Chamxsenna didymobotrya). Shrub to 10 ft.: lvs. about 1 ft. long; lfts. 8-16 pairs, oblong to ovate-elliptic, to 2 in. long, apex mucronate, base rounded; stipules ovate, about ½ in. long; fis. to ½ in. long, racemes erect, to 1 ft. long; pods to 4 in. long and ¾ in. wide. Trop. Afr.; nat. locally in S. Fla.

fasciculata (C. Chamacrista of hort.). Partridge-Pea. Ann. to 1½ ft.: lvs. of 12-44 linear-oblong sensitive lfts. to 3½ in. long; ffs. yellow, clustered in axils, to ¾ in. long, stamens 10: pods ffat, linear, to 1½ in. long. N. Amer., W. Indies.

Fistula. Golden-Shower. Pudding-Pipe-Tree. Tree to 30 ft.: lvs. large, of 8-16 ovate lfts. to 2½ in. across: ffs. pale yellow, in racemes 1 ft. or more long, blooming in spring before the lvs.: pods cylindrical, to 2 ft. long. India.

floribúnda: C. corymbosa var. plurijuga.

glauca. Tall shrub or tree: lvs. of 12-20 obovate lfts. about $1\frac{1}{2}$ in. long: fis. bright yellow, in umbel-like racemes: pods flat, to 6 in. long. Trop. Asia.

grandiflòra: C. læmaata.

grandis. PINK-SHOWER. Tree to 50 ft.: lvs. of 16-40 oblong lfts. to 2½ in. long, tomentose beneath: fis. rose-colored, in lateral racemes: pods somewhat flattened, to 2 ft. long. Trop. Amer.

hirsuta (Ditremexa hirsuta). Per. to 6 ft.: lvs. hirsute; lfts. ovate to ovate-lanceolate, 3-5 pairs, to 3 in. long, acute or acuminate: fls. to 34 in. long, in short axillary racemes: pods linear, to 6 in. long, densely hairy. Trop. Amer.

javánica. Small tree: lvs. of many oval lfts. to 2 in. long: fls. rosy-pink: pods cylindrical, to 2 ft. long. Sumatra,

Levigata (C. grandiflora. Adipera levigata). Shrub to 6 ft.: lvs. of 6-8 ovate-lanceolate lifts. to 3 in. long: ffs. yellow, in axillary racemes: pods cylindrical, to 3½ in. yellow, in axil

magnifica is referred to C. multijuga.

marifandica (Ditremexa marilandica). WILD S. Per. herb to 4 ft.: lvs. of 10-20 oblong lfts. to 2 in. long: fls. yellow, in axillary racemes: pods linear, flat, to 4 in. long. E. U. S.

Médsgeri (Ditremexa Medsgeri). Per.: lvs. of 8-16 oblong or elliptic lfts. to 2 in. long: fls. yellow, in axillary racemes: pods linear, curved, to 4 in. long. Pa. to Ga. and

moschata. Tree to 30 ft. and more: lvs. of 10 or more pairs of oblong lfts. pubescent beneath: fs. yellow or orangered, 1 in. across, in drooping racemes to 8 in. long: pods cylindrical. Trop. Amer.

multijuga (Peiranisia multijuga). Tree to 20 ft.: lvs. of 18-40 pars of linear-oblong lfts. to ¾ in. long: fls. yellow, to 2 in. across: pods flattened, 6 in. long. S. Amer., W. Indies

nairobénsis. Shrub to 10 ft.: lvs. of numerous oblong lfts. to 2 in. long: fls. yellow, 1½ in. across, in racemes: pods flattened, 4 in. or more long. Afr.

nictitans (Chamæcrista procumbens). WILD SENSITIVE-PLANT. Ann. to 18 in., erect or decumbent, somewhat pubescent: Ivs. sensitive; Ifts. linear, 6-22 pairs, to ¾ in. long: fls. yellow, very small, axillary: pods linear, to 1½ in. long. Me. to Ga. west to Ind. and Tex., W. Indies.

nodòsa. Jointwood. Tree to 50 ft.: lvs. of 12-24 oblong lfts. to 4 in. long: fls. bright pink, in dense racemes: pods cylindrical, to 15 in. long. E. Himalayas to Malaya.

pilifera. Herb or subshrub to 6 ft.: lvs. of 4 ovate lfts.: fls. 1 in. across, petals contracted into long claw. Brazil.

polyántha (Pterocassia polyantha). Shrub or small tree to 18 ft.: lvs. of 16-28 elliptic-oblong líts. to ¾ in. long; fls. yellow: pods flattened, winged, about 2½ in. long. Mex.

Roemeriana (Earleocassia Roemeriana). Per. to 1½ ft.: lvs. of 2 linear-lanceolate lfts. to 2½ in. long: fis. orangeyellow, in terminal long. Tex. to Mex. in terminal corymbose racemes: pods about 1 in.

siamea (Sciacassia siamea). Kasson-Tree. Tree to 40 ft.: lvs. of 16-18 oblong lfts. to 3 in. long: fis. bright yellow, in corymbs forming a large terminal panicle: pods flat, to 9 in. long. E. Indies and Malaya.

spectábilis (Pseudocassia spectabilis). Tree to 40 ft.; lvs. of 8-15 pairs of lanceolate lfts. to 3 in. long; fis. bright yellow, 1½ in. across, in racemes to 2 ft. long; pods cylindrical, I ft. long. Trop. Amer.

spléndida. Shrub to 10 ft.: lvs. of 4 oval to oblong lfts. to 3 in. long: fls. yellow, large, in panicled racemes: pods nearly cylindrical, to 1½ in. long. Brazil.

stenopétala: listed name.

tomentosa (Adipera tomentosa). Shrub to 12 ft.: lvs. of 12-16 oblong lfts. to 2½ in. long, white-tomentose beneath: fls. deep yellow: pods flattened, to 5 in. long. Mex.

CASSIA-BARK-TREE: Cinnamomum Cassia. -Flower-Tree: Cinnamomum Loureiri.

CASSIE: Acacia Farnesiana.

CASSÍNIA. Compositæ. Evergreen shrubs native in Australia, New Zeal, and S. Afr., with alternate entire lvs. and small heads of disk-fls. borne in corymbs or panicles; pappus bristly. A few species are grown out-of-doors in Calif.

álbida: C. Vauvilliersii var.

adrea. Lvs. linear-lanceolate, to 2 in. long, glandular beneath, glabrous above: heads in compound corymbs; scales, with bright yellow tips. Australia.

fülvida. To 6 ft.: lvs. crowded, to ½ in. long, yellowish-tomentose beneath, sticky above: heads white in dense corymbs to 2 in. across; scales lacking or few among the florets. New Zeal.

ieptophýlla. To 15 ft.: lvs. crowded, to 1/2 in. long, whiteor yellowish-tomentose beneath: heads white, in terminal corymbs: scales many among florets. New Zeal.

Vauvillièrsii. To 6 ft.: lvs. crowded, ¼ in. long, whiteor yellowish-tomentose beneath, sticky above: heads white, in terminal corymbs; scales many among florets. New Zeal. Var. álbida (C. albida) has lvs. whitish beneath.

CASSIOPE. Ericaceæ. Low evergreen shrubs with scale-like or linear lvs., small solitary nodding white or pinkish fls., and capsular frs.; useful for rock-gardens.

Cassiopes should be planted in moist and partially shady locations, in peaty or sandy soil. Propagated by cuttings of mature wood in August under glass; also by layers and seeds.

fastigiàta. Densely tufted shrub 6-12 in. high: lvs. ovate-oblong, imbricated, ciliate: fis. white, broadly campanulate, to ½ in. long, axillary. Himalayas.

hypnoides. To 3 in. or more, sts. densely tufted, branched, ascending: lvs. linear-subulate, to ½ in. long, not grooved: fls. clear white or tinged pink, 5-cleft, on terminal peduncles to 1 in. long. Arctic regions of northern hemisphere.

lycopodioides. Sts. creeping and filiform: lvs. about 1/2 in. long, closely imbricated in 4 ranks: fls. white, style slender. Siberia, Alaska to Ore.

Mertensiana. To 1 ft., tufted, the sts. covered with small thick crowded lvs. 1/4 in. long: fis. white, to 1/4 in. across. Alaska to Calif.

Stelleriana (*Ilarrimanella Stelleriana*). Spreading, with matted sts.: lvs. spreading, oblong-linear, ½ in. long: fis. white, ½ in. long. Alaska to Wash.

tetragona. To 1 ft., sts. erect or ascending: lvs. to ½ in. long, with deep dorsal furrow, usually pubescent when young: fls. 5-lobed, on lateral peduncles to 1 in. long. Ore. to Alaska and eastward.

CASTALIA: Nymphaa.

CASTÂNEA. CHESTNUT. Fagacex. Attractive hardy deciduous trees and shrubs of the north temp. zone, having alternate, toothed, oblong or lanceolate lvs., unisexual fls. in catkins, and 1–7 large brown nuts inclosed in a prickly dehiseent involucre or bur; grown for ornament and the edible nuts. For cult. see Chestnut.

americana: C. dentata.

crenata (C. japonica) Japanese C. To 30 ft.: lvs. to 6 in. long, closely toothed with sinuses between, commonly tomentose beneath: nuts usually 2-3, about 1 in. across. Japan.

dentata (C. americana). American C. To 100 ft.: lvs. to 10 in long, coarsely toothed, glabrous beneath, mostly tapering or narrow at base: nuts usually 2-3, 1 in. or less across. Me. to Miss.

Hénryi. Tree to 90 ft.: lys. ovate to lanceolate, to 6 in. long, apex acuminate, tapering to base or broadly obtuse to heart-shaped, margin sharply dentate, glabrous: nut usually solitary, about ½ in. across. China.

japónica: C. crenata.

koraiénsis: trade name.

mollissima. Chinese C. To 60 ft.: lvs. to 6 in. long, coarsely toothed, pubescent beneath: nuts usually 2-3, about 1 in. across. China, Korea.

pubinérvis: referable to C. crenata.

pumila. Chinquapin. Shrub or tree to 45 ft.: lvs. to 5 in. long, coarsely toothed, white-tomentose beneath: nut usually solitary, ½ in. or less across. Pa. to Fla. and Tex.

sativa (C. vesca). Spanish or Eurasian C. To 100 ft.: lvs. to 8 in. long, with coarse spreading teeth, pubescent beneath when young, mostly rounded or broad at base: nuts 1-3, 1 in. or more across. S. Eu., N. Afr., W. Asia.—There are forms with variegated lvs., var. asplenifolia has lobed and abnormal lvs., and var. macrocárpa has larger frs.

Seguinii. Tree or shrub to 30 ft.: lvs. lanceolate, elliptical or oboyate, to 5½ in. long, apex acuminate, base obtuse to heart-shaped, pubescent on veins beneath: nuts usually 3, about ½ in. across. China.

támba: listed name. vésca: C. sativa.

CASTANÓPSIS. Fagaceæ. Evergreen trees and shrubs native in Asia and W. N. Amer., with alternate entire or dentate lvs., unisexual fls. usually in separate catkins, and 1-3 nuts

inclosed in a spiny or tubercled involucre; not hardy in cold climates. Cult. as for Chestnut.

caudata. Shrub to 20 ft., much branched: lvs. usually glaucescent, coriaceous and glossy. China.

chrysophélia. Giant Chinquaein. To 100 ft. or more although sometimes shrub-like: lvs. oblong, to 6 in. long, entire, shining dark green above and with golden-yellow scales beneath: fr. with spiny husk. Ore. Calif., Nev. Var. sempérvirens (C. sempervirens) is a shrubby form.

cuspidata (Quercus cuspidata). Lvs. ovate or oblong, to 3 in. long, entire or toothed toward tip, gray-tomentose beneath: fr. with tubercled husk. Japan.

Delavayi. Lvs. stiff, elliptic to obovate, toothed or crenate, glabrous at maturity, grayish underneath: fr. about ½ in. across, spiny. W. China.

sclerophylla. Lvs. oblong-ovate, to 6 in. long, toothed above middle: fr. with tubercled husk. China.

sempérvirens: C. chrysophylla var.

CASTANOSPÉRMUM. Leguminosæ. Two species, only one from Australia planted in trop. and semi-trop. regions. C. austrâle. Moreton-Bay-Chestnut. Black Bean. Evergreen tree to 60 ft. with large pinnate lvs. composed of 11-15 broadly oblong lfts. to 5 in. long, striking yellow to orange and reddish papilionaccous long-stamened fis. in racemes to 6 in. long, and cylindrical pods to 9 in. long. Propagated by seeds; the latter are eaten by the natives.

CASTILLA (Castilloa). Moracex. Trop. American trees with milky juice from which commercial rubber is obtained, having large alternate lvs. and unisexual fls. in dense heads.

Propagated by seeds and the seedlings should be transplanted to a permanent position when about 1 foot high. Trees are ready for tapping at about eight years old.

elástica. Mexican Rubber-Tree To 60 ft.: lvs. elliptic-obovate, to 1½ ft. long, densely pubescent beneath, short-stalked. Mex., Cent. Amer., N. S. Amer.

CASTILLEJA. PAINTED-CUP. Scrophulariaceæ. Herbs usually parasitic on roots of other plants, ann., bien., per., with narrow alternate lvs., small 2-lipped tubular fls. in terminal gaudy-bracted heads or spikes; mostly native in western hemisphere, many of them in U. S. They are seldom grown in the garden.

affinis. Per. to 2 ft.: lvs. linear to lanceolate, to 4 in. long: ft.-bracts scarlet; fls. yellowish, 1½ in. long. Calif. Var. lineariæfòlia is C. lancariæfòlia.

angustifòlia. Per. to 1 ft., sts. pilose-hispid: lvs. lanceolate, to 1% in. long, entire or 3-parted: fi-bracts reddish; corolla to 1% in. long. B. C. to Colo. and Calif.

californica. Indian Paint-Brush. Per., slender, to 1½ ft.: lvs. linear, to 1½ in. long: ff-bracts red or red-typed; fls. bright red, the tube greenish-yellow, 1 in. long. Calif.

coccinea. Scarlet P. Ann. or bien. to 2 ft., hairy: lvs. oblong to linear, to 3 in. long; st-lvs. 3-5-lobed: fl.-bracts scarlet; fls. pale yellow, to 1 in. long. Me. to N. C. and Tex.

collina. Cespitose per. to 1 ft., sts. somewhat white-villous: lvs. to 2 in. long, segms. linear, dark green: ft.-bracts green near base, scarlet above, deeply lobed; corolla green, crimson rimmed, to 1 ½ in. long. Wyo. to Colo.

foliolosa. Woolly P. Per., white-woolly, to 11/2 ft., base woody: Ivs. linear, 1 in. long: fls. yellowish or greenish, 3/4 in. long. Calif.

Haydenii. Per. to 10 in., sts. glabrous below infl.: lvs. linear to lanceolate, entire to 3-5-parted: fl.-bracts dark crimson, deeply 3-7-cleft; corolla green tipped dark crimson, to 1 in. long. Mts. of Colo.

indivisa. Texas P. Ann. to 2 ft.: lvs. linear or linear-lanceolate, to 4 in. long: bracts bright red, calyx red and about length of corolla. Tex.

integra. Per. to 1 ft., tomentose: lvs. narrow-linear, to 3 in. long: fl.-bracts crimson, pink or yellowish; fls. green bordered with crimson, 1 in. long. Colo. to Mex.

lancifòlia. Per. to 2 ft., sts. solitary: lvs. lanceolate, to 2 in. long, entire, usually glabrous: fl.-bracts crimson, lanceolate and often cleft. Alaska to Ore. and Alta. south to Colo.

latifolia. Per., viscid-pubescent, to 1½ ft.: lvs. thick, mostly oval or obovate, to 1 in. long (usually shorter), the

upper ones sometimes 3-lobed at apex fls. in leafy spike, the bracts yellow or red; corolla about ¾ in. long. Calif.

Lindheimeri. Per. to 1 ft., hairy: lvs. cut into 3-5 linear segms., to 2 in. long: bracts rose or brick-red; fls. green edged with pink, 1 in. long. Tex., Colo.

linearisefòlia (C. affinis var linearisefòlia). Lvs. linear, sometimes cut into linear segms, to 4 in. long: fi-bracts crimson; fls. greenish-yellow tinged red, 2 in. long. Calif. to Wyo. and New Mex.

lutéscens. Per to 20 in , sts. hairy: lvs. linear to lanceolate, entire, the upper ones 3-cleft and 5-ribbed: fl.-bracts yellow tipped brown or red, mostly entire or only slightly lobed. Mont. to Wash. and Ida.

Martinii. Per. with woody decumbent base, branches ascending, sticky-harry: lvs. linear, 1 in. long: bracts scarlet-tipped; fls. reddish, 1 in. long. Calif.

miniata. Per. to 3 ft.: lvs. linear-lanceolate, to 2 in. long: ff-bracts tipped brick-red; fls. green edged with red, ¾ in. long. Alaska to Calif.

occidentalis. Per. to 8 in., sts. hairy: lvs. linear to lanceolate, to 2 in. long: fl.-bracts brownish-crimson to yellowish-green, villous; corolla to ½ in. long. B. C. to Alta. south to Utah and Colo.

parviflora. To 2 ft., hairy: lvs. cut into lanceolate or linear segms, or the upper ones entire: corolla about 1 in. long, the bracts red, yellow to white. Colo., Calif. and elsewhere.—Variable.

pinetôrum. To 1½ ft., sticky-pubescent: lvs. linear-lanceolate, to 2 m. long: fls.-bracts red above; fls. 1 in. long. Ore., Calif., Nev.

rhexifòlia. Per to 2 ft.: lvs. oblong-lanceolate to ovate, 2 m. long: fl-bracts scarlet or rose; fls. green bordered with scarlet, 1 m. long. Rocky Mts.

sessiliflora. To 1 ft., sts. villous: lvs. linear or linear-lobed, to 2 in. long, entire, puberulent: fls. yellow, to 2 in. long, in loose terminal leafy spikes. Ill. to Sask. south to Mo. and Ariz.

stenántha. Ann. to 2½ ft., glandular-pubescent: lvs. limear-lanceolate, to 3 in. long: bracts tipped with scarlet; fls green or yellowish, lower lip with scarlet teeth, to 1½ in. long. Calif.

sulphùrea. Per. to 1½ ft.: lvs. lanceolate to ovate, 2 in. long: fl.-bracts light yellow; fls. greenish, 1 in. long. Rocky

CASTILLOA: Castilla.

CASTOR-OIL PLANT: Ricinus communis,

CASUARINA. BEEFWOOD. SHE-OAK. AUSTRALIAN-PINE. Casuarinaceæ. Hardwooded trees or shrubs native in Australia and Pacific Isls., having jointed branches resembling the horsetail or equisetum, lvs. reduced to minute scales or teeth, unisexual fls., the staminate borne in spikes and the pistillate in dense heads becoming dry cones in fr.

Casuarinas are much planted as avenue trees in Florida and other warm regions; they do well near salt water. Propagated by cuttings of half-ripened wood, and also by seeds.

Cunninghamiana. To 70 ft.: cones globular, 1/4 in. or less across, with glabrous valves: teeth on branchlets 8-10.

distyla. Shrub or small tree: cones oblong, to 1 in. long, the valves with dorsal protuberance: teeth on branchlets usually 6.

equisetifdia. Horsetail-Tree. To 70 ft., the branches drooping: cones globular, ½ in. across, with pubescent valves: teeth on branchlets commonly 7. Nat. in Fla.

glauca. To 50 ft., glaucous: cones globular, 1/2 in. across: teeth on branchlets about 16.

hórrida. Shrub to 9 ft. with erect stiff branches: cones nearly globular, about ½ in. across, bristly: teeth on branchlets 10 or 12.

lepidophlòia. To 40, or rarely to 70 ft., twigs smooth or faintly ribbed, ascending: cones 1 in. or more in diam., globose, pubescent: teeth on branchlets 9-16.

quadriválvis: C. stricta.

stricta (C. quadrivalvis). To 30 ft., the branches drooping: cones globular or ovoid, 1 in. or more across: teeth on branchlets about 10.

suberòsa. To 50 ft.: cones cylindrical-oblong, $\frac{1}{2}$ in across: teeth on branchlets 6-8.

CASUARINACEÆ. CASUARINA FAMILY. Only one genus, trees or tree-like, Casuarina which is employed for ornamental planting in Calif., Fla. and other southern parts.

CATABROSA. Graminex. Aquatic pergrasses with creeping rhizomes, 2-fld. spikelets in open panicles. N. Amer., Eurasia. C. aquática (Glyceria aquatica and G. spectabilis). Brook-Grass. To 4 ft.: lvs. to 4 in. long and ½ in. across, glabrous: panicle erect to 8 in. high, usually pyramidal, yellowish-brown. Wet places.

CATÁLPA. Bignoniaceæ. Small or large trees with large, simple, long-stalked lvs., mostly deciduous, bell-shaped irregular white, whitish or rose-colored fls. in terminal panicles or racemes, and fr. a long narrow caps. 1 ft. or more long; native in N. Amer. and E. Asia.

Catalpas are popular lawn and avenue trees and mostly hardy North, very showy when in bloom in late spring and early summer; sometimes planted for small timber. They do well in any good soil. Propagated by seeds in spring and cuttings of mature wood; also by layers, root-cuttings, cuttings of young wood in early summer, and named varieties by grafting on seedlings or cuttings of young trees.

bignonioldes (C. syringxfolia. C. cordifolia). Common C. Indian-Bean. To 60 ft.: lvs. ovate, to 8 in. long, abruptly short-acuminate, pubescent beneath: fis. white with 2 yellow stripes and brown sported, 2 in. across, in panicles 8 in. long. Ga. to Fla. and Miss. Var. aurea has yellow lvs. and var. nana is dwarf, and is usually gratted on upright boles forming standards with dense umbrellalike heads and is the C. Bunger of horticulturists.

Bungei. Small tree: lvs. triangular-ovate, to 6 in. long, long-acuminate, sometimes toothed or angled near base, glabrous: fls. white spotted purple, 1½ in. long. China.—This name is often applied to C. bignonioides var. nana.

cordifòlia: C. bignonioides.

Duclouxii: C. Fargesii var.

Fargesii. To 60 ft.: lvs. ovate, to 6 in. long, long-acuminate, densely pubescent beneath, 3-lobed on young plants: fis. pink or purplish spotted with brown, 1½ in. long. China. Var. Ducloùxii (C. Duclouxia), to 80 ft., lvs. somewhat larger, glabrous and fis. rose marked with orange.

hýbrida (C. Tasii). Hybrid between C. bignonioides and C. ovata, intermediate in character: lvs. larger than in C. ovata, mostly purplish when young, sometimes angled or shallowly lobed: fis. resembling C. bignonioides but smaller. Much planted.

Kaémpferi: C. ovata.

longfssima. Tree to 50 ft.: lvs. small, oblong-pointed to broad-lanceolate, 4-5 in. long and less than one-half as broad; fis 1 in. or less long, white with fine purple or pink lines: pod very slender, to 18 in. or more. W. Indies.—Planted in S. Fla.

ovata (C. Kaempfert). To 30 ft. or more: lvs. broadovate, sometimes 3-5-lobed, to 10 in. long, abruptly acuminate, pubescent on veins beneath: fis. yellowish-white marked with orange and violet, to 3/4 in. long, in panicles to 10 in. long. China.

speciòsa. Western C. To 100 ft.: lvs. ovate, to 1 ft. long, long-acuminate, densely pubescent beneath: fls. white spotted with brown, 23½ in. across, in panicles 6 in. long. Ill. to Ark.

syringæfðlia: C. bignonioides.

Tèasii: C. hybrida.

CATANÁNCHE. CUPIDS-DART. Compositæ. Herbaceous annuals and perennials with narrow lvs. borne near base of st. and long-stalked blue or yellow heads of ray- and disk-fls. and chaffy involucre; pappus of bristles or scales; native to Medit. region.

One is cultivated in the flower-garden and as an everlasting. It grows well in the average garden soil and under the usual treatment for perennuals. Raised from seed sown in spring and blooming the same year; also by division.

cærulea. Per. to 2 ft., blooming first year from seed: lvs. lanceolate, few-toothed, tomentose: heads 2 in. across, ray-fis. blue, involucre chaff-like, June-Aug. S. Eu. Var. álba has white rays and bicolor blue rays edged with white.

CATASÈTUM. Orchidaceæ. Trop. American terrestrial or epiphytic orchids, having pseudobulbs bearing 2 or more plaited lvs., polygamous fls. of 3 different forms borne in racemes, the pollen-masses flying out when the appendages of the column are touched. Cult. in the hot-

house, commonly suspended and given a resting period. See Orchids.

Bungerdthii: C. mleatum.

callosum. Fls. in 10-15-fld. racemes to 1 ft. high; sepals and petals brown, about 2 in. long; lip green spotted with red, shortly saccate at base. Dec. Venezuela, Colombia.

Christyanum: C. saccatum var.

integérrimum (C. maculatum). Fls. in 6-12-fld. racemes to 16 in. high; sepals and petals bright green often spotted with purple; lip green without (sometimes purple spotted), purple-suffused within. Jan.-Dec. Cent. Amer.

macrocárpum (C. tridentatum). Pseudobulbs oblong, to 8 in. long, striated: lvs. to 1½ ft. long, elliptic-lanceolate, keeled: scape erect or arching, 6 in.-1½ ft. tall, about 5-14 fls. in male spike; sepals and petals yellowish-green spotted with red or purple within; lip bright yellow with greenish at apex or bright green, usually purple-spotted within. Trinidad, S. Amer.—Somewhat variable in fl. coloration.

maculatum: C. integerrimum.

mèdium. Fls. small, in many-fld. racemes; sepals and petals greenish-yellow barred with brown; lip yellowish, purple-spotted. Habitat unknown.

pileatum (C. Bungerothn). Racemes several-to many-fid., to 1 ft. high; fis. white or yellowish-white or light rose sometimes purple-spotted; sepals about 2 in. long; lip transversely oblong or semiorbicular and shortly saccate. June. Trimidad, Venezuela, Brazil.—Varieties have red, orange or yellow in their fis.

Russellianum. Racemes pendent, many-fid., nearly 1½ ft. long; sepals and petals oblong, about 1½ in. long, pale green; lip sac-like with a double fringe of teeth. Aug.—sept. Cent. Amer.

saccâtum var. Christyanum (C. Christyanum). Fls. in 5-8- or more-fld. loose pendent racemes to 1½ ft. long; sepals and petals about 2 in. long, narrowly lanceolate, acute, greenish with brownish-red spots; lip greenish fringed with rose-red hairs, the mouth of the central saccate area white. Nov.-Mar. Brazil.

scurra; C. Warscewiczii.

tridentatum: C. macrocarpum.

viridiflayum. Pseudobulbs ollong, to 5 in. long: lvs. lanceolate-elliptic, acute, to about 1 ft. long, striate: spike shorter than lvs., up to 12-fld.; petals wider than sepals, all uniformly yellow-green; lip yellow or yellow-green without, deep yellow within, margin ciliate. Cent. Amer. (Panama).

Warscewiczii (C. scurra). Fls. pale straw-color or white with green veins, in drooping racemes, fragrant, the lip with the 2 fringed side lobes and the protuberant middle lobe bilobed and fringed at the apex. Cent. Amer., Colombia, Venezuela, British Guiana.

CAT-BRIER: Smilax glauca.

CATCHFLY: Silene. German: Lychnis Viscaria.

CATESBÈA. Rubiacex. W. Indian spiny shrubs or small trees with opposite or whorled lvs., white, funnelform or campanulate, 4-lobed, solitary fls., and fr. a white berry; one species grown in S. Fla. and other warm regions.

spinosa. Lala-Thorn. To 15 ft., with spines 1 in. or more long: lvs. ovate, to 1 in. long: fts. creamy, to 6 in. long, much exceeding the small lvs.: berries to 2 in. long. Cuba, Bahamas.

CATHA. Celastracex. Evergreen shrub native from Abyssinia to S. Afr., the lvs. much used by the Arabs in the preparation of a drink. C. edůlis. Khat. Cafta. To 10 ft.: lvs. opposite, sometimes alternate on infertile shoots, oval, to 4 in. long, toothed: fls. small, white, in axillary clusters: fr. a 3-angled caps., about 1/4 in. long.—Planted in S. Fla. and Calif., and also sometimes under glass for its economic interest. See Gymnosporia.

CATHARTOLINUM: Linum.

CATHCARTIA: Meconopsis.

CATJANG: Vigna Catjang.

CATKIN: a scaly-bracted spike with unisexual flowers; ament; prominent in willows and poplars.

CATMINT: Nepeta Cataria.

CATNEP, CATNIP: Nepeta Cataria.

CATS-CLAW: Doxantha Unguis-cati, Pithecellobium Unguis-cati. -Ear: Calochortus cæruleus, Hypochæris.

CAT-TAIL: Typha. Redhot: Acalypha hispida.

CATTLEYA. Orchidaceæ. Epiphytes native in trop. Amer., having pseudobulbs with 1-3 very thick lvs. and fls. in terminal clusters or rarely solitary, the sepals similar, the petals broader, lip of commonly 2 lateral lobes which form a tube around the column, and spreading middle lobe. Popular orchids grown in the intermediate house; see Orchids for cult. There are large numbers of hybrids and hort. forms.

Aclandise. Pseudobulbs to 6 in. long, with 2 broadly elliptic lvs. to nearly 3 in. long; fls. to 4 in. across, 1 or 2 together; sepals and petals yellowish-green spotted with purple-brown; lip with short whitish-rose side lobes and magenta wavy middle lobe. May-June, Sept.-Oct. Brazil.

Álwynii álba. Hybrid between C. Enid alba and C. amabilis alba.

amábilis. Hybrid between C. labiata and C. Warsce-

amethystoglóssa. Lvs. 2, elliptic-oblong, to over 8 in. long; fls. about 4 in. across, 5-8 together; sepals and petals white suffused with rose and spotted with violet; lip with whitish side lobes and bluish-violet middle lobe. Nov.-July. Brazil

ardentíssima. Hybrid between C. fabia and C. Petersii. armainvillierénsis. Hybrid between C. Mendelii and C. Warscewiczii.

Armstrongiæ. Hybrid between C. Hardyana and C. Harrisonana

Harrisoniana.

Ashtonii. Hybrid between C. Harrisoniana and C. Warscewiczii.

aurantiaca (Epulendrum aurantiacum). Fls. orange-red, to 1½ in. across. Dec.-May. Cent. Amer.

aurea: C. Dowiana var.

Ballantineàna. Hybrid between C. Trianxi and C. Warscewiczii.

Ballaurea. Hybrid between C. Ballantineana and C. Downana var. aurea.

Bánksiæ. Hybrid between C. Catherine and C. Mendelii. between C. intermedia and C. Skinner.

belairénsis álba. Hybrid between C. intermedia var. alba and C. Skinneri var. alba.

Bértii. Hybrid between C. Harrisoniana and C. libiata. Beyrodtiàna: C. libiata var.

bicolor. Lvs. oblong-lanceolate, to about 6 in. long: fis. 3-41½ in. across, 2-8 together; sepals and petals bronzegreen; lip rose-purple sometimes edged with white, toothed, without side lobes. Jan.-Apr., Sept.-Nov. Brazil.

Bláckii. Hybrid between C. Gaskelliana and C. Mendeln.

Bowringiana. Lvs. oblong or elliptic-oblong, to 8 in. long: fls. about 3 in. across, 5-13 together; sepals and petals rose-violet; lip rose, lilac within, white edged with chestnut-brown in throat. Oct.-Dec. Cent. Amer. Var. tri umphans has rich purple fls.

Cáppei. Hybrid between C. Trianxi and its var. Schroederiana.

Cáppei álba. Hybrid between C. Trianxi var. Schroederana and var. alba.

Chápmanii. Hybrid between C. Bowringiana and C. Warneri.

chocoénsis: C. Trianzi var.

chrysotóxa: C. Dowiana.

citrina. TULIP C. Lvs. strap-shaped, to 9½ in. long; fls. citron-yellow, usually solitary on drooping stalks slightly longer or shorter than lvs.; lip white on edges and wavy. Apr.-June. Mex.

Clárkiæ. Hybrid between C. labiata and C. bicolor.

Cooksonii. Hybrid between C. Hardyana and C. Trianæi.

Cooksonii álba. Hybrid with same parents as C. Cooksonii.

Dowlana (C. labiata var. Dowlana, C. chrysotora). Queen C. Lvs. solitary, to 1 ft. long: fls. to nearly 7 inacross, 2-6 together; sepals and petals nankeen-yellow; lip dark purple lined with radiating golden threads. Mar.-May, July-Aug. Costa Rica. Var. ahrea (C. aurea). Lip with more and deeper yellow lines. Colombia. Var. rosita has creamy-white sepals tinged with purple, and rosepurple petals tinged with yellow.

Dupreana. Hybrid between C. Warneri and C. Warneringii.

Dússeldorfii. Hybrid between C. intermedia var. alba and C. Mossiæ var. alba.

Edithiæ álba. Hybrid between C. Suzanne Hye and C. Trianæi var. alba.

Édwardii. Hybrid between C. Schilleriana and C. Wasseymezii.

Eldorado. Pseudobulbs to 8 in., 1-lvd., stout: lvs. oblong or elliptic-oblong, to 12 in.: fis. fragrant, to about 6 in. across, pale rosy-lilac shading to white; lip crisped, centrally blotched with orange and with purple margins.

Brazil

elongata. Pseudobulbs elongate, 2-lvd.: lvs. elliptic, to 6 in. long: fls. 3-4 in. across, 2-8 together; sepals and petals red-brown or orange, undulate on the margins; lip rose, darker lined. Mar., Oct. Brazil.

Enid. Hybrid between C. Mossiæ and C. Warscewiczii.

Fernándii. Hybrid between C. Warscewiczni and C. Aclandim.

Fórbesii. Pseudobulbs stem-like, 2-lvd.: lvs. elliptic-ob-long, to 5 in. long: fls. 3-4 in. across, 1-5 together; sepals and petals olive- or yellow-green; lip white or pale yellow outside, yellow inside often marked with red. May-Oct.

Gaskelliàna (C. labiata var. Gaskelliana). Summer C. Pseudobulbs 1-lvd: lvs. oblong, to almost 1 ft. long: fls. to 7 in across, 2-3 together; sepals and petals purple-violet suffused with white; lip purple-violet with a saddle-shaped yellow blotch, crisped on margin. May-Sept. Venezuela, Brazil. Var. álba has pure white sepals and petals, creamy-white lip with yellow throat. Var. cærùlea has pure white fls. with blush spot on base of lip. Var. delicàta has very pale purple-violet fls.

gigas: C. Warscewiczii.

Gildenii. Hybrid between C. Hardyana and C. Maggie Raphael.

granulosa. Lvs. 2, elliptic-oblong, to 6 in long: fls. to 4 in. across, 5-8 together; sepuls and petals olive-green more or less spotted with red-brown; lp white dotted with purple, the claw of the middle lobe yellowish marked with red, wavy. Aug.-Sept. Guatemala, Brazil.

guttata. Lvs. 2, oblong-elliptic, to 9 in. long: fis to 4 in. across, about 4-6 together; sepals and petals green spotted with red-purple; lip with side lobes rose or white, and middle lobe violet-purple. Apr.—Oct. Brazil.

Hardyana. Hybrid between C. Dowiana and C. Warscewiczii. Named variants of this hybrid are álba, aurea, delicata, élegans, éxcellens.

Harrisoniana. Lvs. 2, oblong-lanceolate, to 6 in. long: fls. to 4 in. across, 2-5 together, rose-lilac, the middle lobe of lip whitish-rose with yellow spot. Jan.-Feb., July-Oct. Brazil.

Hássellii. Hybrid between C. labiata and C. Empress Frederick.

Heldisiæ. Hybrid between C. Forbesii and C. Mossiæ. Héntschelii. Hybrid between C. Dupreana and C. Warscewiczu.

intermèdia. Lvs. 2, oblong, to 6 in. long: fls. to 5 in. across, usually 3-5 together, pale rose with middle lobe of lip purple and crisped. Apr.-June, Sept.-Nov. Brazil. Var. álba has pure white fls.

intertéxta. Hybrid between C. Mossir and C. Warneri. iridéscens. Hybrid between C. Eldorado and C. bicolor.

Kienastiàna. Hybrid between C. Dowiana and C. Lueddemannana.

labita. AUTUMN C. Lvs. solitary, oblong, to 10 in. long: fls. to 6 in. across, 2-5 together, rose-lilac, the very wavy limb of lip violet-purple bordered with rose-lilac with deeper streaks and yellow throat. Oct.-Mar. W. Indies, Brazil. Var. 41ba has white fls. with a yellow throat. Var. Amesiana has white fls. with lilac lip. Var. Beyrodtiana has yellow lip streaked with purple. Var. Cooksoniæ has white fls. with crimson-purple lip edged with white. Var. rosea has very light rose fls.

Lawrenceana. Lvs. solitary, oblong or elliptic-oblong, to 9 in. long: fls. to 5 in. across, 5-7 or more together, rose-purple, the limb of lip purple with a maroon band and a white throat below. Feb.-Apr. British Guiana, Venezuela.

Lèopoldii (C. guttata var. Leopoldii). Lvs. 2-3, oblongelliptic, to 8 in. long: fls. to 4 in. across, 10-25 together; sepals and petals brown dotted with purple-red; lip white in the throat, purple above, wavy. Oct.—Nov. Brazil.

lobata: Lælia lobata.

Lóddigesii. Pseudobulbs to 12 in. long, 2-lvd., cylindric: lvs. elliptic-oblong, to 5 in. long; fls. to 4 in. or more across, rose-lilac, the lip 3-lobed and white inside with yellow at base, crisped on the margins. Brazil.

Lueddemanniana (C. labiata var. Lueddemanniana, C. speciosissima). Lvs. solitary, oblong or elliptic-oblong, to 10 in long: fls. to 6 in. across, 2-5 together, rose-purple, the lip with wavy amethyst-purple limb, throat spotted with yellow or white. July-Sept. Brazil, Venezuela. Var.

álba has white fis. In var. Stánleyi the white fis. have the limb lined with purple.

Lueges. Hybrid of C. Dowiana var. Rosita and C. Enid. luteola. Lvs. solitary, oblong-elliptic, to 9 in. long: fls. to 2 in. across, 2-6 together, citron-yellow sometimes with lilac stripes, the middle lobe of lip whitish and wavy. Nov.-Aug. Brazil, Ecuador, Peru, Bolivia.

Nov.-Aug. Brazil, Ecuador, Peru, Bolivia.

Mántinii. Hybrid between C. Bowringiana and C.

Dowiana var. aurea.

Marliata. Hybrid between C. labiata and C. Marriottiana. Máronii. Hybrid between C. Dowiana and C. velutina.

Marriottiana. Hybrid between C. Eldorado and C. Warscewiczii.

máxima. Lvs. solitary, oblong, to 10 in. long: fis. to 5 in. across, 3-7 together, lilae or pale rose, the limb of lip whitish to crimson-purple with darker veins and orange-yellow central band, wavy. Apr.-July, Oct.-Nov. Colombia, Ecuador, Peru.

McMastersiæ. Hybrid between C. Schilleriana and C. Mendelu.

Méndelii (C. labiata var. Mendelii). VIRGINS C. Lvs. solitary, oblong, to 10 in. long: fls. to 8 in. across, 2-3 together, white or rosy, the limb of lip very wavy, white or rosy at base, purple near apex, with yellow throat. Apr.-Sept. Colombia.

Mendelissima. Hybrid between C. Lueddemanniana and C. Mendelii.

Minûcia. Hybrid between C. Loddigesii and C. Wars-cewiczii.

Môssiæ. Spring C. Lvs. oblong, to 8 in. long: fls. 5-8 in. across, 3-5 together, rose, the very wavy lip with purple limb variegated with violet and edged with rose, the throat yellow and orange. Mar.—Aug. Venezuela. Var. álba has white fls. In var. cærûlea the sepals and petals are blue-violet. Var. Reineckiàna has white fls. with yellow throat and violet limb. Var. Wågeneri has white fls. with yellow spot on lip. Other listed varieties include aùrea, delicàta, grandiflòra, lutèola and matùtina.

Mossmaniana. Hybrid between C. A. Dimmock and C. Trunwi.

Múrrayi. Hybrid between C. Mendelii and C. Law-renceana.

Orátinii. Hybrid between C. Princess Royal and C. Enid. Peètersii. Hybrid between C. Hardyana and C. labiata. Peètersii álba. Hybrid between C. Hardyana var. alba and C. labiata.

Percivalliàna (C. labiata var. Percivalliana). Christmas C. Similar to C. Mossiæ but with smaller somewhat darker colored fls. Jan.-Mar. Venezuela. Var. Aiba, fls. white. Var. Roeblingiàna, fls. white with rose-purple lip.

Pittiàna. Hybrid between C. Dowiana and C. granulosa. Ráfaeliæ. Hybrid between C. Dowiana and C. Trianæi.

Réx. Lvs. solitary, oblong, to 1 ft. or more long: fts. 6-7 in. across, 3-6 together; sepals and petals yellowishwhite; lip yellow with crimson limb edged with white, wavy. July-Sept. Peru.

Rochrsiana. Hybrid between C. Hardyana and C. Mendelii.

Rothschildiana. Hybrid between C. Dowiana and C. Gaskelliana.

Sanderiana: C. Warscewiczii.

Schilleriana. I.vs. 2, elliptic, to 4 in. long: fls. to 4 in. across, 1-2 together; sepals and petals wavy on the margin, green spotted with brown; lip within yellow near base, purplish-crimson above, fimbriate. Apr.-May, Sept.-Oct. Brazil.

Schroederiana: C. Trianzi var.

Skinneri. Lvs. 2, elliptic, to 8 in. long: fls. 4-5 in. across, 4-rarely 13 together, rose-purple with yellowish-white in throat of lip. Jan.-Aug. Cent. Amer. Var. álba has white

speciosissima: C. Lueddemanniana.

Sthartii. Hybrid between C. Mendelii and C. Mossiæ, suarior. Hybrid between C. Mendelii and C. intermedia.

supérba: C. riolacea.

Thayeriana. Hybrid between C. intermedia and C. Trianzi var. Schroederiana.

Thayeriana alba. Hybrid between C. intermedia var. alba and C. Trianzi var. Schroederiana alba.

Thurgoodiana. Hybrid between C. Hardyana and C. Lueddemanniana.

Triansei (C. labiata var. Triansei). Winter C. Lvs. solitary, oblong, to 8 in. long: fis. to 7 in. across, 2-3 together, rose, the lip with dark purple wavy limb and yellow throat. Dec.—Mar. Colombia. Var. álba has white fis. and var. atropurpurea crimson-purple. Var. Backhousiàna

has rose-purple sepals and petals with darker spot at tip. Var. chocoénsis has fragrant white fis. sometimes tinged with pale lilac. Var. Schroederiàna, EASTER C., has fragrant pink fis. with purple-tipped lip. Forms of this var. are alba, cærulea, citrina and refulgens. Var. triúmphans has rose-pink sepals and petals with purple lip and goldengellow tube. Var. variegāta is listed. Var. Wéllesleyæ (C. Wellesleyæ) has white fis.

triûmphans. Hybrid between C. Dowiana and C. Rex. velûtina. Lvs. 2, broadly lanceolate, to 10 in. long: fls. 3½-4 in. across, 2-8 together, fragrant; sepals and petals orange-yellow spotted with purple; lip whitish with purple lines, throat yellow. Feb.-May, Aug.-Oct. Brazil.

veriflora. Hybrid between C. labiata and C. Trianzi.
vestàlis. Hybrid between C. Dowiana and C. maxima.

violace (C. superba). Lvs. 2, elliptic or oval, to 6 in. long: fis. 4-almost 5½ in. across, 3-6 together, fragrant; sepals and petals rose-purple; lip deep purple, the throat with a central band of yellow separating 2 white blotches. Jan.—Dec. Colombia, Venezuela, British Guiana, Brazil, Peru.

Walkeriana. Pseudobulbs to 5 in. high, furrowed, 1- or 2-lvd.: lvs. elliptic-oblong, to 5 in. long: fls. 1-3, to 5 in. across; sepals and petals pale to deep llac-purple, disk of lip yellow streaked with purple and with a deep border of purple. Brazil, Bolivia.

Warneri (C. labiata var. Warneri). Lvs. solitary, oblong, to 7 in. long: fls. to 8 in. across, 3-5 together, rosy, with limb of lip carmine and very wavy and yellow throat. May-July. Brazil. In var. álba the fls. are white except for the yellow throat.

Warscewiczii (C. labiata var. Warscewiczii. C. qigas. C. Sanderiana). Sr. Johns C. Lvs. solitary, oblong, to 10 in. long: fls. to 9 in. across, 2-3 together; sepals and petals violet-rose; lip deep purple with 2 yellow spots in throat, wavy. May-Aug. Colombia. Forms are alba with pure white fls and rochellensis with white fls. having lip tinged with color.

Wavriniana. Hybrid between C. granulosa and C. Warscewiczi.

Wéllesleyæ: C. Trianxi var.

Wendlandiana. Hybrid between C. Bowringiana and C. Warscewiczii.

Whitei. Hybrid between C. Schilleriana and C. Warneri.

Wiganii. Hybrid between C. Dowiana and C. Schiller

Williamsiæ. Hybrid between C. Gaskelliana and C. Harrisoniana.

CAUDOXALIS: Oxalis Bowieana.

CAULÁNTHUS. WILD CABBAGE. Cruciferæ. Mostly ann. herbs, fls. with narrow and usually crisped petals, fr. a terete or compressed nearly sessile pod with short beak; sometimes confused with Streptanthus, a per. with lyrate basal lvs. and pods not beaked.

inflatus (Streptanthus inflatus). SQUAW-CABBAGE. Annto 2 ft., sts. conspicuously inflated, glabrous: lvs. clasping, oblanceolate to ovate: fls. white, to ¾ in. across or more, petals crisped near tip, stigma deeply 2-lobed: pods stout, to 4 in. long, ascending.

CAULESCENT: more or less stemmed or stem-bearing; having an evident stem above ground.

CAULIFLOWER, BROCCOLI (Brassica oleracea var. botrytis). Biennial plants (running to seed the second year) of the cabbage tribe but more tender to frost and untoward conditions, the edible part being a head formed of the condensed and thickened malformed flower-cluster rather than an aggregation of leaves. If the old plant is set out the following year, good flowering and seed-bearing shoots will arise from the stump and from such parts of the head as may not have been removed, as in the cabbage.

Cauliflower is not as cosmopolitan as to conditions as cabbage, or as easy to grow. It does best in a rather cool moist soil and under equable conditions; only highly selected seed should be used; the plant must be kept in a continuous state of thrift. Insects and diseases must be kept under full control; they are the same as the pests of cabbage.

The great heats and dryness of midsummer are to be avoided as far as possible at heading time, if the crop is to be grown in untoward regions. To this end, very early varieties may be grown, starting them under glass and harvesting the crop in June or early summer. The plants are handled as are cabbages, and the distances for the early varieties may be 18 inches in the row. For the late or main crop, seeds may be sown in seed-beds in late spring or early summer, and as these varieties make bigger plants the distances should be 2 feet in the row or even more for the larger kinds. Far South the crop may be grown for early spring use from seeds sown in autumn. In parts of California the crop is grown in winter. Wherever irrigation is available, many of the difficulties of cauliflower growing may be overcome.

A continuous steady growth from high-class seeds and well-grown plants should produce a solid head of regular shape, without "buttons" or breaks or straggling branches. To whiten the head, the outer leaves are sometimes tied together over it, but openings should be left on the sides for ventilation or the head may decay from the accumulation of moisture. Heads should be harvested as fast as they mature or they may crack or become discolored or develop decayed spots. In harvesting, a good circle of leaves should go with the head, and these leaves are trimmed a little above the head to serve as a protection, and to provide a cup in which the

head sits attractively.

A race of very late large cauliflower is known as broccoli; the culture is in general the same as for the ordinary cauliflower except that it requires the entire season in which to grow; in mild climates it may be left in the field over winter maturing its heads in spring. The winter, maturing its heads in spring. Asparagus or Sprouting broccoli, Calabrese, is a different plant, Brassica oleracea var. italica (or var. asparagoides). It does not produce a thick solid white head but rather a small greenish head on the main stalk and similar heads on thick branches after the first head is cut; all these shoots are edible and are prized by those who know them. It may be started early in plant beds and brought to maturity in late spring or in autumn of the same year. All the broccolis are specially prized by Italians.

Another plant sometimes but erroneously known as broccoli or "Italian kale" is the Seventop turnip; see Brassica septiceps; also B. Ruvo.

CAULINE: pertaining or belonging to the stem.

CAULOPHYLLUM. Berberidacex. Two erect per. rhizomatous herbs, one in E. N. Amer., and one in E. Asia, the former sometimes planted in the wild-garden or border. The genus is distinguished by the naked seeds left by the bursting of the pericarp and which become blue and berry-like. Fls. small, in a cluster, with the young ternately compound rue-like lvs.

thalictroides. BLUE COHOSH. To 3 ft.: fls. yellow-green, about ½ in. across, in early spring: fr. ornamental. ¼ in. across. Deep woods; requires shade.—The Asian C. robustum (sometimes considered a var. of the American plant) has less deeply toothed and more pointed lifts.

CEANÒTHUS. Rhamnaceæ. N. American shrubs, particularly on the Pacific Coast, or small trees, with simple deciduous or persistent lvs., mostly showy blue or white small fls. in dense panicles or racemes, and 3-lobed capsular fr.; furnishes many ornamental subjects, among

them many hybrids of European origin and giving rise to named hort. vars. The Pacific species and their derivatives are not hardy in the northeastern states. The following species are mostly deciduous.

Ceanothus thrives best in light well-drained soil in sunny positions. Few species are hardy North and plants may be dug in fall, stored in a frost-proof place, and set out again in spring. Propagated by seeds sown in spring, layers, and varieties by grafting on roots of C. americanus in spring under glass; also by cuttings of mature wood in autumn or soft-wood cuttings in spring from forced plants. Those native in the eastern parts of the country are sometimes transferred to grounds in that region.

americanus (C procumbens). New-Jersey-Tea. To 3 ft.: lvs. alternate, ovate, finely toothed: fls. white. Me. to S. C. and Tex.

arbòreus. Evergreen shrub or tree to 20 ft.: lvs. alternate, ovate, finely toothed. white-tomentose beneath: fls. pale to deep blue, fragrant. Isls. off Calif. coast.—The plant cult in Calif. as C. hybridus is said to be a hybrid between C. arboreus and C. spinosus.

Arnouldii: C. Delilianus.

austromontanus. Similar to C. foliosus, growing to 8 ft. high. Mts. of S. Calif.

azureus: C. cæruleus.

cerûleus (C. azureus). Shrub or small tree to 20 ft. and more: lvs. alternate, oblong-lanceolate to ovate, finely toothed, rusty-tomentose beneath: fis. blue or nearly white. Mex. Guatemala.

califórnicus: C. integerrimus.

cordulatus. Much branched spiny shrub to 4 ft., forming flattened clumps: lvs. alternate, ovate, entire or finely toothed: fis. white. Ore, Cahf.

crassifòlius. Shrub to 6 ft., young sts. pubescent: lvs. opposite, elliptic to obovate, to 1 in. long, white-pubescent beneath, somewhat fleshy, margins usually revolute and dentate: fis. white S. and Lower Calif. Var. planus has lvs. entire without revolute margins.

cuneatus. Buck-Brush. Erect shrub to 8 ft.: lvs. opposite, persistent, spatulate-obovate, to 1 in. long: fis. white, lavender or blue. Calif.

cyaneus. Shrub to 10 ft: lvs. alternate, persistent, ovate-elliptic, to 2 in. long, glossy, margins entire to glandulur-toothed: fls. dark blue becoming paler, in clusters to 1 ft. long. S. Calif.

Delilianus (C. Arnouldri. C. hybridus). A hybrid between C. americanus and C. caruleus: to 3 ft.: lvs. alternate, ovate, finely toothed: fls. pale or deep blue. The commonly cult. "Glorre de Versailles" belongs here.

dentātus. To 3 ft., densely branched, evergreen: lvs. alternate, obovate, margins revolute: fis. blue. Calif. Var. impréssus is C. impressus.

divaricatus: the material in cult. under this name is $C.\ leucodermis.$

Féndleri. To 11/4 ft., spiny: lvs. alternate, ovate, entire, silky beneath: fls. white. S. D. to Wyo. and N. Mex.

foliosus. Evergreen, to 1 ft. or more, densely branched: level, alternate, oblong, to 34 in. long, pale beneath: fis. blue. Cent. Calif.

gloridsus. Prostrate shrub to 1 ft.: lvs. opposite, persistent, broadly elliptic to round, to 1½ in. long, dark green, leathery, usually spiny-toothed: fis. deep blue to purple. S. Calii. Var. exaltatus is an upright plant to 12 ft.

Gréggii. Shrub to 6 ft.: lvs. elliptic-oblong, to $\frac{5}{8}$ in. long, gravish on both sudes, entire or with 1-3 small teeth near the buse, rarely concave above: fts. white, in small umbels. N. Mox. to New Mox. and S. Calif. Var. perpléxans has yellowish-green lvs. broadly elliptic to obovate, to $\frac{3}{4}$ in. long or more, usually more pungently tipped.

hybridas: see C. Delilianus and C. arboreus.

impréssus (C. dentatus var. impressus). Spreading shrub to 8 ft. high and 20 ft. across: lvs. alternate, persistent, broadly elliptie to round, to 1 in. long, loosely villous: fls. dark blue. S. Calif.

incanus. To 8 ft., bark white: lvs. alternate, ovate, usually entire, whitish-pubescent beneath: fls. white. Calif.

integérrimus (C. californicus). DEER-BRUSH. To 12 ft.: lvs. alternate, ovate, entire: fis. white, rarely pale blue or pink. Calif.

Jépsonii. To 5 ft.: lvs. opposite, elliptic, leathery, spiny-toothed: fls. white or blue. Calif. Var. purpureus is C. purpureus.

leucodérmis (C. divaricatus). To 12 ft.: lvs. alternate, persistent, elliptic-oblong to ovate, to 1½ in. long, 3-veined from base, entire to serrulate, glabrous: fis. pale blue to white: fr. globose. Calif., Lower Calif.

Lobbianus. Hybrid between C. dentatus and C. thyrsi-

florus: evergreen shrub to 10 ft.: lvs. alternate, oblong, remotely toothed, whitish beneath: fis. dark blue.

macrocárpus: C. megacarpus var. insularis.

megacarpus. Shrub to 12 ft.: lvs. mostly alternate, cuneate-obovate, to 1 in. long, apex truncate or notched: fis. white, in small clusters: fr. globose, to ½ in. diam., with large dorsal horns. S. Calif. Var. insularis (C. macrocarpus) has lvs. often opposite with fr. scarcely if at all horned. Var. péndulus has long slender arching or drooping branches.

microphfilus. Shrub to 2 ft., sts. erect, diffuse: lvs. suborbicular to elliptic, to ½ in. long, entire, somewhat fleshy: fls. white, to ½ in. across, in loose terminal and axillary panicles. Ga. to Fla. and Ala.

oligánthus. To 12 ft.: lvs. alternate, ovate, finely toothed, pale green or brown beneath: fis. deep blue or purplish. Calif.

ovatus. To 3 ft.: lvs. alternate, oblong or oval, toothed, shining above: fls. white. Vt. to Colo. and Tex.

pállidus. Hybrid between C. Delilianus and C. ovatus: to 3 ft. or less: lvs. alternate, oblong, finely toothed: fls. light blue. "Marie Simon," with flesh-colored fls. belongs here

papillòsus. To 6 ft, evergreen: lvs. alternate, oblong to linear, margins revolute, upper surface papillose, pubescent beneath: fls. blue. Calif. Var. Roweanus is spreading, to 3 ft. high, of compact habit with narrower lvs. Var. supréssus, prostrate.

supréssus, prostrate.

Párryi. To 6 ft. or more, evergreen: lvs. alternate, oblong, finely toothed but margins becoming revolute, tomentose beneath: fis. blue. Calif.

parvifòlius. Spreading shrub to 3 ft.: lvs. alternate, deciduous, oblong-elliptic to elliptic, to 1 in. long, entire or sometimes toothed: fis. pale to deep blue, in clusters to 3 in. long. Calif.

procumbens: C. americanus.

prostratus. Mahala Mar. Prostrate: lvs. evergreen, opposite, obovate, coarsely spiny-toothed: fis. blue. Wash. to Calif. Var. divergens has horizontally spreading or trailing branches.

pumilus. Prostrate shrub to 8 in. or less high, sts. matforming, to 18 m. long, much branched: lvs. cuneate to obovate, to ½ in. long, finely white-pubescent beneath, nearly sessile: fis. blue to white. Ore.

purphreus (C. Jepsoni var. purpureus). Holly-leaf C. Erect or spreading shrub to 4 ft. high: lvs. opposite, persistent, orbicular to broadly elliptic, sinuate, to ¾ in. long, dark green, glossy: fls. deep blue to purple, in umbellate clusters to 2 in. across. Calif.

ramulòsus. To 4 ft., branches spreading, arching or procumbent: lvs opposite, persistent, oblanceolate, obovate or nearly round, to ½ in. long, nearly sessile: fls. blue, lavender or white, in small umbels. Calif.—Grown in rocky sandy situations.

rígidus. To 6 ft., stiffly branched: lvs. opposite, cuneateobovate, entire or toothed near tip: fls. bright blue. Calif. Var. álbus, fls. white.

sanguineus. Shrub to 10 ft., young twigs greenish, long-pubescent, older sts. reddish: lvs. alternate, oval, to 2½ m long, obtuse at apex: fls. white. B. C. to Mont. and N. Calif.

sorediatus. To 7 ft., stiffly branched: lvs. alternate, ovate, finely toothed, pale beneath: fis. blue or nearly white. Calif.

spinosus. To 10 ft., sometimes tree to 24 ft., often spiny: lvs. alternate, oblong, entire or finely toothed: fls. pale blue or white. Calif.

thyrsiflorus. Blue-Blossom. Evergreen, to 8 ft. or tree to 25 ft.: ivs. alternate, oblong, finely toothed, shining above: fs. blue or rarely white. Ore. to Calif. Var. griseus has lvs. densely silky-pubescent beneath, margins revolute between teeth and infil. more dense and compact. Calif.; said to be more hardy.

Veitchianus. Hybrid between C. rigidus and C. thyrsiflorus: to 10 ft.: lvs. evergreen, alternate, obovate, remotely toothed, shining above, whitish beneath: fls. deep blue.

velùtinus. To 15 ft., evergreen: lvs. alternate, elliptic, finely toothed, shining above, tomentose beneath: fis. white. B. C. to Calif. and Colo.

verrucòsus. Low shrub: lvs. alternate, obovate, entire or slightly toothed, small, pale beneath: fis. white. S. and Lower Calif.

CEBATHA: Cocculus.

CECRÒPIA. Moraceæ. Trop. American trees with milky juice, large palmately-lobed peltate lvs. and unisexual fls. in dense spikes; grown in trop. countries and sometimes in S. Fla. and S. Calif. As plants are diœcious both pistillate

and staminate should be planted if fruiting specimens are desired.

palmata. SNAKEWOOD TREE. To 50 ft., with soft wood: lvs. borne at ends of branches, 7-11-lobed to middle or below, rough above, white-tomentose beneath. W. Indies, S. Amer.

CEDAR: Cedrus. Cigarbox-: Cedrela odorata. Ground-: Lycopodium complanatum. Incense-: Libocedrus. Red-: Jumperus. Spanish-: Cedrela odorata. Stinking-: Torreya taxifolia. West-Indian-: Cedrela odorata. White-: Cham taxifolia. West-Indian-: C æcuparis. Tabebuia pallida.

CÉDRELA. Meliaceæ. Trees with colored wood furnishing valuable timber, that of C. odorata extensively used for cigar-boxes, also several species grown for ornament: deciduous or evergreen; lvs. alternate, many-pinnate and somewhat ailanthus-like: fls. small and whitish, in panicles: fr. a woody caps., with winged seeds: occidental and oriental tropics and warm regions.

Cedrelas thrive in fertile loamy soil. Propagated by seeds, cuttings of mature wood, and root-cuttings, over heat. austràlis: C. Toona.

ffssilis. Tree to 50 ft. or more: lfts. oblong-lanceolate, densely pubescent beneath: fls. yellowish, in pubescent panicles longer than lvs., petals velvety: fr. 1 in. or more long. Panama, S. Amer., perhaps Mex.

odorata. West-Indian or Spanish-Cedar. Cigar-Box-Cedar. To 100 ft.: Ifts. entire: fis. yellowish, in panicles shorter than lvs.: fr. to 1½ in. long, the seeds winged below middle. W. Indies, S. Amer.

sinénsis (Toona sinensis). To 50 ft.: Ifts. toothed: fls. white, in very long pendulous panicles: fr. 1 in. long, the seeds winged above. China; stands in N. Y. and S. New England.

Toona (C. australis. Toona ciliata). To 70 ft., nearly evergreen: Ifts. entire or wavy-margined: fls. white, fragrant, in panicles shorter than lvs.: fr. to 1 in. long, the seeds winged at both ends. Himalayas; planted in S. Fla.

CEDRONÉLLA. Labiatæ. One per. shrubby herb to 4 ft. high, native in Canary Isls. and grown in the flower-garden. Propagated by cuttings. C. canariénsis (C. triphylla. Draco-cephalum canariense). CANARY-BALM. Lvs. of 3 oblong or lanceolate toothed lfts.: fls. white or lilac, in whorls in loose terminal spikes. For C. nana and C. mexicana see Brittonastrum.

CÉDRUS, CEDAR, Pinacex, Large evergreen trees with wide-spreading branches, of 4 species in N. Afr. and Asia, having stiff needle-like 4-angled clustered lvs. and small ovoid erect cones with closely imbricated scales. For cult. see Conifers. The species are not reliable north of the latitude of N. Y. on the eastern side of the continent, and then only in favorable locations; they are mostly trees for the middle and warmer parts of the country, but all except perhaps C. brevifolia can be grown in favorable sheltered locations in S. New England.

atlantica. Arlas C. Lvs. less than I in. long, bluishgreen: cones to 3 in. long. N. Afr. Var. argentea, lvs. silvery-white; var. atrea, lvs. yellowish; var. glauca, lvs. glaucous; var. fastigiata, habit narrow-pyramidal; var. pendula, branchlets drooping.

brevifolia. Closely allied to C. libani but with shorter glaucous lvs. and shorter cones. Cyprus.

glaucous lvs. and shorter cones. Cyprus.

Deodara. Deodara C. Branchlets drooping: lvs. to 2 in. long, dark bluish-green: cones to 5 in. long. Himalayas. Var. argentea, lvs. silvery-white; var. aûrea, lvs. yellow; var. crassifòlia, stiff stunted tree with shorter thicker lvs.; var. fontinàlis is listed as producing elongated flexible shoots, it is probably var. pedula which has long drooping branches; var. prostràta, a low-lying form; var. rob ista, a stronger form than type with stiffer lvs.; var. verticillata, compact form with bluish-white lvs.; var. vrirdis, lvs. deeper green, Other listed names are compacta and repandens.

libani. (C. libanitica). CEDAR OF LEBANON. Lvs. 1 in. long, dark or bright green: cones to 4 in. long. Asia Minor. Var. aurea, foliage yellowish-green; var. compacta is listed as more dense growing than type; var. glauca, lvs. blue or silvery-white; var. nana (var. "Comte de Dijon"), dwarf and compact; var. péndula, branches drooping.

libanitica: C. libani.

CEIBA. Bombacacex. Very large deciduous trees with digitately compound lvs., showy fls. in axillary clusters and fr. a leathery caps... the seeds with long cotton-like fiber which is the kapok of commerce; planted as a shade tree in the tropics.

Caseària: C. pentandra.

pentandra (C. Cascaria. Eriodendron anfractuosum).
Silk-Cotton-Tree. To 120 tt., with widely spreading branches, the trunk often 9 ft. thick and the thin buttresses sometimes extending for 30 ft.: lfts. 7, to 6 in. long; fls. white or rose, the woolly petals about 1 in. long, often appearing before the lvs.: fr. to 5 in. long. Tropics of both hemispheres.

CELANDINE: Chelidonium. Tree: Macleaya cordata.

CELASTRÀCEÆ. STAFF-TREE FAMILY. Widely distributed trees and shrubs, often twining, of about 45 genera, with simple mostly deciduous lvs., small regular usually bisexual fls. having 4–5 sepals, petals and stamens, superior 3–5-celled ovary, and seeds usually with a pulpy aril which is disclosed when the pericarp ruptures in autumn. Species in the following genera are cult. for ornament: Catha, Celastrus, Elæodendron, Euonymus, Gymnosporia, Maytenus, Pachistema, Tripterygium.

CELÁSTRUS. Celastracex. Species here entered are twining shrubs, seldom evergreen, with alternate simple lvs., greenish-white polyg-amous fis. in racemes or panicles, capsular fr. and seed with a crimson aril showy when ripe.

Suitable for covering walls, trellises and the like. They thrive in common soils. Propagated by seeds sown in fall or stratified, by suckers, cuttings of young or mature wood, and root-cuttings.

angulatus (C. latifolius). Branches angular: lvs. to 7 in. long: fis. in terminal panicles to 6 in. long: frs. orangered. China; not hardy in northern states.

articulatus: C. orbiculatus.

cassinoldes: Gymnosporia cassinoides.

flagellàris. Branches with spiny stipules: lvs. to 2 in. long: fls. in few-fld. axillary cymes: frs. orange-yellow. N. China, Korea, Japan; hardy in S. New England.

latifòlius. C. angulatus.

orbiculatus (C. articulatus). Branches spiny only when young: lvs. to 4 in. long: fls. in few-fld. axillary cymes: frs. orange-yellow. Japan, China. Var. punctatus is a less vigorous form with smaller lvs.

orientalis: listed name.

Orixa: Orixa japonica.

paniculatus. Branches with pale lenticular warts: lvs. to 4 in. long: fis. in terminal pendulous panicles to 8 in. long. Himalayas; adaptable S.

punctatus: C. orbiculatus var.

Rosthornianus. Lvs. to 3 in. long: fis. in nearly sessile cymes. China; not hardy far N.

scándens. Waxwork. False or Shrubby Bitter-Sweet. Lvs. to 4 in. long: fis. in terminal racemes to 4 in. long: frs. orange-yellow. Que. to N. C. and N. Mex.

CELERI: Apium graveolens var. dulce.

CELERIAC: see Celery.

CELERY (Apium, which see). Biennial or perennial herb grown for the edible leaf-stalks; Biennial or it is raised from seeds, coming to horticultural maturity the same year, but flowers are normally produced the second year although the plant sometimes runs to seed the first year. The leaf-stalks are blanched in the field but the process is often completed in the storage cellar for the

Ordinary deep fertile mellow garden land will produce good celery. It must be thoroughly prepared, and if not naturally retentive of moisture it should be supplemented with a system of irrigation or watering for dry times. The large-area commercial growing of celery is an

important industry on reclaimed lands, particularly on muck and other lowlands that can be drained. Under such conditions a uniform moisture supply can be assured and the ground readily provides the proper tilth. In such areas celery-growing has become a special skilled

industry of great importance.

Celery should make a continued rapid growth. It is specially important that the plants get a "quick" start. Stimulation by some form of available nitrogen, as in nitrate of soda, is advisable. This nitrate may be applied to seed-beds, about 1 teaspoonful to a gallon of water. Heavy applications of well-rotted stablemanure are advisable on uplands, and a chemical fertilizer of a 4-8-12 analysis on muck lands liberally applied. Side dressing the plants with nitrate of soda once or twice during their growth is usually advantageous.

For the home-garden celery may be planted in shallow trenches to facilitate blanching, but this method is now less used than formerly. The plants are commonly set 6 inches apart in rows 28-40 inches apart. Blanching may be accomplished by banking with earth late in the season until only the tops are visible, by shading with boards placed on edge on either side, and by tying with paper, or a drain tile put over each plant. The late crop may be packed in boxes, the roots covered with earth, and placed in the cellar to complete the blanching. Self-blanching may also be practiced, which consists of setting the plants very close together; this requires very rich soil and plenty of moisture; the plants may be set 5 or 6 inches apart in rows 10-24 inches apart.

Propagation is entirely by seed which for the early crop should be sown in boxes or hotbeds and transplanted once before being permanently set out. Seed for the late crop should be sown in a well-prepared seed-bed from which the seedlings should be transplanted to the garden or field. It requires eight to ten weeks for the plants to reach the proper size for setting in the

field, depending on the temperature.

Celery is harvested by cutting the plants just beneath the crown. This is accomplished with a spade in small areas, and by special horse, garden tractor or hand tools in large plantations. The plants are usually trimmed slightly in the field, They may be packed there in crates for storage or taken to a packing shed, where they are trimmed and washed, then tied in bunches or crated for local market or shipment. Storage of celery may be combined with the blanching of it, as already indicated. Plants are placed closely in crates; the storage house or cellar should not freeze but there should be good ventilation and clean sanitary conditions. For late autumn or early winter use late celery may be stored and bleached in field trenches, the tops being covered with straw or similar

The celery crop is subject to devastation by early and late blight, that produce spots and holes on the foliage. These diseases may be prevented by spraying thoroughly every week or ten days with bordcaux mixture, beginning in the seed-bed. Other diseases and pests are frequent, and the grower should avail himself of the latest books and bulletins.

Celeriac is grown the same as celery for the thickened edible crown, except that no blanching

is required: the leaves are not eaten after the manner of celery.

CELMÍSIA. Compositæ. Per. herbs of New Zeal. and Australia, having basal lvs. or imbricated st.-lvs. and large solitary heads of white ray- and disk-fls.; pappus of bristles; planted somewhat on Pacific Coast.

coriàcea. To 3 ft.: lvs. to 2 ft. long and 3 in. wide, leathery, silvery-tomentose: heads to 3 in. across, on woolly scapes. New Zeal.

scapes. New Zeal.
gracifenta. To 15 in., sts. tufted: basal lvs. narrowly
linear, to 15 in. long, white-tomentose beneath, margins
strongly revolute: scapes white-tomentose: heads to ¾ in.
across. New Zeal.

across. New Zeau.

longifòlia. To 1½ ft.: lvs. linear or linear-lanceolate, to
10 in. long, white-tomentose beneath. Australia.—The
New Zeal. plant known under this name has been separated
into other species, of which C. graculenta is cult.

spectabilis. Lvs. to 6 in. long and ¾ in. wide, leathery, woolly beneath: heads 1½ in. across, on woolly scapes. New Zeal.

CELÒSIA. Amaranthaceæ. The cult. celosias are herbaceous annuals, with the st. and branches terminated by dense chaffy spikes usually en-larged and highly colored and in various often fantastic shapes; native in warm countries. The fls. are small and not individually showy.

Celosias thrive in fertile soil with plenty of moisture. Propagated by seeds.

argéntea. To 3 ft.: lvs. linear to ovate-lanceolate, to 2 in. long: fl.-spikes 1-4 in. long, erect or drooping, silvery-white. Tropics.—Little cult. Var. cristâta (C. cristata). Cockscoms. Infl. in many forms, some with heavy-crested heads, others plumy or feathered with a large number of intermediates, the colors ranging from white to yellow, purple, and shades of red; also with variegated lys. Often the cult. types have Latin-form names as C. globosa, glori-sa manufac christants. osa, magnifica, chrysantheflora, pyramidalis, spicata, Thomp-sonii, Thompsonii magnifica, Childsii, plumosa, floribunda.

aurantiaca: orange-yellow form.

Childsii: C. argentea.

chrysanthefldra: C. argentea. cristata: C. argentea var.

floribunda. Much branched green or glaucous glabrous shrub to 12 ft.: Ivs. triangular-ovate to somewhat hastate, to 8 in. long, becoming oblong toward top: fls. very many in close panicles. Lower Calif; sometimes planted in S. Calif. for general interest.—The flower-garden plant known as C. floribunda is a form of C. argentea var. cristata.

globòsa: C. argentea.

Húttonii. To 2 ft., bushy, pyramidal: lvs. red or crimson: spikes 1½ in. long, cylindrical, red. Java.

kermesina is listed as a crimson form; probably belongs under C. argentea.

magnifica: C. argentea.

plumòsa: C. argentea.

pyramidalis: C. argentea.

spicata: C. argentea. Thompsonii: C. argentea.

Scrophulariacex. Yellow-fld. ann., CÉLSIA. bien, or per, herbs much like Verbascum but with 4 stamens instead of 5; mostly native in Medit. region and Asia, frequently planted for orna-

Propagated by seeds sown in the greenhouse, the plants set out in the open after all danger from frosts is past; also by cuttings.

Arctirus. Cretan Bears-Tail. Bien. or per. to 1½ ft., pubsscent: Ivs. ovate, toothed, the lower lyrate-pinnatifid: fls. clear yellow, long-stalked, with purple anthers, in loose racemes. Crete, Asia Minor.

crética. CRETAN MULLEIN. Stout hairy bien. or per. to 6 ft.: lvs. ovate, clasping, toothed, the lower lyrate-pinnatifid: fis. yellow marked with purple, almost sessile, in loose racemes, violet anthers. Medit. region.

orientalis. Ann. to 3 ft., sts. slender, very leafy: lvs. bipinnate, segms. linear to oblong: fls. yellow, in long lax racemes. N. Medit. region.

póntica. Bien. to 5 ft.: lower lvs. oblong, to 9 in. long, obtuse, base somewhat cordate, petioled, upper lvs. ovate, acuminate: fls. yellow, in racemes to 2 ft.\(^1\) long, calyx glandular-hairy. Armenia.

CÉLTIS. HACKBERRY. Ulmaceæ. Northern deciduous or seldom evergreen hemisphere trees or rarely shrubs, with alternate elm-like lys., unisexual or bisexual small fls., and drupaceous fra

Most of the species are hardy in the northern and north-central states where they are grown for shade and orna-ment. They are not particular as to soil. Propagated by seeds, layers and cuttings in the fall, or sometimes grafted on C. occidentalis.

Audibertiana: C. occidentalis var. crassifolia.

australia: C. becuentatis var. cross-jouch.

australia: To 80 ft.: lvs. to 6 in. long, sharply toothed, grayish-green and pubescent beneath: fr. dark purple.

S. Eu., N. Afr., W. Asia.—Grown in Calif.

Bungeana (C. Davidiana). To 50 ft.: lvs. to 3 in. long, slightly toothed only above middle, shining above: fr. purplish-black. China, Manchuria, Korea.

caucasica. Similar to C. australis but with lvs. to 3 in, long and reddish-brown frs. Caucasus, W. Asia,

cordata: C. occidentalis.

Davidiana: C. Bungeana.

Douglasii (C. rugulosa). To 20 ft.: lvs. to 3 in. long, coarsely toothed, pubescent on veins beneath: fr. brown. Colo. to Wash.—The Colorado form is separated by some authors as C. rugulosa, distinguished by the lvs. being pubescent beneath.

Julianse. To 80 ft.: lvs. to 6 in. long, wavy-toothed above the middle, yellowish-green and pubescent beneath: fr. orange. China.—Grown in Calif. and mild climates.

labilis. To 60 ft.: lvs. to 4 in. long, wavy-toothed above the middle, pale or brownish beneath, pubescent on venns: fr. orange. China.—Grown in Calif. and mild climates.

lævigāta (C. mississippiensis. C. occidentalis var. integrifolia). Sugarberry. Mississippi H. To 100 ft.: lvs. to 4 in. long, long-acuminate, usually entire, thin: fr. orange-red becoming dark purple. S. Ind. to Fla. and Tex. mississippiénsis: C. lævigata.

occidentàlis (C. cordata). To 120 ft.: lvs. to 5 in. long, toothed, shining above, paler below: fr. orange-red to dark purple. Que. to N. C. and Ala. Var. crassifòlia (C. Audibertiana) has firmer larger lvs. pubescent on nerves beneath.

orientàlis: C. Tournefortii.

rugulòsa: C. Douglasir.

sinensis. To 60 ft.: lvs. to 4 in. long, wavy-toothed, pubescent beneath when young: fr. dark orange. China, Korea, Japan.—Grown in Calif. and elsewhere.

Tâia. Shrub, with short spines: lvs. about 1 in. long, coarsely toothed or nearly entire. Uruguay.

Tournefórtii (C. orientalis). To 20 ft.: lvs. to 3 in. long, toothed, bluish- or grayish-green: fr. reddish-yellow. S. E. Eu., W. Asia.

CENTAURÈA. Compositæ. Herbaceous annuals and perennials with entire, pinnately lobed or divided lvs.: heads solitary or panicled, purple, blue, yellow or white; fls. all tubular, the marginal ones often enlarged; pappus of scales or bristles. The genus yields a wide variety of ornamental subjects from flower-garden annuals to bedding and foliage plants, basket plants, and stout thistle-like species for rear background effects. They are prevailingly Old World plants.

The annuals are grown from seeds sown directly in the garden or started earlier indoors. C. Cineraria and other foliage types are increased from cuttings taken in September and carried over winter indoors or sometimes from seeds sown in August. C. Cyanus, the bachelors-button, is an easily grown hardy annual.

alpina. To 3 ft.: lvs. spiny, tomentose beneath: heads yellow. S. E. Eu.

amars. Per. to 2 ft.: lvs. lobed, briefly pubescent, upper ones linear-lanceolate: heads to $1\frac{1}{2}$ in. across, pale purple; bracts of involucre scarious, the lvs. beneath not equalling the head. Medit. region.—By some authors considered to be only a variant of C. Jaces.

Amberbòi: C. moschata.

americans. Basket-Flower. Ann. to 6 ft.: lvs. mostly entire, oblong-lanceolate, to 5 in. long: heads solitary, rose or fiesh-colored, sometimes purplish, to 5 in. across, marginal fis. enlarged; bracts of involuere with fringed appendages. Mo. to La. and Mex. Var. álba has white fis.

arenària. Per. to nearly 3 ft.: lvs. 1-2-pinnatisect, green canescent-tomentose, segms. linear-lanceolate, mu-

cronate, upper lvs. with segms. dentate or entire; heads often solitary, to 1/2 in. across, rose-pink. Balkans to Caucasia.

argéntea: C. aumnocarpa.

atropurpurea. Per. to 7 ft., sparsely tomentose: lvs. 1-2-pinnate, segms. frequently dentate, acute: heads to 34 in. across, corolla dark purple or rarely yellow. Car-

babylonica. Per. 4-12 ft., silvery-white or greenish with white webby tomentum: basal lvs. lyrate, to 2 ft. long, st.-lvs. oblong to lanceolate, entire or wavy: heads yellow, subsessile, 1½ in. long, in stiff panicles; bracts of involuere with short recurved spiny tips. Asia Minor.

bélla. Per. to 15 in, sts. usually simple, erect; basal lvs. lyrate-pinnatifid, glandular-punctate above and densely white-tomentose beneath, segms elliptic to obovate, entire, st.-lvs. with narrowly linear segms.; heads about 34 in. across or less, ray-fls. purple or pinkish-lavender; involucial bracts with orbicular membranous lacerated appendage. Russia.

benedicta: Cnicus benedictus.

Bièbersteinii: C. micrantha.

candidíssima: see C. Cineraria.

carniolica. Very similar to C. nigrescens, differing in involucre cylindrical and nearly twice as long as wide. Cent. Eu.—By some authors this and C. nigrescens are treated as variants of the older C. dubia, a species not known to be in cult.

Cineraria. Dusty MILLER. Per. to 1 ft. or more, whitecherana. DUSTY MILLER. Fer. to 1 ft. or more, white-tomentose; lvs. pinnately purted into obtuse lineur-lanceo-late lobes: heads rather large, golden-yellow or purple; bracts of involucre ciliate. S. Italy, Sicily.—For the plant known in cult. as var. candidassima see Senecio leucostachys.

Clémentei. Per., white-woolly: lvs. pinnate into ovate lobes: heads terminal, yellow; bracts of involucre ciliate. Spain.

conifera: Leuzea conifera.

cristata. Ann. or bien.: lower lys. 3-pinnate, upper linear, entire: heads pale pink; bracts of involucre ciliate. S. Eu.

Crocodylium. Ann. to 4 ft.: lower lvs. ovate or lyrate, upper pinnate into linear segms.; heads solitary, rose, marginal fis. enlarged. Syria.

Crupina: Crupina vulgaris.

Cyanus. Cornelower. Bachelors-Button. Blue-Bottle. Popular hardy ann. to 2) 1/2 ft., woolly-white only when young: lvs. linear, to 6 in. long, entire or lower toothed, sometimes pinnately cut: heads blue, purple, pink or white, to 11/2 in. across, marginal fis. enlarged; bracts of involucre fringed. S. E. Eu.; frequently self-sows and sometimes escapes. Var. fibre-plèno has double fis. Var. nanacompacta is listed as a dwarf form.

cynaroides (Rhaponticum cynaroides). Per.: lvs. oblong to ovate, punnatifid: heads solitary or few. purplish; bracts of involucre fringed. Pyrences.

dealbata. Per. to 2 ft.: lvs. pinnate into coarsely toothed lobes, lower to 1½ ft. long, white-tomentose beneath: heads solitary, inner fis. red, marginal ones rosy or white; bracts of involucre fringed. Asia Minor, Persia.

depréssa. Per., almost prostrate, white-pubescent: lower lvs. oblong, entire or lyrate, upper linear-lanceolate: heads blue, about 1½ in. across, marginal fis. enlarged bracts of involucre with black or white margins. Persia,

dichroantha. Per. to 3 ft.: lvs. glabrous, lanceolate-oblong, to 10 in. long, pinnatisect, segms. linear, about ½ in. wide: fls. purple-red or yellow, heads to 1½ in. across; involucral bracts with short pectinate fringe, the margin brownish-black. Cent. Eu.

diluta. Ann. to 3½ ft.: lvs. lanceolate to oblong, to 4 in. long, lyrate-pinnatind or entire, dentate, the teeth spinescent: heads white to pale rose, to 1½ in. across. Spain.

Éndressii: C. nigra.

Fritschii. Per. to 6 ft.: Ivs. mostly pinnatifid, segms. linear-lanceolate, toothed or entire, to ½ in. wide, glabrous above: heads long-pediuncled, to ½ in. across, rose to purple; involucral bracts white-tomentose with blackish cilia. Balkan region.—Similar to C. Scabiosa, differing in its taller habit, the appendages of involucral bracts only to in long and lvs. not scabrous above.

fuscăta. Per. to 2 ft., not much branched: lvs. lyrate-pinnatifid to lanceolate and entire: heads yellow; involucral bracts ovate, yellowish tipped brown. N. Afr.

glastifòlia. Much branched per with winged st.: lvs. entire, oblong, the basal ones sometimes divided: fls. yellow, in solitary heads to 1 in. across, leafy bracts absent. Cent.

graca. To 1½ ft., rarely branched: lvs. lanceolate to narrowly linear, lower ones bipinnatifid, upper ones entire to pinnatisect, mucronate, all webby-woolly when young:

fls. rose-purple, in heads to 1½ in. across; bracts of involucre with stout terminal spine having minute pectinate lateral cilia along basal fourth. Greece.

Grisebachii. Per. to 1½ ft. or more, paniculately branched: lvs. scabrous, pinnatisect, segms. oblong-linear: heads solitary in dense panicles; fls. purple, marginal ones radiating and larger than inner; involucral bracts with small pectinate-ciliate triangular appendages. Greece.

gymnocárpa (C. argentea). DUSTY MILLER. Per. to 2 ft., densely white-woolly: lvs 2-pinnate into linear entire lobes: heads in panicles, small, rose-violet or purple, mostly hidden by the lvs. Capri.

imperialis. Supposed hybrid between *C. moschata* and fragrant. to 4 ft.: heads white, rose, hilac or purple, fragrant.

Jacea. Per. to 2 ft.: lvs. entire, lanceolate: heads solitary, purple or rarely white, to 1½ in. across, marginal fis. enlarged; bracts of involucre brown and fringed. Cent. Eu.; nat. in N. Amer.

Kotschyana. Per., sts. erect, scabrous: lvs. lyrate-pinnatifid to lanceolate and dentate, segms, toothed, somewhat setaceous above: heads globose, to 1½ in. across, dark purple Balkan region.

leucolepis. Bien. to 2 ft., sts. angular, scabrous: basal lvs. bipinnatisect, segms. lanceolate, toothed, green on both sides, st.-lvs. pinnatisect: heads about ³⁄₄ in. wide, pale rose or white; involucral bracts white-scarious with or without a short single terminal spine. Medit. region.

Lippii. Per. to 1 ft., sts. pubescent, striated: lvs. narrowly oblong-spatulate, to 4 in. long or more, pinnate, white-cinereous, segms. obtuse, dentate: heads small, violet-purple. N. Afr.

lugdunénsis. Per. to nearly 2 ft., sts. usually simple: lvs linear-lanceolate, acuminate, pubescent: heads to 1 in. across or less, blue, solitary; margins of bracts brownish-chiate. France.

macrocéphala. Per. to 3 ft.: lvs. ovate-lanceolate, toothed: heads solitary, yellow, to 4 in. across; bracts of involucre fringed and scarious. Armenia.

maculosa (C. rhenana). Bien.: lvs. 1-2-pinnate into linear segms: heads pule purple or rarely white; bracts of involucre uniformly pectmate. S. Eu. Var. álba is listed.

margaritàcea: C. splendens.

Margaritæ: C. moschata var. alba.

melanocéphala. Hybrid between C. alpina and C. Fritschi. per. to 3 ft., webby-pubescent; lower lvs. pinnatifid, upper ones pinnatisect with dentate lanceolate segms. to 3 in long; heads purple to yellow, to $\frac{3}{4}$ in across; involucral bracts broadly ovate, black-tipped, pectinate-lacerate and terminated by spine. Serbia.

melanosticta: listed name.

meliténsis. Ann. to 4 ft., gray-pubescent, the sts. winged by decurrent II.-bases: basal lvs. lyrate, upper entire or lobed; heads solitary or clustered, yellow, small; bracts of involucre spiny-tupped. Medit. region; nat. in N and S A treer.

micrantha (C. Biebersteinii). Similar to C. maculosa from which it differs in having only the terminal end of involueral bracts fringed. Cent. and E. Eu.

montana. Mountain Bluet. Per. to 1 ft. or more: lvs. broadly lanceolate, silvery-white when young: heads blue, to 3 in. across, marginal fls. enlarged; bracts of involucre with black fringe. Eu. Color forms are álba, cárnea, citrina, purpurea and rôsea.

moschata (C. odorata, C. suaveolens, C. Amberboi). Sweet Sultan. Ann, glabrous, to 2 ft.: lvs. toothed or pinnately cut: heads solitary, fragrant, white, yellow or purple, 2 in. across, marginal fis. enlarged: bracts of involucre entire. Orient, Var. 4iba (C. Margaritz) has white fis. Var. rosea fis. rose-pink to purplish-pink.

muricata: Amberboa muricata.

nemoralis. Very similar to C. nigra from which it differs in its smaller heads with appendages of the involucral bracts lanceolate and smaller. Cent. Eu.

nervosa: C. plumosa.

nigra (C. Endressii). KNAPWEED. HARDHEADS. Per., rough-pubescent. to 2 ft.: lvs. oblong or lanceolate, entire or toothed, to 6 in. long; heads solitary, rose-purple, to 1 in. across; bracts of involucre fringed, the appendages broadly ovate. Eu.; nat. in N. Amer. Var. variegata has lvs. margined with white.

nigréscens. Per. to 2½ ft., glabrous or nearly so: lvs. oblong- to ovate-lanceolate, toothed, acute: ray-fis. purple, hasds 1-4, to 1 in. across; involucre ovoid, nearly as wide as long, bracts terminated by a broadly dilated appendage having a stiff blackish pectinate fringe. S. and Cent. Eu.

odorata: C. moschata.

orientalis (C. rigidifolia). Per. to 3 ft.: lvs. somewhat leathery, mostly pinnately cut into linear-oblong segms.: heads yellow, to 2½ in. across; bracts of involucre chestnut-

brown with pale tan or reddish ciliate margin and fringe. Eu. Var. rôsea is listed, but may not be this species.

oxylepis. Per. to 3 ft.: lvs. ovate-lanceolate, punnatifid to dentate, green on both sides or sometimes webbytomentose, margins somewhat spiny-ciliate: heads about 1/2 in. across, rose-purple; involucral bracts lanceolate, denticulate to pectinate-fringed, recurved. Cent. Eu.

paniculata. Bien. to 2½ ft., pubescent to white-woolly: lvs. 1-2-pinnate, segms. linear to oblong: ray-fls. purple, heads solitary and often close together in an elongated panicle; distal end of bracts short-lacinate. S. W. and S. Eu —A confused Linnæan name; some of the material so listed is C. maculosa.

phrýgia (C. pseudophrygia). Per. to 2 ft. or more, paniculately branched: lvs. oblong, toothed: heads solitary, rose; bracts of involucre fringed, brownish-black, long-tapering.

plumòsa (C. nervosa). Per. to 2½ ft., not or only little branched: lvs. lanceolate to ovate, toothed: heads solitary, deep purple; bracts of involucre fringed. Cent. Eu.—Some of the material so named in the trade is referable to C. gymnocarpa.

pseudophrýgia: C. phrygia.

pulchérrima (Ætheopappus pulcherrimus). Per. to 2½ ft.: lvs. lanceolate or pinnatifid, to 7 in. long, gray-pubescent beneath. heads solitary, purple; bracts of involucre brown and fringed. Caucasus.

purpurata. Bien. to 3 ft.: lvs. oblong, pinnatifid, to 1 ft. long, glaucous to tomentose beneath, margin somewhat spiny-ciliate: heads solitary, terminal on lateral branches, purple; involucial bracts pungent and strongly reflexed. Japan.

ragusina. Per. to 3 ft., sts. white-tomentose: lvs. oblong, lyrate-pinnutifid, to 5 in. long, white-canescent, lobes entire to pinnatisect, obtuse: heads to 1½ in. across, bright yellow. W. Medit. region.—Perhaps not hardy N.

rhenàna: C. muculosa.

rigidifòlia: C. orientalis.

rupéstris. Per to 2½ ft., usually branched, webby-hairy: lvs. pinnate, lfts. pinnatsect with segms narrowly linear, acute to mucronate: heads yellow or rarely orange, to 1 in. long; involucral bracts with long yellowish terminal spine and fringe-like lateral appendages: achenes with pappus in 2 rows. S. E. Eu.

ruthénica. Per to 3 ft., glabrous: lvs. pinnately cut into linear toothed lobes: heads usually solitary, pale yellow, to 2 in. across, marginal fis. enlarged; braces of involuere entire. Eu., W. Asia.

rutifòlia. Per. to 3 ft, gray-pubescent: lower lvs. pinnate, upper oblong, entire: heads 5-7, rose, marginal fls. enlarged; bracts of involuere ciliate at tips. Bulgaria.

salmantica. Per., sts. usually glabrous: lvs. lyrate-pinnatifid, denticulate, mucronate: heads long-pedicelled, white to pale violet-purple; involucral bracts spine-tipped. Dalmatia.

salonitans. Per., sts. scabrous: lvs. lanceolate-elliptic, entire or pinnatifid, mucronate: heads yellow, sometimes white to purplish, to 1½ m. across, without leafy bracts subtending the involucre; involucral bracts with pectinate fringe around obtuse apex. Dalmatia.

Scabiosa. Per. to 2 ft, pubescent: lvs. pinnately cut, to 6 in. long: heads solitary, purple or yellow, 2 in. across, marginal fls. enlarged; bracts of involucre fringed and black-margined, the terminal appendage about 1/3 in. long. Eu.; nat. in N. Amer.

sórdida. Per. to 2 ft.: lvs. pinnatifid into linear entire lobes: heads purple or yellowish; bracts of involucre ciliate and spiny-tipped. Reported to be a hybrid between C. rupestris and C. Fritschin.

spléndens (C. margaritacea). Bien. to 2 ft.: lvs 1- or 2-pinnate into narrow entire segms.: fls. rose-red, solitary at tips of branches, the involucre about ½ in. long and wide. S. Eu.

stenólepis. Per. to 3½ ft., webby-pubescent: lvs. simple, entire or dentate, ovate to lanceolate-cuneate to sessile: heads small, marginal fis. radiating, purplish. Cent. and E. En.

stenophylla. Per., sts. much branched, to 2 ft. or more, slender: lvs. narrowly ovate-oblong to lanceolate-linear, pinnatifid to filiform: fls. purple or rarely white; involueral bracts 3-spined, latter short and slender. Spain.—By some authorities considered as a var. of C. aspera.

suavèolens: C. moschata.

Tabscheri. Per., erect, white-tomentose: lvs. pinnatisect to pinnately lobed, webby-woolly, segms. lanceolate to linear: heads rose-colored, solitary, involucre about 1/2 in. across; bracts with triangular terminal appendages having black pectinate-ciliate margins. Cent. Eu.

verbascifòlia. Per., branching: lvs. oval-lanceolate, toothed, white-tomentose: heads violet; bracts of involucre brown. Arabia.

CENTAURIDIUM DRUMMONDII: Xanthisma texanum

CENTAÙRIUM (Erythræa). CENTAURY. Gentianacex. Small mostly ann. herbs with opposite, simple and entire lvs. and red or rose more or less pink-like bright fls. borne in cymes.

Sometimes cultivated in the rock-garden and in borders. They thrive in light sandy loam and require protection from sun and frost. Propagated by seeds, the perennials by cuttings and division. The following are annuals or perhaps sometimes biennials.

Beyrichii. To 8 in., sts. ascending: lvs. to 1 in. long: fis. deep pink, 1 in. across. Ark, to Tex.

conferta (Erythwa conferta and E chloodes). Annor bien, to 4 in., glabrous, the sts. many: lvs. fleshy, oblong, obtuse, lower ones in rosette, upper ones narrower: fls. rose. England, S. W. Eu.

diffùsum: C. Massonii.

Mássonii (C. diffusum). To 4 in , tufted: lvs. to $\frac{1}{2}$ in. long: fls. bright rose Azores.

pulchélla (C. ramosissima). To 6 in.; lvs. oval; fls. pink. Eu.

ramosissima: C. pulchella.

venústum. To 8 in.: lvs. to 1 in. long: fis. rose, the throat white spotted with red, Calif.

CENTAURY: Centaurium.

CENTIPEDE-PLANT: Homalocladium.

CENTRADÈNIA. Melastonuceæ. Herbs and small shrubs native in Mex. and Cent. Amer., with entire unequal lvs., small pink or white fls. in cymes, and capsular fr.; grown in greenhouses for the attractive fls. and often showily colored lvs. They thrive in soil composed of rich leafmold and sharp sand. Propagated by cuttings.

floribunda. Lattle shrub with obscurely angled not winged somewhat pubescent sts.: lvs. narrow-lanceolate, 3-nerved, to about 2 in. long, red underneath: fls. pink. Mex.

grandifòlia. To 2 ft., the sts. winged: lvs. oblong-lanceolate, very uncqual-sided, about 5-nerved, to 6 in. long, bright red beneath: fls. rose-pink. Mex.

CENTRÁNTHUS (or Kentranthus). anaceæ. Ann. or per. herbs native in the Medit. region, having small white or red fls. in dense terminal clusters, the calyx pappus-like, corolla tubular and 5-parted, spurred at base, stamen 1. A few species are grown in the flower-garden, C ruber being common. Propagated by seeds and division.

álbus: probably C. ruber var.

angustifòlius. Per. to 2 ft., glaucous: lvs. linear-lanceo-late or linear, entire, to 3 in. long: fls. rose, fragrant. S. Eu.

atrococcineus: listed name, perhaps a form of C. ruber. Calcitrapa. Ann. to 11/2 ft: lvs. pinnatifid, the lower lyrate, to 3 in. long: fis. rose. S. Eu., N. Afr.

coccineus: C. ruber.

macrosiphon. Ann. to 2 ft.: lvs. ovate, to 3 in. long, toothed or lobed, glaucous: fls. rose. Spain. Var. álbus has white fls.

rûber (Valeriana coccinea and rubra). RED VALERIAN. JUPITERS-BEARD. Per to 3 ft., glaucous: lvs. ovate to lanceolate, to 4 in. long, nearly entire: fis. crimson or pale red, fragrant Eu. to S. W. Asia. Var. álbus has white fis. Var. rôseus is listed.

CENTRIPETAL: developing towards the center from without.

CENTROPÒGON. Lobeliaceæ. Trop. American shrubs or herb-like with alternate toothed lvs., red, orange or greenish tubular 2-lipped fls. having the stamens united with the lower part of corolla-tube, and fr. a berry; grown in hanging-baskets in a warm greenhouse. Propagated by cuttings over heat.

Lucyanus. To 2 ft.: lvs. ovate- or oblong-lanceolate: fls. rose-carmine, 1½ in. long, clustered at ends of branches, the stamen-column exserted.

surinaménsis. To 3 ft., with purplish sts.: lvs. ovate, to 6 in. long: fls. red, to 2 in. long, solitary at ends of branches, the stamen-column exserted.

CENTROSÈMA (Bradburya). BUTTERFLY-PEA. CONCHITA. Leguminosæ. Twining vines with pinnate lvs. mostly of 3 lfts., white or purplish papilionaceous fls. in the axils, and flat linear pods; native of Amer., the first two described species grown as cover-crops in the tropics

brasilianum. Lits. ovate-oblong, to 21/4 in. long: fis. white or blue, 11/4 in. across: pods to 4 in. long and 1/4 in. wide. Brazil.

grandifidrum: C. virginiana.

Plumièri. Lits. ovate, to 5 in. long, blackening in drying: fis. 2 or more in. across, white with purple center: pods to 6 in. long and ½ in. wide. Trop. Amer.

pubéscens. Líts. ovate to oblong, to 3 in. long: fiswhite or yellowish: pods to 8 in. long and 1/4 in. wide. Trop. Amer.

virginianum (C. grandistorum). Lfts. ovate to linear-lanceo late, to 2 in. long: fis. purple to whitish: pods to 5 in. long and 1/2 in. wide. E. N. Amer., trop. Amer., Afr.

CENTROSOLENIA BULLATA: Episcia tessellata.

CENTURY PLANT: Agave.

CEPHAÈLIS (Evea). Rubiacex. Trop. shrubs or small trees with opposite lys, and rather small fls. in terminal heads subtended by involucral bracts; one intro. in S. Calif.

tomentòsa. Shrub to 15 ft., hairy: lvs. lanceolate to elliptic, to 10 in. long, long-acuminate: fls. yellow, the bright red bracts to 2 in. across: fr. blue. Mex. to Bolivia.

CEPHALANDRA: Coccinea.

CEPHALANTHÈRA. Orchidacex. Terrestrial orchids with generally leafy sts. and fls. in spikes: sepals and petals nearly equal; lip saccate.

falcata. Lvs. to 8, distichous, lance olate, strongly nerved: fis. yellow, sessile, in terminal spikes to 5 in. long. China, Japan.

CEPHALÁNTHUS. BUTTON-BUSH. Rubiaceæ. A few shrubs or small trees with opposite or whorled entire lvs., ours deciduous, and small tubular 4-lobed fls. in dense globose showy heads, the styles long-exserted; native in Asia, Afr. and N. Amer.

Of easy cultivation in good land if moist. Propagated by seeds and by cuttings of mature wood in autumn or green wood in spring.

occidentàlis. To 20 ft.: lvs. ovate to oval-lanceolate, to 6 in. long, shining above: fls creamy, in long-stalked heads about 1 in. across, July-Sept. N. Amer., in swamps.—It runs into narrow-lvd. and pubescent forms.

CEPHALÀRIA. Dipsaceæ. Ann. and per. Old World mostly coarse scabiosa-like herbs with opposite simple or compound lvs., small 4-parted whitish, yellowish or bluish fls. in longstalked prominent heads, and fr. a ribbed achene; grown in the flower-garden. Easily propagated by seeds.

alpina. Per. to 6 ft.: lvs. pinnately cut into toothed decurrent lanceolate segms.: fis. sulfur-yellow, in heads to 1½ in. across. S. Eu.

baleárica. Per. to 2½ ft.: lvs. entire or lyrate-pinnatifid, oval or the upper entire, toothed, shining: fis. yellowish-white. Balearic Isls.

 ${\bf centauroldes:}\ \ {\bf probably}\ \ {\it C.\ corniculata}.$

corniculata. Per. to 3½ ft.: lvs. pinnately-lobed, lobes oblong, entire: fis. pale yellow, usually double, on long peduncles; autumn. S. E. Eu.

flava: C. grwca.

graca (C. flava). Per. to 2 ft.: lvs. pinnatisect, segms. ovate to oblong, often dentate or incised: fis. yellow, in long peduncled heads to 1½ in. across. Macedonia, Greece.

lævigàta. Erect glabrous per.: lvs. lanceolate, pinnately lobed, incised or entire: heads pale yellow, involucre with 8 small teeth. Cent. Eu.

leucántha. Per. to 4 ft.: lvs. pinnately-lobed, lobes linear-oblong: fis. creamy-white, in nearly spherical heads.

radiàta. Per.: lvs. pinnatisect, segms. elliptic to lanceolate, terminal one largest, all pubescent: heads yellow

to white, lower involucral bracts ovate-orbicular, upper ones acute. Hungary.

rígida. Per. to 3 ft.: lvs. stiff, ovate-oblong, to 3 in. long, toothed: fis white. S. Afr.

syriaca. Ann. to 1 ft., sts. scabrous-prickly: lvs. oblong-lanceolate, entire or toothed, ciliate: fls. pale blue to lilac, in somewhat elongated heads to ½ in. diam. June-July. Medit. region.

tatárica. Per. to 6 ft.: lvs. pinnately divided into toothed broad-lanceolate lfts.: fls. creamy-white, in heads to 2 in. across. Russia, W. Asia.

Tchihátchewii. Per. to 2 ft., hairy: lvs. lyrate-pinnatifid into oblong-lanceolate 3-5-parted segms.: fis. yellow, in long-stalked heads. Armenia.

transylvánica. Ann. to 3 ft.: lvs. lyrate to pinnatelylobed, lobes linear-lanceolate: fis. creamy-white or bluish, in globular heads on long peduncles. S. E. Eu.

CEPHALOCÈREUS. Cactaceæ. About 50 species of tall slender-columnar spiny or bristle-bearing cacti, Fla. and N. Mex. to Ecuador and Brazil, often with long white hair or wool at or near the top: fls. small, mostly nocturnal, fleshy, often in a head-like aggregation. See Cacti.

With the exception of *C. semils* the species of Cephalocereus are little known in our horticulture. They are handled in the same way as the columnar or arboreous kinds of Cereus, mostly in large collections of cacti or succulents. They are propagated by seeds and cuttings.

albispinus: see Pilocereus albispinus.

alénsis. To 20 ft., branching from base, sts. slender, 12-14-ribbed; spines acicular, 10-14, to % in. long; flowering areoles woolly, hans to 2 in. long; fis. light purple to purplish-green. Mex.

arrábidæ (C. exerens. Cereus exerens. Priocereus arrabidæ). To 10 ft, often much branched at base, ribs 6-8 with areoles rather close together and having long hairs when young; spines 5-10, to 1½ in. long, brownish: fis. white, 2¼ in. long. Brazil.

brasiliénsis (Pilocereus brasiliensis). To 10 ft., branches slender and weak, erect becoming reclining, glaucous-to bright green; ribs 4 or 5, wing-like, obtuse; arcoles close with white hairs longer than spines; radial spines 3-8, to ½ in. long, brown; central usually solitary, to ½ in. long, prorrect; fis. to 2 m. long. Brazil.

cating cola. To 40 ft., with short trunk and much branched top; ribs 4-5, bluish-green, intercostal spaces wider than ribs; are oles woolly; spines yellow when young, unequal, to 1 is in. long: fls. white, about 3 in. long. Brazil.

Celsiànus: Oreocereus Celsianus.

chrysacánthus (Cercus and Pilocereus chrysacanthus). To 15 ft., branching near base, glaucous; ribs 12, areoles ½ in apart; spines 12-15, to 1½ in. long, golden-yellow becoming darker: fls rose-red, to 3 in. long, with mass of long white hairs. Mex.

chrysomállus: Pachycereus chrysomallus.

chrysostèle. Similar to C. Gounellei from which it differs in sts. with 15-20 ribs, areoles $\frac{1}{24}-\frac{1}{24}$ in. across, radial spines 12-20, to $\frac{3}{4}$ in. long, yellow or reddish, central spines reddish with yellow tip and base. Brazil.

Collinsii (Pulocereus Collinsii). To 10 ft., branches few, to 1¾ in. diam; ribs usually 6-8, rounded; areoles woolly, to ½ in. apart; spines mostly alike, unequal, to 1¾ in. long, numerous, needle-like; fis. about 2 in. long. Mex.

colombianus (Cereus and Pilocereus colombianus). To 20 ft., branched; ribs 8, areoles with long white wool; spines 25 or more, slender: fls. pale pink, 3 in. long. Colombia.

Columna-Trajani: Pachycereus Columna-Trajani.

comètes (Cereus cometes). Cylindric; ribs 12-15; areoles close together, the flowering ones with yellow hair or wool; spines ¾ in. long, pink or brownish. Mex.

Dautwitzii: Espostoa lanata.

Deeringii. To 35 ft., st. slender, simple or remotely branched, 9-10-ribbed; areoles short-hairy; spines 25-31, to ½ in. long: fis. white, to 2½ in. long: fr. dark red. Fla.

Dybowskii. To 15 ft., sts. much branched, erect, to 3½ in. diam.; ribs 18-20, areoles about ½ in. apart; central spines 1-2, yellow, to 1½ in. long; radial spines hidden in yellowish-white matted wool: fis. white, opening at night, to 1½ in. long: fr pinkish, globular. Brazil.

erythrocéphalus: see Denmoza rhodacantha.

euphorbioides (Cereus and Pilocereus euphorbioides).
Columnar and usually simple, to 15 ft. and more, with 8 sharp ribs and areoles close together and felted with white, the flowering ones not confluent: fis. diurnal, brownish outside, rose-red inside, tube to 2 in. long. Probably S. Amer.

exèrens: C. arrabidæ.

fernambucénsis: hort. name, probably Cereus pernam-

fluminénsis. Forms clumps, sts. erect, pendent or ascending, to 7 ft. long; ribs 12-17, to ½ in. deep, angle acute; spines many, yellow, longest to 1½ in. intermixed with bristles to 2½ in. long; fs. white, to nearly 3 in. long; fr. bright red to purple. Brazil.

glaucéscens. St. to 2 in. thick, usually 7-9-ribbed, angles acute, light glaucous-green; areoles about ½ in. apart, with yellow wool and har; radial spines 14-20, golden-yellow, to nearly ½ in. long; central spines golden-yellow to reddish-brown, usually 3-5, to ½ in. long; fl. color not known. Brazil.

Gounéllei (Pilocereus Gounellei and setosus. Cereus Gounellei). To 8 ft., much branched, lower branches spreading or creeping; ribs 10-11, areoles ½ in. across, flowering ones with long white hairs; radial spines 15-24, to nearly ½ in. long, brown; central spines 3-5, amberyellow fading to white: fls. white, to 3½ in. long. Brazil.

hapalacánthus. St. 7-9-ribbed, angles obtuse, dark green, notched; areoles about ½ in. apart, tufted with brown hairs to ½ in. long; radial spines usually 11-13, to ½ in. long, brown; central spines 1-2, to ½ in. long. Brazil.

Hôppenstedtii (Cereus and Pilocereus Hoppenstedtu). To 30 ft., often clambering; ribs 20 or more, areoles close together; radial spines 14-18, short, white: fis. white tipped with rose, 3 m. long. S. Mex.

keyénsis. To 18 ft., with few erect branches; ribs 9-10, very glaucous, areoles ½ m. apart; spines 15, ½ in. long, yellow, wool short and grayish: fls. brownish-purple, 2½ in. long. Fla. Keys.

lanuginòsus (Pilocereus lanuginosus). Tree-like, branched; ribs 9-13, bright blue, areoles woolly; spines light yellow: fis. white, green outside, 2½ in. long. Curacao.

leucocephalus. To 17 ft. long and 4 in. diam., usually 3-15 branches arising from lower portion, usually 12-ribbed; spines 8-12, to 34 in. long, hairs of flowering areoles to 4 in. long: fis. white, to 2½ in. long: fr. to 1¾ in. diam., dull purple. Mex.

leucostèle (Pilocereus and Stephanocereus leucostele). Cylindrical, to 10 ft. high and 4 in. diam., usually unbranched, glaucous-green; ribs 12-18, shallow; areoles to ½ in. apart, dense wool covering the st; radial spines 10-20, to ½ in. long, white to brownish, slender; centrals 1-2, to 1¾ in. long, white to yellow: fls. white, to 2½ in. long, stigma 11-lobed and exceeding stamens. Brazil—Cephalium usually densely white-woolly with yellow bristles to 3 in. long.

 ${\it Llanosii}$: listed name of plant thought to be similar to ${\it Cereus \ peruvanus}$.

macrocéphalus (Cereus and Pilocereus macrocephalus). To 30 ft. and more, with woody trunk, simple or slightly branched; ribs 24, pale green; radial spines 12; flowering arcoles with white hairs or bristles: fls. 2 in. long. Mex.

melanostèle: Haageocereus chosicensis.

Moritzianus (Cereus and Pilocereus Moritzianus). To 30 ft., much branched; ribs 7-10, areoles ½ in. apart, white-woolly; radial spines 6-8, to 1½ in. long: fis. white, 2 in. long. Venezuela.

Níckelsii: C. polylophus.

niger: listed name.

nobilis (Pilocereus nobilis). Erect, cylindrical, to 3 in. diam., branched, dark green; ribs 5-11, rounded; areoles to ¾ in. apart, wool yellow becoming black; radial spines 7-10, to 1½ in. long, reddish-yellow becoming brownish; centrals 1-4, to nearly 2 in. long: fis. light pink within and greenish-red outside, to 2 in. long: fr. red to violet-red. W. Indies.

Pálmeri (Cereus Palmeri. Pilocereus Houlletii). To 18 ft., much branched; ribs 7-9, white-hairy at top, areoles ½ in. apart; radual spines 8-12, 1 in. long, brown: fls. purplish or brownish, 2½ in. long. E. Mex.

pasacana: Trichocereus pasacana.

pentædróphorus (Pilocereus pentædrophorus). Sts. slender, usually to 15 ft., rarely to 35 ft. high, and about 4 m. diam., bluish-green; rbs 4-8, notched; areoles glabrous; spines alike, yellow, 6-12, to 1½ in. long; fis. to 2½ in. long, tube bent near middle. Brazil.

pheacanthus (Cereus pheacanthus. Monvillea pheacanthus). To 12 ft., branching at base; ribs usually 13; areoles ½ in. apart, with tufts of white wool; spines numerous, ½ in. long: fis. white, greenish-brown outside, 2½ in. long. Brazil.

piauhyénsis. Tree-like to 40 ft., trunk woody, to 20 in. diam.; branches many, usually 12-13-ribbed, slender, bluish-green; areoles about ½ in. apart, yellow, woolly, the hair to ½ in. long; spines yellow, radials 10-15, to ½ in. long, centrals 3-5, to ¾ in. long: fis. to 1½ in. long. Brasil

pòco: listed name; perhaps Trichocereus poco.

polylophus (Cereus Nickelsii. Pachycereus polylophus). St. columnar, to 40 ft. tall and 14 in. diam.; ribs usually 15-40, acute, about ½ in. high; spines yellow tipped brown, to ¾ in. long, radials 7-9, central 1 and to 3 in. long: fis. dark red, to 2 in. long. W. Mex.

purpureus. Unbranched, to 12 ft. or more; ribs 12-20. strongly notched, areoles white-woolly; radial spines 15 or more, to ½ in. long; central spines 4-6, unequal, to 2 in. long; fp. pale pink outside, white within, to 1½ in. long: fr. obconical, purplish-violet. Brazil.

Púrpusii (Pilocereus Purpusu). Sts. erect, to 10 ft. high and 2 in. diam., rarely branched; ribs 12, to 1/4 in. high, notched or irregularly depressed; are oles about 1/4 in. long, yellow becoming gray. Mex.

rhodánthus: Arrojadoa rhodantha.

Róbinii. To 27 ft. or more, branching profusely above the base, branches bright glaucous-green when young, to 4 in. thick; ribs 10-13; spines 15-20, to 1 in. long, yellow becoming gray: fis. brownish-green, to 2 in. long: fr. reddish-purple. Cuba.

Royenii). To 20 ft., branching near base, glaucous; ribs 7-11, are oles close together and with wool when young; spines $\frac{1}{2}-\frac{2}{2}\frac{1}{2}$ in long: fis. greenishyellow or purplish, 2 in. long. W. Indies.

Russellanus (Cereus and Pilocereus Russellanus). To 25 ft., with woody trunk branched at top; ribs 4-6, areoles large, ½ in. apart, with white wool when young; spines 8-14, ½ in. long, dark brown becoming gray: fis. cream or pinkish, to 3½ in. long. Venezuela, Colombia.

salvadorénsis: listed name.

Sartorianus (Prlocereus Sartorianus. Cereus Houlletii). To 15 ft.; ribs 7; areoles ½ in. apart, with cobwebby hairs; radial spines 7-8 or more, ½ in. long: fls. rose, to 3 in. long. Mex

senilis (Cereus and Pilocereus senilis). OLD-MAN CACTUS. To 40 ft. and more, mostly simple; ribs 20-30, the areoles bearing long white bristles or hairs and aggregated into a head: fls. about 2 in. long, rose-colored. Mex.

Smithianus (Pilocereus Smithianus). Erect or clambering simple or branched; ribs 9-11, are oles felted; spines 1½ in. long: fis. white, to 3 in. long. Venezuela, Trinidad.

sublanatus: listed name.

Swartzii. To 20 ft. or more, not much branched: ribs usually 10, rounded, deeply notched; spines 8-10, or to 20 in young plants, to 1 in. long: fis. yellow tinged pink or green, to 2½ in. long. Jamaica.

Tetétzo: Pachycereus Tetetzo. Trelèasii: Lemarreocereus Treleasii.

versicolor: IIaageocereus versicolor.

CEPHALOPHYLLUM. Aizoaceæ. A large S. African genus separated from Mesembryan-CEPHALOPHÝLLUM. themum, having cylindrical or 3-angled lvs. with pellucid dots, borne in rosettes, and solitary terminal long-stalked fls.; petals numerous, linear; stigmas 10-20.

acutum: C. subulatoides.

Alstonii (M. Alstonii). Lvs. to 41/4 in. long and 1/4 in. wide, glaucous: fls. ruby-purple with violet anthers, to 3 in. across

anemoniflorum (M. anemoniflorum). Lvs. 1 in. long and $\frac{1}{1}$ in. wide, glaucous-green suffused with purple: fis. salmon-colored, $2\frac{1}{2}$ in. across.

confusum (M. confusum). Lvs. to 11/2 in. long and 1/5 in. thick: fis. golden-yellow, 1 in. across.

decipiens (C, leve. M, decipiens). Lvs. 2 in. or more long and \mathcal{V}_{4} in. wide, bright green: fis. yellow.

læve: C. decipiens.

spongiosum (M. spongiosum). Lvs. to 4 in. long and 14 in. wide, with whitish spongy surface: fis. vermilion with yellow base, 2½ in. across.

subulatoides (C. acutum. M. acutum). Lvs. spreading to 3 in. long and 1/4 in. wide, gray-green: fis. purple-red, to 11/4 in. across, on stalks to 3 in. long.

tricoldrum (M. tricolorum). Lvs. 2 in. or more long and $\frac{1}{2}$ in. thick, bright green or often reddish: fis. yellow, purple at base and reddish at tip, about 2 in. across

CEPHALOSTACHYUM. Graminex. East Indian bamboo-like shrubby grasses with spikelets borne in heads or the heads panicled or clustered, stamens 6. Sometimes planted in warm countries. See Bamboo.

pergrácile. To 40 ft., sts. glaucous: lvs. to 1 ft. long and 1½ in. wide, rough on edges, rugose: heads about 2 in. apart in the large panicles.

CEPHALOTAXÀCEÆ. PLUM-YEW FAMILY. A small family of the southern hemisphere of which one genus, Cephalotaxus, is cult. It is composed of evergreen resinous coniferous trees or shrubs and was formerly included in Taxaceæ, from which it differs in the fertile pistillate fls. composed of several 2-ovuled carpels from which only 1-2 seeds develop; the branches are opposite and the lvs. have 2 broad glaucous-green lines beneath.

CEPHALOTÁXUS. Plum-Yew. taxacex. Asian evergreen trees and shrubs with linear lvs. having 2 broad glaucous bands beneath, and drupe-like stalked frs. or seeds; they can be grown in N. Y. and New England. Dis-tinguished from Taxus in the glaucous lines on under surface of lvs., the drupe-like fr. and characters of fls. For cult. see Confers.

drupdeea, Japanese P. Tree to 30 ft.: lvs. 1-2 in. long, abruptly pointed: fr. green. Japan. Hort. vars are: fastigata, Spiral P., of columnar habit; nana, to 0 ft. tall; pedunculata (C. Harringtoma, C. pedunculata), Harringtoma, P., with heads of male fis. long-stalked; hardy in sheltered positions Northeast, but grows slowly; sinensis, a shrub to 14 ft., lvs. tapering acutely. China.

Fortunii. Chinese P. Tree to 30 ft.: lvs. 2-3 in. long, tapering: fr. purple. China; hardy in sheltered positions in the Northeast, but usually remains a bush.

Harringtonia: C. drupacea var. pedunculata.

Oliveri. Shrub: lvs. closely set, 1 in. long, spiny-pointed.

pedunculata: C. drupacea var.

CERÁSTIUM. MOUSE-EAR CHICKWEED. Caryophyllacex. Herbaceous often tufted or mat-forming annuals and perennials, usually more or less hairy and sometimes hoary, with white fls. in terminal cymes and small entire opposite lvs.; of world-wide distribution, especially abundant in temp. zones.

Cerastiums are employed in rock-gardens or for edgings in bedding and borders. They grow well under ordinary garden conditions. Propagated by divisions or by cuttings taken after flowering, also by seeds.

alpinum. Per. to 6 in., generally silky-hairy: lvs. small: fls. white, solitary or in rather hairy few-fld. panicles, summer. Que, Lab., arctic Amer., and in alpine and arctic Eu. and Asia. Var. greenlandicum is listed. Var. lanàtum. Very hairy, the rosettes white-woolly.

argenteum: C. grandiflorum.

arvénse (C. strictum). Starry Grasswort. Per. to 10 in., densely tufted with erect or ascending sts. lvs. very narrow, to 1½ in. long: fls. numerous, white. Apr.-May. N. Amer., Eu., Asia. Var. compáctum is a low form. Var. gaspénsis is said to be a large-fld. form from the Gaspé Peninsula.

Bièbersteinii. Per. to 6 in., creeping and spreading: lvs. grayish-woolly, to 1½ in. long and ½ in. wide: fis. white. May-June. Mts. of Asia Minor.

Boissièri (C. gibraltaricum). Per. to 1 ft.: lvs. silvery; fis. large, white, in cymes. Spain.

cæspitòsum. Per. to 1 ft., sts. often procumbent: lvs. about ½ in. long and ½ in. wide: fls. white. Eu.

Colúmnæ: C. tomentosum.

gibraltáricum: C. Boissieri.

glaciàle: C. uniflorum.

grandiflorum (C. argenteum). Per., creeping, to 8 in.: lvs. linear, grayish: fis. transparent white. E. Eu.

Lerchenfeldianum. Erect, to 8 in.: lvs. lanceolate, about ½ in. long and ½ in. wide, ciliate: fis. white, the cymes usually many-fid. Eu.

strictum: C. arvense.

Thomasii. Low per., with sts. 1-2 fld., peduncle very short: lower lvs. obovate, upper ones oblong. Alpine region, Cent. Italy.

tomentosum (C. Columnæ). Snow-in-Summer. Per., creeping, branching, to 6 in., grayish-woolly: lvs. to ¾ in. long and ¼ in. wide: fis. white, rather large, early summer.

uniflorum (C. glaciale). Per. to 3 in.: lvs. to ¾ in. long and ¼ in. wide: fis. white, to ¼ in. across, in 1-3-fid. cymes, summer. Eu.

villosum: the plants cult. under this name are probably $C.\ alpinum$.

CERASUS: Cherry: see Prunus.

CERATOCHLOA PENDULA: Bromus unioloides.

CERATONIA. Leguminosæ. One evergreen tree to 50 ft., with pinnate lvs. of 4-6 round or obovate shining lfts. to 4 in. long, small red fls. in short lateral racemes from old branchlets, and flattened leathery pods to 1 ft. long. C. Sfliqua, CAROB, ST. JOHNS-BREAD, from the E. Medit. region, has been intro. into S. Calif. and Fla. for the pods which are eaten by livestock and as human food; a special dehydrated product has been developed as a breakfast food and for other uses.

The carob sometimes withstands a few degrees of frost but is generally adapted to the same range as the orange. It will grow on any well-drained soil, and trees in orchards should be planted 35-40 feet apart. Propagated by seeds, preferably under glass, and the seedlings afterwards budded; or by cuttungs over bottom heat.

CERATOPÉTALUM. Cunoniaceæ. Australian resinous trees or shrubs with opposite lvs. of 1-3 digitate lfts. and small white, rose or yellow fls. in terminal cymes or panieles; grown under glass or out-of-doors in the S. Propagated by cuttings of half-ripened wood.

apétalum. Tree to 60 ft., bark silvery: lfts. usually 1, ovate-lanceolate, to 5 in. and more long, toothed: fls. without petals, calyx to 1/4 in. long in fr.

gummiferum. Tree to 40 ft.: lfts. 3, lanceolate, to 1½ in. and more long, toothed: fls. with deeply lobed petals, calyx to ½ in. long in fr.

CERATOPHÝLLUM, the only genus of Ceratophyllacex. One submerged aquatic herb, widely distributed in ponds and lakes in temp. and trop. regions, sometimes grown in aquaria for its foliage; fls. not showy. C. demérsum. Hornwort. Lvs. forked into thread-like divisions, to 1 in. long, in whorls: fls. minute, unisexual, without perianth, solitary and sessile in the axils: fr. oval, with a spine-like beak.—Of easy cult., pieces being transferred from ponds.

CERATÓPTERIS. WATER-FERN. FLOATING-FERN. The only genus of *Ceratopteridaceæ*. The only true aquatic ferns, growing in the mud with the sterile fronds often floating, the fertile fronds erect, 2—4-pinnate.

These ferns are useful in ponds and aquaria, planted in pots and submerged slightly. Propagated by buds which are formed on all parts of the fronds.

cornùta: C. thalictroides.

pteridoides. Sterile fronds to 10 in. long, short-stalked, irregularly lobed, floating; fertile fronds erect, to 16 in. long, divided into linear segms. Fla. to Brazil.

thalictroides (C. cornuta). Sterile fronds long-stalked, 1-2-pinnatifid into triangular segms., not floating; fertile fronds similar but segms. linear. Old World tropics.

CERATOSTÍGMA. Plumbaginacex. Per. herbs or shrubs with alternate simple lvs. and blue or rose salver-shaped fls. in terminal clusters or heads; grown in the border. Propagated by division and cuttings.

Griffithii. Low shrub, much branched, rusty-hairy: lvs. spatulate, with red margins: fls. blue, India.

Larpéntiæ: C. plumbaginoides.

plumbaginoides (Plumbago Larpentiæ). Per. to 1 ft., diffuse: lvs. obovate, to 3 in. long, the margins ciliate: fis. deep blue, ½ in. across. Aug.-Sept. China; hardy N.

Willmottlanum. Shrub to 5 ft.: lvs. rhombic, to 2 in. long, ciliate. fls. bright blue with rosy tube, to ¾ in. across. July-Nov. China.

CERATOTHÈCA. Pedaliaceæ. Small genus of African annuals having membranous toothed

lvs. and solitary zygomorphic fls. in lf.-axils. One species is cult., C. trfloba. To 6 ft. tall, simply branched, with hairy obtusely 4-sided sts.: lvs. ovate-cordate to triangular and 3-lobed, to 6 in. long, coarsely crenate to entire: fls. lilac, striped purple in throat, to 3 in. long: fr. a caps. to 1 in. long, pubescent. S. Afr.

CERATOZÀMIA. Cycadaceæ. Mexican palmlike cycads with stiff pinnate lvs. borne in a whorl at top of short trunk, the fls. in cones and the cone-scales horned; 6 species, one sometimes grown in the greenhouse or out-of-doors in warm regions. For cult. see Cycas.

latifolia. To 3½ ft. or more; lvs. nearly 3 ft. long, with 15-20 pairs of lanceolate lfts. to 5 in. long and 1¾ in. wide, notice with the state of t

petiole prickly.
longifòlia: C. mexicana.

mexicana (C. longnfolia). To 4 or rarely 6 ft., trunk short: lvs. about 3 ft. long, with 15-20 pairs of lfts. to 1234 in. long and 1 m. wide, petiole prickly.

CERBERA THEVETIA: Thevetia nereifolia.

CERCIDIPHYLLÀCEÆ. CERCIDIPHYLLUM OF KATSURA-TREE FAMILY. Only the genus Cercidiphyllum comprises this family which is separated from Trochodendraceæ: lvs. opposite, with stipules: carpel in the fl. 1.

CERCIDIPHÝLLUM. Cercidiphyllaceæ. One odd deciduous tree sometimes attaining 100 ft., from Japan. C. japónicum. Katsura-Tree. Lvs. orbicular or ovate, to 4 in. long, cordate at base, obtuse, wavy-toothed, palmately veined, becoming yellow or scarlet in autumn: fls. unisexual, before the lvs.: fr. a pod about ¾ in. long. Japan. Var. sinénse is a taller form from China.—The katsura-tree grows best in rich moist soil; hardy in N. Y. and Cent. New England. Propagated by seeds, cuttings of green wood in spring, or by layers.

CERCÍDIUM. Leguminosæ. A few trees and shrubs in the warmer parts of Amer., with alternate bipinnate deciduous lvs., sharp spines and green-barked branches: fls. not papilionaceous, nearly regular, yellow, in short axillary racemes: pods flattish, linear or oblong.

Torreyanum. PALO VERDE Characteristic small bushy tree in the and regions of Mex., Ariz., S. Calif. and sometimes planted in its region: to 25 ft., leafless most of the year, the foliage appearing in spring and soon falling, sometimes a second leafage in autumn: fls. to ¾ in. across: pods to 3 in. long.

CÉRCIS. REDBUD. JUDAS-TREE. Leguminosx. Small trees and shrubs native in N. Amer., S. Eu. and Asia, with simple entire broad lvs., pink or red imperfectly papilionaceous fls. in racemes or clusters appearing in spring before or with the lvs., and flattened pods having narrow wings on the ventral suture.

Redbuds thrive in fertile sandy loam; only C. canadensis is hardy north of New York. Propagated by seeds sown in spring in heat; by layers, greenwood cuttings in spring, or C. chinensis by soft cuttings in summer under glass.

canadénsis. Shrub or tree to 40 ft.: Ivs. roundish, abruptly acute: fls. rosy-pink, 1/2 in. long, in clusters: pods to 31/2 in. long. N. J. to Fla. and Tex. Var. álba has white fls. and plèna double fls.

chinénsis (C. japonica). Tree to 50 ft.: lvs. roundish, abruptly acute: fis. purplish-pink, % in. long, in clusters: pods to 5 in. long. China, Japan. Vars. álba and arbòrea are listed.

japónica: C. chinensis.

occidentalis. Shrub to 15 ft.: lvs. kidney-shaped, notched or obtuse at tip: fis. reddish, 1/2 in. long, in clusters: pods 21/2 in. long. Calif.

racemosa. Tree to 30 ft.: lvs. roundish, abruptly acute: fls. rosy-pink, 1/2 in. long, in many-fld. racemes: pods to 4 in. long. Cent. China.

reniformis. Shrub or tree to 40 ft.: lvs. reniform, blunt-pointed: fls. reddish, 1/2 in. long, in clusters: pods to 4 in. long. Tex., N. Mex.

Siliquastrum. Shrub or tree to 40 ft.: lvs. roundish, obtuse or notched at tip: fis. purplish-rose, 1/4 in. long, in clusters: pods to 4 in. long. S. Eu., W. Asia. Var. alba has

CERCOCÁRPUS. MOUNTAIN MAHOGANY. Rosaceæ. Evergreen shrubs or partially deciduous small trees native in W. N. Amer., with simple lys., small greenish or reddish fls. without petals, solitary or clustered, in spring and summer, and fr. an achene with a long feathery style.

Sometimes planted as shrubbery in regions of which they are native or in similar places; they succeed in dry soils and mostly with sunny exposure. Propagated by seeds or cuttings.

betulæfòlius: C. betuloides.

betuloides (C. betulæfolius). To 30 ft.: lvs. obovate, to 2 in. long, toothed, pale beneath. Calif.

ledifolius. To 40 ft.: lvs. lanceolate, to 1 in. long, with tire revolute margins. pubescent beneath. Wash, to entire revolute margins, pubescent beneath. Calif. and Ariz.

monthnus (C. parvifolius). To 6 ft.: lvs. obovate, to 2 in. long, toothed, pale beneath, pubescent both sides. S. D. to New Mex.

parvifòlius; C. montanus.

Tráskiæ. To 20 ft.: lvs. broadly ovate, to 2 in. long, toothed toward apex, densely white-tomentose beneath. Catalina Isl.

CÈREUS (Piptanthocereus). Cactaceæ. Some 900 names have been used in Cereus, a genus formerly held to include many inharmonious species; as now defined, it has about two dozen species in S. Amer. and W. Indies: mostly arborescent columnar plants (but sometimes spreading or prostrate), often massive, usually branching, strongly angled or ribbed, areoles spiny and more or less short-woolly but not bearing long hairs: fls. funnelform, mostly white, nocturnal, tube nearly or quite naked on outside: fr. naked. See Cacti.

The word Cereus is most popularly known in the name "night-blooming cereus," but the plants so designated are now placed in other genera. The kinds of true cereus are not much known in cultivation with us, and mostly under glass. The flowers are not very attractive or striking. The plants are mostly large and columnar. They propagate readily by seeds and cuttings.

Athiops (C. cærulescens). Bush-like, to 6 or 7 ft., sts. bluish-green to purplish; ribs 7 or 8, areoles large and black; fls. 7 in. or more long and about 5 in. across, white.

alacriportanus (C. peruvianus var. alacriportanus. C. paraguayensis). Tall and columnar, to 6 ft.; ribs mostly 5 and strongly compressed, the areoles nearly or quite 1 in. apart; spines 6-9 and spreading; fls. 8 or 9 in. long and 4 in. broad, white with rosy tinge. S. Brazil, Paraguay.

argentinénsis. Erect, to 70 ft. tall, tree-like and much branched, sts. to 6 in. diam.; ribs 4-5, thin, intervals wide, about 2 in. deep; spines brownish, radials 5-8, to 2 in. long, centrals 1-2, to 4 in. long: fls. white inside, to 10 in. long.

aureus: botanically a synonym of C. nobilis, a species not known to be in cult., but applied to several hort. forms of various genera.

azūreus (C. Seidelii). Slender and flexuose, 3-4 ft. high and 1 in. diam., bluish; ribs 6 or 7, areoles several inches apart; radial spines 8-12: fls. 4-5 in. long, white. Brazil.

cæruléscens: C. æthiops.

casius. Cylindrical, to about 20 ft. tall and 7 in. diam.; ribs 5-6, acute, narrow and wing-like, notched; spines yellowish-brown, radials 7-9, spreading, centrals 4-7, to 4 in. long: fls. white. S. Amer.

chalybæus. To 10 ft.; ribs 6 and very high, areoles distant; radial spines 7 or more, dark brown: fis. white, pinkish outside, 8 in. long. Argentina.

Childsii: C. hexagonus.

Dayamii. Erect or tipped, much branched and tree-like, to 80 ft. tall, sts. to 8 in. diam.; ribs 5-6, thin, about 1½ in. high, notched; spines 3-4, to ½ in. long, orange to reddish-brown: fis. white, to 10 in. long. Argentins.

Fórbesii: C. validus.

formòsus: C. pernambucensis.

glaticus: C. Jamacaru.

Hankeanus: C. validus.

hexagonus (C. lepidotus. C. Childsii). To 45 ft. with trunk 1 ft. diam., branches erect; ribs usually 6 with wavy margins, areoles 1/2 in. apart and felted; spines on old branches 8-10 or more and to 2 in. long: fis. white tinged purple outside, to 10 in. long. W. Indies, N. S. Amer.

Hildmannianus. Tall and columnar, to 15 ft., often much branched; ribs 5 or 6, young joints dark blue, areoles distant and developing a few spines: fis. to 9 in. long, white, inner segms. obtuse. Brazil.

hórridus: C. Jamacaru.

Huntingtonianus. To 12 ft. high, much branched at base; ribs 6-8, acutish, to 14 in. high; radial spines 1-4 to 14 in. long, grayish; central 1, to 4 in. long, often absent: fls. pink inside, to 114 in. diam., inner segms. somewhat fringed. Probably S. Amer. but known only in cult.

Jamácaru (C. glaucus. C. horrudus). To 30 ft., very much branched, with short woody trunk, the top compact of upright branches, joints blue when young; ribs 4-6, areoles large and about 1 in. apart; spines usually many: fis. 1 ft. long, white, green outside, ovary purplish. Brazil. Var. monstròsus is listed.

iugatiflòrus. To 10 ft. high and 1 ft. diam.; ribs 6-8, jugathorus. 10 10 it. high and 1 it. diam.; rios 0-5, narrow, subcrenate; radial spines 5-7, acicular, to 1/4 in. long; centrals 1-3, gray-black: fls. whitish within, 6-9 in. long: fr. yellowish, about 3 in. long. Described from cult.

lepidòtus: C. hexagonus.

microspérmus. Trunk to 1 ft. thick, with slender branches; ribs 20, areoles close together and tomentose; spines 12-16 or more, ½ in long, golden-brown. Peru.

milésimus: C. pernambucensis.

monstròsus: C. variabilis.

Monvilleanus. A species of uncertain botanical affinity: columnar, branching; ribs 19; radial spines about 20. S.

paraguayénsis: C. alacriportanus.

perlucens. Erect and branched to 10 ft. or more, sts. blue-green to green; ribs 5-6, thick, straight, somewhat notched; spines 5-10, about 1/8 in. long, reddish-brown: fls. white, to 6 in. long. Brazil.

pernambucénsis (C. formosus. C. milesimus). To 1 ft. or more, often prostrate, making clumps to 15 ft. across; ribs 3-5, very thick and prominent, areoles ½ in. apart with white wool; spines 4-10, to 2 in. long, yellowish: fts. white. Coast, Brazil, Uruguay. Var. monstròsus is a cristate form.

peruvianus. Tall, to 40 ft. or more, much branched and tree-like, branches usually green but sometimes glaucous; ribs 4-9; spines needle-like; fls. about 6 in. long, outer segms. red or brownish, inner white. S. E. S. Amer. Var. monstròsus has ribs broken into irregular tubercles.

Pitahàya: C. variabilis.

Roézlii. Said to be columnar, with sts. 9-ribbed, radial spines 9-12 and a longer solitary central spine. Peru or Ecuador. Probably a Lemaireocereus or Trichocereus.

Seidelii: C. azureus.

stenogonus. To 25 ft., tree-like; ribs 4-5; spines 2-3 and $1\frac{3}{4}$ in. long: fls. rose, to 9 in. long. Paraguay, Argentina. tetragonus. To 6 ft., much branched; ribs usually 4, areoles close together and white-woolly; radial spines 5-6, 1/4 in. long: fls. reddish, 5 in. long. Brazil.

válidus (C. Hankeanus. C Forbesii). Shrubby, 6 ft. or more, somewhat branched, glaucous when young; ribs 4-8 and obtuse; radial spines 5 and short and stout: fls. funnelform, reddish outside, white or reddish inside. Argentina

variabilis (C. Pitahaya. C. monstrosus of hort.). Much branched and shrub-like, to 14 ft. high; ribs 3-5, acute, to 1½ in. high, dull green; spines yellowish-brown, radials 5-7, to ½ in. long, stout, centrals 1-2, to ¾ in. long, straight: fis. white, to 8 in. long. Brazil, Uruguay.

xanthocárpus. To 20 ft., tree-like, very spiny at top; ribs 4-6, high and narrow, areoles to 1½ in. apart and white-woolly; spines 3-4: fls. white, greenish outside, 5 in. long: fr. yellow. Paraguay.

Other names in Cereus may now be discovered in the following places:

acanthurus: Borzicactus acanthurus.

ácifer: Echinocereus acifer.

adscéndens: Harrisia adscendens.

aggregatus: Echinocereus coccineus. alamosénsis: Rathbunia alamosensis. albispinus: Pilocereus albispinus.

amecaménsis: Heliocereus amecamensis.

aureispinus: listed, perhaps Parodia aureispina.

aureus: Erdisia Meyenii.

Báckebergii: Pilocereus Backebergii.

Bankiànus: listed name.
Baùmannii: Cleistocactus Baumannii,
bavdsus: Lemaircocereus Hollianus.
baxaniénsis: Acanthocereus pentagonus.
Benéckei: Lemaireocereus Beneckei.

Berlandièri: Echinocercus Blanckii. bifórmis: Disocactus biformis. Biólleyi: Weberocercus Biolleyi. Blánckii: Echinocercus Blanckii.

Boéckmannii: Selenicereus Boeckmannii.

bolivianus: perhaps referable to Truchocereus macro-

mus.

Bonplandii: Harrisia Bonplandii. brachypétalus: Corryocactus brachypetalus. brevistylus: Corryocactus brevistylus. Bridgesii: Tuchocereus Bridgesii.

Brookei: Harrisia Brookei.

cæspitdsus: Echinocereus Reichenbachii.

calcaràtus: Hylocereus calcaratus.
candelàbrum: Lemaireocereus Weberi.
candelàris: Browningia candelaris.
cándicans: Trichocereus candicans.

Cartwrightianus: Lemarreocereus Carturightianus.

Cávendishii: Monvillea Cavendishii. Celsiànus: Oreocereus Celsianus.

cephalomacróstibas: Trichocereus cephalomacrostibas.

Chénde: Lemaireocereus Chende.
Chíchipe: Lemaireocereus Chichipe.
chiloénsis: Truchocereus chiloensis.
Chiotílla: Escontria Chiotilla.
chloránthus: Echniocereus chloranthus.
chosicénsis: Haugeocereus chosicensis.
chrysacánthus: Cephalocereus chrysacanthus.

chrysomállus: Pachycereus chrysomallus.
cineráscens: Echinocereus cinerascens.

coccineus: Echinocereus coccineus; Heliocereus elegan-

Còchai: Myrtullocaetus Cochal, colombianus: Cephalocereus colombianus, colubrinus: Cleistocaetus Baumennu

Colúmna-Trajani: Pachycereus Columna-Trajani.

comètes: Cephalocereus cometes.

conglomeratus: Echinocercus conglomeratus.

coniflorus: Selenteereus contilorus. conoideus: Echinotereus conoideus, coquímbanus: Trichocercus coçumbanus.

Coryne: Stetsonia Coryne.

costaricénsis: Hylocereus costaricensis. crímsonii: Aporocactus Mallisonii. ctenoides: Echinocereus elemoides. cuzcoénsis: Trichocereus cuicoensis. Damaziòi: Arthrocereus microsphæricus. dasyacánthus; Echinocereus dasyacanthus,

Daûtwitzii: Esposton lanata. dec ûmbens: Haugeocercus decumbens. deficiens: Lemarreocercus deficens. dél Moràlii: Lemarreocercus Chende. Donkelaari: Selencercus Donkelaari. dùbius: Echmocercus dubrus.

dùbius: Echinocereus dubius.
Dumortièri: Lemaireocereus Dumortieri.
eburneus: Lemaireocereus griseus.
Emoryi: Bergerocactus Emoryi.

Éngelmannii: Echinocereus Engelmannii. enneacánthus: Echinocereus enneacanthus.

erióphorus: Harrisia eriophora. Erdca: Macharocereus Eruca.

erythrocéphalus: Denmoza rhodocantha. euphorbioides: Cephalocereus euphorbioides.

exèrens: Cephalocereus arrabidæ. Faischerða: listed name.

fascicularis: Trichocereus fascicularis.

Faustianus: probably Borzicactus Faustianus.

Féndleri; Echinocereus Fendleri.

fernambucénsis: catalogue name for Cereus pernambucensis

flagellifórmis: Aporacactus flagelliformis.
fossulàtus: Oreocereus Celsianus var. foveolatus.

Fricii: Priocereus Fricii. fulgidus: C Maynardii. Funkii: Trichocereus chiloensis.

gemmatus: Lemarreocereus marginatus.

geométrizans: Myrtillocactus geometrians.
gigantèus: Carnegica gigantea.
gladiàtus: Trichocereus candicans.

glycimórphus: Echinocereus glycimorphus. gonacánthus: Echinocereus triglochuliatus.

Gounéllei: Cephalocereus Gounelles.

grandiflòrus: Selenicereus grandiflorus.

Gréggii: Penrocereus Greggii.

gríseus: Lemaireocereus griseus. guatemalénsis: Nyctocereus guatemalensis.

gummòsus: Macherocereus gummosus. hamàtus: Selenicereus hamatus. Hássleri: Mediocactus coccineus.

Herreraanus: listed name.
Hertzogianus: listed name.

Hirschtiànus: Nyctocereus Hirschtianus.
Holliànus: Lemaireocereus Hollianus.
hondurénsis: Selenicereus hondurensis.
Hóppenstedtii: Cephalocereus Hoppenstedtii.

horribilis: Acanthocereus horribilis.
hórridus: Cereus Jamacaru.
Hoúlletii: Cephalocereus Sartorianus.
huáscha: Trichocereus huascha.
hýstrix: Lemaireocereus hystrix.
Irigoyènii: Oreocereus Trollin.
Júsbertii: Harrisia Jusbertii.
lætus: Lemaireocereus ketus.

lampiochlòrus: Trichocereus lamprochlorus.

Lauterbáchii: allied to Monvillea Cavendishii but not

understood botanically.

Lemàirei: Hylocereus Lemairei. Leònii: Leptocereus Leoni. léptophis: Aporocactus leptophis. litoràlis: Truchocercus lutoralis. longisètus: Echinocercus longisetus.

longispina: hort. name, possibly referable to Tricho-

cereus strigosus var.

Macdónaldiæ: Selenicereus Macdonaldiæ, macrocéphalus: Cephalocereus macrocephalus,

macrogònus: Trichocereus macrogonus.
Mállisonii: Aporocactus Mallisonii.
mamillàtus: Echinocereus mamillatus.
marginàtus: Lemaireocereus marginatus.
Martiànus: Aporocactus Martianus.

Mártinii: Harrisia Martinii.

Máynardii (C. fulgidus). Hybrid between Selenicereus grandisorus and Heliocereus speciosus; fls. scarlet, to 7 in. secoss.

melanostèle: Haageocereus chosicensis. melanótrichus: Corryocactus melanotrichus.

microcárpus: listed name.

microsphéricus: Arthrocereus microsphericus.

mojavénsis: Echinocercus mojavensis. monacánthus: Hylocercus monacanthus. Moritziànus: Cephalocercus Moritzianus.

Múnzii: Echinocereus Munzii. Näshii: Harrisia Nashii. Nickelsii: Cephalocereus polylophus.

nycticállus: Selenicereus pteranthus.
obtusángulus: Epiphyllanthus microsphæricus.

ocamponis: Hylocereus ocamponis.

octacanthus: Echinocereus octacanthus.

Óstenii: listed name.

nacalaénsis: perhaps Haggeocereus pacalgensis.

Pálmeri: Cenhalocereus Palmeri. pasacana: Trichocereus pasacana.

paucispinus: Echinocereus triglochidiatus.

pécten-aboriginum: Pachucereus pecten-arboriginum.

pectinatus: Echinocereus pectinatus. pellùcidus: Harrisia Fernowii. pénsilis: Echinocereus pensilis.

pentagonus: Acanthocereus pentagonus. pentálophus: Echinocereus pentalophus. phæacanthus: Cephalocereus phæacanthus. phatnospérmus: Monvillea phatnosperma, phœniceus: Echinocereus coccineus. platinospinus: Borzicactus platinospinus.

pòco: see Trichocereus poco.

polyacánthus: Echinocereus polyacanthus. polylophus: Cephalocereus polylophus. polyrhizus: Hulocereus polyrhizus. pomanénsis: Harrisia pomanensis. portoricénsis: Harrisia portoricensis. Posélgeri: Wilcoxia Poselgeri.

Pringlei: Pachycereus Pringlei. procumbens: Echinocereus pentalophus. pruindsus: Lemaireocereus pruinosus. pteránthus: Selenicereus pteranthus.

pseudomelanostèle: Haageocereus pseudomelanostele.

quadricostàtus: Leptocereus quadricostatus. queretaroénsis: Lemaireocereus queretaroensis, Reichenbachianus: Echinocereus Reichenbachii.

remolinénsis: Pilocereus remolinensis. renándus: Harrisia gracilis. rhodacánthus: Denmoza rhodacantha. rhodánthus: Arrojadoa rhodantha.

Roèmeri: Echinocereus coccineus and E. octacanthus.

Roètteri: Echinocereus Roetteri. rostràtus: Selenicereus hamatus. Rovènii: Cephalocereus Royensi. Russelianus: Cephalocereus Russelianus.

Schottii: Lophocereus Schottii. Schrankii: Heliocereus Schrankii. sciùrus: Echinocereus sciurus. senilis: Cephalocereus senilis. serpentinus: Nyctocereus serpentinus.

setàceus: Mediocactus coccineus. Shaferi: may be Lobivia Shaferi or Trichocereus Shaferi.

Silvéstrii: Chamæcereus Silvestrii. Smithii: Aporocactus Mallisonii. sonorénsis: Rathbunia alamosensis. Spachianus: Trichocereus Spachianus.

speciosissimus; speciòsus: Heliocereus speciosus.

Spegazzînii: Monvillea Spegazzinii. spinibárbis: Eulychnia spinibarbis. spinuldsus: Selenicereus spinulosus. spléndens: Monvillea Cavendishii. squarròsus: Erdisia squarrosa. stellatus: Lemaireocereus stellatus. stenópterus: Hylocereus stenopterus. stramineus: Echinocereus stramineus. Straussii: Cleistocactus Straussii. striàtus: Wilcoxia striata.

strigòsus: Trichocereus strigosus. supérbus: Heliocereus superbus.

tephracanthus: Trichocereus tephracanthus. Terschéckii: Trichocereus Terscheckii.

testudo: Deamia testudo. Tetétzo: Pachucereus Tetetzo.

texénsis: Echinocereus Reichenbachii and E. papillosus.

thelegonoides: Trichocereus thelegonoides. thelegonus: Trichocereus thelegonus. Thurberi: Lemaireocereus Thurberi. tortudsus: Harrisia tortuosa. Trelèasei: Lemaireocereus Treleasei. triangulàris: Hylocereus triangularis.

tricostàtus: Hylocereus undatus.

triglochidiatus: Echinocereus triglochidiatus.

Trollii: Oreocereus Trollii. tuberòsus: Wilcoxia Poselaeri. undatus: Hulocorous undatus

usitàtus: listed name.

vagans: Selenicereus vagans. versicolor: Haagaocereus versicolor. viridifidrus: Echinocereus viridifiorus, Weberbaueri: Trichocereus fascicularis.

Wéberi: Lemaireocereus Weberi.

Weingartianus: Lentocereus Weingartianus.

Werdermannianus: probably Trichocereus Werdermannianue

CERIMAN: Monstera deliciosa.

CERÍNTHE. HONEYWORT. Boraginaceæ. Old World herbs, often glabrous and glaucous, with alternate simple lvs. and vellow fls. among leafy bracts in terminal racemes or cymes; ovary in 2 parts but style undivided. Of easy cult. Propagated by seeds.

major. Ann. to 1 ft.: lvs rough and chate: fls. purplish at top, the bracts showy. Medit. region.

retorta. Ann. to 2 ft.: lvs. glaucous, often spotted with white or red: fls. tipped with purple, the bracts purple. Greece.

CERNUOUS: drooping; declining somewhat from the perpendicular.

CEROCHLÁMYS. Aizoaceæ. One of the Mesembryanthemum group allied to Punctillaria but differing in the caps. having only 5 valves and other technical characters; one species in S. Afr. C. trigona. To 2 in., stemless or nearly so: lvs. to 3/4 in. broad and thick, obtusely 3-angled, covered with waxy secretion: fls. pink, 11/4 in. across

CEROPÈGIA. Asclepiadacex. Herbs or subshrubs, sometimes twining, with opposite lvs. (sometimes lacking) and tubular fls. mostly in axillary clusters; corolla tubular and often inflated at base, crown joined to the staminal tube; follicles slender; native in trop. Asia, Afr. and Malaya; grown in the greenhouse.

They grow in soil composed of loam, leaf-mold or peat, and sand. Propagated by cuttings in spring over bottom

Bárklyi. Sts erect and sometimes twining, to 1½ ft. long: lvs linear to lanceolate, to 1½ in. long, fleshy, dark green with whitish veins: fls. greenish veincd with purplebrown, corolla-tube to ¾ in. long, 2-3 together. S. Afr.

bulbòsa. Sts. twining: roots tuberous: lvs. very variable, from narrowly linear to orbicular, to 8 in. long: fis. greenish outside, purple within, to 1 in. long; infl. 3-5-fid. W. India.

caffrorum. Sts. twining: lvs. linear to ovate-lanceolate, to 1 in. long, fleshy, glabrous: fls. green outside with purple lines, purplish-black within, to ½ in. long, lobes ciliate.

débilis. Sts. twining, to 4 ft. long: lvs. partially cylindrical, to $1\frac{1}{4}$ in. long: fls. greenish marked with purple, corolla-tube to $\frac{3}{4}$ in. long, 1–3 together. Trop. Afr.

dichótoma. Succulent subshrub to 3½ ft., sts. to ½ in. diam., internodes to 4 in. long: lvs. linear, to 1½ in long and ½ in. wide, early deciduous: fis. pale yellow, inconspicuous, in clusters of 3-6 in axils of fallen lvs. Canary Isls.

fúsca. Shrub to $1\frac{1}{2}$ ft. or more: lvs. soon falling, linear, to 2 in. long: fis. dull reddish-brown with light yellow crown. Canary Isls.

hastata. Sts. twining: lvs. linear- to ovate-hastate, to 1½ in. long; fls. purple with darker veins, to ½ in. long; corona may be whitish. S. Afr.

Meyerl. Sts. twining, to 4 ft. tall: roots somewhat tuberous: lvs. ovate to lanceolate, to 3 in. long, base often cordate, somewhat hairy, margin toothed or lobed: fts. greenish-violet, to 2 in. long. S. Afr.

radicans. Sts. prostrate and creeping: lvs. ovate or orbicular, to 1¾ in. long, fleshy: fls. greenish or whitish spotted with purple, lobes purple-brown, corolla-tube to 2 in. long, 1-2 together. S. Afr.

stapeliæfórmis. Sts. decumbent or trailing: lvs. rudi-

mentary, about $\frac{1}{1}$ in. long: fis. white marked with purple, corolla-tube to $1\frac{1}{2}$ in. long, 1-several together. S. Air.

Thorncroftii. Twining per.: lvs. ovate to elliptic-ovate, to 2½ in. long, somewhat fleshy, glabrous, margin wavy: fls. white with small purplish-red blotches, corolla-tube 1 in. long, inflated at base, lobes linear to ½ in. long, arched with tips almost fused together, margins strongly reflexed producing an inflated balloon-like structure. Transvaal.

Woodii. Sts. trailing or prostrate: lvs. heart-shaped, to 34 in. long: fls. light purple or pink, to 34 in. long, usually 2 together. Natal.

CEROPTERIS: Piturogramma.

CEROTHAMNUS: Murica.

Palmacex. Tall unarmed CERÓXYLON. feather-palms of the Andes from Venezuela and Colombia to Peru, at high altitudes; monœcious or polygamous, with long paniculate spadices among the lvs.; species perhaps 5: lvs. terminal, making a heavy crown: fls. large; stamens 9-15: fr. a red or purplish berry, 1 in. or less diam. For cult. see Palm.

andicola. Wax Palm. Very tall, the trunk ringed and incrusted with wax, swollen at or above the middle: lvs. to 20 ft. long; pinne many, linear, acuminate, bifid at apex, deep green above, densely silvery-tomentose underneath; fr. purplish —This tree has been intro, into S. Calif., but with only indifferent success; not regularly cult. in U.S.

CESPITOSE, CÆSPITOSE: matted; growing in tufts or dense clumps; said of low plants that make mats or turf of their basal growths.

CÉSTRUM. Solanaceæ. Shrubs and small trees grown in warm countries and under glass in northern latitudes for the axillary or terminal cymes of bright small tubular mostly fragrant fls., red, yellow, greenish or white, blooming from Jan. to Apr.: lvs. simple, entire and usually narrow, deciduous or persistent: fr. a small berry: native in American tropics.

Propagated by cuttings in February or early March and kept in a warm temperature; also by seed when obtainable.

aurantiacum. Half-climbing shrub: lvs. oval, to 4 in. long: fls in a terminal panicle, orange-yellow, 1 in. long, the lobes strongly reflexed. Guatemala.

coccineum: color form of C. fasciculatum.

diffrium. Day-Jessamine. Shrub to 15 ft.: lvs. oblong or oval, to 3½ in long, thick and evergreen, glossy above: fis. white, ½ in. long, the lobes reflexed, fragrant by day, in short clusters on long axillary sts. W. Indies.—Frequently planted far S. even along the coast.

élegans: C. purpureum.

fasciculatum. Differs from C. purpureum in the broader lvs. to 2½ in. wide, larger purplish-red fls. in compact clusters usually subtended by lvs. Mex. Var. Néwellii (C. Newellii), fls. crimson, large, free-blooming; foliage more glandular.

Néwellii: C. fasciculatum var.

nocturnum. Night-Jessamine. Shrub to 12 ft.: lvs. oblong-ovate or oval, to 8 in. long, more or less shining on both sides: fls. greenish-white to cream-colored, ¾ in. long, the pointed lobes erect or spreading, very fragrant at night, in axillary clusters, blooming at intervals throughout the year. W. Indies.

Párqui. WILLOW-LEAVED JESSAMINE. Shrub to 6 ft.: lvs. lanceolate, to 6 in. long; fis. greenish-white to greenish-yellow, 1 in. long, and pointed lobes spreading, fragrant at night, in profuse axillary and terminal clusters. Chile; probably the hardiest.

purphreum (C. elegans. Habrothamnus elegans). Shrub to 10 ft. or more, somewhat climbing, branches soft-hairy; lvs. ovate to ovate-lanceolate, to 4 in. long and 1½ in. wide: fls. in loose terminal more or less nodding clusters, to 1 in. long, red-purple, constricted at throat, of continuous bloom; berries red. Mex. Var. Smithii (C. Smithii), fls. blush-rose. There is also a variegated form.

Smithii: C. purpureum var.

CHÆNÁCTIS. Compositæ. Ann. or per. herbs of W. N. Amer. with alternate usually dissected lvs. and heads of yellow disk-fls. solitary or in cymes; pappus of scales. Propagated by seeds or division.

glabriúscula. To 1 ft., branching: lvs. to 1½ in. long, 1-2-pinnate into linear segms.: heads solitary, ½ in. across, marginal corollas longer than others. Calif.

CHÆNOMÈLES. FLOWERING QUINCE. Rosacex. Deciduous or semi-evergreen shrubs native in E. Asia, with alternate toothed lvs., solitary or clustered showy waxy fis. in early spring before the lvs., and fr. a hard quince-like pome. Often listed as Cydonia.

These are attractive ornamental subjects and hardy North except C. sinensis, and this fruits on Long Island and in similar climates. The fruits of some kinds are also used sparingly for making preserves. Propagated by seeds stratified and sown in spring, by root-cuttings or cuttings of half-ripe wood under glass, by layers, and rare kinds by grafting on C. layenaria or Cydonia oblonga.

cathavénsis: C. lagenaria var.

japónica (C. vedrariensis. C., Pyrus, and Cydonia Maulei. Pyrus japonica). DWARF JAPANESE QUINCE. To 3 ft., with spiny branches: lvs. broad-ovate, to 2 in. long, coarsely toothed: fls. orange-scarlet, to 1½ in. across, clustered, Mar.-Apr.: fr. yellow, 1½ in. long. Japan. Var. alpina (Cydonia Sargentii) has procumbent sts. and lvs. to l in. long.

Cyaonia Sargentii) has procumbent sts. and ivs. to 1 in. long.

lagenària (Cydonia japonica of horticulturists). Japanese Quince. To 10 ft., with spiny branches: lvs. oblong, to 3 in. long, finely toothed, shining above: fis. scarlet-red, to 2 in. across, clustered, Mar.-Apr.: fr. greenish-yellow, to 2 in. long. China. Var. diba, fis. nearly white; var. Editzii, fis. rosy-pink; var. cándida, fis. white or nearly so; var. cardinàlis, fis. cardinal-red; var. cathayénsis, lvs. lanceolate; var. contôrta has twisted and contorted branches, fis. white; var. corállina, fis. salmon-pink; var. fôliis rûbris, lvs. bronzy; var. fritico-álba, frs. white; var. roliis rûbris, fis. large, nearly white; var. kermesiàna, fis. pink to red, semi-double; var. macrocárpa, sts. thornless, fis. red; var. marmorata, fis. pink variegated white; var. Moerloòsei, fis. white, striped with pink; var. nivalis, fis. nearly white; vars. nàna and pygmæa are listed as dwarf forms; var. rôseo-plèno, fis. rose, partially double; var. rûbra grandi-fôra, fis. deep crimson, large; var. sanguínea plêna, fis. scarlet, double; var. umbilicâta, fis. rose-red; var. Wilsonii, lvs. tomentose beneath, fis. salmon-pink; other listed vars. are semperflorens, Simonsii and versicolor.—This, in its many forms, is the commonly cult. Japanese quince, and formerly supposed to be the plant originally intended to bear the name japonica. bear the name japonica.

Maùlei: C. japonica.

sinensis (Cydonia, and Pseudocydonia sinensis). Chinese Quince. To 20 ft., spineless: lvs. elliptic, to 3 in. long, sharp-toothed, often persistent or turning searlet in autumn: fls. light pink, solitary, to 1½ in. across, May: fr. yellow, to 7 in. long, woody, aromatic. China.

supérba. Hybrid between C. japonuca and C. lagenaria: lvs. narrowly ovate to obovate, to 3 in. long, twigs hairy: fls. typically blood-red, to 2 in. across. Forms having white, rose or scarlet fls. are known.

vedrariénsis: C. japonica.

CHENORRHÌNUM. Scrophulariaceæ. Ann. or per. herbs native in Medit. region and Asia: lvs. entire: fls. 2-lipped, solitary in the axils of upper lvs. and often forming racemes. Once combined with Linaria from which it is separated by the caps, dehiscing by narrow distal openings and the plants glandular-pubescent.

glaredsum: C. origanifolium.

minus (Linaria minor). Ann. to 1 ft., much branched, glandular-pubescent: lvs. linear-lanceolate, sessile: fls. lilac, to 1/4 in. long, long-stalked, in loose leafy racemes. Eu

origanifolium (Linaria origanifolia. Anarrhinum and Antirrhinum crassifolium, in part. Antirrhinum and C. glareosum). Per. to 10 in.: lvs. oblong to obovate, glandularhairy: fls. pale purple to white with yellow palate, 1/4 in. long, spur shorter than corolla. S. Eu.

CHÆNÓSTOMA. Scrophulariaceæ. S. African herbs and subshrubs with usually opposite lvs., white, yellow or reddish tubular fls. with 4 exserted stamens, and capsular frs.

Certain low kinds are grown out-of-doors in southern United States and in the greenhouse for the profuse small bloom and compact habit; useful for edgings. Propagated by seeds or cuttings.

fastigiatum (Sutera cephalotes). Per. to 1 ft.: lvs. oblong, about 1/2 in. long, with few teeth toward spex: fis. 1/2 in. long, in head-like racemes.

grandiflorum (Sutera grandiflora). Erect subshrub to 4 ft., sticky-pubescent: lvs. usually alternate, ovate-oblong, to 1½ in. long, base wedge-shaped, hispid, margin crenateserrate: fis. deep purple, to 1½ in. long and as wide, tube very slender, in racemes to 1 ft. long.

hispidum (Sutera brachiata). Per. or subshrub to 2 ft., hairy: lvs. oval to oblong, to 1½ in. long, entire: fis. pink or whitish, to ½ in. long, in leafy racemes.

phlogifibrum (Sutera phlogifibra). Decumbent or suberect subshrub to 2 ft.: lvs. somewhat fasciculate, ovate to obovate or oblong, to 1/2 in. long, incise-dentate or pinnatifid.: fls. bright purple to white, to 1/2 in. long, in lax racemes.

polyanthum (Sutera polyantha). Ann. to 1 ft.: lvs. ovate to lanceolate, to 1½ in. long, toothed: fis. bluish-lilac, ½ in.

roseum: listed as a shrubby plant with pink fis.

CHEROPHÝLLUM. Umbelliferæ. Herbs with pinnately or ternately compound lvs., small white fls. in compound umbels, and flattened frs.; one species is grown for the edible root. See Chernil

bulbosum. Turnip-rooted Chervil. Bien. to 3 ft., with gray or blackish tuberous root having yellowish-white flesh: lvs. decompound into linear segms. Eu.

CHÆTOCHLOA: Setaria.

CHÆTOSPERMUM: Swinglea.

CHAFF: a small, thin, dry and membranous scale or bract; in particular, the bracts in the flower-heads of composites.

CHALCAS: Murræa.

CHALICE-VINE: Solandra.

CHAMÆBÀTIA. Rosaceæ. Two shrubs native in Calif. and Lower Calif., with alternate thrice-pinnatifid lvs. and white fls. in terminal corymbs; related to Purshia.

Adapted to rock-gardens in warm parts of the country, doing best in sunny positions in sandy well-drained soil. Propagated in spring by seeds, or by cuttings of green wood under glass.

foliolòsa. To 3 ft., partially evergreen: lvs. to 3 in. long, finely divided: fis. to ¾ in. across. July. Calif.

CHAMÆBATIÀRIA. Rosaceæ. One aromatic deciduous shrub native Ida. to Nev. and Calif., sometimes included in Spiræa. C. Millefòlium. To 4 ft., glandular-pubescent: lvs. alternate, bipinnate, to 3 in. long, with linear deeply cut segms.: fls. white, ½ in. across, in terminal leafy panicles to 6 in. long.—It does best in a sunny well-drained position. Propagated by cuttings of half-ripened wood in Aug. and by seeds sown in spring. seeds sown in spring.

CHAMÆCÈREUS. Cactaceæ. One species, Argentina, forming little clumps of cylindric plant-bodies or joints that are 2 in. or so long with 6-9 ribs and soft white spines. C. Silvéstri (Cereus Silvestri) resembles some of the creeping kinds of Echinocereus, with orange-scarlet diurnal solitary fls. nearly 3 in. long, the tube narrow and stamens included: fr. small, globular, Var. crassicaule (C. crassicaule) is woolly. listed as having more spherical sts.

CHAMÆCRISTA: Cassia.

CHAMÆCÝPARIS. FALSE-CYPRESS. Cup ressaceæ. Large evergreen trees of pyramidal habit, mostly attaining 100 ft. or more in native habitats, with scale-like lvs. densely clothing the branchlets, appressed on old branches, spreading and needle-like on young growth, yellow (or red in C. Lawsoniana) staminate fls., and small globose cones of peltate scales bearing a point or prominence in middle; species few, in northern hemisphere. For cult. see Conifers. Excellent in cult. as small trees, ornamental and most of them hardy in the northern parts of the country, and widely variable. Retinisporas

(or retinosporas) are juvenile forms of Chamecvparis and Thuia.

andelyénsis: C. thyoides var. decussata: Thuia orientalis var.

filicoides: C. obtusa var. filifera: C. pisifera var.

formosénsis. Branches drooping at tips: cones to 1/4 in. across. Formosa.—Not to be confused with C. obulsa var. formosana

Lawsoniana (Cupressus Lawsoniana). Branches usually drooping, the branchlets frond-like: lvs. obtuse, with indistinct white markings below: cones ½ in. across. Ore., Calif.; hardy in latitude of central states and some of the forms stand in sheltered positions in S. New England; much grown in warm regions and much prized in its many very ornamental forms. Some of the hort. vars. are: álbo-spica, Cream C., branchlets creamy-white at tips; Allumii, Scarab C., columnar form with very glaucous foliage; argentea, foliage silvery; adrea, foliage golden-yellow when young; Bowleri, compact form with branchlets drooping at tips; darleyénsis, low form with branchlets form with gray-green foliage; erécta (var. erecta viridis), columnar form with bright green lvs. or glaucous in its form glauca; filiformis, branchlets drooping; Flétcheri, dense columnar form with glaucous lvs.; Forsteckians, branchlets twisted into cocksomb-like heads; Fraseri, columnar form with dark blue lvs.; glauca, lvs. steel-blue; grácilis, branchlets drooping, lvs. light green; intertéxts, pyramidal form with bluish-green lvs.; Krameri of thin habit, with slender whip-like branches: lûtea, young growth gracius, orancheus drooping, ivs.; krāmeri of thin habit with slender whip-like branches; lūtea, young growth bright yellow; lycopodioides, with irregular branches and twisted branchlets; mínima glaūca, dwarf form with steelblue lvs.; nāna, of dwarf globose habit, and its form glaūca with lvs. bluish-green; nidiformis, horizontal branches radiating from dense center; pātula, compact, branches spreading, lvs. glossy dark green; pēndula, branchets drooping and its form vēra with branches also drooping; Pottensii has dense and compact ultimate branch systems; pyramidālis, columnar and its form álba with young growth white; Stewartii, young shoots with deep yellow foliage; Westermannii, of stiff pyramidal habit, lvs. light yellow; Wissēlii, of columnar habit, with glaucous lvs.; Yoūngii, vigorous upright form. Other listed names under this species are: cerulea, Drummondii, clegans, elegantissima, globosa, grandis, lutescens, monumentalis, nestoides, Rosenthalii, semper-horizontalis, stricta, sulphurea, tortuosa, Veitchinglauca and versicolor.

leptoclada: C. thyoides var. andelyensis.

nootkatensis (Cupressus nootkatensis. Thujopsis borealis). Nootka C. Branchlets drooping: lvs. acute, dark green, without white markings: cones ½ in. across. Alaska to Ore.; hardy N., but should have protection from winter winds. Var compacta, dwarf and compact; gladca, lvs. very glaucous; lûtea, young growth light yellow; pendula, branches drooping. A form viridis is also listed.

obtusa (Retinospora and Cupressus obtusa). Hinoxi C. Branchlets flattened and frond-like, drooping: lvs. obtuse, glossy above and with whitish lines beneath: cones ½ in. across. Japan. Some of the hort. vars. are: ålbo-spica, shoots creamy-white when young; altrea, lvs. golden-yellow when young and its form Youngi with more drooping branchlets: breviramea, pyramidal form with short branches: compácta, dwarf broad form; Crippsii, lvs. pale yellow; erécta, branches ascending; ericoides (C. pist/era var. Sandera). low form with linear bluish-gray lvs; filicoides, branchlets short and frond-like; filiformis, branches thick and thread-like, drooping; formosana, with slenderer branchlets and smaller cones, Formosa; grácilis, pyramidal form with dark green lvs. or in abrea bright yellow when young; lycopodioides, of dwarf shrubby habit; magnifica, vigorous form with glossy bright green lvs.; mínima and nane, of low growth and in abrea golden-yellow when young; péndula, drooping habit; pygmæa, very dwarf form with almost creeping branches; tetragona, dwarf form with 4-angled branchlets, partly golden-yellow. Other listed names under this species are: acuta, decussata, letinea aurea, lutea, pyramidals glauca and vividis.

pistera (Retinispora and Cupressus pistfera). Sawara C.

pisffera (Retinispora and Viridis.

pisffera (Retinispora and Cupressus pisifera). Sawara C,
Branchlets flattened and slightly drooping: lvs. acuminate.
glossy above and with whitish lines beneath: cones to ½ in.
across. Japan; likely to suffer in exposed places N. There
are many hort. vars. as: aûrea, lvs. golden-yellow; ericoldes
with smaller lvs.; filifera, branches thread-like, drooping,
and its forms aûrea with young growth golden-yellow, and
aûreo-variegāta with branchlets variegated yellow; plumbas,
dense conical habit with feathery branchlets, and its forms
argéntea with tips of branchlets whitish, aûrea with young
growth golden-yellow, and flavéscens with tips of branchlets yellowish, lutéscens, low form with branchlets tipped
yellow; squarrôsa, Moss R., bushy habit with feathery
branchlets, and its form dumbas of more compact and
slower-growing habit, and sulphûrea with yellow lvs.,
Veitchii and Sieboldii are listed under this var.; sulphûrea,

lys. light yellow. Other vars. listed are: globosa. nana and руатиел

Sánderi: C obtuen var errorides

sphæroidea: C. thuoides. texàna glaùca: a listed name.

thyoldes (C. spheroidea. Cupressus thyoides). White-Cedar. Branchlets flattened, not drooping: lvs. acute, light green or glaucous; cones ¼ in. across. Me. to Fla. and Miss., hardy near const. Hort. vars are: andelyénsis (C leptoclada), of upright habit with loosely appressed lvs.; ericoides, Cedar R., dense shrub with spreading lvs. having 2 glaucous lines beneath; glaûca, lvs. nearly silvery-white; Hoveyi, of slender habit, the branchlets with dense terminal tufts; variegata, branchlets variegated yellow.

Westermanii: C. Lawsoniana var.

CHAMÆDÁPHNE. Ericacex. One evergreen shrub to 5 ft., native in bogs in N. Eu., N. Asia and N. Amer. C. calyculata (Andromeda and Cassandra calyculata). Leather-Leaf. Lvs. alternate, oblong, to 2 in. long, rusty-scaly beneath: fls. white, urn-shaped, nodding, 1/4 in. long, in racemes to 5 in. long, Apr.-June. Var. nana, to 1 ft.—A good shrub for the rock-garden where it does best in a moist soil of sand and peat. Propagated by seeds only slightly covered, by cuttings of ripe wood under glass, by layers and suckers.

CHAMÆDÒREA. Palmacex. Small thin-lvd. shade-loving unarmed directious or seldom monocious palms, Mex. to S. Amer., with solitary or clustered reed-like ringed or jointed or sheathed sts., sometimes climbing, and pinnate, pinnatisect or pinnate-veined lvs., probably more than 60 species: spadices among the lvs. or below them, simple and cord-like or paniculately branched and with slender parts, the spathes usually prominent; stamens 6; pistillate fls. very small and often sunken in pits: fr. small, of 1–3 globose or oblong carpels, purplish or red or orange. The Chamædoreas are imperfectly known botanically; the identity of the cult. kinds is perplexing inasmuch as the two sexes may not be grown together and as fr. is little known. They are attractive neat green-stemmed palms for porch and patio use where protection may be provided from winds and burning sun, in S. Calif. and S. Fla.; well adapted to lath houses. For cult. see Palm.

Arenbergiana. St. erect, 5-6 ft., remotely ringed: lvs. pinnate, recurved at apex; pinnæ 16-30, long-oblong and falcate, very long-acuminate, the apex pendulous, primary nerves 9; spadtces below the lvs.: fr. subglobose, in a dense cluster. Cent. Amer.

consider. Cent. Amer.

corállina. St. solitary, sheathed and not ringed, to 4 ft. or more: spadices among the lvs., the pistillate divaricately branched: lvs. pinnate, green both sides but lighter underneath, 2 ft or more long; pinnæ 8-12 in. long, broad-oblong and abruptly long-pointed, 3 in. broad at middle, the terminal one confluent and bifid and many-ribbed, lateral ones with 1 prominent rib off-center and many secondary ones Venezuela.

desmoncoldes. Climbing with age, with long slender sts.: lvs. pinnate, 2-3 ft long; pinnæ 12 in. long, narrow, drooping; petiole glaucous. Mex.

elatior. Slender and more or less climbing, the st. covered with petiole-sheaths: st.-lvs. pinnate, 6-8 ft. long, sheath 18 in. long; pinnæ 2 ft. long, 1 in. broad, long-acuminate, strongly several-nerved. Mex.

élegans: Collinia elegans.

Ernesti-Augústii. St. solitary, slender, ringed, with brace-roots at base: Ivs. simple; blade obovate or ovate-oblong, 1½ ft. long and half as broad, bifid at apex to half or more the depth, strongly many-ribbed, the margins bluntly dentate; sometimes the If. is pinnate, with a broad bifid terminal lobe and many-ribbed lateral pinnæ 1-2 in. broad: fertile spadix simple; staminate erect, branched: fis. ræddish. Max. reddish. Mex.

fragans. St. 4-6 ft., scarcely 1 in. thick, ringed: lvs. mostly 5 or 6, 1 ft. long, 2-lobed below the middle, each lobe long-acuminate and many-nerved: fis. fragrant: fr. elliptic, black-purple. Peru.

geonomæfórmis. St. solitary, sheathed, about 4 ft.: lvs. simple, oblong, 8-12 in. long, 5 or 6 in. broad, deeply bifd, deep green, about 12 nerves on either lobe; staminate spadix from st. just below the lvs, wth several long drooping branches 8-10 in. long. Guatemala.

glaucifòlia. St. tall, to 20 ft, solitary, ringed remotely: lvs. pinnate, 4-6 ft. long, glaucous on both sides; pinnæ 70-80, long and slender, very long acuminate: spadix tall, erect or ascending, among the lvs., on slender elongated peduncle. Guatemala.

graminifòlia. St. remotely ringed: lvs. pinnate, erect, dark green; pinnæ about 40, rather close together, linear-lanceolate, very long-acuminate, spreading horizontally, strongly several-nerved: staminate spadix erect, with long pendulous branches. Guatemala.

Martiana. St. short, creeping, dwarf and spreading, with many forking sts.: lvs. pinnate; pinnæ many, linear, pendent, 6-8 in. long. Mex.

oblongata. St. ringed: lvs. pinnate, at apex pinnæ confluent and commonly truncate and erose but otherwise oblong or falcate-acuminate: pistillate spadix erect, much branched: fr. oblong, black. Mex.

branched: fr. oblong, black. Mex.

Pacàya. St. slender and erect, 8-10 ft., remotely ringed:
lvs. erect-spreading, 2-3 ft. long; pinnæ about 7, dull
green, plicute, middle ones 7-8 in. long and 1½ in. broad,
long-acuminate, the terminal ones very broad and seriste
on outer margins; fertile spadix about 20 in. long, with
flattened peduncle compressed below to caudex, the
branches 5 or 6 and 3-4 in. long: fr. oblique-obovoid, about 1/3 in. long. Costa Rica.

Pringlei. Nearly or quite stemless: lvs. pinnate, erect, firm in texture, 3 ft. long; pinnæ 25-30, widely spaced, linear-lanceolate and very long-acuminate, 6-8 in. long and γ_3 in. or less broad, strongly nerved: spadix simple. San Louis Potosi, Mex.

Sártori. St. 8-14 ft., solitary, ringed and above covered Sartori. St. 8-14 ft., solitary, ringed and above covered with If.-sheaths: lvs. pinnate, 3 ft. long, rather soft; pinnæ about 15, broad-lanceolate, 10-12 in. long and to 2½ in. broad, abruptly acuminate, with 1 mostly off-center rib and several secondary ones, the upper ones more or less confluent at base: spadices with and below the lvs., simply branched, the stammate with long pendulous branches Mex.

Teppilote (Edanthe Teppilote). St. to 10 ft, solitary, strongly and rather closely ringed, with swollen joints: Ivs pinnate, to 4 ft. long; pinnæ 20-30, about $1-1\frac{1}{2}$ ft. long, $1\frac{1}{2}-2$ in broad, long-acute: spadices below the Ivs. with a sheathed peduncle, simply branched, the stammate branches long-drooping. Mex.

Wendlandiana. St. stout, solitary, a few ft., ringed: lvs. pinnate, lurge, strongly ascending, to 4 ft.; pinnae 36-40, narrow-lanceolate, 1½ ft. long and to 2 n. broad, long-acuminate, with several or many very strong light-colored ribs: spadix on the trunk, the stammate with many and the pistillate with few branches. Mex. to Fanama.

CHAMÆLAÙCIUM. Myrtaceæ. Australian heath-like shrubs with mostly small opposite lvs., 5-parted fls. borne in axils or short terminal racemes, the stamens 10; planted in Calif.

ciliatum. To 2 ft.: lvs. terete or 3-angled, to $\frac{1}{12}$ in. long: fls. about $\frac{1}{12}$ in. long, axillary, the calyx-lobes fringed.

uncinàtum. Lvs. opposite, linear, 3-sided, to ¾ in. long, apex usually hooked, tapering below middle: fis. 2-4 in axillary corymbs, petals orbicular. Australia.

CHAMÆLÍRIUM. Liliaceæ. One per. herb with tuberous roots, native from Mass. to Fla. and Ark., sometimes planted in shady situations in the garden. C. luteum. BLAZING STAR. FAIRYWAND. To 4 ft.: lvs. to 8 in. long and 11/2 in. wide: fls. yellowish-white, small, diœcious, in spike-like racemes.

CHAMÆMELUM CAUCASICUM: Chrysanthemum caucasicum. Tchihatchewii; Matricaria Tchihatchewii. 11

CHAMÆNERION: Epilobium angustifolium.

CHAMÆPERICLYMENUM: Cornus canadensis.

CHAMÆPEUCE: Cirsium Diacantha.

CHAMÆROPS. Palmaceæ. One low bushy diœcious (or polygamous) fan-palm in the Medit. region, the only palm native in Eu., and much planted where a hardy small species is required and under glass: very variable, and several specific names have been applied to the forms. Plant usually suckering and making a

clump but growing to a single trunk in some forms and when sprouts are removed: spadices among the lvs. and shorter than they, short-branched, not pendent; stamens 6–9: fr. ovoid, oblong or globose (depending on the var.), drupe-like, ½-1½ in. long, with somewhat succulent exterior, brown or yellow; one group of vars. has ovoid or oblong frs., and another group has nearly or quite spherical frs. Trachycarpus was formerly included in this genus. See Palm.

antillarum: Zombia antillarum.

argéntea. Glaucous-blue form of C. humilis.

excélsa: see Trachycarpus. Fórtunei: see Trachycarpus.

humilis. Usually with trunks only 3-5 ft. tall, but sometimes to 20 ft. or more in arborescent forms: lvs. relatively small, mostly 2-3 ft. across, stiff, green or glaucous-blue, with many narrow bifid segms, extending nearly to the base; petiole long and slender, strongly long-spined — Easily grown; hardy along the Gulf Coast and somewhat northward; propagated by seeds and suckers. There are a number of named vars, differing in stature, lvs. and fr., but hardly distinguishable as species.

macrocárpa. A large-fruited var. of C. humilis: fr. spherical, $\frac{3}{4}$ in. diam.

Mocinii: Cryosophila nana.

Ritchieana: Nannorrhops Ritchieana.

CHAMÆSENNA: Cassia didumobotrua.

CHAMBEÝRÔNIA. Palmaceæ. Two recognized monœcious unarmed tall handsome feather-palms of New Caledonia, more or less confused in cult. and usually known as Kentia or Kentiopsis; the name Kentia Lindenii appears to have been applied to both species. From Kentiopsis the genus differs in technical characters of the larger fr., and the indefinite (rather than definite, say 20 or less) number of stamens

macrocárpa (Kentia and Kentiopsis macrocarpa). Tall tree, attaining 60 ft. and more: Ivs. large, reddish underneath when young but becoming nearly equally green both sides; pinnæ many, 3-4 in. broad, equidistant on rachis, with strong rib on margin as well as midrib and pronunent intermediate nerves: spadix below the erown, branched, glabrous; fls normally in 3's, center one pistillate or all stammate toward end of branches; stammate fls. about 3's in. long, stamens numerous: fr. ovod-elliptic, about 1½ in long, in a shallow cup-like enlarged perianth.—C. Hoōkeri has Ivs. paler underneath: stammate fls. larger: fr. long-ellipsoid, about 2 in long, the perianth deeply cup-like Both grown sparingly under glass, probably adapted to S. Fla.

CHAMISO: Adenostoma.

CHAMOMILE: Matricaria, Anthemis nobilis.

CHAMOMILLA: Matricaria.

CHAPTÀLIA. Compositæ. Small woolly per. American herbs with lvs. in basal rosette and solitary nodding heads on simple naked scapes, the white or purple ray-fls. sterile and disk-fls. 2-lipped with anthers caudate at base.

tomentosa. To 1 ft.: lvs. elliptic to oblanceolate, to 4 in. long, apiculate, glabrous above and densely white-tomentose beneath: ray-fls. purple on reverse, whitsh above, in heads to $\frac{8}{4}$ in. across. N. C. to Fla. west to Tex.

CHARD, SWISS: see Beta.

CHÁRIEIS. Compositæ. One ann. herb in S. Afr., sometimes grown in flower-gardens and of easy cult. C. heterophýlla (C. Neesii. Kaulfussią amelloides). To 1 ft., hairy: lvs. oblong, entire, to 2½ in. long: heads solitary and long-stalked, ¾ in. across, rays blue, disk yellow or blue; pappus plumose.

CHARITY: Polemonium caruleum.

CHARLOCK: Brassica kaber.

CHASMANTHE. Iridacex. A small genus of S. Afr., formerly united with Antholyza and differing from it in sts. ending in a spike of 5-25 fls. with the upper lobe of corolla much longer than other 5, being spatulate and hooded; it is distinguished from Gladiolus by the fl.-tube abruptly contracted below the middle into a slender basal part. Cult. as for Gladiolus.

æthiòpica (Antholyza æthiopica). To 4 ft.: basal lvs. to 1½ ft. long and 1 in. broad: fls. red-yellow, to 2½ in. long, curved.

floribúnda (Antholyza floribunda and præalta). Differs from C. æthiopica in its much broader lys. and perianthube tapering or rounding into constricted portion and not abruptly truncated.

CHASMATOPHYLLUM. Aizoaceæ. Succulents of the Mesembryanthemum group, with creeping branches, short thick lvs. having whitish warts beneath, and solitary terminal short-stalked fis.; stigmas 5, filiform.

musculinum (M. musculinum). Creeping, making thick clumps: lvs. to 1 in. long and 1/4 in wide, convex above, often with 1 or 2 small teeth near apex: fls. yellow, 1/4 in. across. S. Afr.

CHASTE-TREE: Vitex Agnus-castus.

CHAULMOOGRA: see Taraktogenos.

CHAYOTE (Sechium edule, which see for botanical description). A cucurbit grown for the edible fruits and root tubers, native in tropical America, widespread in the western tropics as a cultivated plant and adaptable also to the coastal parts of the United States from South Carolina southward and in southern California; in regions in which the ground does not freeze more than an inch or so deep the roots survive the winter if given protection. If grown only as an annual each year from seed, the plant may be raised to fruiting stage farther north, although a long season is required. Two or more plants should be grown to insure pollination.

The chayote is propagated from seed, the entire ripe fruit being planted in spring, or perhaps in autumn in southern Florida; the fruit is placed with the broad end sloping downward and the stem end slightly exposed. There is one seed in a fruit. The plants are started where they are to stand, and they should be 8-12 feet apart and trellis or other support provided. Special or named varieties are propagated by cuttings of shoots taken at the crown of the plant, and struck under glass or other protection. If the soil is fertile, a plant should produce 50 to 100 or more fruits in a season. The fruits are boiled, and prepared in various ways for eating. In tropical countries the large root tubers are eaten after the manner of potatoes; the tubers are usually harvested after the second years growth. If tubers are left in the ground in regions where they do not freeze, the plant is of course perennial. The chayote fruit is much prized in tropical America, where it may be known also as christophine and chuchu, and in some places as mirliton and vegetable-pear. The herbage supplies good forage, and the young parts are sometimes used after the manner of asparagus and spinach.

CHECKERBERRY: Gaultheria procumbens.

CHECKERBLOOM: Sidalcea malvæflora.

CHEILANTHES. LIP-FERN. Polypodiaceæ. Small rock-loving greenhouse or semi-hardy ferns, often hairy or woolly: fronds 1-3-pinnate; sori terminal on veins: widely distributed in temp. and trop. regions, where they do best in

dry rocky situations. Under glass the foliage should be kept dry. See Ferns.

alabamensis. Fronds to 10 in. long, 2-pinnate, nearly glabrous, on black stipes to 7 in. long. Va. to Ala. and

califórnica. Fronds to 1 ft. long, 3-4-pinnate, glabrous, on brownish stipes to 1 ft. long. Calif.

Còvillei. Fronds tufted, to 4 in. long, 3-pinnate, densely covered beneath with white or brown scales, on brown or purplish stipes to 7 in. long. S. Calif., Nev., Ariz., Utah. dénsa: Pellæa densa.

Fèci. Fronds to 5 in. long, 2-3-pinnate, densely woolly beneath, on slender stipes to 5 in. long. Wis. to B. C.,

Féndleri. Fronds to 10 in. long, 3-pinnate, brown-scaly beneath not tomentose, on brown stipes. Tex., Colo., Ariz., Calif, Mex.

gracillima. LACE-FERN. Fronds to 10 in. long, 2-pinnate, woolly beneath, margins of segms. strongly reflexed, on dark brown stipes to 6 in. long. B. C. to Calif.

landsa. Fronds to 9 in. long, 2-pinnate, densely rusty-hairy, on brown stipes to 4 in. long. Conn. to Ga. and Tex. myriophylla. Fronds densely tufted, to 9 in. long, 3-4-pinnate, densely scaly and woolly beneath, on brown stipes. Mex. to S. Amer.

siliquòsa: Pellæa densa.

tomentosa. Fronds to 1½ ft. long, 3-pinnate, covered all over with brownish-white hairs, on stout brown tomentose stipes to 8 in. long. W.Va. to Ariz. and Mex.

CHEIRÁNTHUS. Crucifera. A few perennials, sometimes woody at base, native from the Canary and Madeira Isls. to the Himalayas, one of them an old garden plant, and others sometimes planted for ornament. Plants more or less grayish-pubescent: lvs. narrow, nearly or quite entire: fls. for the most part yellow or orange, sometimes brownish: pod or silique long. angled.

The usual species in cultivation is the wallflower, C. Cheirs. It is a spring-blooming low erect perennial, much like stock but the colors in yellow, yellow-brown, red to red-black, much prized in Europe (where it is native) but less popular in this country. It requires a cool season for best bloom, and in the northern United States the maiden plants must usually be carried over in a frame. In England they are frequent inhabitants of fence-walls and quarries. The free flowering rich deep colors and pleasant fragrance they are frequent inhabitants of fence-walls and quarries. The free flowering, rich deep colors, and pleasant fragrance make wallflowers good subjects for very early spring bloom, or for winter bloom in mild climates. Special colors are propagated by means of cuttings. Usually they are grown from seeds; plants should be strong and bushy to go through the winter well Seeds may be sown early in the year, the plants transplanted once or twice, and be ready for bloom the following spring. If wanted for bedding-out, they may be carried over winter dormant in pots, and turned out as soon as the ground is open. Plants started in late spring or early summer may make satisfactory spring-blooming subjects if the season and all other conditions turn out favorable to them, but it is better to sow seeds earlier. Good plants may be purchased of dealers. Some of the strains give bloom the first year from seeds, started early, the plants being practically annual.

Allidnii of gardens: see Erusimum asperum.

Allidnii of gardens: see Erysimum asperum.

alpinus. To 1 ft.: lvs lanceolate, pubescent: fis. lemonyellow. Norway, Lapland.

Cheiri (C. fruticulosus). Wallflower, discussed above. To 2½ ft., strongly erect: lvs. lanceolate or narrower, acute, to 3 in. long: fis. to 1 in. long, fragrant, yellow to yellow-brown. S. Eu.

fruticuldsus: C. Cheiri.

kewénsis. Bushy per. with upright racemes: fls. about 1 in. across, brownish-orange inside and reddish-brown outside, becoming pale purple. Hybrid.

linifolius: Erysimum linifolium.

maritimus: Malcomia maritima.

Senoneri. Per., woody, much branched, with curved parts: lvs. ovate-oblong and entire or short-toothed: fis. orange, fragrant. Greece.

CHEIRIDÓPSIS. Aizoaceæ. A large genus of segregates from Mesembryanthemum, with tuited habit, usually spotted lvs. and solitary terminal stalked fls. with numerous petals; stigmas 8-19. S. Afr.

acuminata. Lvs. 1/4 in. long and about 1/4 in. wide and thick, pale green, spotted: fis. pale yellow, on pedicels 1 in. long; stigmas 11.

åspera. Short-stemmed, slightly branched: lvs. 2 in. long and ¼ in. wide and thick, bright green with many whitish cartilaginous dots: fis. yellow, 2 in. across, on pedicels 1½ in. long; stigmas 10.

bélla: probably Lithops bella.

Braunsii: Arauroderma Braunsii.

candidissima (M. candidissimum). Lvs. to 4 in. long, ½ in. wide and ¾ in. thick at top, white or whitish, not spotted: fis. white or pale pink, 2 in. across, on pedicels to 3 in. long: stigmas 17-19.

carinata. Lvs. 2 in. long and ½ in. wide and thick, glaucous, spotted: fis. ivory-white, sepals conspicuously keeled; stigmas 10.

Caroli-Schmidtii (M. Caroli-Schmidtii). To 2 in.: lvs. to 1½ in. long and ½ in. wide and thick, whitish-green dotted with dark green: fls. yellow, 1½ in. across, on pedicels 1/2 in, long.

chérri-bélla: listed name.

cigarettifera (M. cigarettiferum). Plant in resting state a tutt of cup-like sheaths ½ in. long inclosing a pair of erect lvs. ½ in long: free lvs. to 1½ in. long, ½ in. wide and ½ in. thick, glaucous, dotted, second pair united into an oblong-ovoid body: fis. bright yellow, 1½ in. across, on pedicels to 1½ in. long; stigmas 10.

Comptonii: a name without description.

Derenbergiana. Stemless, much branched: lvs. in 2 pairs, the second to 1 in. long and 1/4 in. thick and wide, keeled on back: fis. undescribed.

Hérrei. Stemless, branched, sterile growths with 4 flowering growths bearing 2 lvs. ½-¾ in. long, ½-½ in. broad, keeled on back, velvety to the touch, glaucous or brownish-gray: fls. to 2 in. across, on pedicels ¾ in. long; stigmas 10.

inæqualis. Stemless, branched, sterile growths with 4-6 lvs, flowering growths each with 2 lvs. to 1¾ in. long, ⅓ in. broad and ¼ in. thick, velvety to the touch, glaucousgreen with inconspicuous dots: fls. 2 in. across, yellow, reddish outside, on pedicels to 1¾ in. long.

insignis. Sts. short and thick: lvs. 1½ in. long, ¾ in. wide and thick, bluish-green, with many dark dots; fis.

inspérsa (M. inspersum). Similar to C. tuberculata but with longer branches, shorter smoother lvs. with a dark purple tumor at base of upper surface.

Johánnis-Winkleri: C. Schlechteri.

16ngipes. Lvs. about 2 in. long and ½ in. wide and thick, spotted; fis. bright yellow, reddish outside, to 2 in. across, on pedicels 3 in. long; stigmas 11.

Márlothii. Lvs. to 1½ in. long, ½ in. wide and thick, one pair free, the other united, sheaths white, glaucous dotted with dark green, tinged red at apex: fis. citron-yellow, ½ in.

Meyeri. To 1 in., growths an orbicular body ½ in. long: lvs. an opposite pair united at base, to 1 in. long, ½ in. wide and ½ in. thick, keeled on back, dotted, the second pairs of lvs. a solid body keeled on top: fls. bright yellow, on pedicels ½ in. long; stigmas 10.

multiseriàta. Sterile growths with 4 lvs. 1½-2 in. long, ½ in. broad and ½ in. thick, keeled, bluish glaucous-green: fls. 2½ in. across, golden-yellow, reddish outside, on pedicels 1 in. long; stigmas 10.

peculiaris. Plant in resting stage a laterally flattened whitish ellipsoid body: lvs. a broad spreading pair with second pair between united nearly to their apex, glaucous tinged purple and dotted dark green: fls. yellow, 2 in. across, on pedicels 3 in. long; stigmas 14-15.

Peèrsii (Nananthus Peersii. Deilanthe Peersii). Stemless: lvs. flattened, spreading, to 1½ in. long, ½ in. wide and ½ in. thick, velvety-pubeaent, whitish-green: fls. yellow, 1-1½ in. across, slightly fragrant; stigmas 10-13.—There is confusion as to the exact application of this mame.

Pillansii. Lvs. laterally compressed, to 3 in. long and 1 in. wide, velvety: fis. cream-colored, white toward base, 3 in. across; stigmas 11.

purpuráscens (M. purpurascens). Nearly stemless, branched: lvs. to 3 in. long, ½ in. wide and ¼ in. thick, united at base, bluish-green, purplish at base, dotted with dark green: fls. deep yellow, 2 in. across, on pedicels to 3 in.

Richardiana. Sterile growths with 4 lvs. \(\frac{4}{-1}\) in. long and \(\frac{1}{4}\) in. broad and thick, pale glaucous-green, dotted: fis. 1\(\frac{1}{4}\) in. across, golden-yellow, on pedicels \(\frac{1}{4}\) in. long.

Schlechteri (C. Johannis-Winkleri). Lvs. of one kind, united at base, free part to ¾ in. long and ¼ in. wide, light green indistinctly dotted: fis. unknown.

serrulata. Sterile growths with 4 lvs. to 1% in. long.

1/2 in. broad and 1/2 in. thick, keeled and the keel serrulate green: fls. 1½ in. across, lemon-yellow, on pedicels to 1½ in. long.

tuberculata (M. tuberculatum). Stemless: lvs. to 4 in. long, ½ in. wide and ½ in. thick, united at base into a cylindrical body, blue-green with transparent dots: fis. yellow, 1½ in. across, on pedicels to 4 in. long.

yellow, 1½ in. across, on pedicels to 4 in. long.

Vanzijili. Lvs. to 1 in. long and about ½ in. wide and thick, velutinous, spotted: fis. yellow, paler outside, 2 in. and more across, on pedicels ½ in. long; stigmas 10.

velutina. Lvs. 1½ in. long, glaucous-green, velutinous, inconspicuously spotted; fis. yellow, 2½ in. across, on pedicels 2½ in. long.

verrucosa. Tufted: lvs. united to form a conical body about ¾ in. long and wide and ½ in. thick, gray-green with dark dots: fis. yellow, 1 in. across, on pedicels ¾ in. long.

CHEIRINIA: Erusimum.

CHEIROSTYLIS: Dossinia.

CHELIDÒNIUM. CELANDINE. Papaveracex. One weedy bien, or per, herb with orange-colored juice, sometimes grown in wild-gardens. Propagated by seeds or division of roots. C. majus. To 4 ft.: lvs. deeply pinnatifid, glaucous beneath: fls. yellow, to 2/3 in. across, in small umbels, sometimes double: fr. linear, to 2 in. long. Eu.; nat. in E. N. Amer. Var. laciniatum has more finely divided lvs. See *Dicranostigma* for C. Franchetianum.

CHELÒNE. TURTLE-HEAD. Scrophulariaceæ. Hardy herbaceous perennials, closely allied to Penstemon, with showy 2-lipped or gaping fls. in dense axillary or terminal spikes, in summer: lys, opposite and toothed; native in N. Amer.

These plants thrive in partial shade and in soil not too dry as they are native mostly in swampy places and damp woods. Propagated by seed or by division.

barbata: Penstemon barbatus.

chlorántha. To 5 ft.: lvs. elliptic-lanceolate, to 7 in. long, sharply toothed, long-acummate: fls. white to yellow-ish-green, not tinged purple or pink, to 1 in. long. N. C.—Close to C. glubra, differing in wider lvs., longer petiole and fl. color.

glabra (C. obliqua var. alba). White T. Snake-Head. To 3 ft.: lvs. lanceolate, to 6 in. long, short-petioled; fis. white or pinkish, 1 in. long. Newf. to Ga. and Minn.

Lyonii. To 3 ft.: lvs. ovate, to 7 in. long, long-petioled: fis. rose-purple, 1 in. long. Mts. N. C, S. C. and Tenn., but hardy N. There is a lower or dwarf form.

nemordsa: Penstemon nemorosus.

obliqua. To 2 ft.: lvs oblong, to 8 in. long, very veiny, petioled: fis. deep rose, 1 in. long. Md. to Ill., Fla. and Miss. Var. álba is C. glabra.

Pentstèmon: Penstemon lævigatus.

CHENILLE PLANT: Acalypha hispida.

CHENOPODIÀCEÆ. GOOSEFOOT FAMILY. Herbs or shrubs of about 75 widespread genera, many of them weedy but a few grown as vege-tables and for ornament. Family characterized by mostly alternate simple lvs. and small inconspicuous bisexual or unisexual fls. having no petals, 2–5-lobed calyx or sometimes lacking, 2–5 stamens, usually superior 1-celled ovary, and fr. a utricle or achene. Those herein treated are Anabasis, Atriplex, Beta, Camphorosma, Chenopodium, Enchylæna, Eurotia, Kochia, Rhagodia, Salicornia, Salsola, Sarcobatus, Spincicio

CHENOPODIUM. GOOSEFOOT. PIGWEED. Chenopodiaceæ. Mealy or glandular herbs or subshrubs with alternate lvs. and small greenish bisexual fis. in spikes or panicles; mostly weedy, but a few grown as pot-herbs and for ornament, and one is medicinal. Of easy cult. Propagated by seed.

álbum. LAMBS-QUARTERS. Ann. to 10 ft.: lvs. rhombioovate to lanceolate, to 4 in. long, entire, toothed or lobed, often white-mealy beneath. Eu., Asia, N. Amer.—Sometimes collected for greens.

amaranticolor. Ann. to 8 ft.: lvs. triangular-ovate, to 4 in. long, irregularly toothed and notched, violet-red toward top of plant. Original habitat unknown.

ambrosioides. American Wormseed. Mexican Tea. Ann. or per. to 3½ ft., strong-smelling: lvs. ovate to lance-olate, to 5 in. long, coarsely toothed or cut. Trop. Amer.; nat. in N. Amer., Eu., Asia.—Has medicinal properties.

Atriplicis: C. purpurascens.

169

Bonus-Henricus. Good King Henry. Mercury. Per. to 2½ ft.: lvs. arrow-shaped, to 3 in. and more long, entire. Eu., nat. in E. N. Amer.—Grown as pot-herb.

Bôtrys. Feather-Geranium. Jerusalem-Oak. Ann. to 2 ft., glandular-pubescent and strong-smelling: lvs. oval to oblong, to 2 in. long, lobed or pinnatifid. Eu., Asia, Afr.; nat. in N. Amer.—The plant is sometimes cult. under the name Ambrosia mexicana.

capitatum (Blitum capitatum). Ann. to 1½ ft.: lvs. triangular-ovate, toothed: fis. in dense heads becoming berry-like in fr. Eu.—Sometimes grown for pot-herb.

purpuráscens (C. Atriplicis). Ann. to 3 ft., covered with violet-purple crystalline pubescence: lower lvs. spatulate to oval and toothed, upper lanceolate and entire.

Quinoa. Quinoa. Ann. to 5 ft.: lvs. triangular-ovate, angular-toothed or pinnatifid. Andes.—The seeds are extensively eaten in S. Amer.

CHERIMOYA (Annona Cherimola). A South American small tree, cultivated in warm and subtropical regions for the delicious edible fruit, which is heart-shaped or conical, averaging about a pound or less in weight. The flesh is white, soft and melting, containing black beanlike seeds. It is a dessert fruit, with a subacid flavor somewhat suggestive of the pineapple. There are many varieties, superior to the average run of seedlings. It is not strictly a tropical fruit, being native in more or less elevated regions, and requires a relatively dry climate. It should thrive in parts of southern California where it has been planted in a small way. It does not endure temperatures much below freezing without injury.

The cultivation of the cherimoya is similar to that of the citrus fruits. It is planted 20 to 30 feet apart. Choice varieties are multiplied by shield-budding or grafting on seedlings of cherimoya although other species of Annona may be employed as stocks. Trees begin to bear in three or four years after planting in the orchard. Probably the scant yield of some trees of cherimova is the result of insufficient

pollination.

CHERRY. Fruits of the Rose family, genus Prunus. The usual fruit-bearing cherries are of two species, the sweet cherry, Prunus avium, and the sour cherry, Prunus Cerasus; the duke cherries, with the habit of P. avium but bearing acid fruit, are *P. avium* var. regalis, by some investigators accounted hybrids between the two species. The dwarf cherries of the Plains region are Prunus Besseyi, a native species; this is sometimes employed as a stock for sour cherries in cold regions. Prunus tomentosa and other species also yield edible fruits.

The sweet and sour cherries differ markedly in their ability to succeed under a wide range of climatic and soil conditions. The sweet cherry is the much more restricted of the two and can be grown to advantage only in the more favored fruit regions which have an equable climate, as, for example, the Hudson Valley of New York, the shores of the Great Lakes and on the Pacific Coast. It is about as tender to injury from winter cold and late frosts as is the peach and does not endure heat as well. The sour cherry, on the other hand, can be grown over a much wider territory extending north of the sweet cherry belt and south into the Mississippi Valley and along the Atlantic Coast. The largest sour cherry plantings are in New York, Michigan and Wisconsin.

Soils are of less importance than climate in cherry growing. Sour cherries thrive on most well-drained soils, either light or heavy, and withstand rather dry conditions. Sweet cherries are more exacting, and reach their best development in deep well-drained sandy or gravelly looms

Propagation of both sweet and sour cherries is by budding on seedling stocks. The sweet cherry grows best on Mazzard stock although Mahaleb stocks are used in many cases with fair results. Sour cherries are commonly budded on the Mahaleb stock which is preferred by the nurserymen because it makes a better nursery tree. Mazzard stocks make better orchard trees under most conditions.

Orchard treatment is not unusual. One- or two-year nursery trees are set in very early spring or, in the milder climates, in the late autumn. Sour cherries are placed about 18 x 18 feet, although 24 x 24 feet is better for the more vigorous sorts on good soil. Sweet cherries may be set 25 x 25 feet, or 30 x 30 feet in favorable situations. Sour cherries succeed best commercially under cultivation and cover-crops, as described for the apple, although in the home fruit-garden considerable fruit will be produced under sod or almost total neglect. Sweet cherries withstand sod culture even better than the sour kinds. Fairly vigorous terminal growth is necessary for crop production with both sweet and sour cherries. This can be stimulated by nitrate of soda or other nitrogenous fertilizer applied early in the spring at the rate of 3-5 pounds to the mature tree.

Pruning is begun when the two-year tree is set out; all but the leader and two well-spaced laterals should be removed. The remaining branches should not be headed back. For the mature sweet cherry the spreading type of tree with several large seaffold branches is the most desirable. The main branches may be headed back when they become too high for convenient harvesting. Sour cherries are pruned rather lightly at first, but as soon as growth begins to get short and spurry, the branches must be thinned out and renewal pruning practiced to keep up the vigor of growth.

Harvesting and marketing require special attention. For the cannery and freezer, which absorb a large part of the crop in the fruit districts, cherries are allowed to become dead ripe and then picked without the stems, into lugs or buckets. If they are to be sold fresh on the market they are picked with the stems, taking great care not to bruise the fruit. In the East they are packed either in quart berry baskets and shipped in berry crates or in climax baskets holding 4-12 pounds. In the West sweet cherries are usually marketed in 15-pound boxes which are faced. Quantities of sour cherries are pitted and frozen at about 0° F., either with or without sugar, and thus held indefinitely.

Yields are likely to be very variable, due to local conditions. Sour cherries may yield from 15-40 quarts a tree or 3 or 4 tons to the acre. Sweet cherries may yield much more than this under good conditions. Storing fresh cherries for more than a few weeks is not practicable.

Most varieties of sweet cherries need a pollinizer, so at least two varieties should be planted near together. In commercial planting this matter should receive careful attention for some varieties, as for example Napoleon (Royal Anne), Lambert and Bing, will not pollinate each other, but may be pollinated by such varieties as Black Tartarian, Black Republican, and Windsor. Sour cherries do not need a pollinizer but yields are increased by placing honeybees in the orchard to self-pollinate the blossoms. The following lists are given in approximate order of ripening, commercial varieties being starred: Sweet cherries Seneca, Lyons, Ida, Governor Wood, Coe, *Black Tartarian, *Black Republican, *Napoleon, *Lambert, *Bing, *Yellow Spanish, *Schmidt, *Windsor. Sour cherries—Early Richmond, *Montmorency, *English Morello, Chase. Duke or hybrid cherries—May Duke, Arch Duke, Olivet, Louis Phillippe, Reine Hortense, Late Duke.

Serious diseases of cherries are brown-rot and leaf-spot; the most important pests cherry fruit-flies and on sweet cherries the black aphis. In the commercial orchard an adequate spray program should be worked out with local spray service agencies with reference to the spray residue tolerances. Control is based on the application of a spray mixture made up of 2 gallons liquid lime-sulfur, 2½ pounds lead arsenate, 100 gallons water, applied just as the early varieties of cherries show color and again two weeks later. For aphid and tent caterpillar control this spray may be employed with the addition of 1 pint of nicotine sulfate as the tips of the buds show green.

CHERRY, BARBADOS-: Malpighia glabra. Cornelian-: Cornus mas. Ground-: Physults. Indian-: Rhamnus carolinana. Jerusalem-: Solunum Pseudo-Capsicum and Capsicastrum. Madden-: Maddenia hypoleuca. Spanish-: Mimusops Elengi. Surinam-: Eugenia unifora. Winter-: Physalts Alkekeugi.

CHERVIL. Two vegetable-garden plants are known as chervil, both native in Europe and members of the Parsley family.

Salad chervil is a hardy annual, Anthriscus Cerefolium, of simple culture, the leaves employed in salad and garnishing. It is grown as a spring or autumn crop, not thriving in the heat of summer. Usable leaves are obtained in six or eight weeks after seeds are sown; the autumn sowing is sometimes carried over winter in frames or in mild climates with a protection of mulch. Plants may stand at distances of 8-12 inches; they grow 1½ feet or more tall.

Tuberous chervil is a hardy biennial, Chærophyllum bulbosum, producing a carrot-like small gray or blackish edible root. Seed may be sown in August or September (that is, as soon as ripe), but usually it does not germinate till spring and the roots mature in four to six months thereafter; culture otherwise as for carrot. It is the better practice to stratify the seeds in autumn, and they are then regularly sown in spring. If kept in the usual way and allowed to remain dry, they may probably not germinate till the second spring if at all.

CHESTNUT. Attractive trees grown for edible nuts and to some extent for shade and ornament. The native chestnut, Castanea dentata (americana), formerly covered large areas of the eastern United States but this

species has been nearly destroyed by the chest-nut bark disease or blight. It persists mostly as sprouts, coming up from the old stumps in the native forests. The European chestnut, distributed but plantings of this species also have succumbed to the bark disease.

More recently the Japanese chestnut, C. crenata (japonica), and C. mollissima, the Chinese chestnut, have been introduced. Both of these species are more resistant to the blight than the American or European sorts and promise by hybridization to give rise to acceptable varieties that can be grown in the blight-in-fested area. Hybrid sorts being propagated for their nuts and tried in the East are the Carr, Hobson, and Stoke. Although not immune to the blight, they are sufficiently resistant to persist in spite of blight infection.

The American species excels the others in hardiness to cold and quality of nuts which are much smaller in size. The larger fruited species mostly produce nuts lacking sweetness and used for their food value. A few of the hybrid selections have nuts of good quality. Varieties of Chinese and Japanese origin are subject to winter injury in parts of the North having winter temperatures of 20° to 30° F. The European kinds are somewhat hardier.

Commercially, chestnuts are raised to some extent on the Pacific Coast of the United States which is outside the blight-infested region. Here the American and European species and their hybrids may be grown. In the eastern part of the country the varieties of Japanese and Chinese origin are being tried out in a small way

with some promise of success.

Chestnuts are naturally tolerant of acid soils and present no special cultural difficulties on well-drained land. Blight is the limiting factor. though weevils may become troublesome. The trees are precocious, often bearing nuts two or

three years after planting.

Propagation by budding or grafting on chestnut stocks is practiced. Seedlings of the Chinese species are suitable stocks for varieties of oriental origin. Expert workmanship is essential for a high percentage of "take." The breeding of chestnuts for blight resistance, both as forest trees and nuts, is receiving much attention from federal and other agencies and enough progress has been made to indicate that in the future chestnuts again may be grown in the United States in spite of the blight.

CHESTNUT: Castanea. Cape-: Calodendrum capensis. Guiana-: Pachira aquatica. Horse-: Æsculus. Moreton-Bay-: Castanospermum australe. Water-: Trapa. Water-, Chinese: Eleocharis dulcis.

CHICKWEED: Stellaria media. Mouse-ear: Cerastium.

CHICORY (Cichorium Intybus). This perennial, native in Europe, is grown for the roots and also as salad. The same plant is also extensively run wild in North America along roadsides and in neglected fields.

The thick roots are employed as substitute for coffee. In this capacity it is a field crop, grown in deep well-prepared soil. Seeds are sown in spring in drills about 18 inches apart, good tillage is provided, and the hard parsniplike roots are garnered in autumn.

Chicory is grown for the foliage, used as greens or salad. The best-known product is witloof, which is the crown of uncolored leaves

forced in winter or spring from stored roots. Seeds of the strain of chicory mostly employed for the production of witloof are sown in drills in spring and thinned to about 6 inches in the row. At the close of the season the roots are lifted, the tops cut off above the crown, and stored in a cellar, the same as other root-crops. For the production of the crown of leaves known as witloof, the roots are trimmed on the lower end to 8 or 9 inches long, then placed upright in soil or sand in a box and the crowns covered with about 8 inches of sand; temperature is kept at about 60°, and in a fortnight the white salad witloof should be ready, a good "head" being 6 inches long.

Sometimes the leaves of chicory are blanched in the field late in the season by banking as for celery; or the same treatment may be applied in spring to the new leaves arising from roots remaining in the ground over winter. Some persons force the stored roots in darkness to obtain the blanched tops. The unblanched

leaves are sometimes used as greens.

CHILDSIA: Hidalgoa Wercklei. CHILEAN NUT: Gevurna Avellana. CHILE-BELLS: Lapageria rosea.

CHILÈNIA. Cactacex. A Chilean genus segregated from Neoporteria and said to differ in producing 2 flower-buds simultaneously of which one may not mature.

acutissima (Neoporteria acutissima. Echinocactus acutissimus). Plant subcylindrical, erect becoming prostrate, gray-green; rbs 18-21; radial spines about 24, to ½ in. long; centrals 4, to ½ in. long, yellowish; fis. carmine-red, to 1¾ in. long.

castaneoides. Plant globose, gray-green; ribs 15-18, acute to somewhat thickened and rounded, argoles about 15 in a part and white-woolly; radial spines 16-20, to 34 in. long, grayish; centrals 6, erect, brownish, usually longer. fls. carmine-red with whitish throat: fr. reddish-green to

chilénsis (Neoporteria and Echinocactus chilensis). Plant globose to short-cylindrical, to 10 in. tall, top woolly; ribs 20-21, tubercled; spines curved, yellow becoming brown or whitish; radials 20-30, to ½ in. long; centrals about 6, to ¾ in. long; fls. pink to carmine-red, to 2 in. across, segms. narrow, acute, toothed, style and stigma

heteracantha. Depressed-globose, to 4 in. diam.; ribs about 19, notched, are oles about ½ in. apart; radial spines about 20, stiff and closely clustered, to ½ in. long, slightly curved; centrals 6, to 1½ in. long, dull white to brownishgray: fls. carmine with white throat: fr. red.

nigrifiorrida. Depressed-globose, to 4 in. diam. and 2½ in. high; ribs usually 16-18, to ½ in. wide, acutely compressed between arcoles; spines gray but appearing black when wet; radials 16-18, to ½ in. long; centrals 6-8, to 1½ in. long, stout: fis. carmine, white in throat, to 1¾ in. crosses: for radials arrows. across: fr. reddish-green.

senilis: listed name, perhaps Neoporteria Nidus.

subgibbosa (Echinocactus guyannensis. E. erculptus. Neoporterus subgibbosa). Globose becoming cylindrical, to about 4 in. diam., erect becoming prostrate or pendent to about 4 in. dam, erect becoming prostrate or pendent from rocks, pale green, densely spiny; ribs usually 15-20, compressed, to ½ in. high, warty; spines yellow to brown; radials about 24, slender, sharp; centrals 4-5, stouter; fls. carmine-red, to 1¾ in. long.—Said to differ from C. acutissima in its more warty ribs and sharper stiffer spines, but by some authors the two are treated as conspecific.

CHILICOTHE: Echinocystis macrocarpa.

CHILOPSIS. Bignoniacex. One deciduous shrub or tree to 20 ft., native Tex., Calif. and Mex. in dry regions, mostly near springs or stream beds, and planted in the S. C. linearis (C. saligna). Desert- or Flowering-Willow. Lvs. linear, to 1 ft. long, entire: fls. trumpet-shaped with 5-lobed crimped limb, lilac with 2 yellow stripes inside, to 2 in. long, in terminal racemes: fr. linear, to 1 ft. long. Var. álba has white fls.

CHIMÁPHILA. PIPSISSEWA. Pyrolaceæ. Evergreen woods herbs or little subshrubs with creeping sts., toothed lvs. in irregular whorls, white or pinkish fls. in few-fld. terminal long-stalked umbels, and capsular frs.; grown in the wild-garden where it prefers partial shade. Propagated by divisions of the creeping sts.

maculata. To 10 in.: lvs. broadest below the middle, variegated white along the veins. Me. to Ga. and Ala.

Ménziesii. To 10 in : lvs. broadest below the middle, sometimes variegated. B. C. to Calif.

umbellata. To 10 m.: lvs. broadest above the middle, not variegated. Eu., Asia. Var. cisatlantica is the form native in E. N. Amer.

CHIMONÁNTHUS. Calycanthaceæ. Two Chinese shrubs with opposite entire lvs., yellow fls. long before the lvs., and fr. contracted at the mouth. Requires winter protection in the N. Propagated by seeds sown in spring and by layering in autumn.—Chimonanthus has been conserved over the older Meratia by ruling of the International Botanical Congress.

fragrans: C. præcox.

præcox (C. fragrans. Calycanthus and Meratia præcox).
To 10 ft., deciduous: lvs. elliptic-ovate to oblong-lanceolate, 6 in. long: fls. fragrant, about 1 in. across, the inner sepals striped with purplish-brown. Var. grandiflöra has larger lvs. and fls.

CHIMONOBAMBUSA. Gramineæ. Bamboolike shrubs with creeping rootstocks and nearly solid round sts. whose sheaths are deciduous and with several branches arising from each node: differs from Arundinaria in fls. having 2 styles, not solitary. About a dozen species, from E. or S. Asia.

marmorea (Arundinaria and Bambusa marmorea). To 3 ft. or more, sheaths marbled with purple: lvs. to 5 in. long and ¾ in. wide, toothed, bright green. Japan.

CHINA-BERRY: Melia Azedarach. -Brier, Faise: Smilax laurifolia. -Tree: Melia Azedarach.

CHINESE EVERGREEN: Aglaonema simplex. -Hat Plant: Holmskioldia sanguinea.

CHINKAPIN, WATER: Nelumbium pentapetalum.

CHINQUAPIN: Castanea pumila. Giant: Castanopsis chrysophylla.

CHIOCÓCCA. SNOWBERRY. Rubiaceæ. Shrubs or vines with opposite leathery lvs., small yellow or white fls. in axillary racemes, and fr. a globular white drupe; native Fla. to trop. Amer.

álba (C. racemosa). Shrub to 10 ft., or vine: lvs. elliptic or ovate, to 3 in. long: fls. yellow, to 1/2 in. long.

racemòsa: C. alba.

CHIÓGENES. Ericaceæ. Two evergreen creeping little plants with small alternate lvs., bell-shaped solitary fls. and fr. a white berry; adapted to the rock-garden, forming mats. A moist peaty soil and partial shade are desirable. Propagated by seeds, division or cuttings.

hispidula (C. serpyllifolia. Gaultheria hispidula). Creeping Snowberry. Lys. ovate, to 1/2 in. long: fis. white, 1/2 in. long. May-June. N. Amer.

serpyllifòlia: C. hispidula.

CHIONANTHUS. FRINGE-TREE. Oleaceæ. Two deciduous practically dicecious trees or shrubs with opposite entire lvs., many small white fis. in showy panicles, the 4 petals linear and united only at base, and fr. a dark blue drupe.

The fringe-trees are hardy North with some protection. They succeed in sunny positions in moist sandy loam. Propagated by seeds in autumn or stratified, by layers and cuttings of forced plants, and by grafting or budding on the ash.

retusa. To 20 ft.: lvs. ovate or elliptic, to 4 in. long: panicles to 4 in. long. June-July. China.

virginica. To 30 ft.: lvs. mostly colong or obovateoblong, to 8 in. long: panicles to 8 in. long. May-June. Pa. to Fla. and Tex.

172

CHIONODÓXA. GLORY-OF-THE-SNOW. Liliaceæ. Early spring-blooming bulbous herbs with narrow basal lvs. and blue or white short-tubed open fls. in loose racemes terminating the scape.

Chionodoxas thrive in any soil but need plenty of moisture and light. Bulbs should be planted approximately 3 inches deep and replanted about the third year. Propagated by offsets or seeds.

Allenii. Said to be a natural hybrid between C. Lucilize and Scilla bifolia, having the general habit of the former but with perianth segms, cut to the base and an indistinct white even

crética. Differs from C. Luciliæ in having smaller fls. with only 1-2 on a scape, white or very pale blue. Crete. Var. álba is offered.

gigantèa: a large form of C. Luciliæ.

grandiflora: a large-fld, form of C. Luciliæ.

Lucslie. To 8 in.: fls. bright blue with white center, 1 in. across. Asia Minor. Var. álba has white fls. Var. ròsea, fls. pink.

sardénsis. Perhaps only a form of C. Luciliæ with fewer dark blue fls. without white center.

tmolusii: a late-blooming form of C. Luciliæ.

CHIONÓGRAPHIS. Liliaceæ. A monotypic genus from Japan allied to Chamælirium and differing in having only 3-4 perianth-segms., the stamen filaments very short or absent, and fis. perfect and in a spike rather than unisexual and in a raceme. C. japónica. Per. to 12 in.: basal lvs. in rosette, broadly elliptic to linear-oblong, to 3 in. long, irregularly toothed to entire, reticulately veined, st.-lvs. linear, to 1½ in. long, sessile: fis. white, to ¾ in. across, segms. narrowly linear and spreading.

CHIONÓPHILA. Scrophulariacex. One per. herb to 6 in. high native in the Rocky Mts. of Colo. and Wyo. and sometimes transferred to the rock-garden. C. Jāmesii. Lvs. mostly basal, spatulate or lanceolate, entire: fls. cream-colored, ½ in. long, tubular and 2-lipped, in one-sided spikes.

CHIRITA. Gesneriaceæ. Soft per. herbs, more or less succulent, much like Gesnerias, E. Indian and Malayan: lvs. opposite: fls. irregular, showy in terminal small clusters or on short axillary branchlets; fertile stamens 2: fr. a long narrow caps. C. lavandulacea is an attractive warmhouse plant to 3 ft. high, branched: lvs. soft-pubescent, broad-ovate, with many parallel side-ribs departing from the midrib: fls. about 2 in. long; corolla finely pubescent, tube white and upper part lavender-blue.

CHIRÒNIA. Gentianaceæ. African herbs with simple opposite lvs. and pink or rarely purple 5-lobed fls. borne in cymes; intro. in Calif.

baccifera. Much branched per. to 2 ft.: lvs. linear to linear-oblong, to 1½ in. long, entire: fis. rose-pink, to % in. across: fr. a reddish-orange berry-like caps. Trop. Afr.

ixifera: C. linoides.

linoides (C. ixifera). Sts. to 3 ft.: lvs. linear or lanceolate, to 1½ in. long; fis. about ½ in. long, solitary or 2-5 together. S. Afr.

CHITTAMWOOD: Bumelia lanuginosa.

CHIVE: under Onion.

CHLIDÁNTHUS. Amaryllidaceæ. Trop. American bulbs with basal strap-shaped lvs. and fragrant yellow fis. borne in few-fid. umbels at tips of solid scapes, blooming in summer; one

species intro. in Calif. and hardy when well mulched. Propagated by offsets or seeds. See Bulbs.

fragrans. To 10 in.: lvs. with the fis., glaucous: fis. to 3 in. long. Andes.

CHLORANTHÀCEÆ. CHLORANTHUS FAMILY. Three genera growing in warm regions, trees or shrubs with opposite lvs., small unisexual fls. without perianth borne in spikes or panicles, having 1 or 3 stamens, 1-celled ovary, and drupaceous fr. The family is allied to Piperaceæ. Ascarina and Chloranthus may be planted out-of-doors in the S.

CHLORÁNTHUS. Chloranthaceæ. Trop. herbs or shrubs with opposite simple lvs. and inconspicuous fls. in slender terminal spikes; one species intro. in S. Calif.

brachýstachys: C. glaber.

glaber (C. brachystachys). Shrub to 2 ft.: lvs. elliptic-lanceolate, to 5 in. long, coarsely toothed: fr. a bright red globose drupe. India, China, Malaya.

CHLÒRIS. FINGER-GRASS. Gramineæ. Ann. and per. grasses grown for ornament or forage, native in warm regions of the world: spikelets awned, in 2 rows on one side of the rachis, in spikes which are solitary or in terminal umbels. See Grasses.

barbàta: may be either C. paraguayensis or C. polydactyla: see also C. truncata.

élegans: C. virgata.

Gayàna. Rhodes-Grass. Per. to 4 ft., stoloniferous: lvs. to 1 ft. long and ½ in. wide, flat or folded: spikes to 4 in. long, in umbels of 6-15. Afr., but nat, elsewhere.—Grown in the S. for forage.

paraguayénsis. Ann. to 2 ft.: lvs. to 4 in. long, flat or folded: spikes to 2 in. long, purplish, few or several in the umbels. Tropics.

polydáctyla. Per. to 4 ft.: lvs. to 2 ft. long and 1/4 in. wide: spikes to 6 in. long, in umbels of 6-25. Trop. Amer.

truncata (C. barbata vera). Per. to 1 ft.: lvs. short, to $\frac{1}{12}$ in. wide, flat or folded: spikes to 6 in. long, several in one or two whorls. Australia, but nat. in N. Amer.

virgata (C. elegans). Per. or ann. to 3 ft.: lvs. to 4 in. long and $\frac{1}{12}$ in. wide, flat or folded: spikes to $2\frac{1}{2}$ in. long, pale or purplish, in umbels of 6-15 or more. Tropics.

CHLOROCÒDON (Mondia). Asclepiadaceæ. Vines with opposite large lvs., toothed or frilled stipules, and wheel-shaped fis. in axillary panicles; 2 species in Afr., the roots used in medicine and one grown under glass or out-of-doors in the S. Propagated by cuttings over bottom heat.

Whitei. Mundr-Root. Tall-twining: lvs. ovate, heart-shaped at base, to 7 in. long: fis. purplish, to 1 in. across, having a white 5-lobed crown, Aug. Natal, trop. Afr.

CHLORÓGALUM (Laothoe). Liliaceæ. Tall bulbous herbs with mostly basal tufted lvs. and white or purplish fls. in panicles, the perianth-segms. distinct; native in Calif. Cult. as for Camassia.

angustifòlium. To 1½ ft.: lvs. narrow and grass-like: fis. white lined with green, to ½ in. long, perianth funnel-form, segms. narrow-oblong, pedicels very short.

pomeridianum. Soap-Plant. Amole. To 5 ft.: lvs. to 1½ ft. long and ¾ in. wide, wavy-margined: fis. white veined purple, ¾ in. long, opening in afternoon.

CHLORÓPHORA. Moraceæ. Milky-juiced trees from trop. Amer. and trop. Afr., with alternate lvs., staminate fls. in dense catkin-like spikes, pistillate in dense heads, and fr. an achene; grown in trop. countries for the yellow dye and the valuable yellow wood.

tinctòria. Fusric. To 60 ft., with spreading broad head; lvs. lanceolate to elliptic, to 5 in. long, entire or toothed. W. Indies, S. Amer.

CHLORÓPHYTUM. Liliaceæ. Trop. herbs closely related to Anthericum and differing chiefly in the somewhat broader lvs. and sharply 3-angled caps.; fls. in long open erect racemes or spikes. Grown in greenhouses and out-of-doors in warm regions; they are more or less proliferous, and are easily multiplied.

combsum (Anthericum comosum. C. Sternbergianum). To 3 ft.: lvs. 1 ft. long: fls. white, to ½ in. across, in leafy-tipped racemes. S. and Cent. Afr.—A white-striped form is known as Anthericum Mandaianum; A. picturatum has lvs. striped vellow.

elatum (Anthericum elatum). To 3 ft.: lvs. 1 ft. long: fls. ivory-white, to % in. across, in non-leafy racemes. S. Afr.—Forms known as Anthericum variegatum and vittatum have lvs. striped white.

Sternbergianum: C. comosum.

CHOÍSYA. Rutaceæ. Mexican evergreen shrubs with digitately compound lvs., showy white fls. in axillary cymes, and fr. of 3 or 5 carnels.

One species is grown under glass, and out-of-doors in the South and California where it stands a few degrees of frost. Propagated by cuttings of young wood over heat or of older wood in a coldframe.

ternata. Mexican-Orange. To 10 ft.: lvs. of 3 oblong to ovate or obovate lfts. to 3 in. long: fis. fragrant, 1 in. or more across, conspicuous over the foliage.

CHOKEBERRY: Aronia.

CHOKE-CHERRY: Prunus virginiana.

CHOLLA: Opuntia.

CHONDROSEA: Saxifraga Aizoon.

CHORÍSIA. Bombacacex. S. American spiny trees with alternate digitately compound lvs., large fls. and pear-shaped capsular frs., the silky floss on the seeds used for stuffing pillows. Sometimes planted in S. U. S.

specidsa. Floss-Silk Tree. Lfts. lanceolate, toothed: fls. yellowish striped with brown at base, 3 in. across, solitary in axils. Brazil.

CHORIZANTHE. Polygonacex. Ann. and per. herbs native in Calif. and Chile: lvs. usually in basal rosettes, the st.-lvs. reduced to bracts: fls. included in the involucre, usually solitary. Adapted to dry locations in warm regions.

Páimeri. To 12 in., erect or prostrate: lvs. linear to oblong-spatulate, to 1½ in. long, lanate becoming glabrate above, sessile or nearly so: fis. rose-pink, calyx-lobes rounded, the inner ones fringed. S. Calif.

staticoides. To 10 in., with spreading branches, reddish or purplish: lvs. oblong, to 34 in. long, on long petioles, white-tomentose beneath: fls. very small, rose or white calyx exserted from involucre, lobes not fringed. S. Calif.

CHORIZEMA. Leguminosæ. Shrubs or subshrubs with simple alternate lvs., papilionaceous showy fls. in racemes, and short pods; Australia.

They may be planted out-of-doors in the South or grown in greenhouses; they require plenty of sun. Propagated by cuttings in spring under glass.

cordatum. Shrub to 10 ft. with weak branches: lvs with small prickly teeth, ovate-lanceolate: fls. orange-red, or scarlet with purplish keel, in long loose or open racemes, abundantly produced.

grandiflorum: a form of C. varium.

ilicifòlium; the plant known to the trade under this name is C. cordatum.

varium. Shrub to 6 ft.: lvs. cordate-ovate, with prickly teeth: fls. with light orange standard and purple-red wings and keel, borne in short close racemes.—Apparently not in general cult, with us.

CHOROGI: Stachys Sieboldii.

CHRISTMAS-BERRY: Heteromeles arbutifolia. -Tree: Schinus terebinthifolius.

CHRISTMAS-ROSE: Helleborus niger.

CHRISTOPHINE: Chayote, Sechium.

CHROSPERMA: Amianthium muscætoxicum.

CHRYSALIDOCÁRPUS. Palmacex. 10 often gregarious unarmed feather-palms of mostly small stature in Madagascar, one of them popular in cult.: sts. slender, ringed: lvs. plume-like, gracefully arching; pinnæ very many, bifid, narrow: spadix among the lvs., branching; stamens 6, pistillode more or less 3 lobed: fr. ovoid or ellipsoid, about 1 in. or less long. See Palm.

lucubensis. St. singlé, ringed, to 30 ft. or more: pinne in clusters along the midrib and 1½ ft. long and ¾ in. broad, glossy on upper surface: spadices much branched, about ½ as long as blade of ff.: fr. oblong, about ¾ in. long, the exterior thin and hard. Forest of Lucuba, island of Nossi-Be off northwest coast of Madagascar.—Planted in S. Fla., and further S.

Int. S. Fia., and farther S.

Iutéscens (Areca lutescens). Sts. many, forming an attractive clump to 25 or 30 ft., foliaged nearly or quite to the base: pinner 40-60 pairs, mostly less than 1 in. broad, midrib strong, the ends not much arching or drooping; petiole 2 ft. long, yellow, convex below and deeply furrowed above, suddenly much expanded at base: fr. oblong-ellipsoid, about ¾ in. long, violet-black.—Much grown as a florists plant for pots and tubs, and attractive in the open in S. Fla. and troopies. in S. Fla. and tropics.

madagascariensis (Dypsis madagascariensis). Clumps with a denser head than C. lutescens and less likely to be foliaged to base, the lvs. more numerous and the pinner about twice as many with the tips arching or hanging: fr. ovoid-elliptic, about ½ in. long.

CHRYSAMPHORA: Darlingtonia.

CHRYSANTHEMUM. Composite. Large genus of ann. and per. herbs, some of them woody at the base, a number of which are grown for the showy bloom; native in temp. and boreal regions, mostly in the Old World. Matricaria, Myconella and Tanacetum are closely allied.

allied.

Cultivated chrysanthemums are hardy and half hardy mostly strong-scented and rather coarse plants, with colors in various series except blue and true purple; they usually bloom late in the season in the open A half dozen cultural clusses may be distinguished: 1. The flower-garden annuals; 2. feverfews; 3 pyrethrums; 4. marguerites; 5. perennial border kinds, yielding some of the flower known as dissies; 6. the florists chrysanthemum. In these various ranges are excellent decorative materials and possibilities. The interest in these plants is represented by the Chrysanthemum Society of America.

1. The annual chrysanthemums are big flower-garden subjects, suitable for late summer and autumn mass colors, raised readily from seeds which commonly are sown as soon as the ground is fit directly where the plants are to stand; they may be grown thickly in back rows, but for best blooms should be thinned to 12-24 inches apart; provide an open sunny position. Three species are involved. C. coronarium is the tallest, and single large plants sometimes need staking. C. carinatum is the usual flower-garden kind, in many colors. C. segetum yields good clear yellows.

yellows

2. Feverfews are forms of C. Parthenium, sometimes

yellows

2. Feverfews are forms of C. Parthenium, sometimes known as a pyrethrum. All are perennal, hardy, of the simplest culture, and persistent. They are grown for the abundant little white-rayed heads with yellow center, and dwarf compact forms for the foliage which is sometimes crisped and yellow-tinged; the latter kinds are known as Golden-Feather. They grow readily from seeds, blooming the second year, and frequently they seed themselves; offsets may be taken from the clumps.

3. Pyrethrums, product of C. cocaneum, useful for cutting and employed as a florist flower. The stems are long and simple from a crown of attractive foliage; the daisy-like heads are bright white, rose, carmine, like and other shades; bloom in late spring and summer; an autumn cutting may be had if the flowers are all cut regularly. Propagated by seeds, blooming the second year; named horticultural varieties by offsets or division.

4. Marguerite chrysanthemums belong to C. frutescens, although the related C. anethrfolium is sometimes seen; it is frequently known as Paris daisy. It is tender in the North, and is grown in pots and tubs for late winter, spring and summer bloom. Propagated by cuttings, like the florists chrysanthemum; taken in spring they should give blooming plants for the following winter and spring. Shift into larger pots as needed. Old plants may be cut down and bloom renewed for another year if grown in tubs or big pots.

5. The perennial border chrysanthemums are hardy

big pots.
5. The perennial border chrysanthemums are hardy strong plants propagated by division, and by seeds which

give blooming plants the second year; if necessary, they may be multiplied by short cuttings of young firm shoots. They require sunny positions. Some of the recent introductions belong to C. rubellum.

6. The common chrysanthemum of florists (C. morifolum) is known in two races or types: the kinds developed into very large flowers for pot culture, and the border bushy kinds that remain always in the perennial garden. These two types are not essentially different, however, as the large flowers of the florists kinds are developed not alone by selection but by extra care in propagation, culture, pruning and disbudding, they express the skill of the grower; if left to themselves to produce bushy plants, the florists kinds bear many small or medium-sized flowers. All these plants are essentially hardy perennials, propagated by seeds, cuttings and division.

The usual propagation of the house chrysanthemum is by cuttings taken in spring from shoots that arise from crowns of plants that have been carried through the winter; when the plants begin to stool or to send up new growth, the shoots are cut 2 or 3 inches long and inserted in sand in boxes or on a bench; the cuttings are trimmed of their lower leaves and the remaining (upper) leaves are usually cut in two to reduce evaporating surface; as soon as rooted they are placed in small pots, say 23-rinch.

The young plants may be carried through the summer in pots, after reporting two or three times, or planted in the ground and lifted in October or November. Every pains should be taken to keep the plants growing without check or insect or fungus injury. If one does not care to propagate them, plants may be purchased in late spring or early summer, that have been potted and are well rooted and stocky. By the time the plants are to bloom they should be m 6-inch pots or larger; if very large bushy plants are desired, the pots should be 10- or 12-inch.

For cut-flowers, the plants are cutally grown by florists in benches under thas from first till last, after the cuttings

pannts are desired, the pois should be 10-0712-inch.

For cut-flowers, the plants are usually grown by florists in benches under glass from first till last, after the cuttings are turned out of their first small pots; if to be grown to single stems for very large bloom, the plants may be set 8-12 inches apart each way on the benches, and they are tied, trained and disbudded as they grow, only the terminal but being setupoid.

bud being retained.

tied, trained and disbudded as they grow, only the terminal bud being retained.

The amateur usually prefers to allow bushy plants with a good number of smaller flowers. The plants are allowed to branch. All weak growths should be removed as they appear, and when buds begin to show they should all be removed except the terminal one on the branch; in this way there will be as many flowers as branches, say one to two dozen depending on the size and vigor of the plant and the wish of the grower. The heads or flowers will be of approximately one size. The plants may be bloomed in pots 6 inches or larger or in soap boxes for the window. The plants are discarded after blooming unless one wants to propagate a new lot for the following year, and in this case the tops are cut down and the pot or box placed in a cellar and kept dry enough to maintain life and strength but not to start into growth or induce decay; in February or March the plant may be brought to warmth and light, given water, and shoots for cuttings will soon start. It is to be remembered that the plant is a hardy perennial and that it should be grown cool when in the house.

The types or groups of C. mortfolum are many, and there are named varieties under each group. This range allows of a choice to satisfy any taste.

allows of a choice to satisfy any taste.

achilleæfòlium. Yarrow C. Per. border species, 2 ft. little branched, rooting at bottom: lvs. soft-hairy: fls. yellow. Siberia, Caucasus.

alpinum (Leucanthemum alpinum). Per., 2-6 in. high, with 1 terminal head on each st.: lvs. to 2 in. long at base of st, cut into narrow segms. those on st. few and very small: fl.-heads white. High Alps.—Rock-garden.

Amaliæ: listed as a dwarf summer-blooming plant with

anethifòlium. GLAUCOUS MARGUERITE OF DILL C. Per. with fine glaucous foliage: fls. white, sometimes lemonyellow. Canaries—Greenhouse plant in the N. much like marguerite but less coarse.

Arcticum. Arctic C. Per. to 6 in., more or less decumbent at base: fls. aster-like, to 2 in. across, white to lilac. Arctic regions.—Border plant; the material usually cult. under this name is referable to *C. yezoense*.

atratum (C. coronopifolium). Per. 6-12 in., mostly 1-headed: lower lvs. 1-divided, the segms. 5-7-toothed, those on st. lanceolate or linear: rays white. Alps.

atrococcineum: C. carinatum. aureum: C. Parthenium var.

Balsámita (Balsamita vulgaris, Tanacetum Balsamita). Balsamita (Balsamita vugaris. Tanacerum Balsamita). Costmarr. Per. 2-3 ft.: Ivs. serrate: heads many, ½-¾ in across, with very short white rays; commonly rayless and then known as var. tanacetoides. W. Asia.—Persistent plant sometimes grown for its sweet-smelling herbage, and erroneously called "lavender"; also known as "mint-geranium."

bicolor: C. carinatum.

Broussonètii (Ismelia Broussonetii). Per. 2-3 ft.; lvs ovate or obovate, pinnatifid, the narrow segms. pinnatifid or toothed: heads long-peduncled, to 3 in. across, rays hlac, yellowish at base. Canaries.

Burridgeanum; C. carinatum

carinatum. TRICOLOR C. Glabrous ann., 2-3 ft., nearly simple or somewhat forking: lvs. pinnatifid into linear lobes: heads large, 2½ in. or less, rays white, red, purple, yellow, disk purple, colored ring at base of rays. Mo occo.—Flower-garden; cult. also as C. atrococcineum, C. bicolor, C. Burridgeanum, C. Dunettii, C. tricolor.

caucásicum (Pyrethrum caucasicum. Chamæmelum caucasicum). Per., st. erect from the rhizome, 1-headed: lvs. parted into linear-awl-like lobes: head long-peduncled, 1½ in. across, rays white. Caucasus.

cinerariæfòlium. Dalmatian C. or Pyrethrum. Per., 12-24 in, producing many slender sts., herbage silvery: heads white, 1 in. or more across, on very long sts. Dalmatia.—A source of insect powder.

matia.—A source of insect powder.

coccineum (Pyrethrum rossum. P. carneum. P. atrosanguineum). Pyrethrum. Painted Daisy. Per., nearly
or quite simple, 1-2 ft: lvs. bipinnatifid, fern-like: heads
large and showy, terminating the sts., red in various
shades, pink, lilac, white, sometimes double. Caucasus,
Persia.—Used by florists. Var. Kélwayi has dark red fls.
Var. rôseum has rose-pink fls. Var. Wilsonii (C. Wilsoni) has pure pink double fis.

coreanum: hort. name for a form with single white fis.; it may be C. rubellum or C. Zawadskii var. sibiricum.

coronarium. Garland C. Crown Daisy. Stout branchy ann., 3-4 ft., with lvs. divided nearly to the midrib, the segms. less than ½ in. broad and again cut or toothed: heads many, 1-1½ in. across, yellow or whitish, often double; achenes with prominent straight parallel ridges on back. Medit. region.—Flower-garden; young shoots eaten in Japan. Var. spatiosum. To 2 ft. or more, stout and very leafy, glaucous: lvs. broad-spatulate, mostly 1 in. or more across, lobed or cut half way or less to midrib or with deeper lobes on narrow lower part: fls. light yellow: grooves on achenes not prominently purallel or deep. China.—Grown for the young shoots which are eaten, and not unknown in this country; known as "boong-hau-ts'ai," "shungiku" and "chop suey greens." coronarium. GARLAND C. CROWN DAISY.

coronopifolium; C. atratum; sometimes C. coccineum

corymbosum (Pyrethrum corymbosum). Per., 2-4 ft.: lvs. bipinnatifid: heads many on terminal branches, 1 in. or less across, white. Caucasus.—Border.

Dunéttii: C. carinatum.

erubéscens: the plant in cult. in N. Amer. under this name is apparently C. rubellum. C. erubescens itself is a smaller more slender plant than C. rubellum with ovate to reniform lvs. cut only about to the middle and sinuses very narrow.

Fontanèsii (Hymenostemma Fontanesii). Ann., slender, much branched, 12-18 in.: lvs. spatulate, toothed or almost lobed: heads small, about ½ in. across, rays white. W. Medit. region.-Flower-garden.

frutéscens. Marguerite. Paris Daisy. Per., to 3 ft., much branched, becoming woody: lvs. not glaucous, coarsely divided, rather fleshy: heads many, on straight sts., 1½-2½ in. across, white or lemon-yellow. Canaries.—Florists subject.

glaucum: see C. multifidum.

hispánicum (Pyrethrum hispanicum). Per.: lower lvs. pinnatifid, lobes linear and cuspidate: heads with white, yellow or reddish rays that are 4-nerved and 3-toothed. Spain —Varies in cut of lvs.

hortdrum: C. morifolium.

hybridum; hort, name, perhaps for a garden race of C. coccineum.

fndicum. Per., 2-3 ft., much branched, soft-foliaged: lvs. divided, felty gray beneath: heads numerous, short-stemmed in clusters, ½-1 in. across, yellow, showy only in mass. China.—Border; very little known in cult.

inoddrum: Matricaria inodora.

isponicola (C. Makinoi var. japonicum). Small per., 8-32 in. high: Ivs somewhat glaucous, cuneate, 3-lobed: heads to 1½ in. across, on slender peduncles, white. Japan.—Once described as C. japonicum (C. sinense var. japonicum), but name invalidated by the earlier japonicum of Thunberg which is a confused unit. C. japonense is another but similar Japanese plant. The plant listed in North America as C. japonicum awaits identification.

jesoense: C. yezoense.

laciniatum: botanically the name is a synonym of C. segetum, but material so listed in the trade may be C. maximum var.

lacustre. Portuguese C. or Daisy. Tall per., 3-6 ft., branched at top: lvs. narrow, serrate-dentate: heads long-stemmed, 2-3 in. across, white. Portugal.—Border.

lavendulæfðlium. Per. to 4½ ft., sts. erect, short-pulescent: lvs. broadly ovate, to 4 in. long, acuminate, often pinnate: heads to ½ in. across, in paniculate cymes, rav-fls. yellow. Japan.

ray-iis. yellow. Japan.

Leucánthemum (Leucanthemum rulgare. L. grandsflorum). Whiteweed. Ox-eye Daisy. Per., slender,
1-2 ft., simple or little branched: Ivs. simple, notched or
cut: heads terminal and long-stemmed, 1-2 in. across,
white. Eurasia, and an abundant weed in E. U. S.—Sometimes planted in borders. Var. californicum has creamcolored fis. Var. grandiflorum is said to have larger fis.
Var. præcox is listed as an early bloomer.

macrophyllum (Tanacetum macrophyllum). Tansy C. Per. 2½ to 3½ ft., erect, branching: lvs. coarsely pinnatisect: heads numerous in terminal corymbs, ½ m. or less across, with small white or yellowish rays. S. E. Eu. to Caucasus.—Border.

Máwii. Half-shrubby per. to 18 in. high: lvs. 1 in. long, main ones pinnatifid: heads 1½ in. across, with rays white on face and rose on back. Greater Atlas Mts, N. Afr.

máximum. Max C. or Daisy. Short-lived per., often maximum. Max C. of Daisy. Short-lived per, often treated as bien, erect, simple or only sparingly branched, 1-2 ft.: lvs. long and narrow, serrate-dentate: heads terminal and large, 2-4 in. across, with many white rays. Pyrenees.—Border plant, known in many forms, as King Edward VII, Chrysanthemum daisy, Shasta daisy, Glory of the Wayside, C. Robinsonn and erroneously as C. Leucanthemum. Var. laciniatum has fringed or laciniate ray-fls.

millefoliatum. Per. to 2½ ft., pubescent: lvs. pinnatisect, lobes linear, entire, acutish: heads yellow, in lax corymbs, ray-fls. 10-20. S. W. Russia—Similar to C. achillex/folium, differing in its larger lvs. and longer lf.-segms.

morifolium (C. sinense in part. C. hortorum). Florists C. Per, 2-4 ft., branched: Ivs. broad, lobed, gray-pubescent, strong-scented: heads many terminating branches, of various sizes and greatly modified in shape, fashion and color. Cultigen, probably of Chinese origin.—Under glass, and some of the kinds in the permanent border.

multifidum (Pyrethrum glaucum). Differs from C. Balsamila in lvs. lyrate-pinnatifid and achenes more nearly ovoid. E. Eu. to W. Asia.

Myconis: Myconella Myconis.

nipponicum. Nippon C. or Daisy. Per., shrubby at base, 1½-2 ft., leafy above, sts. simple or little branched: lys. thick, spatulate and obtuse, serrate at end; heads terminating sts, 1½-3½ in. across, white. Japan.—

Nivellei. Ann., sts. erect, about 1 ft. or less, leafy: lvs. thickish obovate, pinnately parted: heads solitary on branches, 1 in. or more diam., tomentose, rays white. Mts., Morocco.

pállens. Per., st. erect, hispid, simple or nearly so, 10-16 m: lower lys. obovate, obtuse, crenate, petiolate, upper ones ligulate and somewhat clasping and becoming entire toward top of st.: heads solitary, rays white. Mts. France.

Parthènium (Pyrethrum Parthenium and P. parthenifolium. Matricaria parthenoides, M. capensis, M. erimia
and M. alba). Feverrew. Bushy per, 1-2 or 3 ft., very
leafy: Ivs. variable, pinnatisect, often yellowish (var.
aŭreum), sometimes crisped (var. crispum): heads many
in open terminal clusters, 34 in. and less across, whiterayed, sometimes rays absent. Eurasia.—Border; there
are dwarf very compact forms.

ptarmicæflòrum. Shrubby, white-tomentose, 1 ft. and more high: lvs. bipinnately parted much as in certain achilleas: heads corymbose, small, with white rays.

radiatum: hort. name of unknown botanical standing. Róbinsonii: C. maximum.

rotundifòlium. Per., st. glabrous, simple, erect, to 18 in.: lower lvs. ovate to broad-cordate, petiolate, mucronate-dentate, upper ones becoming narrower: head solitary, 1 in. and more across, white. Hungary.

rubéllum (C. erubescens of hort. Chrysoboltonia pulcher-rima). Per. to 3 ft, slightly to much branched: lvs. to 6 in. long, pinnately 5-partite, segms, far apart and coarsely toothed or lobed, bright green above, thinly white-pubescent beneath: heads numerous, to 314 in across, ray-fls. pink. Known only in cult, and recently recognized as a separate species. Var. Clara Curtis belongs here—Similar separate species. Var. Clara Curtis belongs here—Similar to C. Zawadskii, differing in larger size, more coarsely cut lvs. and larger fis.

segetum. Corn-Marigold. Ann., 1-2 ft., much branched: lvs. notched or shallowly pinnatifid: heads terminating branches, to 2½ in. across, yellow to whitish. Old World.—Flower-garden cult. forms with more divided lvs. are supposed to belong here, as Morning Star, Evening Star, Gold Star, Northern Star, White Glory, although different things may be grown under one or another of these verifal pages. these varietal names.

selaginoides (Pyrethrum selaginoides) has golden-yellow foliage and is presumably a race of C. coccineum. golden-

serátinum: uncertain name in lista. sibíricum: C. Zawadsku var.

sinéfise: C. morifolium.

Tchihatchewii: Matricaria Tchihatchewii.

tricolor: C. carinatum.

uliginosum. High or Giant Daisy. Tall and much-branched per., 4-7 ft.: lvs. narrow, long-pointed and cut-toothed: heads terminating branches, 1½-3 in. across, white. Eu.-Border.

wine. Eu.—Dorder.

viscidi-hirtum (C. viscosum). Ann., somewhat viscid,
st. fleshy, mostly branched above: lower lvs. oblong, narrowed at base, pinnatifid with short obtuse denticulate
lobes, upper ones oblong-lanceolate and clasping: rays
long-oblong, yellow. S. Spain, N. Afr.

viscosum: C. viscidi-hirtum.

viscosum; C. viscidi-hirtum.
vulgare: Tanacetum vulgare.
Wilsonii: C. coccineum var.
yezoense (C. jesoense). Similar to C. arcticum from which
it differs in its larger more robust habit, growing to 10 in.
tall, and fls. to 2½ in. across becoming pink with age.
Japan.—More floriferous than C. arcticum and blossoms
about a month later.

Zawádskii. To 1½ ft., simple or only closely branched: lvs. 2-pinnate, segms. linear-oblong and sometimes toothed: ray-fis. white to pale pink, heads to 1½ in. across, solitary. Galicia. Var. sibfricum (C. and Leucanthemum sibiricum) differs in its more broadly dissected lvs. Siberia.

CHRYSOBACTRON: Rulbinella Hooker

CHRYSOBÁLANUS. Rosaceæ. Shrubs or small trees with alternate simple leathery lvs., small white or greenish fls. in cymes or panicles, and fr. a pulpy drupe; native in Amer. and Afr. and planted somewhat in S. U. S.

Icaco. Coco-Plum. To 30 ft., evergreen: lvs. broad-obovate or nearly orbicular, to 3 in. long, obtuse or emar-ginate, shining above: fls. white, in short cymes: fr. to 1½ in. long. S. Fla. to N. S. Amer.

CHRYSOBOLTONIA PULCHERRIMA: Chrysanthemum rubellum.

CHRYSOBOTRYA: Ribes aureum and odoratum.

CHRYSÓCOMA. Compositæ. Low S. African subshrubs with small alternate linear lvs., the branches terminating in short-peduncled yellow globose heads composed only of perfect disk-fls.

côma-aurea. To 1½ ft., sts. erect, fastigiately branching: lvs. usually ½ in. long, flat, glabrous, entire, about ¼ in. wide: heads about ½ in. across, on slender peduncles to 1½

CHRYSOCOPTIS: Coptis occidentalis.

CHRYSÓGONUM. Compositæ. One per. herb native from S. Pa. to Fla. and Ala. and sometimes transferred to gardens. C. virginianum. Golden-Star. To 1 ft., hairy: lys. basal and opposite, ovate or oblong, to 3 in. long, toothed: heads yellow, to 1½ in. across, long-stalked, of ray- and disk-fls., Apr.-July; pappus a short crown. Var. canéscens is listed.

CHRYSOPHYLLUM. Sapotacex. Trop. evergreen trees, one in S. Fla., with alternate entire lvs., small 5-lobed fls. in clusters, and fr. a berry; one species grown for ornament and the edible fr.

The star-apple requires tropical temperatures and a humid atmosphere. It has been grown successfully in southern Florids. It is not particular as to soil. Propagated by seed, by cuttings of ripe wood over heat, and probably by budding.

Cainito. Star-Apple. Ornamental, to 50 ft.: lvs. oval or oblong, to 6 in. long, shining above, golden-brown and silky beneath: fls. purplish-white: fr. globular, to 4 in. across, smooth, purple or light green, with 3-8 shining seeds embedded in white translucent pulp. Trop. Amer.

oliviforme. SATIN-LEAF. Tree to 30 ft.: lvs. mostly smaller than in *C. Cainito*, densely brown- or reddishtomentose underneath: fr. about ¾ in. long, purple, usually 1-seeded. Fla., trop. Amer.

CHRYSOPSIS. GOLDEN ASTER. Compositæ. N. American per. herbs with alternate entire sessile lvs. and yellow heads of ray- and disk-fis.; pappus of bristles or scales. Sometimes transferred to the border. Propagated by seeds and division

amplifòlia. To 20 in., branched, pubescent: basal lvs. spatulate, to 2 in. long, obtuse, upper ones cordate: heads sessile, subtended by lvs., in corymbiform infl. Colo., Wyo.

falcata. To 1 ft., woolly-pubescent: lvs. linear, to 4 in. long, stiff: heads 1/4 in. across, in corymbs. Mass. to N. J. foliòsa. To 2 ft., pubescent: basal lvs. oblanceolate, to 2 in. long, acute, white-silky-strigose: heads subsessile, subtended by lvs., bracts strigose, linear. Minn., Kans., Utah. Wash.

gossýpina. Bien., densely woolly: lvs. oblanceolate to oblong, white-lanate, obtuse: heads long-peduncled, few. Pine barrens, Va. to Fla.

graminifòlia. To 3 ft., silvery-pubescent: lvs. linear, grass-like, to 1 ft. long: heads ½ in. across, in few-fid. corymbs. Del. to Fla. and Mex.

mariàna. To 2½ ft., pubescent: lvs. oblong or spatulate, to 4 in. long: heads to 1 in. across, numerous, in panicled corymbs. S. N. Y. to Fla. and La.

villosa. To 2 ft., pubescent: lvs. oblong to lanceolate, to 2 in. long; heads 1 in. or more across, in few-fid. corymbs. Minn. to B. C. and New Mex. Var. prostrata is a low

CHRYSOSPLÈNIUM. GOLDEN SAXIFRAGE. Saxifragaceæ. Semi-aquatic little creeping or prostrate paludose herbs with very small greenish fls., sometimes employed as a cover on moist ground or in bog-gardens or at pools.

alternifòlium. To 6 in.: lvs. alternate, orbicular-reniform, coarsely toothed: fis. in early spring. Eu., N. Asia.

americanum. Sts. creeping, to 8 in. long: lvs. opposite or the upper alternate, ovate or orbicular, to ¾ in. long: fls. solitary in the axils, in spring. N. S. to Minn. and Ga. oppositifolium. To 4 in.: lvs. opposite, orbicular: fls. May-June. Eu., N. Asia.

CHRÝSOTHÁMNUS. Compositæ. Low shrubs of W. N. Amer. with linear entire mostly alternate lvs. and heads of yellow disk-fls.; pappus of bristles. Sometimes transferred to grounds in dry regions.

graveolens. To 5 ft.: lvs. to 2% in. long: heads in compound corymbs. Mont. to New Mex.

linifolius. To 3 ft., tufted, branches white: lvs. to 11/2 in, long: heads numerous, in cymes. Wyo., Colo.

nausedsus. To 31/2 ft., white-tomentose: lvs. to 21/2 in. long; heads in cymes. B. C. to Mont. and Calif.

pûmilus. To 1 ft., branches whitish: lvs. to 1½ in. long. Mont. to Colo. Var. vàrus is much branched with strongly twisted lys.

CHRYSURUS: Lamarckia.

CHUCHU: see Chavote.

CHUFA: Cuperus esculentus.

CHUPEROSA: Beloperone californica.

CHUSOUEA. Gramineæ. Bamboo-like shrubby or climbing grasses with rather small lvs. and spikelets borne in terminal panicles, stamens 3; native in the Andean region from Mex. to Chile. See Bamboo.

tessellata. Shrub: lvs. to 3 in. long and ¼ in. wide, toothed, tessellated: panicle spike-like, to 6 in. long. Colom-

CHYSIS. Orchidaceæ. Cent. American epiphytes with pseudobulbs or spindle-shaped sts. and often fleshy fls. in lateral racemes, the petals and dorsal sepal similar, the side sepals forming a chin or extension with the foot of the column, the lip with 3 lobes. Grown in the trop. greenhouse; see Orchids.

aurea. Lvs. elliptic-lanceolate, sometimes to 17 in. long: fls. about 2 in. across, in 4-13-fld. racemes to 6 in. long; sepals and petals golden-yellow, whitish near base; lip yellow marked with red, marcon or purple, keeled at base, the limb wavy. Mar.-Aug., Dec. Cent. Amer., Colombia, Verseyello

bractéscens. Fls. to 31/4 in. across, in 3-8-fld. partially drooping racemes, ivory-white with yellow lip marked with red or purple. Feb.-May. Mex., Guatemala.

Chélsonii. Hybrid between C. lavis and C. Limminghei: sepals and petals yellow with a large red-brown spot; lip white finely spotted with purple.

CIBÒTIUM. Dicksoniaceæ. A small group of stout tree-ferns, often grown under glass in juvenile form, with mostly 3-pinnate fronds, sori at tips of veinlets; native in Cent. Amer., Mex. and Polynesia. See Ferns.

Bárometz. Scythian Lamb. Trunkless: fronds fragrant, segms. linear-oblong, to 6 in. long, glaucous beneath. China, Malaya.—Sometimes grown for its historic interest. A Dryopteris has been grown erroneously under this name. princeps: probably a mistake for Cyathea princeps which is a synonym of Cyathea insignis.

regale. Trunk to 30 ft. high: fronds to 12 ft. long, with falcate deeply cut segms., glaucous beneath. Mex.

Schièdel. Trunk to 15 ft.: fronds to 5 ft. long, gracefully drooping, segms. to 8 in. long, deeply cut, glaucous beneath, on stout brown-hairy stipes. Mex., Guatemala.

CICCA DISTICHA: Phyllanthus acidus.

CICELY, SWEET: Myrrhis odorata.

CICER. Leguminosæ. Herbs with pinnate toothed lvs., small inconspicuous papilionaceous fls., and short inflated pods; native in W. Asia, one species grown for the edible seeds which may be planted 8-12 in. apart in drills 2 ft. apart.

arietinum. CHICK-PEA. GARBANZO. Ann. to 2 ft.: fls. white or reddish, solitary in the axils: pods to 1 in. long and ½ in. wide, contaming 1 or 2 seeds.—Long cult. in S. Eu. and Asia for human food, and in the American tropics.

CICHÒRIUM. Compositæ. Herbs of the Old World, mostly with deep hard roots, alternate lvs. usually near base of plant, and blue, purple or white heads of ligulate or ray-fls. See Chicory and Endive.

Endívia. Endive. Ann. or bien. to 3 ft.: lvs. many at base, brittle, oblong, lobed or much cut and curied: heads purple, subtended by leafy bracts usually longer than heads. Probably India.

Intybus. Chicory. Succory. Per. to 6 ft.: lvs. broadoblong or lanceolate: heads bright azure-blue, 134 in. across, opening in forenoon, in some races pink or white, subtended by bracts shorter than heads. Eu.; extensively nat. in N. Amer.

CICÙTA. WATER-HEMLOCK. Umbelliferæ. Per. heavy-scented herbs with poisonous roots and decompound lvs., very small white fls. in terminal compound umbels, and slightly flattened 'frs.; sometimes transplanted to the wildor bog-garden.

maculata. Musquash-Root. To 6 ft.: lvs. 2- or 3-pinnate into lanceolate segms. to 5 in. long. N. B. to Fla. and New Mex., in swamps.

CIENFUEGÒSIA (Alyogyne. Fuqosia). Malvaceæ. Shrubs or subshrubs from the tropics of Afr., Amer. and Australia, resembling Hibiscus in habit and to which it is allied, differing in style thickened toward the top and grooved or divided into short erect lobes with decurrent stigmas.

hakeæfðlia. Erect glabrous shrub to 5 ft., branches few, twiggy, dark green: lvs. bipinnatifid to ternate or uppermost ones entire, segms. linear and somewhat fleshy: fls. pale purplish-lilac with a deep red-purple eye surrounding the long staminal column, to 3 in. across. W. Australia.

CIGAR-FLOWER: Cuphea platycentra.

CILIATE: bearing hairs on the margin; fringed with hairs.

CIMICIFUGA. BUGBANE. Ranunculaceæ. Erect and mostly tall herbaceous perennials, usually of rich woods, sometimes planted in the back of the border or in partially shaded places in the wild-garden: lvs. 2-compound, rather

large: fls. small, white, in racemes: native in north temp. zone. Closely allied to Actæa but fr. a follicle instead of a berry.

Bugbanes thrive best in rich soil. Propagated by seed or division of roots in early spring or fall.

acerina: C. japonica.

americana. To 5 ft.: lfts. ovate to oblong, to 3 in. long: fl.-pedicels with minute bracts; pistils 3-8, stalked. Aug.-Sept. N. Y. to Ga.

cordifolia (C. racemosa var. cordifolia). To 6 ft.: lvs. broad-ovate, to 7 in. wide, cordate at base: fl.-pedicels bracted; pistil 1, sessile. Aug. Va. to N. C. and Tenn.

davurica. To 4 ft.: lvs. cordate: fis. creamy-white, pedicels bracted; pistils 5. Autumn. Asia.

elata. To 8 ft.: lits. cordate, to 4 in. across, lobed: petals none; pistils 1-3, sessile. Wash., Ore.

fétida (Actea Cimicifuga). To 6 ft.: lfts. ovate or lanceolate, to 3 in. long: ft.-pedicels with minute bracts; pistils 4-8. Summer. E. Eu., Siberia.

japónica (C. acerina. Pityrosperma acerinum. Actæa japonica). To 3 ft. but true st. almost none, the scapes and lvs. arising from near the ground: lvs. ternate, lfts. thin, to 6 in. long and nearly or quite as broad, lobed and dentate, with the look of foliage of Anemore japonica: fis. sessile, without bracts, in slender spikes, dull-colored; stamens about 6. Japan.—Variable, in several forms.

laciniata. To 5 ft.: lfts. oblong or ovate, laciniately toothed; petals usually present; pistils 3-5, stalked. Ore.

racemòsa. Black Cohosh. Black Snakenor. To 8 ft.: Ifts. ovate or oblong: ff-pedicels bracted; pistils 1-2, sessile: fr. 1/2 in. long. July-Aug. Me. to Ga. and Mo.

rubifòlia. Similar to C. racemosa, differing in shorter stamens and fr. to 1/2 in. long. Tenn.

simplex (C. racemosa var. simplex). To 3 ft.: fls. in slender dense racemes, pedicels with minute bract or none; pistils 2-3, stalked. Autumn. Kamtschatka.

CINCHÒNA. Rubiaceæ. Trees and shrubs native in the Andes, the bark yielding quinine for which they are cult. in trop. regions and known as Peruvian bark trees: lvs. opposite: fls. small, rose or yellowish-white, tubular, 5-lobed, in terminal panicles: fr. a caps. with winged seeds.

A few species are grown for ornament and economic interest in southern California, and sometimes under glass. Propagated by seeds.

Calisaya. Tall tree: lvs. oblong to obovate, to 7 in. long, shining, purplish-green below: fis. rose or whitish: caps. ovate, scarcely as long as fis. Bolivia, Peru.

officinalis. Tall tree: lvs. oblong, to 5 in. long: fis. rose, ½ in. long, in panicles to 6 in. long: caps. oblong, ½ in. long. Peru, Bolivia. Var. condaminea has ovate caps.

succirûbra. Tall tree: lvs. ovate or oval, to 9 in. long, pale beneath: fls. rose with purplish-red calyx: caps. lanceolate. Ecuador.

CINERARIA of florists is a Senecio, supposed to be the issue of S. cruentus either directly or in hybridization with other species. It is much grown under glass for the profuse bloom in many colors except yellows, well set off by the heavy attractive foliage. The plant is perennial but it is commonly grown as an annual inasmuch as the bloom from strong well-grown new stock is most profuse. The single-flowered kinds are mostly preferred, being raised each year from seeds. For bloom in autumn and early winter seeds may be sown in May: for winter and spring bloom in late summer or early autumn. The main lot is usually started in midsummer. The young plants are pricked off into pots and afterwards shifted to maintain a continuous growth, and not allowed to bloom until in their final 5- or 6-inch pots or 8-inch for very large specimens. The double-flowered kinds are propagated by cuttings of strong shoots that arise after the flowering tops are removed. Cinerarias must be grown cool or they will not give good results, as cool as carnations. If broad bushy plants are desired, the center may be pinched out when

the flower-buds begin to show. The cineraria is subject to greenfly or aphis; if fumigation cannot be practiced, the pots may be stood on tobacco stems or tobacco preparations may be employed. Cineraria is adapted to window-garden culture if not grown too hot or neglected and stunted.

Other plants known as cinerarias are some of the dusty millers: see Senecio Cineraria and

S. leucostachus.

CINEREOUS: ash-colored: light gray.

CINNAMÒMUM. Lauraceæ. Aromatic trees and shrubs from Asia and Australia, usually evergreen, with coriaceous lvs. strongly 3-nerved from base except in C. Camphora, small bisexual or unisexual fls. in panicles, and fr. a berry; grown somewhat far S. for ornament and for medicines and spice, and likely to be seen as specimens in collections of economic plants.

A sandy loam soil is good for them. Propagated by seeds and the seedlings early transplanted into pots preparatory to permanent planting out; also cuttings of half-ripened wood in spring with heat.

Burmanii. Tree: lvs. opposite or sometimes alternate, ovate-oblong, acuminate. Malaya.

ovate-oblong, acuminate. Malaya.

Camphora (Camphora officinarum. Laurus Camphora).

Camphora Tree. Tree to 40 ft., the buds inclosed by large imbricated scales: Ivs. alternate, ovate-elliptic, acuminate, to 5 in. long, whitish beneath: fts. yellow, in panicles shorter than Ivs. China, Japan.—Wood furnishes commercial camphor; thrives in S. Calif. and in southernmost states, as a street tree.

Cássia. Cassia-Bark-Tree. Tree to 40 ft.: lvs. opposite, oblong to lanceolate, long-acuminate, to 6 in. long fls. in panicles as long as lvs. China.—Bark used as substitute for cinnamon.

glanduliferum (Laurus ylandulifera). Tree: lvs. alternate, elliptic or lanceolate, to 5 in. long, caudate-acuminate: fls. in panicles 2 in. long. Himalayas.

Loureiri. Cassia-Flower-Tree. Medium-sized tree: alternate or opposite, elliptic to oblong, to 5 in. long.

China, Japan.

pedunculatum. Tree: lvs. alternate, oblong-lanceolate, acuminate, to 5 in. long: fls. in corymbs about length of lvs. Japan.

zeylanicum. CINNAMON-TREE. Tree to 30 ft.: lvs. ovate to ovate-lanceolate, obtuse or acute, to 7 in. long; fts. yellowish-white, in panicles as long as lvs. India, Malaya.—Bark yields commercial cinnamon.

CINNAMON-TREE: Cinnamomum zeylanicum. -Vine: Dioscorea Batatas. Wild: Canella Winterana.

CINOUEFOIL: Potentilla.

CIPÙRA (Marica). Iridacee. Trop. American bulbous herbs with white or blue fls. having short tube and 3 inner petals much shorter than 3 outer; grown under glass or out-of-doors in S. Propagated by offsets and seeds.

martinicénsis: Trimeza martinicensis.

paludòsa. Lvs. linear, to 1 ft. long: fls. in clusters, white, 1/4 in. long, opening in morning and soon withering. dad, S. Amer.

CIRCAA. Onagracex. A few species of small soft erect per herbs, mostly in woods of the northern hemisphere, not regular hort. plants but sometimes raised in shaded or moist rock-gardens: lvs. opposite, ovate, dentate or angled: fls. whitish, very small, 2-petalled, in terminal raceme: fr. bristly.

lutetiana. Enchanters-Nightshade. Soft closely pubescent herb to 2 ft or more, branched, with thick stolons: lvs. broad-ovate: petals broad-obovate, longer than broad. Eu.—An American plant that has mostly passed under this name is C. latifolia, with sts. glabrous below the infl, stolons very slender, lvs. oblong-ovate, petals sometimes as broad as long. N. B. to Tenn. and Okla., and E. Asia.

CIRCASSIAN SEEDS: Adenanthera pavonina.

CIRCUMSCISSILE: opening or dehiscing by a line around the anther or fruit, the valve usually coming off as

CIRRHOPETALUM: Bulbophyllum.

Cfrsium. PLUMED THISTLE. Compositæ. Prickly coarse herbs with basal or alternate very spiny lvs. and purple, yellow or white heads of disk-fls., the bracts of involucre densely imbricated and often spiny-tipped; pappus plumose, this differing from Carduus. A few species are grown for ornament, being adapted to bold effects.

acaule: Carlina acaulis.

altíssimum. Bien. or per. to 10 ft., st. branched, pubescent: lvs. ovate-oblong to ovate-lanceolate, to 8 in. long, densely white-tomentose beneath, margins spinulose, dentate, sometimes pinnate: heads light purple, to 2 in. across, usually solitary. Mass. to Fla. west to Minn. and Tex.

bulbòsum; C. tuberosum.

ciliàtum. Bien. to 3 ft.: lvs. pinnate into linear-lanceolate egms., hairy above, gray-tomentose below: heads purple. S Russia

Diacantha (Chamæpeuce Diacantha). FISHBONE THISTLE. Bien. to 3 ft.: lvs. linear-lanceolate, slightly toothed, glabrous above, white-tomentose beaneath: heads purplish.

discolor. Bien. or per. to 7 ft.: lvs. pinnately cut into tear toothed segms. white-tomentose beneath: heads toothed pale purple or pink, to 2 in. across. N. B. to Ga. and Mo.

erióphorum. Bien. to 5 ft.: lvs. lanceolate, white-to-mentose beneath, not decurrent, margins spiny: heads large, purple, involucral bracts much constricted back of spatulate tip. S. and Cent. Eu.

Hillii. Per. to 2 ft: lvs oblong, lobed or pinnatifid into broad obtuse toothed segms, green both sides: heads purple, to 3 m. across. Ont. to Pa. and Ia.

horridulum. Bien, or per, to 5 ft., woolly when young, becoming glabrescent; lys. lanceolate to oblong, somewhat clasping at base, green on both sides, margins spiny: heads pale yellow, occasionally purple, to 4 in. across, outer involucral bracts prickle-pointed. Me. to Fla. west to Tex.

lanceolatum. Bull Thistle. Bien. to 5 ft.: lvs. pinnatifid into lanceolate toothed segms., hairy above, browntomentose beneath: heads dark purple, to 2 in. across. Eu., Asia; nat. in N. Amer.

monspessulanum. Per. to 5 ft.: lvs. oblong-lanceolate to lanceolate, acute, margins ciliate-bristly but not spiny: heads purple, to 112 in. across. Medit. region.

mûticum. Swamp Thistle. Bien to 8 ft., woolly when young, becoming glabrescent: lvs lanceolate-oblong, to 8 in. long, pinnatifid, densely white-tomentose beneath, segms. lanceolate, usually serrate and spiny: heads purple, to 1½ in. across, usually solitary, peduncle naked. Newf. to Fla. west to Sask, and Tex.

occidentale. Bien. to 3 ft., the herbage mostly white-florcose: lvs. lanceolate to oblong, to 10 in. long, dentate or pinnatifid, more or less prickly; heads to 2 in. high, reddish or purple. S. Ore., Calif. Var. candidissimum is very stout and prominently white-tomentose. Var. Coulteri has long branches bearing single heads. Var. venústum has heads webby rather than wooly or tomentose.

Pitcheri. Bien. to 2 ft., white-tomentose: lvs. lance olate, to 1 ft. long, pinnately divided, segms. linear, entire or pinnatifid, margins revolute: heads cream-colored, to 1½ in. across. Shores of Lakes Michigan, Huron and Superior

pulchérrimum. Probably bien to 1½ ft., leafy, gray-tomentose: lvs. lanceolate, to 6 in. long, white-woolly beneath, pinnately divided, segms, pinnatifid, spiny: heads rose-pink, to 1½ in. across, outer bracts with yellow spines to ½ in. long. Wyo. to N. Mex.

purpuratum. To 3 ft.: lvs. pinnatifid, to 8 in. long, lower ones with cuncate base and winged petiole, others sessile and cordate, segms. ovate-lanceolate, acute, often spiny-toothed: heads violet-purple, involucral bracts strongly reflexed and pectinose-spined. Japan.

syriacum (Notobasis syriaca). Ann. to 3 ft. or more: lvs. oblong, lobed, spiny-toothed, the upper pinnate into narrow segms., pubescent beneath: heads hlac, to 1 in. long. Medit region.

tuberòsum (C. bulbosum). Bien. to 5 ft.: lvs. elliptic-lanceolate, woolly beneath, pinnate, segms. lobed or serrate: heads purple, rarely bright rose to white, to 1½ in. across, solitary, peduncle naked or nearly so. Cent. Eu.

undulatum. Bien. to 3 ft., white-tomentose: lvs lanceolate to oblong-lanceolate, to 8 in. long, lobed or pinnatifid, often prickly: heads rose or purple, to 3 in. across. B. C. to Tex. and Mich.

Velenovskyi. Per. to 4½ ft.: lvs. pinnatifid into linear-lanceolate or linear segms., spiny: fis. purple, in globose heads to 3½ in. across, the involucre cobwebby. E. Eu.

CÍSSUS. Vitacex. Mostly tendril-climbing shrubs often with fleshy sts., lvs. simple or compound, deciduous or persistent, fls. with parts in 4's, bisexual or unisexual, in cymes, fr. a berry. Grown under glass, and out-of-doors in warm regions. Propagated by cuttings, and by seeds when obtainable.

ácida (*Vitis acida*). Low somewhat succulent climber: lvs. stiff, 3-foliolate, lfts. sharply toothed near apex; fls. in compound umbel-like clusters: fr. enlarged above middle. S. Fla., Ariz., and south.

adenópodus. Herbaceous climber, roots tuberous: lvs. 3-foliolate, to 6 in. long, pubescent, green above and red beneath, lfts. coarsely serrate with nerves sunken above: fls. pale yellow, in clusters to 4 in. long. Trop. Afr.—A very rapid grower.

álbo-nitens. Climber: lvs. usually simple, oblongacuminate, silvery-white and glossy above, base somewhat cordate. Brazil.

antárctica (Vitis antarctica). Lvs. ovate to oblong, to to long, entire or slightly toothed, shining above. Australia.

arbòrea: Ampelopsis arborea.

capénsis (Vitis capensis). Roots tuberous: lvs. evergreen, orbicular or kidney-shaped, to 8 in. across, wavytoothed, rusty-tomentose beneath. S. Afr.—Much planted in S. Calif.

discolor. Lvs. ovate, to 6 in. long, finely toothed, purplish beneath, tinged above with white, pink and purple. Java.—An old greenhouse "foliage plant."

gongylodes (Vitts gongylodes and pterophora). Sts. 4-angled and -winged, the branches bearing a terminal tuber to 6 in. long: lvs. of 3 lfts. which are often 3-lobed.

himalayana (C. neilgherrensis). Plant without tendrils, fleshy: Ivs. 3-foliolate, ovate to obovate, acummate or obtuse, to 5 in. long: fls. in clusters to 8 in. long. Himalayas.

hypoglauca (Ampelopsis and Vitis hypoglauca). Rusty-tomentose when young: lvs. of 5 obovate leathery lfts. to 3 in. long, toothed toward the apex, pale beneath. Australia.

incisa (Vitus uncisa). MARINE IVY. Long climber, fleshy: lvs. of 3 ovate lits. to 1 in. long, coarsely toothed or lobed fls. in 3-parted clusters: fr. thekened below middle. Mo. to Fla and Ariz.

neilgherrénsis: C. himalayana.

oblonga (Vitis oblonga). Bushy tree: lvs. oblong, to 2½ in. long, entire, very obtuse. Australia.

quadrangulàris ($Vitis\ quadrangularis$). Sts. 4-angled and -winged: lvs ovate, entire or deeply 3-lobed, to $1\frac{1}{2}$ in, long. Trop. Asia and Afr.

rhombifolia (Vitis rhombifolia). Lvs. evergreen, of 3 rhombie-ovate lifts to 4 in. long, sharp-toothed, rusty-hairy on veins beneath. N. S. Amer.

sicoides. Climber, sts. striate: lvs. simple, ovate to oblong, to 4 in. long, bristly-serrate or somewhat lacmiate, usually pubescent, green: fls. green through white to purplish. Fla., trop. Amer.

striata. Lvs. evergreen, of 3-5 obovate or spatulate lfts. usually about 1 in. long, toothed at apex. S. Amer.—Has been cult. as Vitus semperurens.

CISTACEÆ. ROCK-ROSE FAMILY. Shrubs or herbs of about 8 genera, characterized by simple entire lvs., regular bisexual fls. with 5 sepals of which 2 are small, 5 petals which usually fall early, numerous stamens, superior 1-celled ovary, and capsular fr.; mostly in the Medit. region and N. Amer. The genera Cistus, Crocanthemum, Fumana, Halimium, Helianthemum and Hudsonia are known to general hort.

CÍSTUS. ROCK-ROSE. Cistaceæ. Low Mediterranean shrubs with opposite simple entire lvs., and showy wide-open white or purple fls. with yellow blotch at base of petals, in terminal cymes or solitary; grown in the rock-garden; mostly evergreen or partially so.

Rock roses prefer well-drained limestone soil and sunny exposures and will not stand many degrees of frost. Propagated by seeds which should be sown in pots as seedlings do not transplant well. Also increased by layers or cuttings under glass. The species are useful in California and stand in the southern states. They are plants long known to horticulture.

acutifòlius: C. hybridus.

álbidus. To 6 ft.: lvs. ovate-oblong, to 2 in. long, sessile, white-tomentose: fis. lilac or rosy, 2½ in. across. S. W. Eu., N. W. Afr.

algarvénsis: Halimium ocumoides.

canéscens. Hybrid between *C. albidus* and *C. villosus*: lvs. oblong-lanceolate, slightly petioled, gray-tomentose; fis. dark purple.

corbariénsis: C. hybridus.

créticus: C. villosus var. undulatus.

crispus. To 2 ft.: lvs. oblong-elliptic, 1 in. long, wrinkled: fls. deep rose, to 2 in. across. S. W. Eu.

cyprius. Hybrid between C. ladaniferus and C. laurifolius: to 6 ft.: Ivs. oblong-lancoolate, to 3 in. long, petioled, white-tomentose beneath: umbel 2-many-fld.; fls. white with purple spot at base, 3 in. across.

florentinus. Hybrid between C. monspeliensis and C. salvifolius: Ivs. lanceolate, to 1½ in. long, petioled: infi. 2-many-fld.; fls. white, 2 in. across.

formosus: Halimium lasianthum.

halimifòlius: Halimium halimifolium,

hirsùtus. To 3 ft., hany: lvs. elliptic-lanceolate, to 2½ in. long, sessile, margins cihate: fls. white, 1½ in. across. Spain, Portugal.

hýbridus (C. corbariensis. C. acutifolius). Hybrid between C. populifolius and C. salvifolius: lvs. ovate, to 2 in. long: fls. white, 1½ in. across.

ladansferus. To 5 ft.: lvs. lanccolate, to 4 in. long, sessible, dark green and glutinous above, white-tomentose beneath: fls. solitary, white, sepals 3: carpels 10. S. W. Eu. Var. albiflorus is synonymous with the species. Var. maculatus, petals with crimson blotch at base. Var. petiolatus, lvs. petioled, viscad not glutinous, carpels less than 10. N. Afr.

laurifolius. To 8 ft.: lvs. ovate to ovate-lanceolate, to 2 1/4 in. long, white- or brown-tomentose beneath: infl. an umbel; fls. white, to 3 in. across, sepals 3: carpels 5.

Lorétii: C. stenophyllus.

maculatus: C. ladaniferus var.

monspeliensis. To 5 ft.: lvs. lanceolate, to 2 in. long, sessile, wrinkled: infl. scorpioid; fls. white, to 1 in. across.

parviflorus. Shrub to 2 ft., sts. much branched, pubescent: lvs. elliptic-ovate, to 1 in. long, undulate, twisted: fls. pale rose, to 1 in. across, petals not overlapping. Greece, populifolius. To 6 ft.: lvs. cordate-ovate, to 3½ in. long: fls. white, 2 in. across.

purpureus. Hybrid between C. ladaniferus and C. villosus: Ivs. lanceolate, to 2 m. long: fis. purple, yellow at base with maroon spots, 3 m. across.

salvifòlius. To 2 ft.: lvs. oval to oblong, to 1 34 in. long, petioled, wrinkled and tomentose, infl. 1-2-fid.; ffs. white.

stenophyllus (C. Lareta). Hybrid between C. monspeliensis and C. ladam/erus: lvs. linear-lanceolate, to 2½ in. long, sticky, gray-pubescent beneath: infl. 2- or more-fid.; fis. white with crimson spot at base, to 2½ in. across.

symphytifòlius. Shrub to 2 ft.: Ivs. ovate, acuminate, petroled: fls. dark rose. Canary Isls.

tauricus: C. villosus var.

villòsus. To 3 ft.: lvs. ovate-oblong, to 2½ in. long, petioled, gray-tomentose beneath: fls. purple or rose, to 2½ in. across. Var. tadricus (C. tauricus), lvs. loosely connate, not glandular. Var. undulàtus (C. creticus), lvs. strongly connate, glandular.

CITHARÉXYLUM. Verbenacex. Shrubs or small trees with opposite simple lvs. and small fragrant yellow or white fls. in racemes; fr. a little drupe: planted out-of-doors in the lower S. They have something the look of wild cherry trees, and are frequently seen in warm countries.

ilicifolium. Low shrub: lvs. leathery, to 2 in. long, entire or spiny-toothed: fls. white, in short racemes. Ecuador.

spindsum. Fiddle-Wood. Tree to 50 ft.: lvs. to 8 in. long, entire or coarsely toothed; fts. white, in alender raceines to 1 ft. long. W. Indies.

CITRANGE: see Citrus Fruits (page 184).

CITRANGEQUAT: see Crtrus Fruits (page 184).

CITRON: Citrus medica; name also applied to a form of watermelon, for which see Citrullus.

CITRONELLA: Collinsonia canadensis.

CITRÓPSIS. AFRICAN CHERRY-ORANGE. Rutaceæ. Several trop. African small spiny trees mentioned as stocks for citrus frs. and for hybridizing, and of interest to cultivators: lvs. with

3, 5 or 7 lfts. and winged rachis and petiole: fls. large and white, borne in the lf.-axils; stamens 8: fr. small, in clusters. C. Schweinfurthii has 3-5 narrow-lanceolate acute lfts.: fr. like limes, 1½ in. diam., sweet.

CITRÚLLUS. Cucurbitaceæ. Tendril-bearing ann. and per. vines of a few species in S. and trop. Afr. and probably Asia, one extensively cult. for its edible frs.: monœcious: fls. mediumsize, solitary in axils, corolla 5-parted.

vulgaris. Watermelon, which see. Ann., long-running, hairy: lvs. pinnately divided or dissected: fis. about 1½ in. across: fr. globular to oblong to cylindric, mottled or striped green, flesh red. Trop. and S. Afr.; run wild in different parts of western hemisphere. Var. citroldes. Cirnon or Presenving Melon. Fr. small, with white hard flesh, used only for preserving; seeds not marked or marbled (as they usually are in watermelon).

CÍTRUS. Rutaceæ. Small or medium-sized mostly evergreen sometimes spiny trees of trop. and subtrop. Asia and regions beyond, comprising several much-prized citrus frs., as orange, lemon, lime, citron: lvs. compound but reduced to a single lft. (developed lfts. may appear on young strong shoots): fls. clustered in the axils or in cymes or sometimes solitary, white or pink and usually very fragrant; stamens 15 or more: fr. mostly thick-skinned, 8-15-celled, juicy, pulpy and aromatic, the kind of fr. known as a hesperidium. Propagated by seeds and by grafting on seedlings. For cult. see Citrus Fruits.

aurantifòlia (C. Limetta in part). Lime. Small very tender tree with sharp spines: lvs. small, petiole narrowly winged: fls. white: fr. oval. 1½ in. or less diam., thin-skinned and smooth, greenish-yellow, very acid. Probably India and S. E. Asia.—Much grown in W. Indies.

Aufantium (C. Bigaradia. C. vulgaris). Sour or Seville Orange. Medium tree with rather blunt spines: petioles broadly wingod: fls. white: fr. sour, with a hollow core when ripe, usually with loose skin, globose and somewhat flattened, to 31/4 in. diam. Probably Cochin-China.— C. myrtifolia is a short-jointed narrow-lvd. form, useful as a pot-plant.

Bergamia. Bergamor. Small spiny tree: lvs. oblongoval, petiole winged: fls. small, white: fr. pyriform, sour, thin-skinned, 3-4 in. diam.—Grown in Eu. for the essential oil and perfume, and sometimes for curiosity here.

Bigaràdia: C. Aurantium. decumàna: C. maxima. deliciòsa: C. nobilis var. grándis: C. maxima.

ichangénsis. Small slender-spined tree from S. W. (Ichang region) China, grown somewhat as an ornamental Fla. to Miss.: lvs. narrow-oblong, not much broader than the winged petiole: fls. white: fr. lemon-form, 3-4 in. long.

japónica: Fortunella japonica.

Limétta: C. aurantifolia.

Limònia. Lemon. Small tree with short spines: lvs. long-ovate, petiole not winged: fls. reddish-tinted in bud: fr. oval or oblong with a terminal nipple, 3-5 in. long, very sour. Probably farther Asia.

maxima (C. decumana. C. grandis). Shaddock. Pummaxima (C. decumana. C. grandis). Shaddock. Pummelo. Pompelmous. Very tender tree 15-30 ft. high: lvs. large, 4-8 in. long, somewhat pubescent underneath, petiole widely winged: fr. very large, borne singly, flesh coarsegrained and the segmis. often separating readily, oil-glands of rind few and large. See C. paradisi. Scarcely known in U. S.; native probably of Malaya and Polynesia.

mèdica. Cirron. Large thorny shrub or small tree: lvs oblong, 4-7 in. long, serrate, petiole wingless: fls. large, clustered, reddish in bud: fr. oval or oblong, 6-10 in. long, rough or warty, with scant acid pulp. Probably farther Asia. The specific name is geographic, from the ancient country Media.—Grown in S. Eu. for the peel which is candied; sometimes planted in Fla. and Calif. for interest, being a striking fr. The Etrog is a form of C. medica.

mitis. Calamondin or Panama Orange. Small thick-topped tree, spineless or with few very short prickles: lvs. broad-oval, petiole very narrowly winged: fis. small: fr. borne on tips of branches, globose or oblate, to 1½ in. diam., with loose skin and acid pulp. Philippines.—One of the hardiest citrus frs.: used same as limes and lemons.

myrtifòlia: see C. Aurantium.

nóbilis. King Orange. Small tree, thornless or nearly so, with small lanceolate to oval lvs. and short petioles nearly or quite wingless: fis. small and white: fr. oblate, orange or reddish, with rather loose peel and hollow pith, sweet or subacid, segms. separating from each other and from the rough rind. Cochin-China. Var. deliciosa. Mandarin and Tangerine Oranges. Lvs. willow-like: fr. small, depressed-globose, with nearly or quite smooth loose thin skin, yellow to reddish, all parts separating freely. Sometimes called kid-glove orange. Var. Unshits. Satuma Orange. Var. Unshits. Satuma Orange. Var. Unshits. Satuma Orange. Satuma Orange. Satuma Orange. Var.
paradisi (C. mazima var. uvacarpa). Pomelo. Grape-Fruit. Larger and hardier tree than the pummelo (C. mazima) with smooth lvs: frs. large and borne close together forming clusters, relatively fine-grained, with many small oil-glands in the rind. Much grown in U. S.; origin unknown.

ponderòsa: listed name.

sinénsis. Common or Sweet Orange. Medium tree, with rather blunt spines or none: lvs. oblong-ovate, more or less acuminate, petiole narrowly winged: fis. white: fr. subglobose or oval, with solid core and sweet pulp. China or Cochin-China.—The Navel orange is a form with supernumerary carpels.

taitéasis. Otahette Orange. Small, usually a little bush of unknown origin, sometimes grown as a pot plant: lvs. oblong to elliptic, finely crenulate, petiole narrowly winged: fis. pink outside, fragrant: fr. lemon-shaped, about 2 in. long, ornamental.

trifoliàta: Poncirus trifoliata.

vulgaris: C. Aurantium.

CITRUS FRUITS. The genus Citrus, with its allies, yields several fruits of major importance in semi-tropical regions of the world. The present article presents a general discussion of citrus fruits from the pomological point of view, and then separate discussions of certain ones of them as follows (see also Citrus):

Sweet oranges, page 182 Sour orange, page 183 Calamondin, page 183 Kumquat, page 183 Trifoliate orange, page 183 Grapefruit, page 183 Shaddock, page 183 Lemon, page 184 Lime, page 184 Citrus hybrids, page 184

Among subtropical fruits those belonging to the citrus group are the most important and they are grown the world around in regions suited to them. In the continental United States they are produced most largely in California and Florida, and in the Rio Grande Valley in Texas, and to a lesser extent in Arizona, and the warmer sections of the Gulf states.

None of these citrus regions is free from the effects of frost, and the extension of culture northward is definitely limited by winter temperatures. Within the group, which includes the lime, lemon, grapefruit, orange, tangerine or mandarin, satsuma, calamondin and kumquat there is a marked variation in their cold resistance. Roughly they are hardy in the order named and while the lime requires an almost frostless climate and succeeds well in the tropics, the kumquat has withstood temperatures down to about 12° or 15° F. Tangerine fruits are more tender to freezing injury than oranges, though the wood is more hardy. Indeed it is doubtful whether the best citrus fruits of some kinds can be grown outside those regions in which frosts occur at intervals during their ripening season. Orchard heating is standard procedure in the intensive citrus districts particularly in California.

Soils varying from very light sand to heavy

sticky clay are capable of producing citrus fruits. A careful survey of older plantings, however, makes it plain that many soils on which groves are planted are not satisfactory and should have been avoided. If soils are too light and sandy, it is more difficult and expensive to maintain fertility and the optimum of organic matter so necessary to the welfare of the trees. On the other hand, those that are too heavy and sticky are difficult to handle and are likely to be poorly drained. The necessity for adequate drainage must be emphasized, as nothing is more inimical to the welfare of the trees than the presence of stagnant water. A deep mellow rather open soil is desirable

Propagation of citrus trees for orchard planting is by shield-budding desired varieties on two- or three-year seedling stocks of the same or other species. Seedling sweet orange, sour orange, grapefruit, rough lemon and trifoliate orange have all been employed, but propagation is now limited mostly to sour orange. rough lemon and trifoliate orange. Sour orange is used for lands of good quality, rough lemon for light sandy soils, and trifoliate orange for heavier soils with good moisture supply in the colder districts. Rough lemon is the most tender of the three. Seeds are sown in rows or drills much as are garden peas. They are liberally supplied with fertilizer and usually the seed-beds are irrigated. At the end of twelve to eighteen months, the seedlings are large enough to plant out in the nursery rows. About 8,000 are set to an acre. Selection is made at time of transplanting and only the most vigorous seedlings saved. In the nursery rows they are grown for one or two years, when they are budded.

Best results follow dormant budding in autumn, thus giving a full growing season when the buds start in spring. Just before the buds push out, the stocks are cut off with a sloping cut. As soon as the buds are started, a stake is set against each one and the growing shoot trained and tied to it until a height of 24 to 30 inches is reached, where the top of the bud growth is cut off to force branching. At the end of the seasons growth they are ready for transplanting or they may be allowed to remain a year or two longer.

Planting of nursery trees in the grove is usually in winter, but to a limited extent they are also set during the early summer season in the Southeast. If rains are sufficient and frequent enough, this can be undertaken suc-The usual planting distances are cessfully. 25-30 feet for oranges and grapefruit, 25 feet for tangerines and lemons and 15 feet for kumquats. It is important that trees should be set no deeper than they grew in the nursery, with earth well packed about the roots and in the drier districts watered copiously.

Cover-crops and tillage must receive careful tention. The maintenance of an adequate attention. The maintenance of an adequate supply of organic matter in citrus soils is important. It is impossible to keep a planting in good condition unless the humus is adequate. In California and other irrigation districts this is accomplished by growing cover-crops in winter, while in the southern and southeastern sections they are commonly grown in the summer season. In the first instance they are raised in winter because water is then available, while in the

latter they do the useful work of using up the surplus moisture supplied by summer rains. In the West the favorite cover-crops are vetch, Canada field peas and bur clover, while in the East cowpeas, velvet beans, beggarweed and crotalaria are used. Occasionally groves are grown in sod, grass in the East and alfalfa in the West.

Citrus groves or orchards are usually clean-tilled in the eastern districts from early spring, when growth starts after the winter dormant season until about the first of July, when the summer rainy season starts; and in the western irrigation sections throughout the summer. Once every week or ten days is usually sufficient to keep down weed growth. Disk, spring-tooth or acme harrows are employed. In autumn the groves are either plowed or disked to incorporate the summer cover-crop in the soil and as a safeguard against fire.

Irrigation is essential in the western districts, with an insufficient rainfall of about 25 inches; sufficient water is added to meet the requirements of the trees. Thus a total of 40 to 45 inches is secured. Irrigation and cultivation are alternated. In the southeastern districts irrigation

is seldom practiced.

Fertilizers are applied to citrus plantings to supply nitrogen, phosphorus, and potash. In some sections, as in Florida, the use of commercial fertilizer is an important part of suc-cessful citrus culture. Indeed, there are few locations in that area where their judicious and continued use is not necessary, and results are usually in direct proportion to their liberal use. In California, on the other hand, soils commonly contain sufficient phosphorus and potash and only fertilizers containing nitrogen are useful.

The common practice in Florida is to make three applications each year, February, June, September or October. Young trees receive applications containing relatively higher amounts of nitrogen or ammonia, while bearing trees receive larger amounts of phosphorus or phosphoric acid and potash. A standard formula for young trees in Florida contains 6 per cent phosphoric acid, 5 per cent potash and 4 per cent ammonia, while a mixture for fruiting trees will contain about 8 per cent phosphoric acid, 10 per cent potash and 3 per cent ammonia. The amount required will depend on the size and age of the trees and the crop carried. It will vary from 4 or 5 pounds each for young trees to 50 or more pounds for old trees in full bearing. Application may be made by machin-ery, but fertilizer is more frequently scattered by hand, being evenly distributed fairly close to and around young trees and over the whole surface of the ground in old established groves. Immediately after being applied the ground is usually cultivated. In recent years the practice of supplying certain trace elements to the trees either as a soil amendment or in the form of a foliage spray to control certain physiological disorders has been a spectacular development in both Florida and California. Zinc, copper, manganese and magnesium are the principal trace element supplements used.

Pruning nursery trees, one to three years old, is by cutting back to 18 to 24 inches at time of planting, thus insuring low branched heads. No further pruning is undertaken for a year or two unless to remove sprouts that have come from below the bud union. The first pruning after the trees are well established consists in removing all branches from the original stem except four or five chosen to form the framework of the tree.

It is the habit of citrus trees to grow with shapely symmetrical heads and comparatively little pruning is required to secure this end. Too numerous sprouts are removed from time to time. Dead branches are taken out. If these are the result of frost injury it is best to allow sufficient time for new shoots to grow before pruning away the dead parts; by so doing much unnecessary labor is avoided. Neglected or out-of-condition trees can often be rejuvenated

by heading back.

Harvesting, marketing, yields vary greatly in different regions. Citrus fruits are in the markets in quantity the year around. The Florida crop, consisting of oranges and grape-fruit, is marketed from October 15th to July 1st. California oranges are shipped the year around, the navel orange crop moving from November to May and the Valencia oranges from June to October. Lemons are harvested in California to some extent every month in the year, the heaviest cropping season being in February, March and April. Limes are harvested in greatest quantity in the summer months. Oranges and grapefruit are allowed to nature on the trees. If picked green, development is checked and the product is unsatisfactory. The shipment of green fruit is prohibited by law. Lemons and limes are picked when still green although they must have reached a certain size and degree of maturity. Lemons are cured and ripened before shipment. Limes are shipped while still green but have usually colored wholly or in part when seen on the markets.

Citrus fruits of all kinds are gathered carefully to prevent bruising or injury to the rind, each individual fruit being cut closely with short stems and smooth cuts. Special clippers are used for the purpose. As a rule the crop is prepared for packing in large centralized packinghouses by washing and polishing, graded by hand and sized by machinery, wrapped and packed by hand in standard boxes. More recently Florida oranges have been artificially colored to improve their appearance. Much of the fruit is waxed to delay dessication and improve the "finish." Quantities of lower grade fruit reach the market without wrapping in boxes or sacks made from netting. When loaded in cars for shipment the boxes are stood on end and securely cleated or braced in place to prevent shifting. The bulk of the American crop is sold through cooperative marketing agencies. The total crop approximates 90,000,000 boxes annually. An average of three boxes a tree for oranges and five boxes for grapefruit is a good yield at ten to twelve years.

Insects and diseases are numerous, although many of them are of minor importance. The greater portion of the damage from year to year is credited to purple scale, red scale, black scale, whitefly and rust mite among insects, and stem-end rot, scab, melanose, anthracnose and brown-rot among diseases. The fungus diseases are more troublesome in moist climates than in dry ones and insects more difficult to control in dry climates than in moist ones. In

damp climates insects are held in check to a considerable extent by the attacks upon them by parasitic fungi.

In the Florida and other southern districts insect and disease control is almost entirely by spraying with bordeaux mixture and lime-sulfur or wettable sulfur wash, while in California fumigation with hydrocyanic acid gas is the favorite method against most insects. The popular sprays against insects are miscible oil and lime-sulfur wash. In all sections powdered sulfur in different combinations is employed for dusting to control red-spider and rust or silver mite.

Sweet oranges

The sweet oranges of grove cultivation and the markets are botanically Citrus sinensis. of numerous varieties. Products of these plants far surpass all other citrus fruits in quantity produced and the esteem in which they are held. The crop for 1937 produced in Florida was 24,000,000 boxes and 40,461,000 boxes in California. Its cultivation in these states goes back to the earliest beginnings of fruit-growing, and orange culture with its related industries has become a commercial enterprise of vast proportions. Interest in planting and cultivation has had much to do with the development of those sections in which oranges are grown. American markets are supplied almost entirely from domestic sources.

Orange culture in America was started with trees raised from seed, and many seedling plantings are still in bearing. The product of these groves still makes up a large part of the Florida midseason crop, while a relatively smaller amount is still marketed from California. Many seedling trees have been top-worked. Numerous seedling varieties have been selected, propagated by budding and planted, but in later years the number has been greatly reduced.

later years the number has been greatly reduced.

A large number of varieties, such as Valencia, Majorca, Jaffa and Ruby were introduced from Mediterranean countries and elsewhere. Few of these have gained a permanent place in grove plantings. As the growing of citrus fruits has become a great commercial enterprise, the standardization of cultural practices and marketing procedure has made it necessary to limit more recent plantings to a smaller number of varieties of proved merit.

Climatic conditions in California make it possible to cover a twelve-month shipping season with two varieties, the Bahia or Washington Navel (from Brazil) covering the period from November to April and May, and the Valencia (from Spain) covering the season from May or June to November. A miscellaneous crop of seedling and other varieties is marketed in May and June.

It is necessary to use a larger number of varieties in Florida to cover the shipping season from October to July. In order of their ripening from early to late the varieties commonly planted are Hamlin and Parson Brown, Homasassa, Pineapple, Valencia and Lue Gim Gong. All except Valencia are seedlings of local origin.

Of the fruits referable to Citrus nobilis, the high quality King orange, with a green color and rough skin, is grown sparingly in Florida as a fancy fruit. The mandarin or tangerine

oranges (var. deliciosa) are of greater importance, particularly the variety Dancy which is planted commercially in Florida and is usually available on northern markets in early winter. The Satsuma orange (var. Unshiu) is one of the hardiest citrus fruits when grown on trifoliate stock and has been planted in northern Florida and the coastal regions of the Gulf states. Severe freezes make the growing of even this hardy variety precarious outside the citrus regions of Florida.

Sour orange

In Spain the sour orange, Citrus Aurantium, is grown for its fruit and some of the most beautiful plantings in that country are of this species. In America, however, the sour orange is not a cultivated fruit in the usual accepted sense of the term. Such trees as occur here and there are either those that are feral on the shores of lake and river or in similar locations. as in Florida, or are to be found in plantings of sweet oranges when the top variety has died out and the stock has sprouted and taken its place. Under these conditions the trees are usually neglected and ill-kept. The fruit of the sour orange is valuable in the making of orangeade orange is variable in the making of orangeade and marmalade. For the latter purpose it is widely and largely employed and the quality of the product is scarcely surpassed by that secured from any other citrus. Seedlings are largely used for stock on which to grow many other kinds of citrus. The stock is adapted to heavy and moist soils of good depth; it is very hardy, remarkably resistant or immune to footrot and gum diseases. On it a high quality fruit is produced and in a world-wide way it is more commonly used than any other stock.

Calamondin

The calamondin, Citrus mitis, is unique among citrus fruits in being the hardiest of the acid species now grown in America. Its dense head with bright green leaves, upright habit, and small fruits resembling tangerines in shape and color make it one of the most ornamental of the citrus allies. The fruits are bright orange-red, $1-1\frac{1}{2}$ inches in diameter, with deep orange flesh. The juice is well flavored and very acid. It is a valuable garden fruit adapted to those sections where the Satsuma orange and kumquat are grown. Among ade-making fruits it is unsurpassed.

Kumquat

The kumquats, the smallest both in size of plant and fruit among the citrus in cultivation in America, are closely related to the genus Citrus. Commonly they are grown as shrubs, the largest reaching a height of 12 feet or so with a head diameter of about 8 feet. The tops are dense and when well fruited the plants are very ornamental.

Three kinds representing as many species are grown. These are Nagami (Fortunella margarita), Marumi (Fortunella japonica), Meiwa (Fortunella crassifolia). The fruits of Nagami are oblong, 1½ by 1½ inches, with acid juice; those of Marumi are round, 1½ inch in diameter, acid; those of Meiwa are round, 1½ inch in diameter, with sweet rind and almost juiceless pulp. They are grown as ornemental shrubs, the fruits are used for decorations and in the making of jellies and fine marmalades. They

are propagated on trifoliate orange and rough lemon stocks and commonly planted 15 feet apart when grown in orchards.

Trifoliate orange

The trifoliate (trifoliolate) or three-leaved orange is *Poncirus trifoliata* (formerly *Citrus trifoliata*). The fruit is not eaten but the plant is prized for its hardiness as an ornamental and hedge plant, as far north as Washington and Philadelphia; for use as stocks on which to work sweet and Satsuma oranges; and as a parent in hybridization in the procuring of hardy races and of fruits superior for the making of ades. Trifoliate seedlings are extensively grown as orange stocks, to be employed on the northern limits of orange culture and for moist deep rich soils.

Grapefruit

Once considered to be of the same species as the shaddock, the grapefruit or pomelo is now regarded as a distinct species, Citrus paradisi. The culture of grapefruit, essentially an American enterprise, has been developed in Florida to a greater extent than in other citrus districts of the continental United States, although also grown in southern Texas and California. Total production in the United States in 1937 was 26,000,000 boxes. The fruit was unknown to early European citrus growers; there is evidence that it originated as a seedling sport in the West Indies and its introduction into the United States, probably about 1809, was much more recent than that of the sour or sweet orange. The first fruit was marketed from Florida about 1880 or 1885. Plantings have been increased greatly, to the point of serious over-production. The market outlook has been improved somewhat by the use of very considerable amounts of fruit in canning the pulp and juice.

the pulp and juice.

Here and there small seedling grapefruit groves are to be found, but in a large way the fruit marketed is the product of budded trees. The varieties are of Florida origin, selections from earlier plantings of seedling trees. The number of varieties introduced from time to time is much less than that of sweet oranges. Present plantings are usually made with Duncan, McCarty, or Marsh. Other varieties are Walters, Hall, and occasionally Triumph. The last is a small-sized early sort. Marsh is the favorite variety in California. When varieties containing seeds are held late on the trees, the seeds sprout and the flavor of the fruit is impaired. Marsh is favored as a late variety because it is seedless. Duncan is hardy and unsurpassed in quality. Several pinkfleshed varieties, including the Foster, Thompson and Pink Marsh, are grown somewhat in groves and as garden fruits and commercially in Texas.

Shaddock

This fruit, Citrus maxima, has taken its name from Captain Shaddock who is credited with having brought it to Barbados some time prior to 1707. It is also properly called pummelo. In the far East it is known as pampelmous. By some writers it has been regarded as the progenitor of the grapefruit. It is of no commercial importance in North America but is occasionally found in the warmer citrus dis-

tricts where its large glossy foliage and huge fruits (sometimes weighing several pounds) make it an interesting and valued garden plant. Since it is tender, its cultural range is limited. In southern Asia the shaddock is highly esteemed.

Lemon

Of the acid citrus fruits, the lemon (Citrus Limonia) is the most widely and largely grown in commercial plantings. The success achieved in the culture of the lemon in California is one of the outstanding horticultural developments of recent years. Elsewhere in American citrus districts it is grown only as a garden fruit. At one time considerable quantities of lemons were raised in Florida, but a combination of difficulties, among which may be mentioned cold weather, seab and other diseases, and troubles in curing, led to the abandonment of the plantings.

The lemon is hardier than the lime but less hardy than the orange and, consequently, unless adequate protection can be given, its cultivation is limited to warmer locations than are required for that fruit. In addition to this lack of hardiness the lemon is perhaps less resistant to certain diseases than either the orange or grapefruit. Lemons are picked green when they have reached a diameter over 2½ inches. This is determined by passing them through a ring of that size. Those that pass through are allowed to remain and increase in size. They are cured to shrivel the rind and become light yellow in color before marketing. The greater care in picking and curing add materially to the cost of handling. Losses sometimes occur in curing.

The principal varieties planted in California are Lisbon and Eureka. The latter is the favorite. In Florida the variety usually planted is Villa Franca. Recently the Perrine, a lime-

lemon hybrid, has seemed promising.

Lime

The acid lime (Citrus aurantifolia) is a distinctly tropical fruit. It is grown in the tropics the world around and, because it is very tender, its culture does not extend far outside that region. In southern California it is grown as a home-garden fruit, while in extreme southern Florida it is a crop of considerable importance. It is also grown in the latter state as a garden fruit for considerable distances north of the commercial areas.

The greater part of the lime crop that finds its way into the markets both from Florida and from the tropics is the product of seedling trees. Usually this fruit is named for the point of origin, as Key, West Indian, or Mexican The trees are very thorny and very thick-headed and receive a minimum of attention in pruning, cultivation and fertilizer; they are much like wild trees. The fruit is thinskinned, round, about 1½ inches in diameter, and very acid. It is produced to some extent the year around but the season of heaviest production is the summer months. The Tahitian limes, apparently a distinct race or type, are larger, resembling small-fruited lemons. On rough lemon stock they are grown in small plantings for home use and local market. Bearss, a variety grown in California, is of this type. Rangpur from India is not a true lime and is much hardier. It is orange-red in color, aromatic, and very acid.

Citrus hubrids

Citrus hybrids are many. By far the most important are the tangelos obtained by crossing the grapefruit and the tangerine in various ways. The fruits of many of these are of good size, beautifully colored and of excellent flavor and aroma. Unfortunately they have the disadvantage of being too tender to stand up under long-distance shipment and are mostly limited to local market and home use. Among the varieties listed are the Sampson, Thornton, Seminole and Mincola.

The citrange is a hybrid between the sweet and the trifoliate orange. The plants are hardier than oranges and on trifoliate stock may be grown in southern Georgia and the southern part of the cotton belt. The acid orange-like fruits 2–3 inches in diameter are used for ades and culinary purposes. Named varieties are the Coleman, Morton and Rusk. The citrange-quats are secondary hybrids produced by crossing the citrange with the kumquat. They are useful for ades and marmalades and because of their hardiness may be grown north of the citrus belt.

Hybrids of the Marumi kumquat and the West Indian lime have been named "limequats." One variety, the Eustis, has light yellow oval fruits about 2 inches long that are agreeably acid. Propagated on trifoliate orange stock they have about the same cultural range as

the kumquat.

The citrus breeding work of the federal and state experiment stations has produced many new and promising hybrids that have not been tested as to their merit. A good summary is given in the United States Department of Agriculture Yearbook of Agriculture for 1937.

CLADÁNTHUS. Compositæ. One herbaceous strong-smelling ann. native in S. Spain and Morocco and sometimes grown in the flowergarden. C. arábicus (C. proliferus. Anthemis arabica). To 3½ ft.:lvs. alternate, finely divided: heads solitary and others arising from beneath them, yellow, of ray- and disk-fls.; pappus none.

CLADOTHÁMNUS. Ericaceæ. One deciduous shrub native Alaska to Ore. and sometimes planted, related to Ledum and Elliottia. C. pyrolæfðrus. To 10 ft., much branched: lvs. alternate, obovate-oblong, to 3 in. long, entire: fls. pink, to 1 in. across, usually solitary.

CLADRÁSTIS. YELLOW-WOOD. Leguminosæ. Deciduous trees native in N. Amer. and E. Asia, with pinnate lvs. and alternate lfts., white papilionaceous fls. in usually panicled racemes, and flattened pods; planted for ornament. See Maackia.

Propagated by seeds in spring, and by root-cuttings kept over winter in moderately cool and moist sand or moss.

amurénsis: Maackia amurensis.

lùtea (C. tinctoria. Virgilia lutea). To 50 ft.: lvs. of 7-9 ovate lfts.: fls. 1 in. long, fragrant, in June: pods to 4 in. long. S. E. U. S.

platycarpa (Sophora platycarpa). To 60 ft.: lvs. of 7-15 ovate lfts.: fls. ½ in. long, white with yellow spot at base; pods to 3 in. long, winged all around. Japan.

sinénsis. To 80 ft.: lvs. of 9-13 oblong lfts.: fis. 1/2 in. long, June-July: pods to 3 in. long. China. tinctòria: C. lutea.

CLÁRKIA. Onagraceæ. Ann. herbs with alternate lvs., rose or purple showy fls. in racemes or solitary, and linear capsular frs.

Grown in flower-gardens and latterly as greenhouse subjects for winter and spring bloom. Of easy cultivation in sunny situations. Propagated by seeds sown where plants are to stand in the open.

álba: listed name of a hort, form.

Brèweri (Eucharidium Breweri). FAIRY FANS. To 9 in.: lvs. lance olate, to 2 in. long: fis. deep pink, petals fan-shaped, 3-lobed, middle lobe much narrower than lateral ones.

concinna (C. grandiflora. Eucharidium concinnum, E. grandiflorum). RED RIBBONS. To 2 ft.: lvs. ovate-lanceolate to elliptical, to 2½ in. long: fts. deep pink to lavender, petals fan-shaped, 3-lobed, middle lobe as wide as lateral ones. Calif.

élegans. To 3 ft. (more under glass), with reddish glaucous sts.: lvs. ovate to ovate-lanceolate: fls. purple or rose or white in var. álba, sometimes double; claws of petals not toothed or notched. Calif. Var. salmònea, fls. salmon-pink

grandiflora: C. concinna.

pulchélla. To 1½ ft.: lvs. linear to linear-lanceolate: fls. lilac varying to white in var. álba, the claws of petals toothed. B. C. to Calif. Var. holopétala (var. integripetala) has entire petals. Var. marginata has claws of petals has entire petals. notched at tip.

CLARY: Salvia Sclarea.

CLASPING: leaf partly or wholly surrounding stem.

CLAUSÈNA. Rutaceæ. Several species of spineless trees in trop. Asia, Australia and Afr., with pinnate lvs. and small fls. in racemes or terminal panicles; stamens 8-10: fr. berrylike, small and globose, 4-5-celled. C. punctata (C. Lansium. C. Wampi). Wampi. Small tree sometimes planted far S. for ornament or interest: lfts. 5-9, ovate-elliptic, more or less punctate: fr. ovate-globose, about 1 in. long. China, where it is sometimes cult. as a fruit-tree; can be grafted on Citrus.

CLAVATE: club-shaped; said of a long body thickened toward the top.

CLAVEL DE LA INDIA: Ervatamia coronaria.

CLAVIJA. Theophrastaceæ. Evergreen trees or shrubs with unbranched trunk bearing at top a cluster of stiff simple lvs. with spike-like racemes of unisexual fls. in the axils; fls. white, yellow or orange; native in trop. Amer. and one intro. in S. Calif. Propagated by seeds and cuttings of half-ripe wood.

longifolia (C. ornata). Discious tree to 20 ft.: lvs. to 2 ft. long and 6 in. wide, with few spiny teeth: fls. small, deep orange, the staminate fragrant, in drooping racemes to 10 in. long. Trinidad, S. Amer.

ornàta: C. longifolia.

CLAW: the long narrow petiole-like base of petals or sepals in some flowers.

CLAYTONIA. Spring Beauty. Portulacaceæ. Succulent little spring-blooming perennials having deep-seated hard corm or tuber, 2-lvd. sts... white or rose fls. in terminal racemes, and capsular frs.; sometimes transplanted from the wild to moist shady positions and rock-gardens.

caroliniàna. Per. to 1 ft.: lvs. broad in middle, to ¾ in., obtuse, those on st. with distinct petiole. E. N. Amer.

megarrhiza. Per., sts. and lvs. from fleshy root: basal lvs. spatulate with margined petioles, to 6 in. long: fls. pink or white, sessile, in 3-7-fld. corymbs. Wash. to New Mex.

multiscapa. To 6 in.: basal lvs. narrowly oblong to oblanceolate, to 2 in. long, st.-lvs. lanceolate, shorter: fls. white with purple veins, sepals rhombic-ovate. Iowa to Mont.

nivalis. To 3 in., with tap-root, corm absent: basal lvs. very fleshy, in rosette, spatulate, to 3 in. long: fls. rosepink, to ¾ in. across, in 3-7-fld. corymbs on pedicels about ½ in. long, sepals ovate, ½ in. long. Wash.

parviflòra: Montia parviflora.

perfoliata: Montia perfoliata.

ròsea. To 4 in. or more: lvs. rarely basal, spatulate, to 2 in. long, sessile: fls. rose-pink, sepals rounded-ovate, 1/2 in. long or less. Colo. to Utah and Wyo.

Sweetseri: see Montia Sweetseri.

virginica. Per., sts. to 1 ft. long: lvs. linear or linear-lanceolate, to 5 in. long, about 1/4 in. broad: fis. white tinged with pink, 1/4 in. across. E. N. Amer.

CLEÍSTES. Orchidacex. A small genus of terrestrial American orchids closely allied to Pogonia and Isotria, differing from Pogonia in having compound pollen-grains which cohere in 4's and from Isotria in having its lvs. solitary or alternate, not whorled. One species, C. divaricata (Pogonia divaricata) is cult. To 2½ ft.: If, oblong or lanceolate-elliptic, to 6 in, long: petals pale salmon-pink, elliptic-lanceolate, sepals narrower and darker colored, lip greenish with purple veins, not bearded. Apr.-July. N. J. to Fla. and Ala.

CLEISTOCÁCTUS. Cactaceæ. Slender crect or clambering plants known by the fl. remaining closed or the perianth-limb not expanding, of S. S. Amer.: spines many and slender and very sharp; ribs many, not prominent, the areoles close together: fls. orange-red. See Cacti.

areolètus. Sts. columnar; ribs 12, acute, shallow, conspicuously notched; radial spines 9-10, slender; central 2-4, stout. Andes.

aureus: Erdisia Meyenii.

Balmannii (Cereus Baumannii and colubrinus). Sts. columnar and flexuose, to 6 ft. and 1½ in. diam., with few erect branches and fascicled yellow-brown spines most of them about ½ in. long; ribs usually 14 with yellow-brown arcoles: fls. orange-scarlet, to 3 in. long; fr. a small red berry. Uruguay, Paraguay, Argentina. Var. colubrinus is listed and may not be distinct from the typical form, although said to differ in its slightly thicker and darker green sts. and longer nearly black spines.

Búchtienii: C. Herzogianus var.

Herzogianus. Tree-like, to 7 ft., sts. to 2 in. diam., dull gray-green; ribs usually 11, obtuse and slightly notched; radial spines usually 8, to 3, in. long; 1 central spine to 3, in. long, all pale yellow; fts. bright red, to 2 in. long or less; fr. pinkish-orange. Bolivia. Var. Búchtienii is listed with wine-red fis. to 2½; in. long and 12 radial spines with central spine to 1½ in. long.

Morawetzianus. Much branched shrub to 7 ft., sts. erect, gray-green; spines golden-yellow becoming grayish: fls. white, to 2 in. long and 1/3 in. diam., cylindrical, style long-exserted. Peru.

Roézlii. Erect, sts. to 2 in. diam.; ribs about 9, low, rounded, notched, areoles white-woolly; radial spines 10-12, slender, glossy-white; central 1, to 34 in. long; fls. brick-red, to 2 in. long, tube somewhat constricted. Bolivia. fls. brick-

smaragdiflorus. Sts. to 1 in. diam.; ribs 12-14; central spines to 3/4 in. long; fls. to 2 in. long, outer petals emerald-green, inner ones orange-red. Argentina.

Straussii (Borzicactus, Cereus and Pilocereus Straussii). Straussi Borzicacius, Cereus and Priocereus Straussi). Sts. erect to 3\footnote{1} ft., light green; ribs usually 23-27, shallow; spines bristle-like, white, to \footnote{1} ft. long with 2-4 yellow stiff spines \footnote{1}-1 \footnote{1} ft. long: fts. red to carmine-violet, to nearly 4 in. long. Bolivia. Var. jujuyénsis is offered in the trade as is var. tupizénsis (C. tupizensis), a red-spined form with somewhat paler red fls.

tupizénsis: C. Straussui var.

CLEISTOGAMOUS FLOWERS: small closed fertilized flowers, as in some violets; they are mostly on or under the ground.

CLEISTOYUCCA: Yucca.

CLÉMATIS. CLEMATIS. VIRGINS-BOWER. Ranunculacex. Per. herbs or woody climbing vines with opposite usually compound lvs., solitary or panicled fls. vithout petals but with petal-like sepals and numerous stamens (unless otherwise stated the fls. open wide and flat), and fr. an achene with commonly a long feathery style; mostly native in the north temp. zone, and many of them much prized for ornament.

Clematis prospers in fertile light loamy soil which is well drained. Propagated by stratified seeds, layers, division, and cuttings under glass in summer. Varieties may be grafted on roots of C. Flammula or C. Vrticella; roots should be taken from plants out-of-doors to avoid

nematode infection, and cions from those grown in a

greenhouse.

Some clematises are perennial herbs and should be treated as such in the border. Others are small-flowered woody vines not much modified by domestication, planted for permanent cover of fences, arbors and porches. Others are large-flowered vines used extensively in the development of horticultural hybrids.

for permanent cover of fences, arbors and porches. Others are large-flowered vines used extensively in the development of horticultural hybrids.

These hybrids are segregated into three groups, with the divisions based on the nature of growth and time of blossoming They are: (1) the Florida group, whose flowers appear on old wood in summer; (2) the Patens group, whose flowers appear on old wood in spring; and (3) the Jackmani type (including also those of C. lanujinosa and C. Vincella parentage) which blossom on new wood during summer and autumn. The plants of all three groups should be grown on trellises or posts.

Plants of the Florida group should be pruned lightly and not too frequently. Members of this group in cultivation include: Barillet-Deschamps, Belle of Woking, Comete, Coste et La Brix, Duchess of Edinburgh, Enchantress, Lucie Lemoine, Mme. Alfred Bourneau, Mme. Andre Lecaux, Mme. Chas. Lecaux, Mme. Jouannet, Mme. Victor Vandermarcq, Miss Cavell, Proteus, Soldat Inconnu, T. J. Patyn, Undine, Venus Victrix, Ville de Limoges.

Plants of the Patens group should be treated as the above and include, among others, the following named forms: Baronne de Verdiers, Countess of Lovelaces, Duke of Buccleigh, Edith Jackman, Edouard Defosse, Étoile de Paris, Fair Rosamond, King of the Belgians, Lady Loudesborough, LaLorraine, Lasurstern, La Cid, Lord Gifford, Lord Napier, Miss Bateman, Miss Crawshay, M. Koster, Monstrosa, Mrs. Quilter, Nelly Koster, Sir Garnet Wolseley, Standishii, Stella, The Bride, The Queen, Uranus, Violacea.

Those plants that bloom on wood of the current season should be pruned to the ground during the dormant period. Generally speaking, these plants are more resistant to extreme cold than are the other large-flowered hybrids. Members of this group include such forms as: Admiration, Alexandra, ascotiensis, Beauty of Worcester, Comtesse de Bouchard, Countess of Onslow, Crimson King, Duchess of Albany, Duchess of Onslow, Crimson King, Duchess of Albany, Duchess of Onslow, Crimson Keng, Lawsoni Ville de Lyon, William Kennett.

Most of these hybrids succeed best when planted in

Most of these hyperias succeed best when planted in partial shade, in well-drained soil to which some line has been added. It is advisable to provide the base of the stems with some protection against mechanical injury until plants are well established. In regions where the ground freezes about the roots elematis will not be seriously infected, with the pronted decrease.

infested with the nematode disease.

Addisonii. Per. herb to 3 ft.: lower lvs. simple and sessile, upper lvs. pinnate: fls. red to bluish-purple, nodding, solitary, sepals thick and leathery. May-Aug. Va., Tenn. and N. C.

æthusifòlia. Climbing to 6 ft.: lvs. 1- or 2-pinnate into small deeply cut lfts.: fls. pale yellow, ½ in. long, in few-fld. clusters. Aug.—Sept. Chuna, Manchuria. Var. latisécta has 1-pinnate lvs. with lfts. often deeply lobed, fls. white.

afoliata. Climbing, sts. leafless: lvs. of young plants of 3 minute lfts.; fls. greenish-white, to ¾ in. across, in few-fld. clusters. New Zeal.

akebioldes: A. glauca var.

alpina (Atragene alpina). Climbing to 6 ft.: lvs. usually biternate, It's. coarsely toothed: fis. violet-blue, 1½ in. long, solitary, spring. Eu., Asia. Var. occidentalis is C. pseudoalpina. Var. sibfrica. Fls. yellowish-white. Siberia.

angustifòlia. To 3 ft.: lvs. of few or many narrow entire glabrous lfts.: fls. yellowish-white, 1½-2 in. across, in loose terminal panicles. Asia, S. Eu.

apiifòlia. Climbing to 10 ft.: lvs. of 3 toothed or lobed lfts., sometimes biternate: fis. white, about ½ in. across, in axillary panicles. Sept.-Oct. Japan.

aristata. Directious evergreen vine to 30 ft.: lvs. ternate, margins briefly and sparsely serrate: fls. white, campanulate, erect, to 34 in. across, in corymbs of 4-7, peduncles shorter than lvs. Australia.

Ármandii. Evergreen, climbing to 15 ft.: lvs. of 3 entire leathery lfts.: fls. white, to 2½ in. across, in axillary leafless panicles, in spring. China. Var. Farquhariana has light pink fls.

aromática. Hybrid between C. Flammula and C. integrifolia: upright, to 6 ft.: fls. bluish-violet, fragrant, to 1½ in. across, in terminal cymes. July-Sept.

ascotiénsis. Hybrid with large azure-blue fls. having greenish-white band down center of back of each sepal. June-Aug.

australis. Climbing: lvs. ternate, lfts. pinnate: fls. white, to 1 in. across, in few-fld. panicles or solitary. New Zeal

Báldwinii (Viorna Baldwinii). PINE-HYACINTH. Erect herb to 1½ ft.: lvs. simple or the upper ones of 3 lfts.: fls. urn-shaped, purple or pinkish, about 1 in. long, solitary and nodding, in early spring. Fla.

baleárica. Climbing: lvs. of 3 toothed or 3-lobed lfts.: fls. greenish-yellow spotted with red inside, in spring. S. Eu., Asia Minor.

Beàdlei (Viorna Beadlei). Vine, sts. pubescent at nodes: Ifts. ovate to lanceolate, to 3 in. long, usually lobed, acute to acuminate: fls. to 1 in. long. Mts. of Tenn. to Ga.

brachiàta. Climbing: lvs. 1-2-pinnate into coarsely toothed lits.: fis. greenish-white, fragrant, to 1½ in. across, in axillary panicles. S. Afr.

brevicaudata. Chmbing: Ivs. bipinnate, lfts. toothed or entire: fis. white, to ¾ in. across, in axillary cymes. Aug.—Oct. Manchuria, W. China.

Buchananiàna. Climbing, hairy: lvs. pinnate into oothed or lobed lfts.: fls. to 3 in. across, in panicles. Himalayas.

cærùlea: C. patens.

campaniflora. Climbing to 20 ft.: lvs. bipinnate into entire or lobed lfts: fis. white, to 1 in. across, nodding. July-Aug. Portugal.

Catesbyana (C. holosericea). Climbing: lvs. mostly biternate, lfts. lobed or entire: fls. white, 1 in. across, in panicles, spring and summer. S. C. to Fla. and Miss.

chinénsis. Climbing to 10 ft.: lvs. of usually 5 entire lfts.: fls. white, to 3/2 in, across, in axillary leafless panicles. China to Indo-China.

chrys6coma. Erect or climbing to 20 ft.: lvs. of 2 coarsely toothed or 3-lobed lfts., yellow-pubescent: fls. white or pinkish, 2 in. across, in clusters. June-Sept. China. Var. sericea (C. Spooner). Fls. to 3½ in. across, from old wood.

cirrhòsa. Climbing to 10 ft.: lys. simple, toothed or sometimes lobed: fls. yellowish-white, to 2 in. across, 1-2 in the axils. Mar.-May. S. Eu., Asia Minor. Var. heterophýlla is listed.

coccinea: C. texensis.

Colensdi. Climbing: lvs. of 3 toothed, lobed or divided lfts.: fls. greenish-yellow, to 1 in. across, in panicles or solitary. New Zeal.

columbiana: the western representative of C. verticullaris: fis. blue or purple, with narrow pointed sepals and narrow mostly entire lits.

connata. Climbing to 25 ft.: lvs. pinnate, glabrous, lfts. ovate-lanceolate, toothed or rarely 3-lobed, frequently connate, petioles dilated at base: fls. pale yellow, 1 in. across, in panicles. Aug.—Sept. Himalayas, China.

crispa (C. cylindrica. Viorna crispa). Climbing to 10 ft.: lvs. of 3-7 thm entire or lobed lits: fis. urn-shaped, bluishpurple, to 1½ in. long, solitary and nodding, fragrant, June-Sept: achenes without plumose styles. Va. to Fla. and Tex. Var. Wâlteri. Lits. linear or linear-lanceolate.

cylindrica: C. crispa.

Davidiàna: C heraclexfolia var.

Delavàyi. Shrub to 5 ft.: lvs. pinnate, lfts. entire, silvery-white underneath: fls. white, 1 in. across, silky outside, in terminal cymes. July-Aug. China.

dioscoreæfòlia: C. paniculata var.

Doúglasii. Erect herb to 2 ft.: lvs. 2- or 3-pinnate into pouglash. Frect hero to 2 it.: ivs. 2- or 3-pinnate into linear or linear-lanceolate lifts: fis. tubular, purple inside, paler outside, to 1½ in. long, solitary, calyx elongate-campanulate, distal fourth of sepals spreading. May-July. Colo. to Wash.—By some authorities this is treated as synonymous with C. hirsuitssima, a plant now placed in the genus Anemone. Var. Scottii is C. Scottii.

Drúmmondii. Climbing, ashy-pubescent: lvs. pinnate, lfts. coarsely cut: fls. white, 3/4 in. across, in cymes or solitary. Sept. Tex. to Anz.

Durándii. Hybrid between C. Jackmanii and C. integrifolia: climbing to 10 ft.: lvs. simple: fls. violet-blue, to 5 in. across. June-Sept.

erécta; C. recta.

eriophora (Viorna eriophora). Erect white-hairy herb to 1½ ft.: Ivs. 2-pinnate into linear lifts: fls. bell-shaped, purple, about 1 in. long, solitary and nodding. May-June. Wyo. to New Mex.

eriostèmon (C. Hendersonni, C. intermedia). Hybrid between C. Viticella and C. integrifolia: subshrub to 10 ft, with blue fls. to 2½ in. across.

Fárgesii. Climbing to 20 ft.: lvs. bipinnate, lfts. cut or lobed: fis. white, to 2 in. across, in cymes or solitary. June-Sept. China.

Flammula. Climbing to 15 ft.: lvs. 2-pinnate, the lfts. entire or lobed: fls. white, fragrant, about ¾ in. across, in

many-fid. panicles. Aug.-Oct. Medit. region to Persia. Var. rôsea-purpùrea, fis. listed as rose-colored. Var. rotundifòlia has lits. broader than type.

flórida. Climbing to 12 ft.: Ivs. usually biternate, the lfts. entire or lobed: fls. creamy-white with green band on back and purple stamens, to 4 in. across, solitary, June-July: styles not plumose. Cent. China. In var. plena the fls. are double. In var. Sièboldii (C. Szeboldii) part of the stamens are changed to purple staminodia.

fétida. Climbing: lvs. of 3 entire or lobed lits.: fis. yellowish, fragrant, to ¾ in. across, in branched panicles. New Zeal.

Fórtunei: C. patens var.

Frèmontii (Viorna Fremontii). Erect herb to 1½ ft.: lvs. simple, leathery and reticulated, sessile: fls. bell-shaped, purple, 1 in. long, solitary and nodding, spring and summer. Mo. to Neb.

fruticosa. Erect shrub: lvs. simple, lanceolate, entire or cut-toothed: fls. yellow, in clusters of 1-4. Cent. Asia.

fúsca. Climbing to 15 ft.: lvs. of 5-7 entire lfts.: fls. violet, brownsh-pubescent outside, 1 in. long, solitary, nodding. June-Aug. Asia. Var. violacea, fls. violet out-

Gáttingeri (Viorna Gattingeri). Climbing to 10 ft.: lvs. pinnate, pubescent and glandular: fis. purple, 1/2 in. long, summer. Tenn.

Gebleriana: C. songarica.

gentianoides. Sts. prostrate or creeping, to 4 ft.: lvs. simple or of 3 ovate-lanceolate or lanceolate lfts.: fis. white, solitary or few. Tasmania.

glauca. Climbing: lvs. 1-2-pinnate, lfts. 2-3-lobed: fls. yellow, to 2 in. across, solitary or few. Aug.—Sept. China, Siberia. Var. akebioides has broad toothed lfts. and bronzy-yellow fls. Var. angustifolia has narrow lfts.

globulòsa. Hybrid between C. Scottri and C. texensis: fls. deep purple.

Gouriàna. Climbing: lvs. of 5-7 lfts.: fls. white, ½ in. across, in large panicles. Himalayas, China. Var. Finétii has glabrous foliage.

grandiflora. Slender climber: lvs. usually pinnately 5-foliolate, lfts. ovate-lanceolate, to 6 in. long, broadly crenate-toothed to denticulate, teeth mucronate: fls. greenish, to 1 3/4 in. long, solitary, axillary, sepals nearly erect. Trop. Afr.

grata. Climbing: lvs. usually of 5 coarsely toothed lfts.: fls. white, to ³/₄ in. across, in panicles, sepals spreading. Sept.—Oct. Himalayas. Var. argentilucida (var. grandidentata) has larger and more coarsely toothed lfts., with fls. to 1 in. across. W. China. Reported to be a more vigorous grower than type.

gravèolens: C. orientalis.

grewiæfldra. Climbing, tomentose: lvs. of 3-5 toothed or lobed lfts.: fis. tawny-yellow, 1½ in. long. Himalayas.

Héndersonii: C. errostemon.

Hénryi: C. Lawsoniana var.

heraclesefòlia (C. tubulosa). Erect herb to 4 ft., woody at base: lvs. of 3 large coarsely toothed lifts: fis. tubular, polygamous, to 1 in. long, blue, in axillary clusters. Aug.—Sept. Chma. Var. Davidiana (C. Davidiana) has diœcious fragrant deep blue fls.

hexasépala. Climbing: lvs. of 3 toothed or lobed leathery lfts.: fls. white, to 1½ in. across, in panicles. New Zeal.

Hilárii. Climbing: lvs. of 3 toothed or 3-lobed lfts.: fis. diœcious, in few-fid. panicles. Brazil.

hirsutissima: Anemone patens.

holosericea: C. Catesbyana.

indivisa. Climbing, with thick woody sts.: lvs. of 3 leathery entire or lobed lits: fis. diœcious, white, to 4 in. across, in axıllary panicles, in spring, or winter when grown indoors. New Zeal. Var. lobata is listed.

instricta: listed name of no known botanical standing.

integrifòlia. Erect herb or subshrub to 3 ft.: lvs. thin, simple and entire, sessile: fls. urn-shaped, blue, to 1½ in. long, solitary and nodding. June-July. Eu., Asia.

intermèdia: C. eriostemon

Jáckmanii. A group of hybrids between C. lanuginosa and C. Viticella: climbing to 10 ft.: lvs. pinnate or the upper simple: fis. violet-purple, to 6 in. across, usually in 3's and forming terminal panicles. Listed color forms include alba, purpirea supérba and rûbra. See introductory paragraph for other names having this parentage.

Jouiniana. Hybrid between C. heraclexfolia and C. Vitalba: climbing: fis. white or lilac, 1 in. across, in large panicles. Aug.-Oct.

jubata. To 3 ft., herbaceous: lits. ovate or heart-shaped, glaucous when young: fis. white or cream, fragrant, in large terminal panicles, early summer. Habitat unknown.

Prostrate: lvs. of 3 toothed lfts. which are koreans. Prostrate: 178. of 3 toothed his which are lobed or parted: fis. yellow or violet, solitary and nodding. Korea. Var. lutes, fis. creamy-yellow with dark centers, fragrant. July-Oct.

lancifòlia. lancifòlia. Shrub to 15 in.: lvs. lanceolate or ovate-lanceolate, leathery, deep green; fls. 1 in. across, solitary.

lanuginosa. Climbing to 6 ft.: lvs. simple or of 3 entire lfts.: fs. lavender or white, to 8 in. across, 1-3 together. July-Sept. China. Var. cándida, fls. white with light purplish shading around sepal margins.

lasiándra. Climbing to 15 ft.: lvs. bipinnate, lfts. toothed: fis. whitish or dull violet, ½ in. long, solitary or few. Aug.-Sept. China.

lasiantha. Pipestem C. Climbing: lvs. of 3 coarsely toothed or lobed lits.: fis. polygamous, white, to 2½ in. across, fragrant, 1-3 together. Apr.-May. Calif.

Lawsoniana. A group of hybrids between C. lanuginosa and C. patens: lvs. usually ternate: fis. rose-purple with darker veins, to 6 in. across, solitary. Var. Hénryi (C. Hénryi) has creamy-white fis.

ligusticifòlia. Climbing to 20 ft.: lvs. of 5-7 coarsely toothed or 3-lobed lits.: fis. diœcious, white, ¾ in. across, in cymes. Aug.-Sept. B. C. to Calif. and New Mex.

lilácina floribúnda: listed as a large-fld. hybrid.

macropétala. Climbing: lfts. deeply toothed or lobed: fis. violet, 2 in. long, solitary, China, Siberia.

mandschurica: C. recta var.

marata. Tall evergreen vine: lvs. dark brownish-green, ternate, lfts. linear, to 1 in. long: fls. greenish-yellow, to 1 in. across, fragrant, abundant in long panicles. New

Meyeniana. Climbing: lvs. of 3 entire leathery lfts.: white, to 1 in. across, in many-fid. panicles, summer,

microphýlla. Climbing: lvs. 2-3-ternate into small lfts.: fls. cream-colored, ½ in. long, in short panicles. Australia. missouriénsis: C. virginiana var.

montana. Climbing to 25 ft.: lvs. of 3 cut-toothed lfts. montâna. Climbing to 25 ft.: lvs. of 3 cut-toothed lfts., fts. white turning pink, with yellow stamens, to 2 in. across: in 1-5-fid. clusters, fragrant. May-June. Himalayas, China. Var. álba, fls. white. Var. grandiflöra has fls. to 3 in. across. Var. lilácina, fls. bluish-lilac. Var. perfécta, fls. blush-white, large. Var. platyphylla is listed. Var. rûbens, fls. rose or pink, lvs. purplish. Var. undulâta is a cross between C. montana and C. grachfolia, with large bluish-white fls. Var. Wilsonii has fls. to 3 in. across.

ochroleùca (C. osala. Viorna ochroleuca and osala). Erect herb to 2 ft.: lvs. simple, entire, sessile, base rounded or cordate: fls. yellowish-white or sometimes suffused with purple, to 1 in. long, nodding, solitary, sepals silky outside: achenes with yellowish-brown plumes. May-June. N. Y. to Ga.

Olgæ: said to be an oriental form of C. integrifolia.

orientalis (C. graveolens). Climbing to 20 ft.: lvs. pinnate or bipinnate, the lfts. coarsely toothed or lobed: fls. yellow, to 2 in. across, solitary or in few-fld. clusters. Aug.-Sept. Persia to Himalayas.

ovata: C. ochroleuca.

paniculata. Climbing to 30 ft.: lvs. of 3-5 entire or lobed lfts.: fls. white, about 1 in. across, fragrant, in many-fld. panicles. Sept.-Oct. Japan. Var. dioscoreæfòlia (C. doscoreæfòlia) has heart-shaped lfts. and broader sepals. Var. grandiflora is an improved or selected form.

patens (C. carulea). Climbing to 12 ft.: lvs. of 3-5 entire lfts.: fls. violet to white, to 6 in. across, solitary. May-June. Japan. Var. Fortunei (C. Fortunei). Fls. creamy-white turning pink, to 5 in. across. Var. grandiflöra has larger fls. Var. Ståndishii. Fls. lilac-blue: lfts. 3.

paucifiòra. Climbing: lvs. of 5-9 toothed or lobed lfts.: . white, to 1 in. across, usually solitary. Mar.-Apr. S. Calif.

Pitcheri (Viorna Pitcheri. C. and Viorna Simsi). Climbing: lvs. of 3-7 entire or lobed lits., the terminal one sometimes a tendril: fis. urn-shaped, purplish, to 1 in. long, solitary, in summer: achenes without plumose style. Ind. to Neb. and Tex. Var. Särgentii has smaller and paler fis. than type and lits. rarely lobed.

pseudoalpina (C. alpina var. occidentalis). Climbing: lvs. biternate, lfts. lobed or cut-toothed: fis purple or blue, to 2 in. long, solitary. Colo., Utah, New Mex. pseudoflámmula. To 5 ft., upright: fis. creamy-white,

fragrant. Aug. Caucasus.

pubescens. Climbing: lvs. of 3 slightly toothed or entire lfts.: fls. white, in panicles. Mex.

récta (C. erecta). Erect or ascending herb to 5 ft.: lvs. of 5-9 entire lfts.: fls. white, to 1 in. across, fragrant, in many-fld. terminal panieles, in summer. S. Eu. Var. föllis purpùreis has dark brownish-red foliage. Var. grandi-flòra, fls. white, to 2 in. across. Var. mandschùrica (C.

mandschurica) has sts. decumbent and longer with terminal and axillary panicles. Var. plèna has double fis. Other listed forms are hispanica, lathyrufolia.

Renderiana. Climbing to 25 ft.: lvs. pinnate, lfts. toothed or 3-lobed, silky beneath: fts. pale yellow, fragrant, ½ in. long, nodding, in short pancles. Aug.—Oct. China.

reticulata (Viorna retrculata). Climbing to 10 ft.: lvs. of 3-7 entire leathery reticulated lfts.: fis. urn-shaped, yellowish outside, pale violet within, about ¾ in long, solitary and nodding. July. S. C. to Fla. and Tex.

Scottii (Viorna Scottii). Erect herb to 1½ ft.: lvs. bipinnate, the petioles often twisted: fis. urn-shaped, purplishbrown, to 1¼ in. long, solitary. May-July. Wyo. to New

serratifolia. Climbing to 10 ft.: lvs. biternate, the lfts. toothed or lobed: fis. yellow with purple stamens, 2 in. across, 1-3 together. Aug.-Sept. Korea.

serrulata: listed name, perhaps referable to C. orientalis var. or to C. serratifolia.

sibírica: C. alpina var.

Sièboldii: C. florida var.

Simsii: C. Pitcheri.

smilacifòlia. Climbing: lvs. ovate, leathery, entire or rarely ternate: fis. purple, brown-tomentose outside, to 1½ in. across, in axillary panicles. Himalayas, E. Indies.

songárica (C. Gebleriana). Shrub to 5 ft.: lvs. lanceolate, toothed or slightly pinnatifid near base: fls. yellowish-white, 1 in. across, in terminal cymes. Aug.-Sept. Asia.

Spodneri: C. chrusocoma var. sericea.

stans. Erect herb to 6 ft.: lvs. of 3 large coarsely toothed **Stans.** Effect herb to o it. IVS. of a large coarsely tourists or lobed lits.: fls. dieccious, tubular, white or blunsh, about ½ in. long, in long terminal panicles and axillary clusters. Sept.—Oct. Japan.—Sometimes woody at base and closely related to C. heraclexfolia.

tangatica. Golden C. Climbing to 10 ft.: lvs. pinnate or bipinnate, the lfts. toothed or lobed: fls. bright yellow, to 4 in. across, susually solitary. June and again in autumn. Mongolia, N. China. Var. obtusiúscula has smaller lfts. and more obtuse sepals. Var. Fárreri, fls. golden.

texénsis (C. and Viorna coccinea). SCARLET C. Climbing to 6 ft.: lvs. of 4-8 rather thick glaucous lfts.: fls. urnshaped, scarlet, about 1 in. long, solitary and nodding. July-Sept. Tex.

Thunbergii. Climbing: lvs. pinnate or ternate, lfts. toothed or cut: fls. to 2 in. across, in many-fld. panicles.

trifoliàta. Climbing vine to 10 ft. or more, sts. tinged purple: lvs. ternately decompound, glabrous, lfts. ovate, obtuse, dentate, petioles about 1½ in. long: fls. whitish, in panicles. Japan.

troutbeckiàna. Climbing to 10 ft.: lower lvs. simple, ovate, to 4 in. long; upper lvs. pinnate into entire lfts.: fs. lavender outside, pale green inside, in compound infl. July-Aug. Perhaps a natural hybrid allied to C. Viorna.

tubulòsa: C. heraclexfolia.

vedrariénsis. Hybrid between C. montana and C. chrysocoma: fls. mauve-pink or rose, 2 in. across.

Veitchiana. Climbing: lvs. bipinnate, lits. toothed or 3-lobed, silky beneath: fis. yellowish, fragrant, 1/4 in. long, nodding, in panicles. Sept.—Oct. China.

versícolor (Viorna versicolor). Climbing to 12 ft.: lvs. pinnate, the lfts. entire, glaucous beneath: fls. urn-shaped, ¼ in. long, purplish, solitary and nodding. July. Mo., Ark.

verticillaris (Atragene americana). Climbing or trailing to 10 ft.: lvs. of 3 entire or coarsely toothed lfts.: fls. purple, to 4 in. across, solitary. May-June. N. Amer.

Viôrna (Viorna). Climbing to 10 ft.: lvs. of 5-7 entire or lobed lfts.: fls. urn-shaped, reddish-purple, about 1 in. long, solitary and nodding. May-Aug. Pato Ga. and Ala.

virginiana. Climbing to 20 ft.: lvs. of usually 3 coarsely toothed lfts., glabrous beneath: fls. diœcious, white, to 1 in. across, in leafy panicles, Aug.-Sept. N. S. to Ga. and Kans. Var. missouriénsis (C. missouriensis) usually has 5 lfts., 2-3 in. long, appressed hairy beneath.

Vitálba. Travelers-Joy. Old-Mans-Beard. Climbing to 30 ft.: lvs. of 5 entire, toothed or 3-lobed lfts.: fis. greenish-white, to 1 in. across, fragrant, in panicles. July-Sept. Eu., N. Afr., S. W. Asia.

Viticélia. Climbing to 12 ft.: lvs. pinnate or bipinnate, the lfts. entire or 3-lobed: fls. blue, purple or rose-purple, the stamens yellow, to 2 in. across, 1-3 together, June-Aug.: achenes without plumose styles. S. Eu., W. Asia. Var. albiflora (var. alba), fls. white. Var. cærulea, fls. blue-violet. Var. kermesina has wine-red fls. Var. purpûrea (var. rubra), fls. reddish-purple.

CLEMENTSIA: Sedum rhodanthum.

CLEÒME. Capparidace x.Warm-country herbs and subshrubs with simple or palmately compound lys., white, green, yellowish or purplish fls. solitary or in racemes, petals narrow and stamens long, the ovary long-stalked (on a gynophore), and narrow capsular frs.

One annual species is commonly cultivated as a flower-garden and border subject for its rose-purple or white flowers; it is raised from seeds sown usually where the plants are to stand.

arborea. Pubescent white-fid. shrub of Venezuela; the arborea of the trade is sometimes (perhaps always) C. spinosa

gigantèa: C. spinosa.

grándis: see under C. spinosa.

integrifòlia: C. serrulata.

lùtea. Ann. to 3 ft., glabrous: lfts. 3–5: fls. golden-yellow. Wash. to Calif. and Colo.

núngens: C. spinosa.

serrulata (C. integrifolia). Glabrous ann., 2-3 ft., sometimes planted, formerly as a bee-plant: Ifts. 3: fls. pink or white. N. Amer.

speciòsa: Gynandropsis speciosa.

spinosa (C. giganta opens species).

spinosa (C. giganta of the trade. C. pungens). Spiden-Flower. Pubescent erect strong-scented ann. to 4 ft., with short strong spines on the sts. and very long stamens and stalked pods: Ifts. 5-7. Trop. Amer., sometimes run wild. Vars. alba and rosea are listed.—Some of the stock raised as C. grgantea and C. grandis is Polanisia trachysperma (which see).

CLERODÉNDRUM (Volkameria). GLORY-OWER. Verbenaceæ. Trees, shrubs or herbs with opposite or whorled simple lvs. and white, violet or red fls. in terminal cymes or panicles, the stamens long-exserted; grown in the green-house or out-of-doors in the S. Propagated by seeds or cuttings of half-ripened wood kept in a temperature of about 70°.

Balfouri C Thomsonis

Búngei (C. fatidum). Shrub to 6 ft.: lvs. broadly ovate, to 1 ft. long, coarsely toothed, reddish pubescent beneath: fls. rose-red, 34 in. across, in a head-like cluster to 8 in. across. China; adapted only to southern parts, as Fla., Gulf Coast, Calif.

Colebrookianum. Shrub to 8 ft.: lvs. cordate-ovate, to 9 in. long: fls. rose-purple to white, in loose panicles 1-2 ft. across, corolla-tube to 1 in. long: fr. blue, to 1/4 in. across. India.

cyrtophýllum. Shrub: lvs. oblong-ovate to lanceolate, usually long-acuminate, glabrous, pale beneath: fis. ju cymose panicles, calyx 4-lobed, lobes acute. N. China.

deléctum: C. Thomsoniæ var.

fállax: C. speciosissimum.

Fárgesii: C. trichotomum var.

fcetidum: C. Bungei.

fragans. Shrub 5 to 8 ft.: lvs. broadly ovate, to 10 in. and more long, coarsely toothed, pubescent: fls. white or pale pink, 1 in. across, in terminal clusters resembling the hydrangea, fragrant, with exserted stamens and pistils. China, Japan; adapted Fla. to Calif.—The single-fld. form is seldom seen, the common one both in cult. and run wild being var. pleniflorum, with double fls. in a very compact head.

glabrum. Shrub or small tree, glabrous except sometimes on veins of lvs., which are opposite or whorled, oblong-ovate, to 5 in. long, mostly pointed, entire, glossy above: fis. small, white or pinkish, fragrant, in dense broad terminal cluster. S. Afr.; adapted to S. Calif., S. Fla.

hýbridum is listed as a red-fld. hort. form.

japónicum (C. squamatum). Shrub to 10 ft.: lvs. oval, cordate at base, entire or toothed: fls. bright scarlet, in panicles. China.

ndtans. Shrub 5-7 ft. high: lvs. obovate to oblance olate, to 8 in. long, acuminate and often sharply so, usually entire: fis. white, few in lax terminal panicles, tube to ½ in. long: fr. purple, to ½ in. across. Assam to Himalayas.

Siphonanthus (Siphonanthus indica). TUBEFLOWER, TURKS-TURBAN. Striking erect shrub or woody herb to 8 ft., bearing terminal panicles of white fis. with tube to 4 in. long, closing in morning: lvs. mostly whorled, lance-oblong, to 5 in. or more, entire: fr. showy, red-purple persistent berry subtended by red-brown calyx. E. India; grown in Fla. and spontaneous.

speciosissimum (C. fallax). Shrub to 4 ft.: lvs. ovate,

heart-shaped at base, to 1 ft. long, entire or toothed, densely pubescent: fis. bright scarlet, to 2 in. across, in panicles to $1\frac{1}{2}$ ft. long. Java.

speciosum. Hybrid between C. Thomsoniæ and C. splendens, having dull red fis.

splendens. Twining shrub: lvs. oblong or elliptic, to 6 in. long: fis. bright scarlet or yellow, 1 in. across, in many-fid. cymes. Trop. Afr.—Grown under glass.

squamatum; C. japonicum.

Thomsonise (C. Balfourt). Twining evergreen shrub, favorite in greenhouses: lvs. ovate, to 5 in. long, entire: fis. crimson with large white calyx, in branching racemes. W. Afr. Var. deléctum has very large clusters of rosemagenta fis. Var. variegatum is a variegated form.

trichôtomum. Shrub to 10 ft.: lvs. ovate, to 5 in. long, entire or toothed, pubescent: fls. white with conspicuous reddish-brown calyx, in panicles. Japan; hardy N. Var. Fårgesii (C. Fargesii) has smaller nearly glabrous lvs.

CLÉTHRA. WHITE-ALDER. Clethracex. Shrubs or small trees with alternate simple toothed deciduous or persistent lys. and fragrant white or pink fls. in terminal racemes or panicles in late summer. Allied to Ericacea; species in E. Asia, E. N. Amer., Madeira, and in tropics; most of those listed below are hardy in northern or north-central states.

Propagated by seeds sown in pans in spring, greenwood cuttings under glass, layers, and division.

acuminate. To 15 ft.: lvs. oval or oblong, to 8 in. long, acuminate: racemes nodding, usually solitary. Va. to Ga. acuminate: racemes nodding, usually solitary. Va. to Ga.
alnifòlia. Sweet Peppersbush. Sumer Sweet.
To 10 ft.: lvs. obovate, to 4 in. long, obtuse or acute:
racemes erect, usually panicled. Me. to Fla. Var. paniculàta (C. paniculata) has lvs. less toothed, smooth on both
sides; fis. in panicles; by some authors not considered
distinct from the typical form. Var. ròsea has pink fis.
arbòrea. To 20 ft., evergreen: lvs. narrow-elliptic, to
4 in. long, acuminate, shining above: racemes panicled;
fis. fragrant. Madeira; not hardy N.

barbinervis. To 30 ft.: lvs. obovate, to 5 in. long, acuminate, pubescent: racemes panicled; fls. fragrant.

Fárgesii. To 12 ft.: lvs. oblong-ovate, to 6 in. long, sharply toothed: fls. white, in racemes to 7 in. long, fragrant. Cent. China.

paniculàta: C. alnifolia var.

tomentòsa. To 8 ft.: lvs. obovate, to 4 in. long, acute or acuminate, tomentose beneath: racemes erect, solitary or few. N. C. to Fla. and Ala.

CLETHRACEÆ. WHITE-ALDER FAMILY. Only one genus, Clethra, which is grown for ornament. Family is characterized by regular bisexual fls. having 5-parted calyx, 5 separate petals, 10 stamens, superior 3-celled ovary, and capsular

CLEYERA JAPONICA: Eurya ochnacea.

CLIÁNTHUS. Shrubs par-Leguminos x.tially trailing and often trained on rafters in greenhouses or grown out-of-doors in the S., with pinnate lvs. of many small lfts., large papilionaceous fls. in pendulous axillary racemes, the keel petal long and beak-like, and cylindrical inflated pods. Propagated by seeds and cuttings and C. Dampieri by grafting on roots of Colutea arborescens.

Dampieri. Glory-Pea. To 4 ft., grayish-pubescent: fis. scarlet with a large purplish-black blotch at base of standard, to 3 in. long: pods to 2½ in. long. Australia.

puníceus. Parrots-Bill. Parrot-Beak. Red Kowhai. To 6 ft.: fis. crimson, to 3 in. long: pods to 3 in. long. New Zeal. Var. álbus has white fis.

CLIFF-BRAKE: Pellæa.

CLIFTONIA. BUCKWHEAT-TREE. TITI. Cyrillacex. An evergreen shrub or small tree, C. monophýlla (C. ligustrina), native in swamps Ga., Fla. to La., may sometimes be transplanted to grounds. It has narrow simple lvs. to 2 in. long and terminal racemes of white-blush fls. in spring, and winged fr.

CLINOPÒDIUM. Labiatæ. Shrubs or herbs of the north temp, zone: fls. in axillary cymes. the calvx and corolla 2-lipped; stamens 4. By many authors this genus is included in Satureia.

Calamintha: Satureia Calamintha.

carolinianum: C. georgianum.

coccineum (Satureja coccinea). Shrub to 3 ft.: lvs. obovate or spatulate, entire: fls. scarlet, about 1½ in. long, in axillary cymes. Ga. to Ala.

dentatum. Shrub to 2½ ft.: lvs. obovate to elliptic, about ½ in. long or less, toothed at apex, petioled: fts. white or purplish, to ½ in. long, in clusters of 1-3. Fla.

georgianum (C. carolinianum). Shrub to 2 ft.: lvs. ovate, to 1 in. long, toothed, sessile or nearly so: fls. white or pinkish-purple spotted with purple, 1/2 in. long, in clusters of 5-6. N. C. to Fla. and Miss.

Néneta: Satureia Neneta

CLINTÒNIA. Liliacex. Herbs spreading by long underground rhizomes, having broad basal lvs. and fls. in umbels or solitary at end of scape, the perianth-segms. distinct; native in N. Amer. and E. Asia. There is another Clintonia which is properly Downingia, comprising the species elegans and pulchella.

Clintonias should be planted in moist shady and woodsy places. Propagated by division of roots in spring; attractive for colonizing.

Andrewsiana. To 11/2 ft.: fis. rose-purple, 1/2 in. long, in umbels; berries blue. Calif.

borealis. To 1½ ft.: fls. greenish-yellow, ¾ in. long, nodding, in 3-6-fld. umbels: berries blue. E. N. Amer.

umbellata. To 1½ ft.: fis. white often spotted with purple, ½ in. long, in many-fid. umbels: berries black. N. Y. to Ga. and Tenn.

uniflora. Queen-Cup. To 8 in.: lvs. ovate-lanceolate: fls. pure white, to 1½ in. across, usually solitary: berries prussian blue. Deep woods, N. W. U. S. and B. C.

CLITÒRIA. BUTTERFLY-PEA. Leguminosæ. Per. herbs or shrubs, often climbing, with pinnate lvs., showy papilionaceous fls., solitary or in axillary racemes, and flattened pods; grown for ornament far S. and also under glass. Propagated by seeds or cuttings under glass.

cajanifòlia. Herb to 2 ft.: líts. 3, gray-pubescent beneath: fls. pale violet, to 1½ in. long; pods to 2½ in. long. Trop. Amer., trop. Asia.—Grown as a cover-crop in the

marians. To 3 ft., often twining: lfts. 3: fls. light blue, 2 in. long., June-July: pods to 2 in. long. N. J. to Fls. and Tex.

ternatèa. Slender twiner: lfts. 5-7: fls. bright dark blue with lighter markings, 2 in. long: pods to 4½ in. long. Spread in the tropics, probably Asian.—An attractive climber, hardy only in southern parts. Fls. sometimes more or less double, also white.

KAFIR-LILY. A maryllidace x.African herbs with fleshy roots, the expanded lf.-bases forming bulb-like parts, narrow evergreen lvs., and showy reddish-yellow or scarlet ils. in terminal umbels, the perianth-tube short.

Clivias are good greenhouse or house subjects. Well-grown plants should be kept in the same pots for several years, giving applications of liquid manure. Water should be practically withheld during resting period. In subtropies they are grown in shady places. Propagated by

cyrtanthifldra (Imantophyllum cyrtanthiflorum). Hybrid between C. miniata and C. nobilis.

hýbrida: hort, name.

miniata (Imantophyllum miniatum). Lvs. to 1½ ft. long and 2 in. wide, thick and glossy: fis. erect, scarlet, yellow inside, to 3 in. long: berries bright red, 1 in. long.—The usual species in cult.

nóbilis. Fls. many, drooping, narrower and shorter than in C. miniata, red and yellow and tipped green.

CLOCK-VINE: Thunbergia.

CLON, CLONE. Variety, group or variation propagated by asexual or vegetative parts. Such races may not "come true" from seeds. The horticultural varieties of roses, apples, oranges, strawberries, carnations are clons, also the cultivated forms of day-lilies and plantain-lilies that do not produce seeds. Clon is a horticultural rather than taxonomic term.

CLOUDBERRY: Rubus Chamæmorus.

CLOVER. Species of Trifolium. The clovers are primarily hardy forage and meadow plants and do not come within the range of this Hortus. Many of the species are interesting and showy in the garden, as for example Trifolium rubens, T. incurnatum, T. alpestre, T. hybridum; some of the small kinds are useful in the rock-garden. Clovers are best propagated by seeds; some of them are annuals but even the perennials are likely to be short-lived. T. repens may be increased by the rooting runners, but as a constituent of lawns it is started from seeds. See Trifolium, also Alysicarpus.

CLOVER: Trifolium, Medicago. Alyce: Alysicarpus. Bokhara: Melilotus alba. Bur: Medicago. Bush: Lespedeza. Holy: Onohychis vanafolia. Hubam: Melilotus alba var. annua. Japan: Lespedeza striata. Mexican: Richardia scabra. Muck: Erodium moschatum. Owls: Orthocarpus. Prairie: Petalostemum. Sweet: Melilotus. Tick: Desmodium. Water -: Marsilea.

CLOVE-TREE: Eugenia aromatica. CLUB-MOSS: Lycopodium.

CLÌISIA. Guttifer x.Directions trees and shrubs of trop. and subtrop. Amer., occasionally seemingly epiphytic in habit, branches usually horizontal, and lvs. leathery without conspicuous lateral veins. Technically the fls. differ from those of Calophyllum and Mammea in having a many-ovuled ovary with style wanting or very short: fr. a fleshy caps.

rôsea. Tree 20-50 ft. high, growing on other trees and rocks: lvs. obovate, to 8 in. long, base cuneate: fis. pink and white, to nearly 2 in. across: fr. greenish-white, globose, to 3 in. diam. W. Indies, Panama, Venezuela.—The seeds contain a streky resun which is extracted and used in caulking the scams of boats.

CLYTÓSTOMA. Bignoniacex.Evergreen climbing shrubs with lvs. of 2 entire lfts. and a terminal tendril (or simple on blooming twigs), large attractive funnelform fls. in panicles, and prickly capsular frs.; native in S. Amer.

Clytostomas are grown under glass in the North and in the open in warm regions. They thrive in fertile soil. Propagated by cuttings.

callistegioides (Begnonia speciosa). Lits. oval-oblong, to 3 in. long, wavy-margined: fis. lavender and streaked, to 3 in. long and 3 in. across. Brazil, Argentina.

purpureum (Bignonia purpurea). Lits. ovate-oblong, to 3 in. long, usually entire: fis. mauve with white throat, 1 in. long. Uruguay.

CNEORÍDIUM. Rutacex. Stiff-twiggy evergreen shrub 2-4 ft. high, on hills in S. Calif., with abundant very fragrant pedicelled fis. in upper axils or in very short clusters, nearly white inside and pinkish outside: lvs. linear, about 1 in. long, obtuse, dotted: fr. globose, drupe-like, reddish-brown, about ¼ in. diam. C. dumòsum is the only species; adapted to cult. in its region.

CNEÒRUM, the only genus of Cneoracex. Shrubs with alternate leathery entire lys. and solitary or cymose fls. having 3-4 sepals, petals and stamens, and fr. a 3-parted drupe; native in the Medit. region and Canary Isls.; to be grown in mild climates.

tricoccon. Spurge-Olive. Evergreen, to 4 ft., glabrous: lvs. oblong, to 2 in. long, shining: fis. deep yellow, 1-3 in the axils: fr. greenish-black. S. Eu.

CNICUS. BLESSED THISTLE. Composite. One branching thistle-like ann. in the Medit. region and Caucasus, suitable for rock- and wild-gardens. Easily grown from seed. C. benedictus (Carduus benedictus. Centaurea benedicta). To 2 ft.: lvs. oblong, pinnately cut and toothed, spiny: heads yellow, 1 in. across, terminal, surrounded by leafy bristly bracts. See Cirsium and Carlina for other species advertised as Cnicus.

CNIDÓSCOLUS. TREAD-SOFTLY. Euphorbiacex. Per. monœcious American herbs or subshrubs, mostly with stinging-bristly foliage: lys. alternate, petioled, entire, toothed or divided: fls. in cymes, apetalous: fr. an ovoid caps. separating into 2-valved carpels. Distinguished from Jatropha by the apetalous fls. and staminate fls. with 10-30 stamens.

Hate IIS. WILN 10-50 Stamens.

texhus (Jatropha texana). To 2 ft., covered with stiff bristly yellowish hairs: lvs. to 6 in. across, deeply 3-5-lobed into toothed or cut segms. on long petioles: fls. white, small, staminate calyces bristly. Ark. to Tex.—A closely related species not known to be in cult. is C. stamulosus, having stinging hairs and staminate calyces mostly glabrous at maturity. Va. to Fla. and Tex.

COACH-WHIP: Fougueria splendens. COAT-FLOWER: Tunica Saxifraga.

COBÆA (Rosenbergia). Polemoniacex. Trop. American climbing shrubs or big herbs with pinnately compound lys. terminating in a branched tendril and bell-shaped violet or bright green fls. solitary in the axils, the calyx large, inflated and leaf-like; grown under glass and in the open. Treated as annuals in northern gardens. Propagated by seeds.

macrostoma. Climbing to 10 ft.: lvs. of 6 obovate lfts.: fts. yellowish-green, on long stalks. Guatemala.

scándens. Climbing to 25 ft.: lvs of 4-6 oval or oblong lfts.: fls. violet or greenish-purple, 2 in. long and 1½ in. across, on very long stulks. Mex. Var. álba has white fls. and purphrea deeper purple.

COBNUT: Corylus Avellana var. grandis.

COCA: Erythroxylon Coca.

COCAINE-PLANT: Erythroxylon Coca.

COCCÍNIA (Cephalandra). Cucurbitacex. Tendril-bearing vines from the Asian and African tropics, perhaps a score of species, one of which is rarely seen under glass and is somewhat run wild in trop. Amer.: lvs. angled or lobed: plants mostly diccious, the pistillate fls. solitary and staminate solitary or racemose: fr. roundish to oblong and somewhat berry-like, small, indehiscent.

cordiolia (C. indica). IVY GOURD. Climbing or prostrate, to 6 ft. or more, smooth, root per.: lvs. broadly triangular-ovate and angled, 2-4 in. across: fls. white, bell-shaped, corolla about 1½ in. long with sharp lobes: fr. ovoid or oblong, smooth, scarlet. Asia, Afr.

indica: C. cordifolia.

COCCOCÝPSELUM (Tontanea). Rubiaceæ. Prostrate herbs of trop. Amer. with opposite simple lvs. and funnelform fls. in heads; one suitable for ground-cover or basket-plant.

guianénse. Lvs. ovate, to 2½ in. long, hairy: fis. pur-plish, small: fr. a blue berry about ¾ in. long. Trinidad, N. S. Amer.

COCCÓLOBIS (sometimes spelled Coccoloba). Trop. and subtrop. American Polygonace x.trees and shrubs with alternate entire often very large lvs., greenish fls. in racemes or spikes and fleshy berry-like frs.

Grown out-of-doors in warm and frostless climates, and under glass northward. They do best in rich sandy soil. Propagated by seeds, cuttings of ripe wood and layer-

floridana (C. laurifolia). Pigeon-Plum. Small tree near coast in S. Fla.: lvs. oblong, entire, 2-4 in. long: racemes short bearing edible pear-shaped fr. about 1/4 in. long.

grandifòlia (C. pubescens). Tree to 80 ft.: lvs. orbicular, to 3 ft. across, rusty-pubescent below and with prominent veins: fls. greenish, m erect terminal racemes to 2 ft. long.—Grown in its juvenile stage as a pot-plant for the great ornamental lvs.

laurifòlia: C. floridana.

pubéscens: C. grandifolia.

uvífera. Sea-Grape Tree to 20 ft. or more: lvs. orbicular, to 8 in. across, cordate at base, leathery, glossy and veined red: fls. white, in dense racemes to 10 in. long: frs, purple, resembling bunches of grapes, used for jelly. A characteristic native tree on coasts from S.Fla. southward.

COCCOTHRINAX. SEAMBERRY PALMS. Palmacex. Perhaps 30 species now recognized, from S. Fla. through the W. Indies: small or slender unarmed hermaphrodite fan-palms distinguished from Thrinax by the spadix mostly shorter than petioles (and often curling or incurving with age), stamens mostly 9–12, fr. dark colored inside and out, berry-like, and particularly by albumen ruminate and outside of seed furrowed to correspond. The species have been greatly confused and it is not yet clear how many of them may be planted within our territory.

Alta (Thrincoma alta. Thringus lara and lattfrons). To 20 or 30 ft., with large lvs. and broad segms. silvery underneath and fr. distinctly pedicelled; segms curved over but usually not hanging, main ones to 1½ in. broad at middle: fr. about ½ in. diam., dark brown to blackish. Puerto Rico.—Planted in S. Fla. where it has been called Thrinax altrasima.

anómala: Zombia antillarum.

argentata (C. jucunda, C. Garberi). To about 15 or 20 ft. but sometimes (in the stature called Garberi) fruiting at only 1-2 or 3 ft. of trunk, with small very deeply divided lys. deededly silvery underneath and glossy above, the segms narrow (usually less than I in. broad) and in mature plants many of them hanging in irregular fashion: fr. $\frac{3}{8} = \frac{5}{8}$ in. diam., short-pedicelled, brown at maturity. S. Fla (Broward Co. to Marquesas Isls), Bahamas.

argéntea. To 30 ft. or more, with medium large lvs. silvery underneath and dull green above; segms. usually not drooping and about 34-1 in. across: fr. 14 in. diam., sessile. Hispaniola.—Apparently little known in U. S.

barbadénsis: confused name.

crinita. To 30 ft, stocky, the trunk buried in very long harr-like fibers: Ivs. parted ½ or more depth of blade, greenish underneath and glossy above, segms. ¾-1½ in. broad and curved over: fr. to ¾ in. diam., on short thick pedicels. Cuba, where it was long known only in a sterile state; it has been represented in the U. S. by a single sterile plant under glass at the Brooklyn Bot. Gard., but may now be expected elsewhere.

Gárberi: C. argentata. jucúnda: C. argentata. radiàta: confused name.

CÓCCULUS (Cebatha. Epibaterium). SNAIL-SEED. Menispermaceæ. Shrubs, erect or twining, with alternate, entire or lobed lvs., small unshowy unisexual fls. in racemes or panicles, and drupaceous frs.; of wide distribution. Easily cult. in moist soil. Propagated by seeds or cuttings of half-ripened wood under glass.

carolinus. Carolina Moonseed. Twining: lvs. ovate, to 4 in. long, entire or 3-5-lobed, pubescent beneath panicles to 5 in. long: fr. red. Va. to Fla. and Tex.; hardy well N.

laurifòlius. Evergreen shrub to 15 ft.: lvs. oblong, to 6 in. long, leathery and shining: panicles to 2 in. long: fr. black. Himalayas; adaptable only in warm climates.

trilobus. Twining: lvs. ovate, to 3½ in. long, entire or 3-lobed, pubescent on both sides: fis. in axillary cymes: fr. black. Japan, China, Philippines; hardy N.

COCHEMIÈA. Cactacex. A few small cylindric tubercled cacti of Lower Calif. with tubular slender scarlet fls. bearing petal-like sepals, formerly included in Mammillaria and treated the same under cult. See Cacti.

Halei (Mammillaria IIalei). Cespitose, sts. nearly upright to 20 in., densely covered with reddish-brown to gray spines, tubercles short with woolly axils; radials 10-20; centrals 3 or 4, to nearly 1½ in. long, not hooked; fls. to 2 in. long, scarlet-red.

marítima: an invalid name for a plant differing from C. Hale in the spines being bright reddish-brown and arising from white-woolly areoles. Lower Calif.

Pôndii (Cactus Pondii). Sts. to 18 in. tall and 2½ in. diam., tubercles conical; radial spines 15-25 the outer ones white, the inner brown; centrals 4-6, to ½ in. long, often hooked: fls. glossy pale scarlet.

Posélgeri (Mammillaria Poselgeri and M. Roseana). Sts. numerous, sometimes creeping or hanging, often 6 ft. long and 1½ in. thick, tubercles far apart and somewhat flattened; radials 7-9; central 1 and hooked: fts. about 1½ in. long

setispina (Mammillaria setispina). Sts. ascending, to 1 ft. high, axils woolly; radials 10-12 and white with black tips; centrals 1-4: fls. about 2½ in. long, scarlet-red.

COCHINEAL PLANT: Nopalea cochenillifera.

COCHLEARIA. Scurvy-Grass. Cruciferæ. One little bien. or per., C. officinalis, of high northern regions, is a medicinal plant, and has been grown as a salad plant but the tarry flavor is against it for most persons. For salad, it is grown as an ann., lvs. being ready two to three months after sowing; succession sowings may be made. The plant prefers a cool position, or one partially shaded. It grows 1 ft. high, less or more, when in bloom; the early basal lvs. are heart-shaped or kidney-shaped; fls. small, white, in spring; pod or silicle 1/4 in. or less long. Other species of Cochlearia inhabit the colder parts of north temp. zone but are not cult. For C. saxatilis and Boissieri see Kernera.

COCHLIÒDA. Orchidaceæ. Epiphytic orchids native in the Andes of S. Amer., having rose or scarlet fls. in commonly long racemes, the sepals and petals similar. Cult. as for *Odontoglossum*.

Noezliana. Pseudobulbs to 2 in. long: lvs. linear-oblong: fls. orange-scarlet or rose-red, about 1½ in. across; lin 3-lobed with yellow on disk. Peru, Bolivia.

COCHLOSPERMACEÆ. COCHLOSPERMUM FAMILY. Two genera of woody plants native in trop. regions, separated from Bixaceæ on technical characters of fls. and capsules. Cochlospermum is treated below.

COCHLOSPÉRMUM (Maximilianea). Cochlospermaceæ. Trop. trees or shrubs with palmately lobed or divided lvs., fls. in racemes or panicles appearing at end of dry season before the lvs., and capsular fr.; one species grown in tropics and intro. in S. Calif.

vitifolium. Tree to 40 ft.: lvs. alternate, deeply 5-lobed, to 1 ft. across, the lobes toothed: fis. bright yellow, 4 in. and more across, in terminal clusters, with numerous stamens: caps. to 3 in. long, velvety-pubescent. Mex., Cent. and S. Amer.

COCKSCOMB: Celosia argentea var. cristata. COCKS-EGGS: Salpichroa rhomboidea. COCKS-FOOT: Dactylis glomerata.

COCONUT. The fruit of Cocos nucifera, a widespread palm. The products of the coconut tree are mainly four: toddy or beverage derived from the sap obtained from incising the flower-clusters and which may also be a source of sugar; coir, the fiber from the husk of the nut, much used in cordage and in the making of brushes and mats and otherwise; copra, the dried meat of the nut, employed in the making of oil; the mature edible nut itself.

Coconuts thrive in the tropics, but not necessarily on the seacoast, and grow well in southern Florida but the nuts are there less an article

of commerce than for propagating purposes; that is, in Florida they are planted for ornament and home use. The tree is grown only from seeds. which are ordinarily planted in a shaded seedbed with the nut not completely covered and preferably once or more transplanted before being set in permanent place. When only a few trees are desired, the nut may be planted where the plant is to grow if quick effects are not desired. For fruit-bearing, the trees are planted when perhaps three or four years old. About 25 feet apart each way is a good spacing for a commercial grove. Ordinarily coconuts receive little attention in tillage or fertilizing but they respond to good treatment as well as other plants. A few fruits may be borne in four or five years but no important yield is to be expected before about ten years. Beyond twenty years the grove should be in full bearing. A good tree on fertile ground should yield 75 or more nuts a year, but the average is probably not more than one-third of this number. There are many varieties of coconuts; and in any case the grower should choose nuts from trees producing abundantly of choice fruits if he expects the best product.

COCONUT, DOUBLE: Lodoicea.

Palmacex.As now defined, a monotypic genus including only the coconut, C. nucifera, considered to be of Asiatic or Polynesian origin. Ubiquitous practically unarmed tree in trop. littorals, reaching 60-80 ft. or more, with a more or less crooked or inclined trunk, the spadices from the lower axils of the crown; spathe striate on the outside but not plicate-sulcate: lvs. pinnate, to 15 or more ft. long; pinnæ many, linear-lanceolate and longpointed, of firm texture: staminate fls. numerous and borne on the upper part of the branches of the spadix, the few large pistillate fls. near the base; stamens 6; sepals and petals of pistillate fls. convolute-imbricate: fr. very large, 1-seeded, with an interior cavity containing nutrient liquid. An abundant tree in southern part of

peninsular Fla., apparently spontaneous on some of the Keys. See Coconut.

The breaking up of the old genus Cocos places the kinds planted in the U. S. or in our literature under the following genera: Arecastrum, Arikuryroba, Butia, Rhyticocos, Syagrus. Following are the Cocos names likely to be met in lists:

Alphonsei: unrecognized name.

amàra: Rhyticocos amara.

Arechavaletana: Arecastrum · Romanzoffianum VAL

argentea: Syagrus argentea, apparently not cult., and probably the hort. name belongs with another palm.

australis: Butia capitata; of botanists, Arecastrum Romanzoffianum var. australe.

Blumenàvia: see Butia eriospatha.

Bonnètii: Butia Bonnetii.

botryóphora: Arecastrum Romanzossianum var. ruophorum.

braziliënsis: unidentified name.

campéstris: Syagrus campestris, probably not in cult. here, but the name has been attached to a Butia.

capitata: Butia capitata.

comòsa: Syagrus comosa, apparently not in cult., but name has been associated with a Butia.

coronàta: see Butia capitata.

Datil: Arecastrum Romanzofianum var. australe.

eriospatha: Butia eriospatha.

flexudsa: Arecastrum Romanzoffianum vs of botanists, a Syagrus apparently not in cult. var. australe; Gaértneris Rutia Ronnetii

hùmilis: unidentified name: has been applied to a Butia.

instanis: Sugarus insignis.

lanidèa: confused name; has been attached to a Butia. littoralis: unidentified name: has been used for a Butia.

macrocárpa: Suagrus macrocarpa.

Mariæ-Reginæ: unidentified name. maritima: unidentified name.

Maximiliana: probably a Syagrus.

Nehrlingiana: Butia capitata var. Nehrlingiana.

Normánbyi: Normanbya Normanbyi. odorata: Butia capitata var. odorata.

paraguayensis: Butia paraguayensis; apparently not in cult. in our territory.

petræa: Syagrus petræa.

plumdsa: Arecastrum Romanzoffianum. Procopiana: Syagrus macrocarpa. pulpòsa: Butia capitata var. pulposa.

Romanzoffiana: Arecastrum Romanzoffianum.

rupéstris: Syagrus petraa.

sápida: Syagrus sapida, probably not grown here; the hort, name may mean Rhopalostylis sapida.

schizophýlla: Arikuryroba schizophylla. vinffera: applied to an undetermined Butia. Weddelliana: Syagrus Weddelliana.

Yatav: Butia Yatav.

Yurumáguas: a doubtful Butia.

CODARIOCALYX: Desmodium motorium.

CODIÀUM (Phyllaurea). Croton (of florists). Euphorbiacex. Shrubs from the Old World tropics with thick alternate simple or lobed lvs., small monœcious fls. in axillary racemes, and capsular fr.; extensively grown in southern regions and under glass for the colored ornamental foliage, extensively variable.

Any good soil is suitable for crotons. They develop better coloring if planted in sunny situations. Propagated by seeds, but named sorts should be increased by cuttings of half-ripend wood over bottom heat. Separate plants may be produced from large branches by air-layering; a cut is made in the stem below the leaves and tied with moss; roots will form in about three weeks and the part may be cut and noted.

made in the stem below the leaves and tied with moss; roots will form in about three weeks and the part may be cut and potted.

variegātum var. píctum. To 6 ft. and more: lvs. ovate-lanceolate to linear, entire or lobed, sometimes cut almost to midrib, variously marked with white, yellow or red: fis. white.—Runs into numerous named forms of which the following are the best known: amābile with bright colored lanceolate lvs.; anatomēnse with narrow lvs.; Andreanum with broad yellow lvs.; aucubæfōlium with broad yellow red-blotched lvs.; aûreo-maculātum with green lvs. spotted yellow: Bergmanii with broad cream-yellow lvs. blotched with green; brilliantíssimum with narrow lvs.; bruxellēnse with broad lvs.; Chantrièri with narrow red lvs.; cheisonii with marrow lvs.; cornùtum with mottled lvs.; Chidsonii with narrow lvs.; cornùtum with mottled yellow lvs. and projecting midribs; Crāigii with 3-lobed lvs.; Crōnstædii with sprally twisted lvs. variegated yellow; Davisii with narrow lvs. variegated white; Dormanniānum, small bronze-red and yellow lvs.; edmonténse with narrow bright colored lvs.; elegantíssimum with narrow yellow dotted lvs. and red petiole; Evansiānum with 3-lobed yellow lvs. veined and mottled with red; fasciātum with broad lvs. veined and mottled with red; fasciātum with broad lvs. veined with narrow lvs.; Hanburyānum with narrow yellow lvs. marked with rose; illústre with 3-lobed lvs. variegated with yellow; nimitābile, lvs. yellow veined with red; interrúptum, lvs. yellow with red midrib, sometimes twisted; irregulāre with irregular lvs. and yellow spots and midrib; Jāmesii with broad lvs. irregularly blotched with yellow or white; Johānnis, long narrow lvs. with yellow margins and center; macrophyllum with large lvs.; montefontainénse, with broad, green and yellow; musālcum with yellow and green lus; Něwmannii with broad dark crimson lvs.; nobile with linear yellow lvs. variegated with red; picturātum with richly colored lvs.; Pucciānum with broad lvs.; spotted with red; robro-lineātum with yello

yellow; Thómsonii, lvs. prominently yellow marked; tórtile with spirally twisted lvs. variegated with red; trīlobum with 3-lobed yellow blotched lvs.; undulātum, broad wavy lvs. veined with red or purple; variābilis with narrow lvs.; Veitchii with broad lvs. vanegated with red; volūtum with narrow lvs.; Wárrenii, lvs. yellow variegated with red; Weismanii with narrow wavy-margined lvs. variegated with yellow and with red petiole.

CODONÓPSIS. Campanulaceæ. Per. herbs of Cent. and E. Asia, 40 or more species, bearing bell-shaped or nearly rotate fls. in shades of blue and yellow with darker veins and blotches, some of them climbing or lopping, with milky juice and heavy scent: lvs. mostly opposite: fr. a caps. They are odd rather than showy plants; require winter protection in the N.; otherwise cult. as for Campanula.

clematidea (Glossocomia clematidea). St. erect to 1 ft. or sometimes flexuose and more or less running or climbing: lvs. ovate to oblong to nearly lanceolate, about 1 in. long, petiolate: fls. terminal and usually solitary, pale blue with dark lines and purple blotch inside, nearly or quite 1 in. long, broadly bell-shaped; calyx-lobes large and at length strongly reflexed, not ciliate unless at tip. Cent. W. Asia.

meleagris. St. erect, to 18 in.: lvs. clustered near base, oblong, nearly sessile, 2-3 in. long: fls. terminal, solitary, drooping, greenish-yellow with purplish spots and veins, 1½ in. long. W. China.

ovata. St. upright or somewhat decumbent at base, to 1 ft.: lvs. ovate, about 34 in. long, sessile or nearly so: fls. solutary or few on long bracted pedicels, 1 in. or more long, narrowly bell-shaped, blue with darker veins; calyx-lobes erect, finely chiate on margins. Kashmir.—Plants grown under this name are likely to be C. clematidea.

pilósula (C. subestris). Twining: lvs. broadly ovate and subcordate, undulate, hairy underneath: fls. pale yellow or greenish-yellow, bell-shaped, 1 in. long more or less; calyxlobes broadly lanceolate, glabrous. N. E. Asia.

rotundifòlia. Trailing or climbing, somewhat hairy: lvs. ovate, mostly cordate, petioled, crenate-serrate: fis. solitary and terminal, to 1 in. long, narrow-bell-shaped, yellowishgreen and veined purple; calyx-lobes large and leaf-like, nearly as long as corolla, becoming reflexed. Himalayas.

silvéstris: C. pilosula.

Tängshen. Twining, more or less hairy at joints: lvs. ovate to ovate-lanceolate, about 2 in. long, short-petioled, indistinctly create-serrate: fis. axillary on long peduncles, bell-shaped, more than 1 in. long, greenish with purplish stripes and spots; calyx-lobes oblong-lanceolate. China.

thalictrifòlia. Very slender: lvs. small, rounded, densely harry, not more than ½ in. long: fis. nearly cylindrical or tubular, about 1 in long, blue. Himalayas.

viridiflòra. Climbing: lvs. ovate to lanceolate, 1 in. long more or less, subcordate, lightly harry, petioled, sinuate: fis. terminal, long-stulked, about 1 in. long, yellowish-green with purphsh dots in base; calyx-lobes serrate. E. Asia.

CŒLIA. Orchidacex. Epiphytes native in Cent. Amer. and W. Indies having pseudobulbs bearing 2-4 lvs. and fls. in dense racemes, the column produced into a foot to which the lateral sepals are attached at base. For cult. see Orchids.

Baueriana: C. triptera.

macrostachya. I.vs. narrowly oblong-lanceolate, to about 2 ft. long: fls. rose, on scapes somewhat shorter than the lvs. the lip with 2 small sacs below. Aug.—Oct. Mex. to Costa Rica.

triptera (C. Baueriana). Lvs. linear-lanceolate, to 18 in. long: fis white, on short scapes to about 6 in. long, the ovary sharply 3-winged. Mar.—May. Mex., W. Indies, Guatemala?

CŒLOGLOSSUM: Habenaria viridis var. bracteata.

CŒLÓGYNE. Orchidaceæ. Epiphytes from the eastern hemisphere having pseudobulbs bearing 1–2 lvs. and showy fls. in racemes, the lip concave at base, usually 3-lobed and keeled. Grown under glass, often suspended, mostly in intermediate temperatures: see Orchids.

asperata. Lvs. to about 2½ ft. long and 3-6 in. wide: fls. white or cream-white, fragrant, 3 in. across, in several-to many-fld. drooping racemes to about 16 in. long; lip marked with yellow, orange and brown, and wavy on margins. Mar.-Aug., Dec. E. Indies, Philippines, Malaya.

barbata. Lvs. to 18 in. long and about 2 in. wide: fls. in a dense erect raceme about as long as the lvs., white with ip brownish within and fringed. Oct.—Feb. Himalayas.

burfordiénse. Hybrid between C. asperata and C. pandurata having green sepals and brown lip.

cinnamòmea. Lvs. oblong-lanceolate: fis. in 6-8-fid. recurved racemes, yellowish or yellowish-white, the side lobes of lip yellowish-brown with white margin. Java.

corrugăta: C. nervosa.

cristata. Lvs. to 1 ft. long and 1 in. wide: fls. in drooping racemes, large, fragrant, snow-white with 5 yellow keels on lip. Feb.—Apr. Himalayas. Var. Chátsworthii has large pseudobulbs and fls. Var. hololeùca (var. alba) has white keels. Var. Lemoniàna has keels fringed with citron-yellow. Var. máxima has very large fls.

Dayana. Lvs. to 126 it. long and 4 in. wide: racemes drooping, loosely many-fld., to 40 in. long; fls. to 232 in. across, whitish or pale yellow with the lip blotched with chocolate-brown within and traversed by 6 white keels. May-Aug. Malaya. Var. grandis is listed.

elâta. Lvs. to 1½ ft. long and 3 m. wide: racemes erect, to 14-fid., to 16 in. high; fis. white or cream-white with lip having orange or yellow spot and 2 keels edged with red. Feb.—May. Himalayas.

fimbriata. Lvs. to 5 in. long and rarely 1½ in. wide: fls. in 1-4-fld. racemes, white or greenish-yellow with fringed lip streaked with brown. July-Nov. China, Himalayas.

fláccida. Lvs. to 1 ft. long and about 1 in. wide: racemes to 10 in. long, to 12-fld.; fls. white or cream-white with lip having brownish streaked side lobes, yellow spot in the middle in front, and 3 yellow keels. Feb.-Apr. Himalayas.

fuliginosa. Lvs. to 7 in. long and about 1 in. wide: racemes shorter than the lvs., to 5-fd.; fls. brownish-yellow or brownish-white with fringed lip blotched with deep brown. Aug.-Nov. Himalayas, Burma, Java.

Huettneriana. Lvs. to about 10 in. long and 2 in. wide: racemes drooping, 8-10-fid.; fis. white with lip spotted with ettron-yellow. Apr.-June. Burma. Var. lactea (C. lactea) has no yellow on lip.

láctea: C. Huettneriana var.

Lawrenceana. Lvs. to about 11 in. long and 1 in. wide: racenies to 8 in. long; fis. 1-3, large, greenish-yellow or brownish-white, the lip having brown side lobes, a large central brown spot, white on sides separated by a sulfur-colored band. Mar.-Apr. Indo-China.

lentiginosa. Lvs. to 8 in. long and 1½ in. wide; racemes to 4 in. long, about 4-8-fid.; fis. straw-yellow or yellow-green with the white lip having brown edged side lobes and orange blotched mid-lobe. Dec.-Mar. Burma.

Massangeana. Lvs. to 20 in. long and 6 in. wide: racemes pendulous, to 2 ft. long, loosely many-fld.; fls. pale yellow with lip having brown and yellow streaked side lobes and yellow, brown and white mid-lobe. Mar.-June, Oct.-Nov. Assam, Malaya, Java.

Mayeriana. Lvs. to 8 in. long and 1 in. wide: racemes to 1 ft. long, to 10-fld.; fls. green with lip streaked with dark brown. Apr., Oct.-Nov. Malaya.

Mooreana. Lvs. to 20 in. long and 2 in. wide: fls. in 3-8-fld. racemes to 16 in. long, snow-white with lip spotted with golden-yellow. Dec. Cochin-China.

nervosa (C. corrugata). Lvs. to 6 in. or more long and about 1 in. wide: fls. in 3-6-fld. racemes, white with lip marked with yellow. Aug.-Sept. India.

nítida (C. ocellata). Lvs. to 10 in. long and 1½ in. wide: racemes 3-6-fid.; fls. white with golden-yellow spots on hp. Mar.-May, Sept.-Nov. Himalayas, Burma, Indo-China. Var. máxima has much larger fls.

ocellata: C. nitida.

pandurata. Lvs. to about 26 in. long and 2½ in. wide: racemes arching, nearly as long as lvs., up to 9-fid.; fls. large, pale green, having a warty lip marked with blackish-brown or black. Jan.-Mar., May-July. Malaya, Borneo, Sumatra.

prolifera. Lvs. to 7 in. long: fls. in many-fld. racemes subtended by bracts, greenish-yellow. Ifimalayas.

Rhodeana. Lvs. to 14 in. long and about 1 in. wide: racemes 3-5-fld., to 4 in. long; fls. greenish-white, the lip with brown side lobes and 2 yellow stripes on mid-lobe. Molucca Isls.

Sanderiana. Lvs. to 15 in, long and 3 in, wide: racemes as long as the lvs., to 9-fld.; fls. large, white with side lobes marked with brown and mid-lobe yellow. Sunda Isls., Rorneo.

spársa. Lvs. to about 6 in. long and 1½ in. wide: racemes arching, 7½ in. or less long, up to 7-fld.; fls. small, whitish with brown mottling on side lobes of lip and orange blotch on mid-lobe. Jan.-May, Nov. Philippines.

speciosa. Lvs. to 15 in. long and over 2 in. wide: racemes shorter than lvs., 1-4-fld.; fls. very large, greenish or

yellowish-brown, lip yellowish-white heavily marked with dark brown. Feb.-July, Sept. Java. tomentosa. Lvs. to 20 in. long and 3 in. wide: racemes pendulous, hairy, to 18 in. long; fis. large, light orange-red or red-brown, lip with side lobes streaked with brown and mid-lobe yellow with brown margins. May. Malaya.

COFFÈA. COFFEE. Rubiacex. Evergreen shrubs and trees with usually opposite lvs., cream or white salverform fls. in axillary clusters, and a small 2-seeded colored berry; native in Asia and trop. Afr. and widely grown in the tropics for the coffee "beans" which are really the seeds within the pulpy fr.

In the United States coffee is grown only occasionally as an ornamental subject and for its general interest, and is sometimes seen under glass. Propagated by cuttings of ripe wood, and in the tropics by seeds from which the pulp is removed.

arábica. Common or Arabian C. Shrub to 15 ft.: lvs. oval, to 6 in. long, shining dark green: fis. pure white, fragrant, 5-lobed, ¾ in. long: fr. red, ½ in. long. Trop. Afr.—Listed names of hort. forms are: columnaris, erécta

and excélsa.

libèrica. Liberian C. Shrub: lvs. obovate, to 1 ft. long, shining: fls. 6-7-lobed, 1 in. long: fr. black, ¾ in. long. Trop. Afr.

Zanguebariæ. Zanzibar C. Tree to 6 ft.: lvs. oval or obovate, to 4 in. long: fls. 6-7-lobed: fr. red turning black, 1/2 in. long, nerved longitudinally. Trop. Afr.

COFFEE: Coffea. -Berry: Rhamnus californica. -Tree, Kentucky: Gymnocladus dioica. Wild-: Psychotria.

COGSWELLIA: Lomatrum.

COHERENT: two or more similar parts or organs foined.

COHOSH: Actwa. Black: Cimicifuga racemosa. Blue: Caulophyllum thalictroides.

COIR: see Coconut.

CÒIX. Graminex. Tall grasses with broad lvs., grown for the peculiar bead-like involucre which contains the pistillate spikelets, the staminate spikelets deciduous and borne on the axis projecting from the bead; source of a cereal food (adlay) in parts of Asia. See Grasses.

Lácryma-Jobi. Jobs-Tears. Per. but grown as an ann. Lacryma-jobi. Joss-Earls. Fer. but grown as an ann, and not winter-hardy in cold countries, to 4 ft.: lvs. to 2 ft. long and 1½ in. wide: beads from pearly white to lead color, to 1½ in. across, hard and shining. Trop. Asia, but nat. elsowhere. Var. adrea zebrina has lvs. striped yellow.

CÒLA. Sterculiaceæ. Trop. African trees with alternate entire or lobed lvs., unisexual or polygamous fls. without petals borne in axillary panicles, and fr. of 4-5 leathery or woody carpels; grown in the tropics for the kernel of the fr. which is used in making drinks and in medicine.

Colas do best on sandy loam soil. Propagated by seeds, preferably singly in pots and then set out permanently, as they do not transplant well; also by cuttings of mature

acuminata. Cola or Goora Nut. To 40 ft. evergreen: lvs. entire, obovate, to 8 in. long, leathery: fls. yellow: fr. to 6 in. long.

CÓLCHICUM. Autumn-Crocus. Liliaceæ. Mostly autumn-blooming cormous herbs with broad basal lvs. the following spring, and very long-tubed purple or white fls. arising from the ground without sts.

Adapted to the sunny border and a loamy soil. Bulbs should be planted 2-3 inches deep in August or September, and not lifted until they show signs of deterioration. Propagated by separation of bulbs and by seeds.

agrippinum. Similar to C. variegatum but more robust and lvs. nearly erect. Cultigen.

autumnåle. To 4 in.: lvs. to 2 in. wide: fls. purple or white, sometimes double, to 4 in. across, in autumn. Eu., N. Afr. Var. álbum has white fls., atropurpureum purple.

Var. majus is more robust. Var. minus is listed as a dwarf form. Var. roseum, fls. rose-pink.

Bornmüelleri. To 8 in.: lvs. to 2 in. wide: fls. rose or lilac turning purple, the tube white, 5 in. across, in autumn. Asia Minor.

byzantinum. To 6 in.: lvs. to 4 in. wide: fis. lilac-purple, to 4 in. across, many from a spathe, in autumn. S. E. Eu.

Decaisnei. Lvs. to 1½ in. wide: fis. pale rose, 3 in. or more across. Nov.-Jan. Medit. region.

gigantèum: hort, form with pink fls.

lûteum. Lvs. to $\frac{1}{2}$ in. wide: fis. yellow, to $\frac{1}{2}$ in. across, in spring. Himalayas.

Párkinsonii. To 8 in.: lvs. usually 3, lanceolate, margins strongly undulate, lying flat on the ground: fls. white, heavily tessellated with purple, to 4 in. across, segms. narrowly lanceolate, autum. S. Eu.—By some considered synonymous with C. variegatum.

specidsum. To 1 ft.: lvs. to 4 in. wide: fls. violet with white throat or pink, to 6 in. across, in autumn. Caucasus. Var. album has white fls. Vars. ill ricum and magnificum are listed.

variegatum. To 3 in.: lvs. 1 in. wide: fls. rose with white tube, checkered, to 4 in. across, in autumn, Greece, Asia Minor

COLE, COLEWORT. A general name for what may be called the true Brassicas as distinguished from the mustards. The term covers the blue-leaved species, mostly biennial, as the cabbage tribe, kohlrabi, rutabaga, rape.

COLEONÈMA. Rutacex. S. African shrubs with scattered linear lvs., fls. solitary in the axils, and capsular frs.; one species sometimes planted in warm climates and grown under glass in pots. For cult. see Diosma.

álbum (Diosma alba). To 1 ft. or more, much branched: lvs. ½ in. long. fls. white, about ½ in. across.

púlchrum. Taller than C. album, with longer lvs. and larger red fls.

COLEOSANTHUS: Brickellia.

COLEUS. Labiatæ. Ann. or per. showy-lvd. herbs grown in the window-garden, greenhouse, porch boxes, and to some extent for bedding-out: lvs. toothed: fls. small or medium-sized, usually blue or lilac, in terminal spike-like racemes: native in tropics of Old World.

Coleus is very easily propagated from short cuttings taken at any time; seeds produce many interesting variations. New plants from cuttings every year give best results.

amboinicus (C. aromaticus). Per. to 3 ft., hairy-pubescent: lvs. broad-ovate, to 2 in. long, coarsely round-toothed, fleshy: fls. pule purplish. India, E. Indies.—Cult. in trop. Amer. and shoots sometimes seen in market as "Spanish thyme;" aromatic.

aromaticus: C. amboinicus.

Autranii. Sts. villous at nodes and glabrous along internodes: lvs. broadly ovate, to 5 in. long, base cordate to rounded, pilose above and briefly hispid beneath: fls. hlac. in spikes to 6 m. long, corolla to nearly 34 m. long. Ethiopia.

barbatus. Per. to 4 ft., woody toward base: lvs. ovate to oblong, to 4 in. long, cuneate, apex obtuse, margins crenate, very hairy on both sides: fis. bright blue, to ½ in. long, in lax racemose panicles to 2 ft. long. Trop. Afr.

lax racemose panicles to 2 tt. long. 11op. Air.

Blùmei. The common cult. coleus, in many forms: per.
to 3 ft., erect: lvs. ovate, acuminate or pointed, obtusely
toothed, 4 in. or more long, variously colored with yellow,
dull red and purplish, sometimes deeply cut: fls. dark blue
or whitish, the whorls nearly sessile in the spike. Java.
Var. Verschafféltii is more branching and brilliantly colored.

hybridus: hort. name for probable garden hybrids of unknown parentage.

lanugindsus. Herb, the root bearing tubers: lvs. ovate, to 3 m. long, densely pubescent: fis. in short-stalked clusters in long loose panicles. Cent. Afr.

ornatus: hort. name for a large-lvd. form of C. Blumei.

Persodnii. Erect herb: lvs. ovate, wrinkled and soft-pubescent, in many-fld. nearly sessile clusters. Madagascar.

pumilus. Sts. lax, more or less decumbent and rooting at lower joints: lvs. small, mostly 2 in. or less long, broad and obtuse, coarsely toothed, sometimes lighter colored along rib and nerves: fis. small, in long racemes. Philippines; sometimes cult., and somewhat escaped in S. Fla.

regalis: listed name.

Rehneltianus. Per., sts.\much branched, procumbent: lvs. ovate-triangular, to ¾ in. long, usually wider than long, obtuse, crenate, base acuminate to heart-shaped, margins dark-purple-harry: fls. blue, about ⅓ in. long, in 7-8-fld. cymes forming an elongate raceme to 6 in. long, corolla lip of 4 white lobes. Ceylon. Var. supérbus is listed.

shirénsis. Per. to 3 ft.: lvs. ovate, to 3 in. long, deeply toothed, pubescent beneath: fls. dark blue, in stalked clusters in large erect terminal panicles. Cent. Afr.

thyrsoideus. Bush C. Shrub to 3 ft.: lvs. cordate-ovate, to 7 in. long: fls. bright blue, the clusters in the spike-like racemes long-stalked. Cent. Afr.

Verschafféltii: C. Blumei var.

COLEWORT: see Cole.

COLIC-ROOT: Dioscorea villosa. Yellow: Aletris aurea.

COLLARD, COLLARDS. A large Brassica oleracea var. acephala, grown in the South for greens. It is biennial or potentially perennial, producing a hard stalk 1-2 feet high and bearing a loose crown of cabbage-like leaves (but not a solid head) which are caten. Sometimes collards are grown as a winter annual for spring use; and sometimes the leaves are taken as needed and the plant allowed to stand for a year or more, where winters are very mild. The usual procedure is to sow seeds in spring in a seed-bed, transplant to 3 or 4 feet apart in the field, till through the season, and harvest the crop in autumn; the plant endures hot weather better than cabbage. If seed is wanted, the stocks may be allowed to stand where climate permits, or they may be stored for the winter and planted out the next year as are cabbage stumps.

Sometimes young cabbage plants, or related things, are erroneously called collards when used for greens.

COLLÈTIA. Rhamnacex. Spiny stiff S. American shrubs with thickened often flattened branchlets, the lvs. very small or usually wanting, yellowish or white fls., and fr. a leathery 3-lobed caps.; grown out-of-doors in warm regions or under glass as a curiosity. Propagated by seeds or cuttings of half-ripened wood.

armàta. Branches and spines usually pubescent, spines straight or slightly curved, to ¾ in. long, lvs. small: fis. Sept.-Dec. Chile.

cruciàta. Anchor-Plant. To 4 ft., with very broadspuny flattened branches and few small lvs.: fls. yellowishwhite, in autumn. S. Brazil, Uruguay; seen in Fla. and S. Calif.

Éphedra. Small shrub with flattened branches: fls. white, in spring. Chile.

hórrida: a synonym of the true C. spinosa but in hort, applied either to C. cruciata or C. infausta.

infaùsta. To 10 ft., the stiff green branches with cylindrical spines to 1 in. long and small lvs.: fls. greenish-white, in early spring. Chile.

spinôŝa of gardens is C. infausta or C. armata; the plant long known botanically as C. spinosa is now considered to be two distinct species, C. spinosissima of Argentina and C. aciculata of Peru, neither in cult.

COLLÌNIA. Palmaceæ. One graceful pinnatelvd. shade palm of Mex. and Cent. Amer., differing from Chamædorea in having inner floral envelopes of staminate fls. united at base with filaments and pistillode, corolla of both staminate and pistillate fls. campanulate-tubiform and open at apex.

élegans (Chamædorca elegans. Neanthe bella). Sts. solitary or somewhat clustered, ringed, 2-8 ft.: pinnæ narrow-lanceolate and long-acuminate but sometimes broader and short, green on both surfaces, not ridged, not harsh in texture: spadix much branched; fr. small, globular.—A good porch and pot plant.

COLLÍNSIA. Scrophulariaccæ. Hardy herbaceous attractive annuals with lvs. opposite or in whorls of 3's, the bell-shaped 2-lipped fis. in the axils of the lvs. either solitary or in umbel-like clusters, blooming in mid-summer, the colors ranging from white, lilac, rose to violet and clear bright blue; mostly native in W. N. Amer.

Collinsias require only the usual treatment for annuals,

the seed may be sown outdoors in autumn, if well protected in winter, but preferably in spring in the North.

bartsiæfòlia. Seaside C. To 1 ft., sticky: lvs. ovate to linear, 1 in. long: fls. nearly sessile, whitish, marked with lilac or purple, with short upper lip. Calif.

bicolor. To 2 ft., glabrous or sticky: Ivs. oblong, toothed, to 2 in. long; fls. nearly sessile, to 1 in. long, lower lip violet or rose-purple, upper lip white. Calif. Var. candidissima has all white fls. Var. multicolor (C. multicolor) has variegated fls. Var. purpùrea, fls. rich purple.

candidíssima: C. bicolor var.

cárnea: listed name, probably a color form of *C. bicolor*.

grandiflòra. Blue-Lips. To 15 in.: lvs. oblong to linear, to $1\frac{1}{4}$ in. long, entire: fls. to $\frac{3}{4}$ in. long, pedicels length of fls., corolla-tube shorter than limb, lower lip deep blue or violet, upper lip purple or white. Calif. to B. C.

multicolor: C. bicolor var.

parviflora (C. tenella). Erect or spreading, to 8 in. high: lvs. orbicular, oblong or linear, often toothed, acutish, to ¾ in. long, in whorls of 3-5: fls. violet or blue, to ¼ in. long, axillary, usually solutary, the tube of corolla longer than limb. Ore., Wash.—Some of the material so listed is Touchla tenella.

tenélla: C. parviflora.

tinctoria. To 2 ft., sticky, giving off an iodine-like stain: lvs ovate to lanceolate, to 4 in. long: fls. nearly sessile, pale purplish or nearly white and streaked, the upper lip very short. Calif.

vérna. Blue-eyed Mary. To 2 ft 'lvs. ovate to oblong, to 2 in. long: fls. 12 in. long, long-stalked, lower lip bright blue, upper white or purplish. N. Y. to Wis. and Ky.

COLLINSONIA. Horse-Balm. Horse-Weed. Stone-Root. Labiatæ. Aromatic per. herbs of E. N. Amer., with large opposite lvs. and small yellowish fls. in panieled racemes, the 2 stamens long-exserted; one sometimes grown in the wild-garden in moist woodsy places.

canadénsis. CITRONELLA. To 5 ft., with thick clumpy root: lvs. ovate or ovate-oblong, to 10 in. long, coarsely toothed: fls. ½ in. long, lemon-scented, in panicles to 1 ft. long. Que. to Fla. and Ark.

W. N. Amer. and Chile, allied to Gilia but differing in technical characters, with alternate lvs. and red, yellow or white tubular fls. often borne in heads subtended by leafy bracts.

Of easy cultivation in any garden soil. Propagated by seeds sown where plants are to stand, in open exposures.

biflora (C. and Gilia coccinea). Ann. to 2 ft: lvs. linear, toothed or cut near end: fls. scarlet tinged outside with buff. Bolivia, Chile, Argentina.

coccinea: C. biflora.

grandiflora (Gilia grandiflora). Variable ann. to 2½ ft.: lvs linear-lanceolate, entire: fls. buff or salmon-color. Rocky Mts. to Calif.

Lársenii. Ann. to 6 in. tall or less: lvs. pedately 3-7-divided, to 1 in. long: fis. violet, ½ in. long. Wash., Ore., Calif.

lineàris (Gilia linearis). Ann. to 16 in.: lvs. linear to linear-lanceolate, entire: fls. red-purple or pink. B. C. to Calif. and Colo.

purpùrea: listed name.

COLOCÀSIA (Leucocasia). ELEPHANTS-EAR. Araceæ. Big trop. Asian herbs grown for ornament or the edible tubers, having peltate heartor arrow-shaped lvs. and unisexual fls. borne on spadices which are shorter than the spathes.

Colocasias are usually planted out-of-doors for sub-tropical foliage effects, tubers having been started indoors. They should have damp rich soil. The dasheen is grown for the edible roots in warm climates. Tubers may be planted in hills 3 feet apart in rows 4 feet apart. In about seven months the tubers will be ready for harvesting. The young shoots of dasheen forced and blanched are used as a winter vegetable. Taro is also widely grown for food in the Hawaiian and other Pacific Islands, particularly in the form of "poi."

antiquorum. Lvs. ovate-cordate, to 2 ft. long, green, the petioles to 5 ft. long: spathes pale yellow, to 15 in. long; spadix with very long sterile appendage. E. Indies.—Runs into several forms, a few of which are: Var. euchlora having dark green lvs. with violet margins and petioles; var. Fontanèsii (C. riolacca) with dull green lvs. margined and

veined with purple and purplish petioles; var. illústris

esculénta (Caladum esculentum). TARO. EDDO. DASH-EEN. Closely resembling the above but having large edible tubers and the spadix with very short sterile appendage.

indica. Lvs. ovate-cordate, to 1½ ft long, the petioles to 3 ft. long: spathes glaucous, to 6 in. long; spadix with short sterile appendage. Malaya.

monorhiza: hort, name. multiflòra: hort, name.

neo-guineensis: Schismatoglottis neo-guineensis.

odorata: Alocasia indica.

violècea: C. antronorum var. Fontanesii.

COLPOTHRINAX. Palmacex. One species of fan-palm in Cuba, sometimes referred to Pritchardia but differing in the singularly swollen trunk and in technical floral characters as well

Wrightii (Pritchardia Wrightii). BOTTLE OF BARREL PALM, endemic in Pinar del Rio and Isle of Pines, where it is known as barrigona palm. Tree to 40 ft., the trunk much swollen at or below the middle, slender above: lys. more or less circular in outline, to 5 ft. or more across, with many segms.: fls. sessile, fleshy: fr. globose, 1/2 in. or more diam.

COLOUHOÙNIA. Labiatx.or twining shrubs with all parts of the plants white-woolly when young, the fls. searlet and yellow; native to S. Asia, one cult. somewhat in the S. Propagated by cuttings of growing tips in summer and rooted under glass.

vestita. To 4 ft., permanently white-woolly: lvs. oval or ovate, to 2½ in. long, wavy-toothed: fts. orange-scarlet, ¾ in. long, in whorls, autumn and winter.

COLTSFOOT: Tussilago Sweet: Petasites fragrans.

COLUMBINE: Aquilegia.

COLUMBO: Frasera.

COLUMN: body formed of union of stamens and pistil in orchids, or of stamens, as in mallows.

COLUMNBERRY, TRUEHEDGE: Berberis Thunbergii var. pluriflora.

COLÚMNEA. Gesneriacex. Trop. can shrubs or vines with opposite lvs., 2-lipped tubular red or yellow fls. solitary or clustered in the axils, and fr. a berry; grown in the greenhouse. Propagated by cuttings.

gloriòsa. Per., epiphytic, hairy: lvs. ovate to ovate oblong, to 1½ in. long, strongly nerved: fls. scarlet and yellow, to 3 in. long, 2-lipped, solitary. Costa Rica.

hirta. Per., epiphytic, glandular-hairy: lvs. narrowly elliptic, to 2½ in. long, entire or remotely toothed: fis. vermillion marked orange, to 3 in. long, solitary in leafy axils. Costa Rica.

spléndens: Nematanthus longipes.

COLÙTEA. BLADDER SENNA. Leguminosæ. Shrubs or little trees from the Medit. region to the Himalayas, with deciduous pinnate lvs., papilionaceous fls. in axillary few-fld. racemes, and inflated bladder-like pods; planted for or-nament and hardy N. Propagated by seeds, cuttings in autumn, or choice varieties by grafting on C. arborescens.

arbòrea is arborescens.

arboréscens. To 15 ft.: fls. yellow, the wings about as long as keel: pods to 3 in. long. S. Eu., N. Afr. Var. builâta is a dwarf form with small lifts. Var. crispa has wavy-edged lvs.

cilicica (C. longialata). Differs from C. arborescens in the wings being longer than the keel. Asia Minor.

cruénta: C. orientalis. halépica: C. istria.

istria (C. halepica). To 6 ft. fis. orange-yellow, the wings longer than keel. Asia Minor.

longialàta: C. cilicica.

media. Hybrid probably between C. arborescens and C. orientalis: to 10 ft.: fls. orange or reddish-yellow.

orientalis (C. cruenta). To 6 ft.: fls. brownish-red with yellow spot at base of standard, the wings shorter than keel: pods 1½ in. long. S. E. Eu., Asia.

pérsica. To 8 ft.: fls. yellow, the wings longer than keel: pods to 2 in. long. Persia. Kurdistan.

COLVÍLLEA. Leguminosæ. One African tree rarely planted in semi-trop. regions for the showy bloom. Propagated by seeds. C. racemòsa. To 50 ft., with thick trunk: lvs. 2-pinnate into segms. ½ in. long: fls. scarlet with yellow stainens, in dense drooping showy racemes to 1½ ft. long: pods round.

COLZA: Brassica Napus.

COMANTHOSPHÀCE. Labiatæ. Japanese subshrubs or suffrutescent per, related to Elsholtzia, having 5-lobed strongly bilobed corolla and globose 2-valved anthers, large early-deciduous bracts subtending the fls. and usually apparent only beneath the undeveloped terminal part of infl. One species, C. japônica, is cult. To 2 ft. or more: lvs. ovate-lanceolate, to 5 in. long, acuminate, serrate, base cuncate, veins depressed above: fls. yellow, to 3% in. long, in erect terminal and axillary spikes, stamens and style long-exserted, bracts orbicular to ovate, to 1/2 in. long.

COMAROSTAPHYLIS: Arctostaphylos diversifolia. COMARUM: Potentilla palustris.

COMBRETÀCEÆ. Combretum Trees and shrubs of about 15 trop, genera, in eastern and western hemispheres, characterized by simple lvs., mostly small bisexual fls. having 4-8-lobed calyx, 4-5 petals or none, 4-10 stamens, inferior 1-celled ovary, and dry often winged fr. Bucida, Combretum, Quisqualis and Terminalia are cult for ornament and fr.

COMBRÈTUM. Combretacex. Trop. trees and shrubs, often climbing, with mostly opposite entire lvs., polygamous fls. in spikes or racemes, the stamens long-exserted, and leathery 4-6winged frs.

coccineum (Grislea coccinea). Vine to 20 ft.: lvs. oblong,

to 4 in. long: fls. bright red, 1/2 in. long, in terminal panicled racemes. Madagascar.

grandiflorum. Vine: lvs. ovate-elliptic, to 4 in. long, briefly acuminate, pubescent becoming glabrous fls. red, about 2 in. long, in short axillary and terminal spikes. Trop. Afr.

secúndum. Vine: lvs. oval-oblong, to 6 in. long: fls. scarlet, 1½ in. long, in dense terminal spikes. Trinidad, N. S. Amer.

COMESPÉRMA. Polygalacex.Australian herbs or shrubs, often twining, with small alternate lvs. and irregular fls. in terminal racemes; one planted in Calif.

spinosum. Much branched leafless shrub with thorny branches, the lvs. reduced to scales: fis. small, solitary and scattered.

COMFREY: Symphytum.

COMMELÎNA. DAY-FLOWER. Commelinaceæ. Widely distributed herbs with jointed sts., alternate entire lvs. and irregular mostly blue short-lived fls. in cymes subtended by a leafy bract; grown in greenhouses or out-of-doors, often as ground-cover. Propagated by seeds, cuttings over heat, or division of the tubers when produced.

angustifòlia. Sts. erect or diffuse, to 2 ft. or more long: lvs. nearly or quite linear, to 5 in. long: sheaths often purplish: fis. blue. S. U. S.

clandestina: confused name of uncertain application. cœléstis. Per. with fibrous or tuberous roots, to 11/2 ft. high: fis. deep blue, to 1 in. across. Mex.-A frequent greenhouse plant. Var. álba has white fis. and variegata blue and white.

crispa. Creeping per, with sts. to 3 ft. long; lvs. lanceolate or linear-lanceolate, to 3½ in. long, crisped; fls. with 2 upper petals light blue and lower white. Mo. to New Mex. diffusa (C. nuduflora. C. Selloviana). Creeping per, with sts. rooting at joints: fls. blue, to ½ in. across. N. Amer., S. Amer., Asia, Afr., growing natively as far north as N. J.—Employed as an open-garden plant.

nudiflòra: C. diffusa.

sativa: listed name, possibly referable to C. tuberosa. Sellowiàna: C. diffusa.

sikkimėnsis. Creeping per.: lvs. lanceolate, to 3 in. long, base unequal and usually obtuse: sheaths glabrous or nearly so: fls. blue, usually 6-12 in terminal cymes. Himalavas.

tuberosa. Diffusely branching from tuberous root: lvs. narrowly lanceolate, to 3 in. long: sheaths pubescent: fls. blue. Mts. of Mex.—When planted in the open, the tubers should be lifted and stored in dry sand during winter.

virginica. To 3 ft.: lvs. linear-lanceolate, to 5 in. long and 1 in. across: sheaths often pubescent: fis. blue, to 1 in. across. June-Sept. N. Y. to Mich. south to Paraguay.

COMMELINACEÆ. Spiderwort Family. Herbs of about 26 genera widely scattered, particularly in the tropics, with simple, alternate, parallel-veined, mostly sheathing and entire lvs., bisexual fls. in cymes subtended by leafy bracts (spathes), having 3 sepals and petals, mostly 6 stamens, superior 2–3-celled ovary and capsular or sometimes berry-like frs. The family provides many ornamental subjects, the larger part of which are grown under glass in the N. The genera known to hort. are Commelina, Commelinantia, Cuthbertia, Cyanotis, Dichorisandra, Palisota, Pollia, Rheo, Spironema, Tinantia, Tradescantia, Zebrina.

COMMELINANTIA. Commelinaceæ. Ann. succulent herbs, erect or decumbent, native in Tex., one sometimes grown in that region. C. anômala (Tinantia anomala. Tradescantia anomala). Basal lvs. linear-spatulate, to 1 ft. long: fis. lavender-blue with small white petal, 2–16 in terminal infl. subtended by leaf-like spathe.

COMPARÉTTIA. Orchidaceæ. Small genus of American epiphytes with pendulous simple or branched racemes, similar to Ionopsis from which it differs in having lateral sepals forming long slender spur in contrast to lateral sepals only saccate at base. See Orchids.

falcata. Pseudobulbs oblong, clustered, smooth, 1-lvd.: If. elliptic-lanceolate, acute, to 6 in. long or less: scape arising from base of If., pendent, to 28 in. long, filiform, bearing loose raceme of 2-15 (more when paniculate) purple-red to crimson fls.; spur slender. Cent. Amer., W. Indies, S. Amer.

COMPASS-PLANT: Silphium laciniatum.

COMPÓSITÆ. Composite Family. Over 800 widely dispersed genera of herbs and sometimes shrubs or little trees characterized by the fls. being assembled in involucrate heads and with the anthers joined around the pistil; corolla gamopetalous, often of two kinds in one head, regular and 4–5-lobed, and ligulate or produced into a long limb on one side; stamens 4–5; ovary inferior, 1-celled: fr. an achene mostly crowned by a pappus of scales, barbs or hairs. The family contains numerous ornamental subjects and others grown as vegetables. Most of them are sun-loving plants of simple cultural requirements; the predominant types are summer- and autumn-blooming. The genera known to hort. are Achillea, Actinea, Actinomeris, Ageratum, Agoseris, Amberboa, Amellus, Amennobium, Anacyclus, Anaphalis, Antennaria,

Anthemis, Aphanostephus, Arctium, Arctotis, Arnica, Artemisia, Aster, Athanasia, Baccharis, Baeria, Baileya, Balsamorhiza, Bellis, Bellium, Berlandiera, Bidens, Boltonia, Brachycome, Brachyglottis, Brickellia, Buphthalmum, Cal-Carduus, Calimeris, Callistephus, Calocephalus, Carduus, Carlina, Carpephorus, Carthamus, Cassinia, Catananche, Celmisia, Centaurea, Chnaæctis, Chaptalia, Charicis, Chrysanthemum, Chrysocoma, Chrysogonum, Chrysopsis, Chrysothamnus, Cichorium, Cirsium, Cladanthus, Cnicus, Coreopsis, Corethrogyne, Cosmos, Cotula, Craspedia, Crepis, Crocidium, Crupina, Cryptostemma, Cynara, Dahlia, Dimorphotheca, Diotis, Doronicum, Echinacea, Echinops, Emilia, Encelia, Engelmannia, Ericameria, Erigeron, Eriocephalus, Eriophyllum, Erlangea, Eupatorium, Euryops, Felicia, Filago, Gaillardia, Galactites, Gamolepis, Garberia, Gazania, Geræa, Gerberia, Gnaphalium, Grindelia, Guizotia, Gutierrezia, Gynura, Haastia, Haplopappus, Hazardia, Helenium, Helianthella, Helianthus, Helichrysum, Heliopsis, Helipterum, Hetero-pappus, Heterospermum, Heterotheca, Hidal-goa, Hieracium, Homogyne, Hulsea, Humea, Hymenopappus, Hypocheris, Hysterionica, Inula, Jasonia, Jurinea, Kleinia, Krigia, Kuhnia, Lactuca, Lagenophora, Lasthenia, Layia, Leontodon, Leontopodium, Lepachys, Leptosyne, Lessingia, Leucheria, Leucogenes, Leuzea, Liatris, Ligularia, Lindheimera, Linosyris, Lonas, Luina, Macharanthera, Madia, Malacothrix, Marshallia, Matricaria, Melampodium, Microglossa, Mikania, Monolopia, Montanoa, Moscharia, Mutisia, Myconella, Myriocephalus, Notonia, Odontospermum, Olearia, Onorpordum, Othonna, Pachystegia, Parthenium, Perezia, Pericome, Petasites, Phagnalon, Picris, Piqueria, Pluchea, Podachænium, Podolepis, Polypteris, Prenanthes, Pulicaria, Pyrethrum, Raoulia, Rainiera, Reichardia, Rudbeckia, Santolina, Sanvitalia, Saussurea, Scolymus, Scorzonera, Senecio, Sericocarpus, Serratula, Sideranthus, Silphium, Silybum, Solidago, Solidaster, Sonchus, Spilanthes, Stephanomeria, Stevia, Stokesia, Tagetes, Tanacetum, Taraxacum, Thelesperma, Thymophylla, Tithonia, Tolpis, Townsendia, Tragopogon, Tridax, Trilisa, Tripteris, Tussilago, Uropappus, Urospermum, Ursinia, Venidium, Verbesina, Vernonia, Vittadinia, Wedelia, Wyethia, Xanthisma, Xeranthemum, Zex-Mutisia, Myconella, Myriocephalus. charia, lia, Wyethia, Xanthisma, Xeranthemum, Zexmenia, Zinnia.

COMPOSITE: compound; said of an apparently simple or homogeneous organ or structure made up of several really distinct parts; applied to the heads of Composita.

COMPOUND: of two or more similar parts in one organ, as a leaf of 2 or more leaflets, a fruit of 2 or more carpels.

COMPRESSED: flattened, especially sidewise.

COMPSOA: Tricyrtis.

COMPTÒNIA. Myricacex. One fragrant deciduous shrub native in E. N. Amer., adapted for covering banks or dry sandy soil. C. peregrina (C. asplenifolia. Myrica asplenifolia). Sweet-Fern. To 5 ft.: lvs. fern-like, linear-oblong, deeply pinnately cut, pubescent: fls. unisexual, in catkins.—Propagated by seeds, layers, and division of the clumps.

CONÁNDRON. Gesneriaceæ. One stemless tuberous-rooted herb native in the mts. of Japan and suitable for rock-gardens in S. U. S. C. ramondioides. Lvs. basal, to 7 in. long, oblong, wrinkled and toothed: fls. white or pink with

purple eye, 1 in. across, in drooping clusters on scapes to 1 ft. long.

CONCHITA: Centrosema.

CONDÀLIA. Rhamnaceæ. Shrubs and trees inhabiting the New World, mostly in warm regions, with alternate usually entire lvs. and fls. in umbels, with or without petals; one species is grown out-of-doors in Calif.

lineata. Spiny shrub: lvs. spatulate or obovate, ¼ in. long, leathery, without veins above: fis. whitish, without petals: fr. an oblong drupe ¼ in. long. Patagonia.

CONE: a dense and usually elongated collection of flowers or fruits borne beneath scales, the whole with scales and axis forming a detachable homogeneous fruit-like body; some cones are of short duration, as those of araucaria, and others become dry, woody and durable.

CONEFLOWER: Echinacea, Lepachys, Rudbeckia.

CONE-PLANT: Conophytum.

CONFEDERATE-ROSE: Ilibiscus mutabilis.
CONFEDERATE-VINE: Antigonon leptopus.

CÓNGEA. Verbenaceæ. Malayan climbing shrubs with opposite entire lvs., fls. in head-like cymes subtended by leaf-like bracts and borne in large panicles, and fr. a small drupe; one species sometimes grown out-of-doors in S. Calif. and other mild climates.

tomentòsa. Lvs. ovate, to 3 in. long, tomentose beneath: fis. white, the oval bracts to 1 in. long, white or hlac, tomentose. India.

CONICÒSIA. Aizouceæ. S. African segregate from Mesembryanthemum (which see for cult.), per. with erect or procumbent sts., alternate crowded long narrow 3-sided soft lys. without dots, and large yellow pedicelled fls.; stigmas 10–20.

elongata (M. elongatum). St. ann., prostrate, 1 ft. or more, from a tuberous root: lvs. to 6 in. long and ½ in. thick, semi-cylindrical: fls. solitary on peduncles to 6 in. long, the potals linear.—Somewhat escaped in Calif.

long, the petals linear.—Somewhat escaped in Calif.
Muirii: see under C. pugioniformis.
pugioniformis (M. pugioniforme). St. tall, thick, to
2 ft.: lvs. to 6 in. long, glaucous, 3-angled, gradually tapering from base to apex (pugioniform or dagger-shaped):
petals as long as calyx-lobes.—Plants passing under this
name may be C. capensis, a weak not erect plant and petals
shorter than calyx-lobes. C. Muirii may be involved: it
has a long fleshy radish-like tuber crowned by the tutt of
lvs, whereas C. capensis has a fibrous root and a st. 2-3 ft.

CONIFERS. A general term employed for cone-bearing trees of the pine, spruce and cypress kind, but sometimes used as the English equivalent of Conifera, a technical family name for plants now segregated in the eight families, Araucariaceæ, Cephalotaxaceæ, Cupressaceæ, Ginkgoaceæ, Pinaceæ, Podocarpaceæ, Taxaceæ and Taxodiaceæ.

The conifers are gymnosperms, representative of a class of plants with ovules naked rather than borne in a sac or ovary as in the angiosperms; other living gymnosperms are the cycads, of about 10 genera. Gymnosperms and angiosperms together comprise the spermatophytes (phenogams or "flowering plants"). The conifers, in a broad usage to include also ginkgo, the junipers and yews, are about 300 species, in about 40 genera, widely spread over the globe but most prominent in temperate regions; they are all woody plants, many of them shrubs and others majestic trees that give character to extensive areas. They are well represented in the native flora of North America. To cover the families Taxaceæ and Pinaceæ, the word conifer has a definite connotation even though some of the kinds bear berry-like fruits rather than true

cones; but the characters of foliage and of woody structure, and the balsamic odors, are such as to show the similarities of most of them even to uncritical observers. A few species, as the larches, bear deciduous leaves, but the group as a whole is known as "the evergreens" and it has a horticultural unity. The conifers are treated in their various relations and adaptabilities for American conditions in "The Cultivated Conifers," published by the Macmillan Company.

Conifers are grown for ornament as single specimens, for shelter-belts, the smaller ones for foundation-planting about buildings and in private grounds, and the arboreous species for groves and forests. The timber trees among the conifers constitute the main large forestry stands in this country. All the kinds abound in interest, because of their evergreen character and their strong individuality. Although lacking showy flowers, the striking habit, interesting cones, details of foliage and color of new growths give them an ornamental quality quite their own. They are particularly striking in the winter landscape. These qualities vary widely between the different genera. Most of the genera are known in cultivation somewhere in the United States and Canada.

The conifers are mostly high-land plants. Many of them do well on rather thin land, yet the best results are to be expected in private grounds, when the soil is good or well enriched, for much of the beauty depends on the verdurous growth. For low grounds, the larches, taxodiums, and chamæcyparis may be chosen. The common arbor-vitæ is particularly valuable in low and even swampy places. For effects in large trees, the pines, spruces and firs are generally most adaptable, particularly in cold climates, but cryptomeria, Douglas fir, and sequoias are majestic in milder climates. Of the smaller and shrubby kinds, selections may be made among the true cypresses, junipers, chamæcyparis, thuja, yews; the retinisporas are juvenile states of chamæcyparis and thuja. Inasmuch as so many species of conifers are available for cultivation from so many parts of the world and of such varied characteristics, it follows that the successful planter of them is the one who notes with much care the requirements of each as to climate, soil and exposure.

Seedlings of many conifers vary widely, as in Thuja, Juniperus, Chamæcyparis, and even in some species of Picea. The dwarf forms originating in this way, propagated often by cuttings and layers, are specially interesting for small places and for rock-gardens, and they have the charm of special form and variety of color.

Transplanting of conifers is best performed, as a rule, in spring just before the active new growth begins or about when the buds begin to swell. Early autumn planting is satisfactory in mild climates and with small potted or pruned stock if the land is moist and in good condition and the exposure protected so that they do not dry out seriously before making a roothold. August planting, after the main growth is completed, is often successful if the rainfall is adequate or sufficient water can be supplied. The younger the tree the greater is the likelihood of success in transplanting; but the yould height for the arboreous species is 2 to 3 feet; any addi-

tional height is likely to entail greater care in the transplanting. Very large conifers should be moved only by those skilled in the work. Experience shows that moving large conifers with a frozen ball of earth large enough to include all the roots is usually successful.

The top is not pruned, as a rule, at transplanting. Therefore the roots should be kept intact as much as possible, special care being exercised in the digging, and they should not be allowed to dry out. Plants from shady positions should not be transplanted to the open sun. If the hemlock, for example, is wanted in a sunny exposed place, young trees occupying such positions in the wild should be found. Better results, however, with all conifers, are to be expected from well-handled nursery-grown plants. Newly planted trees may be mulched the first year with straw or similar material to retain the moisture. All the conifers, and especially the hemlocks, should be well guyed after transplanting, for loss is certain if the newly planted tree is racked by the wind.

The after care of conifers requires no peculiar attention except to meet the attacks of the special insects and fungi, and for this work the most recent authoritative books or bulletins should be consulted. Probably the most serious of the diseases at present, since it involves natural forests, is the white pine blister-rust, due to an imported fungus. It attacks the five-leaved or white pines, appearing on the twigs and extending into the trunk. Thorough removal of the blistered or cankered twigs from valuable trees as soon as the injury appears may save the specimen. But the main procedure is to destroy the alternate host on which the fungus lives. These other hosts are currants and gooseberries, and none of these plants should be allowed to stand within 200 to 300 yards of white pines; the cultivated black current is particularly amenable to the disease. For aphis and scale in-sects, thorough spraying is the proper safe-guard. The five-needle pines also suffer from the white pine weevil, which attacks the leading shoots.

Conifers require the minimum of pruning inasmuch as most of them are symmetrical growers. Pines seldom give satisfactory results when clipped. To keep spruces, firs and some of the smaller kinds within bounds or to make them compact and to delay the death of the lower limbs, the tips of the shoots may be pinched back in spring or early summer.

Propagation of conifers is accomplished by means of seeds, cuttings, grafting on other stocks. Seeds are the usual means for the raising of forest stock and for the propagation of the species in general. The horticultural varieties, however, must be increased by cuttings, for seedlings may not come true. Species of which seed is not available, and also certain of the named cultivated varieties, are grafted on other stocks.

Seeds are gathered as soon as ripe and kept in bags or boxes in a dry place until the following spring or else stratified over winter. The seeds are planted in rows in a mellow well-prepared seed-bed, and covered one-half inch or less depending on the size. Small seeds may be broadcast. Rows are usually as close together as 6 inches, and the bed is strewn with

pine needles or other mulch. The young seedlings require protection under lath screens or brush and plenty of moisture, although the seeds themselves may be kept fairly free from water until germination takes place; seed-beds therefore should be in well-drained soil. If mice. squirrels or birds are likely to be troublesome, the beds may be covered with wire netting: the beds would better be protected from washing by a border of boards. Care must be taken to avoid damping-off under the screens. The plants will need protection the first winter. Care should be taken to keep the young seedlings constantly lightly mulched to prevent rain from spattering them with soil, which adheres to the young plants and causes considerable loss. In eighteen months or more, when making the first set of rough leaves, the seedlings may be transplanted; and the subsequent process will determine itself for each species. Conifer seeds may also be stratified the first autumn in boxes or flats, and the seedlings allowed to grow in these boxes the first year; this is a good method for small quantities or for garden practice, and for tender species. Seedlings of some of the rarer species, as of Abies, are so small that it is inadvisable to transplant them until the end of the second year.

Cuttings are made from firm tip shoots late in the season, representing one-year wood and a two-year base, the bottom third or half being trimmed of leaves. These are set in clean sand or peat in flats or a greenhouse bench, close together in rows and the soil firmed tightly about them. Mild bottom heat should be given at first, and raised to perhaps 70° later. In four to eight months, depending on the kind of conifer and the conditions, the cuttings should be rooted and ready for transplanting. Taxus, cedrus, thujas, retinisporas, chamacyparis, junipers, and the like are the kinds most commonly grown from cuttings, although the piceas and others are amenable. Piceas and others that contain a large amount of resin are the most difficult to root, and removal of the resin by dipping the lower end in hot water has been recommended.

Cuttings may also be rooted in outdoor summer frames, with bottom heat provided by a little fermenting manure or other means; a fair percentage of some kinds will root without other bottom heat than that supplied by the

Grafting of conifers is performed on stocks of the same genus, usually in spring when the roots begin to start. The stocks may be grown from seeds or cuttings, usually the former. The stock in any case represents the most abundant or most easily propagated or most seedful species of the genus, as red-cedar for the other junipers, native arborvitæ for the other thujas, Norway spruce for the other bpiceas, white pine for related species, and so on. When large enough for grafting, the stocks are potted and the cion is sideworked near the root and firmly tied. The grafted plants are kept in frames or a propagating house, and in four to six weeks union should have taken place. See the article *Propagation*.

coniográmme (Dictyogramma). Polypodiaceæ. Strong-growing conservatory ferns, useful as specimen plants; fronds 1-2-pinnate; sori naked, following the veins; native in Japan

and Pacific Isls. Sometimes cult. under glass, requiring a rather cool or moderate atmosphere and a well-drained soil. See Ferns.

japónica (Gymnogramma japonica). Bamboo-Fern. Fronds mostly 1-pinnate, to 2 it. long, pinnæ to 1 it. long and 1 in. wide, finely toothed. Japan, Formosa.

Umbelliferæ. Poisonous herbs with pinnately decompound lvs., small white fls. in compound umbels, and ovate somewhat flattened frs.; one species grown for medicinal purposes. Propagated by seeds.

maculatum. Poison-Hemiock. Bien. to 4 ft.: lvs. finely cut into ovate toothed segms., dark green, sometimes known as "winter-fern." Eu.; nat. in N. and S. Amer.

CONNATE: united or joined; in particular, like or similar structures joined as one body or organ, as opposite leaf-blades united about a stem.

CONNECTIVE: the filament or tissue connecting the two cells of an anther, particularly when the cells are distinctly separated.

CONNIVENT: coming together or converging, but not organically connected.

CONOCLINIUM: Eupatorium.

CONOPHÝLLUM. Aizoaceæ. Small succulent shrubs of the Mesembryanthemum group of S. Afr., close to the genus Mitrophyllum: lvs. of two kinds, one pair united into a conical body: fls. whitish.

chrysoleùcum; Monilaria chrysoleuca.

Hérrei. To 1½ ft.: plant-body 2 in. long and 1 in. thick: fls. to 3 in. across, on pedicels 1 in. long; stigmas 5.

CONÓPHYTUM. CONE-PLANT. Aizoaceæ. One of the groups separated from the old polymorphous genus Mesembryanthemum, native in S. Afr.: very small succulent plants with abbreviated roots, several or many growths in a clump but stemless at least when young: each of the growths consists of 2 lvs. completely joined into one body which is globose, obconic, or depressed, 2-lobed or notched at apex and with a small orifice at the center; from this orifice arises a solitary fl., the corolla having a slender tube, color white to rosy, magenta, red. vellow.

albescens. Plant-body about 1 in. high and broad and ½ in. thick, harsh to the touch, whitish-green, indistinctly dotted: fls yellow, 1 in across.

bilobum (M. bilobum). Plant-body heart-shaped, $1\frac{1}{2}$ in. high and 1 in broad and thick; fis. yellow, $1\frac{1}{4}$ in. across.

Braunsii: C. Pearsonn var. minor.

brève. Plant-body about 1/4 in. high and broad, flattish at top, smooth, pale glaucous-green with a few darker dots: fis. yellow, ½ in. across.

Cálculus (M. Calculus). Plant-body globose, to 1 in. across, smooth and whitish-green: fis. light yellow, 3/4 in.

Ernianum. Plant-body to 1 in. high and ¾ in. broad, gray-green spotted with dark green; fls. rose or lilae, to 1 in. across.

frutéscens. Shrubby, to 4 in.: plant-body oblong, 1 in. long and ½ in. wide, deeply 2-lobed, keeled with red: fis. of a very peculiar coppery-orange, 1 in. across.

Johánnis-Winkleri (M. Johannis-Winkleri). Tufted: plant-body about ½ in. high and wide, glaucous-green: fis. not described.

fls. not described.

kubusànum. Plant-body about ¼ in. high and broad, flattish on top, smooth, dull gray-green with scattered dots of dark green: fls. unknown.

kubusbergénsis: probably meant for C. kubusanum.

Luisæ. Much branched: plant-body heart-shaped, about 14 in. high and not quite so wide and thick, slightly dotted: fls. yellow, 34 in. across.

Maughanii: Ophthalmophyllum Maughanii.

Meyeri. Plant-body obovoid, ½ in high and wide id ½ in thick, only slightly notched at apex, velvety: fls. yellow, 36 in. across.

minutiflorum (M. minutiflorum). Plant-body obconic, to 34 in. high and wide, 14 in. thick, glaucous-green: fls. yellow, 14 in. across.

minùtum (M. minutum). Plant-body to 1/3 in. wide, slightly convex at apex, light bluish-green, dotted: fis. with outer petals rosy-magenta and inner yellow, to 3/4 in. across.

Névillei (M. Nevillei). Plant-body obconic, about 1/2 in. across the depressed-flattish top, green, dotted: fis. white or cream, 1/2 in. across.

obconéllum: C. obcordellum.

obcordéllum (C. obconellum. M. obcordellum). Forming cushion-like tufts: plant-body obconic, about ½ in. high, wide and thick, somewhat glaucous dotted with purplish: fis. white to straw-color, ½ in. or more across.

odoratum (M. odoratum). Plant-body to 1 in. high and wide, ¾ in. thick, notched at apex, grayish-green, dotted: fis. magenta-pink, fragrant, 1 in. across.

Pearsonii. Plant-body broad-obconic, ½-1 in. high and thick, light bluish-green: fis. bright magenta with orange-pink tube, ¾ in. across. Var. minor (C. Braunsii)

plantage-plink under 1/2 in. across. var. limits (c. Braunss) has smaller growths.

pfctum (M. pictum). Plant-body 1/3 in. across, convox on top, dull green with irregular brown lines: fis. whitish, to 1/2 in. across.

Pillansii. Plant-body not clustered, surface velvety: fis. large, rose-pink, white at base, anthers golden: petals broad, notched.

Púrpusii (M. Purpusii). Plant-body depressed-conical, about ½ in. high and thick, bluish-green, dark-spotted: fis. pale yellow, ½ in. across.

truncatéllum (M. truncatellum). Plant-body depressed, ½ in. or more thick, glaucous-green with darker dots: fls. pale yellow, ½ in. across.

uvæfórme (C. vanrhynsdorpense). Plant-body to ½ in. long and somewhat broader, lobed to ½ in, pubescent, spotted: fls. white or pale yellow, ½ in. across.

vanrhynsdorpénse: C. uvæforme.

Vanziilii. Differs from C. breve in the exserted calvx and petals in many series.

Wéttsteinii (M. Wettsteinii). Plant-body broad-obconic, to ¾ in high and 1¼ in thick, glaucous-green, slightly dotted; fls. bright magenta with paler tube, 1 in. across.

CONÓSTYLIS. II x modoracex. An Australian genus of about 40 species of herbaceous perennials whose amaryllid-like fls. have the style conical at base. One species, C. cándicans, is offered. Lvs. arranged in two vertical ranks or in crowded tufts on a short rhizome: fls. white or yellowish, in terminal heads or shortly dichotomous cymes. Usually treated as a warmhouse subject.

CONRADÎNA. Labiatx.Shrubs of S. U. S., with narrow clustered lvs. having entire revolute margins and bluish or purplish 2-lipped fls. in axillary cymes; of the Satureja group.

canescens. To 1½ ft., stiffly branched: lvs. to ½ in. long: fls. ½ in. long, in spring. Fla. to Ala., in sandy soils.

CONSOLEA: Opuntia corallicola.

CONVALLARIA. LILY-OF-THE-VALLEY. Liliacex. One per. herb (or the variations considered as distinct species), having horizontal rootas distinct species, having horizontal root-stocks, the upright parts called "pips." C. majālis. Lvs. 2, basal, oblong-oval: fls. bell-shaped, white, fragrant, nodding, in a one-sided raceme terminating the scape. Eu., Asia, E. N. Amer. Var. Fottunei has larger foliage and fls. Var. rosea is listed as a pink-fld. form. C. japonica is a synonym of Ophiopogon japonicum. C. Polygonatum is Polygonatum officinale.

The lily-of-the-valley is hardy out-of-doors in shady places and persists for many years without removal. It is often forced from pips planted in benches of sand in the greenhouse and kept at a temperature of about 65°. The pips are often held in cold storage.

CONVOLVULACEÆ. MORNING-GLORY FAM-ILY. Twining herbs as usually known, but often shrubs or even trees, of nearly or about 50 widely distributed genera: juice often milky: lvs. alternate, simple or compound: fls. regular and bisexual, often large and bright colored, with 5-parted calyx, funnelform gamopetalous corolla, 5 stamens, superior prevailingly 2-celled ovary: fr. a caps. or berry. Many species have medicinal properties and other kinds are grown for ornament, as Argyreia, Calonyction, Convolvulus, Dichondra, Evolvulus, Ipomæa, Jacquemontia, Lettsomia, Porana, Quamoclit.

CONVÓLVULUS. BINDWEED. Convolvulaceæ. Herbs, mostly twining or trailing, pubescent, with simple or lobed lvs., bell-shaped or funnel-form fls. something like those of morning-glory, having a plaited 5-angled limb and capsular frs. C. arvensis is a persistent weed in cult. grounds.

Bindweeds are of easy cultivation but should be planted with care as they are likely to become troublesome weeds. They are grown out-of-doors as covering for fences and banks and the tender kinds in the greenhouse. Propagated by seeds, cuttings of young wood, and by division.

althmoldes. Per., sts. twining to 3 ft.: lower lvs. ovate-cordate, upper pinnatifid: fls. 1-2, pink, about 1 in. long. Medit. region.

arvénsis. Per. vine with deep persisting roots, glabrous or nearly so: lvs. oblong to ovate with sagittate or hastate base, to 2 in. long: fls. pink or whitish, to 1 in. across. Eu.; nat. and a troublesome weed, but has been used in hanging baskets and elsewhere.

aureus supérbus. Per. but grown as ann., sts. twining or trailing to 5 ft.: lvs. cordate-ovate: fls. golden-yellow. Of uncertain origin and botanical position.

Cantábrica. Erect or prostrate, to 2 ft.: lvs. oblong or lacelate: fis. in clusters, rose or pink, about ½ in. long. Medit. region.

Cneòrum. To 4 ft., erect or ascending: lvs. lanceolate or spatulate, persistent: fls. 1-6, white or pinkish. S. Eu. Cupaniànus: C. trucolor.

elongatus. Ann.: lvs. cordate-ovate: fls. solitary, white, small. Canary Isls.

farindsus. Climbing, pubescent: lvs. cordate-ovate, irregularly toothed: fls. 1-6, white veined with brown, to 1/2 in. long. Afr., Mascarene Isls.

flóridus (Rhodorhiza florida). To 6 ft., woody: lvs. linear-lanceolate: fls. in many-fld. terminal clusters, white or pale pink, small. Canary Isls.

incanus. Finely pubescent usually gray per., trailing or decumbent, to 3 ft: lvs. ovate, lanceolate, linear, with diverging lobes at base, to 2 in. long: fls. rose to white. Neb. west and south.

japónicus (Calystegia pubescens). California-Rose. Per., sts. twining to 20 ft.: lvs. narrow-arrow-shaped: fls. solitary, bright pink, to 2 in. across. E. Asia; a sterile double form is nat. in E. U. S.

luteolus. Per. somewhat woody below, climbing to 10 ft. or more: lvs. triangular to lanceolate with sagittate base, to 3 in. long, glabrous and glaucous above: fis. purplish and white, to 2 in. long. Calif.

major: apparently I pomæa purpurea.

mauritánicus. Per., sts. prostrate, woody at base: lvs. round-ovate, small: fls. 1-6, blue or violet-purple with pale throat, to 2 in. across. Afr.—Useful in baskets and vases. minor: C. tricolor.

Núttallii. Suffrutescent, sts. twining, to 6 ft. long: lvs. sagittate or hastate, to 3 in. long or more, lobes entire or toothed: fis. whitish, to 1½ in. across. S. Calif.

pentapetaloides. Ann., sts. prostrate: lvs. oblong or linear-lanceolate: fls. solitary, blue. S. Eu., W. Asia.

Scammònia. Per. trailing vine, sts. angular: lvs. cordatesagittate: fls. white to pink, calyx without membranaceous bracts at base. Asia Minor.

sèpium. RUTLAND BEAUTY. Per., sts. trailing to 10 ft.: lvs. ovate-cordate or arrow-shaped: fis. solitary, white, rose or pink striped with white, 2 in. long. Eu., Asia, N. Amer.

sículus. Ann., sts. prostrate, to 1½ ft.: lvs. ovate-cordate: fls. solitary, pale blue, small. Medit. region.

Soldanélla. Per., sts. prostrate to 1½ ft.: lvs. kidney-shaped: fls. solitary, pink, to 2½ in. across. Seashores around the world.

spléndens: Argyreia splendens.

tricolor (C. Cupanianus. C. minor). DWARF MORNING-GLORY. Ann., sts. erect or ascending to 1 ft. and often much branching: lvs. linear-oblong: fis. 3, blue with yellow throat margined white, to 1½ in. across. S. Eu.—An old flower-garden subject.

undulatus. Ann., sts. ascending: lvs. ovate-oblong, undulate: fis. in nearly sessile clusters, blue. Medit. region.

COONTIE: Zamia floridana.

COOPÈRIA. RAIN- or PRAIRIE-LILY. Amaryllidaceæ. Bulbous night-blooming herbs with basal grass-like lvs. and fragrant white salverform fls. solitary at end of scapes, the perianthtube long.

Sometimes planted, valuable for naturalizing in gardens of the Gulf coast country. Of easy cultivation. In colder areas the bulbs should be stored over winter in dry soil. Much like Zephyranthes; flowers in spring and summer with the narrow leaves.

Drummondii. Bulb large, subglobose: lvs. linear, graygreen, upright or declinate: scapes 4-10 in.; fls. white tinged with red outside, to 6 in. long, the tube to 5 in. long. Tex. New Mex., Mex.

pedunculata. Bulb flattened-globose, deeply buried at maturity: lvs. linear, ¼ in. wide or slightly more, glaucousgreen, twisted, recumbent: scapes 5-8 in.; fls. white tinged red outside, to 3 in. long, the tube to 1½ in. long. Tex.,

Traubii. Bulb globose, to ¾ in. diam.: lvs. linear, to 10 in. long, glaucous, recumbent: fls. star-like, white tinted pink outside, perianth-lobes separated, tube long, slender. Tex.

COPAÍFERA (Copaiva). Leguminosæ. Trees of trop. Amer. and Afr., yielding balsam of copaiba: lvs. pinnate, leathery: fls. small, usually white, not papilionaceous, borne in panicles.

officinalis. To 70 ft.: lvs. of 1-5, usually 3, pairs of ovate lfts. to 3 in. long: pods ovoid-globose, slightly flattened. Trinidad, N. S. Amer.

COPAIVA: Copaifera.

COPERNÍCIA. Palmaceæ. Tall or middlesized hermaphrodite fan-palms of many species Cuba to Argentina, unarmed except on petioles: spadices very long, much branched, borne among the lvs. and often surpassing them; fls. solitary or glomerated on the slender branches, numerous; stamens 6, inserted in tube of perianth and connate at base: fr. globose or ovoid, more or less succulent, of 1 carpel, small. One or 2 species sometimes planted in S. Calif. and S. Fla., but little known in the continental U. S. See Palm.

austrālis. To 70 ft. or perhaps more: lf.-blade orbicular, 2-2½ ft. long, whitish underneath, bearing many rusty dots, deeply divided into about 48 narrow acuminate bifd segms, with very small deciduous filaments; petiole strongly armed: fr. ovoid-olive-form, ¾ in. or less long. Paraguay, Argentina.

cerifera. Carnauba Palm. To 30 or 40 ft., with globose dense head, lower part of trunk long retaining the lf.-bases: lf. 4-6 ft. long, nearly orbicular, light colored with a waxy covering, divided to the middle or beyond into about 60 narrow segms, that are bifid into long very narrow points; petiole with remote spines: fr. ovoid to globose-ovoid, about 1 in. long. Brazil.

nàna: Cryosophila nana.

COPIAPÒA. Cactaceæ. Globose to subconical Chilean plants allied to Rebutia, with top of body densely woolly through which the yellow or reddish campanulate fls. arise; stigmas yellow, lobed; fr. green-scaled on top.

cinerascens. To 5 in. diam., pale green with dense pale yellowish wool on top; ribs about 20, to ¾ in. high, compressed between the areoles, the latter ¾ in. apart; spines brown becoming gray, radials 7-9, to ¼ in. long; central solitary, to 1 in. long and stouter: fls. yellow, inner segms. lanceolate, dentate.

COPPERLEAF: Acalypha Wilkesiana.

COPPERTIP: Crocosmia aurea.

COPRA: see Coconut.

COPRÓSMA. Rubiaceæ. Diœcious shrubs or small trees native from Hawaii to Australia and Borneo, one in Chile, with opposite persistent lvs., small white or greenish fls. in clusters or solitary, the corolla bell-shaped or funnelform and 4-5-lobed, and fr. a fleshy drupe.

Coprosmas are grown for ornament in the open ground in California and other warm regions, for the attractive foliage and fruit, and some of them for hedges. Propagated by cuttings of ripe wood.

areolata. To 15 ft.: lvs orbicular-spatulate, to 34 in. long, neute or apiculate: fr. black, globose, 1/4 in. across. New Zeal.

New Zeal.

Bañeri (C. Stocki). To 25 ft., withstanding clipping and useful in hedges; lvs. ovate or oblong, to 3 in. long, obtuse or notched, thick and shining: fr. orange-yellow, ovoid, ½ in. long. New Zeal. Var. argentea is listed with lvs. smaller, and silver variegated. Var. marginats, lvs. margined yellow. Var. variegata (var. picturata) has lvs. blotched with yellowish-green.—The usual species in cult.

brúnnea. Low spreading shrub to about 3 ft. high, sts. twisted and contorted, rigid: lvs. narrowly-linear, to 1/2 in. leng: fr. oblong to globose, pale blue, to 1/2 in. long. New Zaul

cuneata. To 10 ft., very leafy: lvs. linear- or cuneateoblong, to $\frac{3}{4}$ in. long, usually clustered, stiff and leathery: fr. red, globose, $\frac{1}{4}$ in. across. New Zeal.

Cúnninghamii. To 15 ft.; lvs linear or linear-lanceolate, to 2 in long, neute, leathery; fr. pale and translucent, oblong, ¼ m. long. New Zeal.

Kirkii. To 4 ft. or procumbent, much branched: lvs. linear or linear-oblong, to 1 in. long, obtuse: fr. oblong, ½ in. long New Zeal.

licida. To 15 ft.: lvs. obovate, to 5 in. long, obtuse or acute, leathery and shining: fr. reddish-orange, oblong, ½ in. long. New Zeal.

macrocárpa. To 12 ft.: lvs. ovate-oblong, to 7 in. long, obtuse or acute, leathery and glossy: fr. ovoid, to 1 in. long. New Zeal.

microcárpa. To 12 ft.: lvs linear, to 1/3 in. long: fr. globose, 1/10 in. across. New Zeal.

parviflora. To 15 ft: lvs. obovate, to ¾ in. long, usually clustered, feuthery: fr. blush or black, globose, ¼ in. across. New Zeal.

Pètriei. Creeping, making mats and useful for rockwork: lvs. about ½ in. or less long, narrow-oblong or obovate, hairy: fls. solitary on short branchlets: fr. purplish, to ½ in. diam. New Zeal.

ramulosa. To 4 ft, prostrate or decumbent: lvs. linearobovate, 14 in. long: fr. dark red, globose, 14 in. across. New Zeal.

rhamnoldes. To 6 ft.: lvs. orbicular to narrow-oblong, to ¾ in long: fr. red or rarely black, globose, ¼ in. across. New Zeal.

rigida. To 15 ft: lvs. obovate, to 34 in. long: fr. yellow, oblong, to 14 in. long. New Zeal.

robústa. To 15 ft.: lvs. oval, to 5 in. long, acute, leathery, dark green and shining above, pale beneath: fr. orange, oblong, ½ in. long. New Zeal

rotundifòlia. To 12 ft.: lvs. orbicular or ovate-oblong, to 1 in. long: fr. red, globose, ½ in. across. New Zeal.

rugòsa. To 10 ft.: lvs. narrow-linear, to ¾ in. long: fr. pale blue, oblong or nearly globose, ⅓ in. long. New Zeal. spathulāta. To 5 ft.: lvs. orbicular, to 1⅓ in. long, with winged petiole, obtuse or notched: fr. black, globose, ⅓ in. across. New Zeal.

Stockii: C. Baueri.

tenuicaùlis. To 8 ft., much branched: lvs. orbicular, 1/2 in long, obtuse: fr. black and shining, globose, 1/8 in. diam. New Zeal.

tenuifòlia. To 15 ft.: lvs. ovate to ovate-lanceolate, to 4 in. long, brownish-green above, pale beneath: fr. ovoid, 1/2 in. long. New Zeal.

CÓPTIS. GOLDTHREAD. Ranunculaceæ. Little per. herbs with slender rootstocks which yield a yellow dye and have medicinal properties: lvs. basal, compound: fls. white or yellow, borne on scapes, with petal-like sepals, small hood-like petals and numerous stamens; native in north temp. zone.

A few species sometimes planted in the border or rockgarden. The plants thrive in shady damp situations in peaty soil. Leaves remain green all winter if given some protection. Propagated by seeds which should be covered with leaves or paper and kept moist.

asplenifòlia. Lvs. of 5 long-petioled pinnately divided lfts.: fis. whitish, sepals and petals filiform. Alaska to B. C.

brachypétala (Thalictrum japonicum). Habit as in C. asplentfolia: 1vs biternate, segms, pinnatifid with lobes incised-serrate: fis. 3-4, erect, long-peduncled, petals shorter than the linear and acute sepals. Japan.

grænlåndica. To 6 in., the rootstocks yellow: lvs. shining, long-stalked, of 3 broadly obovate coarsely toothed petiolulate lits.: fls. white, usually solitary, about ½ in. across, the petals broader than long. May-Aug. N. E. N. Amer in bogs and damp mossy woods.—Until recently confused with C. trifolia.

laciniata. To 6 in.: lvs. of 3 deeply cut or divided lfts.: fis. whitish, sepals linear-lance olate, petals nearly filiform.

a third shorter. Wash, to Calif.

occidentalis (Chrysocoptis occidentalis). Lvs. shining, of 3 lfts. which are pinnately 3-5-lobed: fls. greenish or yellowish-white, sepals and petals subulate. Wash., Ore. to Mont.

quinquefòlia. A Japanese species differing from C. grænlandica in the fr. follicle being half-round with upper surface flattened, not ellipsoid, and tip not prominently hooked.

trifòlia. Lits. sessile or essentially so: petals rather narrow, mostly rhombic and as long as broad. N. E. Asia, Alaska.

CORAL-BELLS: Heuchera sanguinea. -Berry: Symphoticarpos orbiculatus. -Blow: Russelia. -Bush: Templetonia retusa. -Drops: Bessera elegans. -Plant: Jatropha multifida, Husselia equisetiformis. -Root: Corallorrhiza. -Tree: Erythrina. -Vine: Antigonon leptopus.

CORALLITA: Antigonon leptopus. White: Porana paniculata.

CORALLORRHIZA. CORAL-ROOT. Orchidaceæ. Terrestrial saprophytic orchids with masses of coral-like rootstocks, lvs. reduced to scales, and small fls. in terminal racemes. May be grown in rich shady places.

Bígelovii: C. striata.

maculata (C. multiflora). To 8 in. tall, scape usually pinkish: racemes to 7½ in. long; sepals and petals brownish-purple, to about ½ in. long, ip always 3-lobed, white with purple spots (yellowish forms occur). Newf. to N. C. west to Calif., Ore. and Wash.

multifldra: C. maculata.

striata (C. Bigliani). To 18 in. tall, scapes often brownish-purple: fls purplish striped with dark purple (yellowish forms occur), about ½ in. long, lip simple. Que. to B. C. south to Mich, New Mex. and Calif.

CORCHO: Microcycas calocoma.

CORCHORÓPSIS. Trliaceæ. A monotypic genus allied to Sparmannia but differing in having only 5 staminodia and 10-15 fertile stamens. C. crenàta. Shrub to 4 ft., sts. much branched and ascending, tips herbaceous: lvs. alternate, ovate to ovate-oblong, acute, coarsely crenate-dentate, usually stellate-hairy: fls. yellow, solitary in axils, calyx tomentose outside, glabrous within: fr. a cylindrical caps. about 1 in. long. Japan.

CÓRCHORUS. Tiliaceæ. Trop. herbs or subshrubs with alternate simple toothed lvs., very small yellow fls., and capsular frs.; grown for the fiber contained in the inner bark and the young shoots eaten as pot-herbs.

Jute requires a warm moist climate and loam soil. Seed may be sown broadcast in spring and the crop will be ready to harvest in about three months. The fiber is grown from Egypt to Japan.

capsulàris. Jute. Ann., to 15 ft.: lvs. oblong, to 4 in. long; fr. globose and wrinkled. India.

japónicus: Kerria japonica.

olitòrius. Jews-Mallow. Differs from C. capsularis only in its elongated and beaked fr. India.

CORDATE: heart-shaped; ovate in general outline, with a snus and rounded lobes at base.

córdia. Boraginaceæ. Trop. trees and shrubs, sometimes partially climbing, in Old and New Worlds, with alternate simple lvs. and white or orange mostly 4-merous fls. in forking bractless clusters or coiled cymes, bisexual or polygamous, the corolla tubular or bell-shaped. The genus is polymorphous and is divided by certain authors; some of the

species bear very small fls., others large and showy ones: fr. a drupe.

Grown in the greenhouse, and out-of-doors in warm regions, for ornament. Propagated by seeds and cuttings.

alba. Tree to 30 ft.: lvs. broad-ovate to roundish, rough. to 4 in. long: fis. papery, white, 1/2 in. across, in large open clusters: fr. an oblong drupe about 1/2 in. long. American

Boissièri. Evergreen shrub or tree to 25 ft.: lvs. ovate or oblong-ovate, to 5 in. long, velvety-tomentose, wavy: fs. white with yellow center, 1½ in. long, in terminal clusters. Tex. to Mex.

Méxa. Deciduous tree to 40 ft.: lvs. broad-ovate, stiffish, to 5 in long, glabrous, entire or wavy-toothed; stmisn, to 5 in long, glabrous, entire or wavy-toothed; fis, white, polygamous, ½ in. or less long, in large clusters: fr. tancolored, ¾ in. duam., mucilaginous and used in medicine. India to Australia; planted in Calif. and American tropics.

Sebestèna (Sebesten Schestena). GEIGER-TREE. Evergreen shrub or tree to 30 ft.: lvs. ovate, to 8 in. long, rough-hairy, margins entire or wavy: fls. orange or scarlet, to 2 in. long, in large terminal clusters. Fla. keys and south.

thyrsifldra: Ehretia thursiflora.

CORDULA: Paphiopedilum.

CORDYLÌNE. Dracena Liliacex. Trees or shrubs with leathery or stiff narrow lvs. usually crowded at top of branches, often variegated, and greenish or yellowish fis. in panicles on solitary pedicels; grown under glass and out-of-doors in warm climates for the foliage; often more or less palm-like in appearance. C. terminalis has foliage in many color combinations. See Dracana.

Propagated by seeds, cuttings and root-layering. The leaves may be removed from ripened stems, these stems cut into 2-4-inch lengths and laid in sand in propagating bed with bottom heat. When the eyes have developed growth of about six leaves, the shoots should be cut off with an eye and put in propagating-bed until rooted and then transplanted into pots.

amabilis. A form of C. terminalis having shining deep green lys. becoming spotted with rose and white.

austràlis (Dracæna australis). To 40 ft.: lvs. to 3 ft. long and 2½ in. across: fis. white, fragrant, in large terminal panicles. New Zeal. Var atropurpurea has base of lf. and midno beneath purple. Var. Veitchii is bright crimson on midrib and base of lf.

Bánksii. To 10 ft.: lvs. to 6 ft. or more long and 3½ in. across: fls. white, in drooping much branched panicles to 5 ft. long. New Zeal.

Baptistii. A form of C. terminalis having deep green lys. striped with pink and yellow.

Bruántii. A garden form of C. rubra.

cannæfòlia. A var. of C. terminalis with oblanceolate lvs. about 1 ft. long.

congésta: C. structa.

Doucètil. A form of C. australis having lvs. edged and striped with white.

Haageana. To 3 ft.: lvs. to 6 in. long and 21/2 in. wide, abruptly contracted into long petiole: fis. white to reddish-purple, to 36 in. long, segms. equal, in few-branched panicles to 1 tt. long or often only to 6 in. long: fr. about 1/8 in. diam. Australia.

hébrida. A form of C, terminalis having deep green lys. margined with rose.

imperialis. Lvs. deep metallic green marked with crimson or pink; form of C. terminalis.

indivisa (Dracæna indivisa). To 25 ft.: lvs. to 6 ft. long and 6 in. wide: fis. white, in drooping panicles to 4 ft. long. New Zeal. Var. Parei is listed.

marginata (Dracæna marginata). Sts. slender, to 12 ft., roughened by abscission sears of old lvs. and terminated by a tuft of lvs: lvs. narrowly ensiform, to 2 ft. long, flat or somewhat concave above toward base, gray-green with purple margins, pungently-tipped: fls. in elongated panicles. Madagascar.

metállica. A form of C. terminalis becoming purplebronze in age.

nigro-rubra. Lvs. narrow, dark brown with rosy centers; form of C. terminalis.

norwoodiénsis. A terminalis variant having lvs. striped with yellow, green and crimson.

Pumilio. Stemless or with st. to 3 ft.: lvs. to 3 ft. long and 34 in. across: fis. white or bluish, in slender panicles to 3 ft. long. New Zeal.

Robinsoniana. Lvs. light green striped with bronze and brownish-crimson: form of C. terminalis.

rùbra. To 15 ft.: lvs. to 15 in. long and 2 in. across: fis. lilac, in nodding lateral panicles. Country unknown.

stricta (C. congesta). To 12 ft.: lvs. to 2 ft. long and 1½ in. across: fis. hlac, in terminal or lateral panicles. Australia. Var. grandis is a large highly colored form.

terminalis. To 10 ft.: Ivs. to 2½ ft. long and 5 in. across: fls. yellowish, white or reddish, in panicles to 1 ft. long. E. Asia.—Runs into many foliage forms, and some of them have been given Latin names as if species.

tricolor: color form of C. terminalis.

Veitchii. C quetrale ver

Youngil. A form of C. terminalis with bright green lvs. streaked with red, bronze in age.

Empetraceæ. Evergreen heath-CORÈMA. like small shrubs with diocious fls. in terminal heads, without sepals or petals; native in N. Amer. and Eu. Propagated by cuttings.

Cônradii. BROOM CROWBERRY. To 2 ft.: lvs. linear, to 1/2 in. long: staminate fls. with long purple stamens. Newf. to N. J. in rocky and sandy places.—Useful for colonizing and for ground-cover.

COREÓPSIS (Calliopsis. Leptosyne). Tick-SEED. Compositæ. Ann. and per. herbs, seldom shrubby, with mostly opposite lvs. that are entire or variously lobed or cut: heads solitary or loosely panicled, yellow, brown or rose, blooming in summer and autumn, of ray-and disk-fls.; pappus of teeth or scales or none. Grown in the flower-garden and border.

Coreopsis grows well in any garden soil. The annuals are started from seed sown indoors in early spring or in the open when the ground is warm, the perennials from seed, or by cuttings of growing wood in summer, and by division. The annual kinds are well-known flower-garden subjects, as C. Atkinsomana, Drummondia, tinctoria. See Thelesperma.

Atkinsoniàna. Ann. or per. to 4 ft.: lvs. 1-2-pinnate into linear lobes: heads to 1½ in. across, on long stalks, rays with brown-purple base, toothed or lobed, disk purple or brownish; achenes narrow-winged. B. C. to N. D.

atrosanguínea. A flower-garden ann., probably Thelesperma Burridgeanum.

auriculata. Per. to 1½ ft.: lvs. oval, simple or with few basal lobes: heads 2 in. across, rays yellow, toothed: achenes narrow-winged. Va. to Fla.—C. auriculata of the trade is C. pubescens.

bicolor: C. tinctoria.

Bigelovii (Leptosyne Bigelovii). Ann. to 14 in.: lvs. in basal tuft, pinnate into linear lobes or sometimes entire: fis. 1½ in. across, rays yellow, pappus of scales. Calif., deserts.

calliopsidea (Leptosyne calliopsidea). Ann. to 2 ft. or less, sts. leafy: lower lvs. narrow or ligulate, the upper ones pinnately parted: heads to 3 in. across; pappus of scales. Calif., on moist hillsides.

cardaminefòlia. Ann. to 2 ft.: lvs. 1-2-pinnate into ovate to linear lobes: heads about 1 in. across, rays brown-purple at base, toothed, disk dark purple: achenes winged. Kans, to Ariz.

coronata: C. nuecensis: see also Bidens coronata.

delphinifòlia. Larkspur C. Per. to 5 ft.: lvs. to 3 in. long, palmately 3-parted and middle segm. again cut into linear lobes: heads to 2½ in. across, disk purple-brown, rays yellow, entire: achenes narrowly winged. Va. to Ga. and Ala.

Douglasii (Leptosyne Douglasii. L. californica). Ann. to about I ft.: Ivs. all basal, filiform to linear and entire or pinnately parted: heads 1½ in. across; pappus none or a little cup. S. Calif., Ariz.

Drúmmondii (C. picta). Golden-Wave. Ann. to 2 ft.: lvs. pinnate into ovate to linear lobes: heads to 2 in. across, long-stalked, ravs yellow, brownish-purple at base, toothed or lobed, disk dark purple: achenes with thick margin. Tex.

élegans: C. tinctoria.

floribúnda: C. grandiflora.

gigantèa (Leptosyne gigantea). Succulent shrub to 6 ft., leafy only towards top: If-divisions nearly or quite filiform: heads to 3 in. across, on clustered peduncles 3-6 in. long; pappus none. Coasts, S. Calif.

grandiflora (C. floribunda. C. lanceolata var. grandiflora). Per. to 2 ft.: lvs. narrow and entire but mostly 3-5-parted,

petioles ciliate: heads to 2½ in. across, on long stalks, rays yellow, lobed, disk yellow: achenes with broad wings. Ga. to New Mex.

lanceolata. Per. to 2 ft.: lvs. usually entire. mostly near the base: heads to 22% in. across, very long-stalked, rays yellow, lobed, disk yellow: achenes broad-winged. Ont. to flu. and La. Var. flore-plèno has double fis. Var. grandiflora is C. grandiflora.

latifòlia. Per. to 5 ft.: lvs. ovate, to 9 in. long, acuminate, sharply serrate, not divided: heads numerous, to 1½ in. across, disk- and ray-fis. yellow. N. C. to Ga.

major (C. sentfolia). Per. to 3 ft.: Ivs. Inneeolate and entire or palmately cut into 3 lanceolate segues: heads to 2 m. across, rays yellow, entire, disk yellow: achenes winged. Va. to Fla. and Ala.

marftima (Leptospne maritima). SEA-DAHLIA. Per. to 3 ft., sts. leafy and hollow: If—divisions linear or broader: heads to 3 ½ in. across, solitary on sts. to 1 ft. long; pappus none. Coasts, S. Calif.

marmorata: C. tinctoria. micronhella. listed name

myriophyllum: listed name. nigra: C. tinctoria var. atromirmirea.

nuecénsis (C. coronata). Ann, glabrous or sparsely pubessent, branched, to 2 ft.: lvs. obovate or spatulate-oblong, to 3 in. long, entire or lower ones 3-parted: rays yellow, dark-lined, the heads to 2 in. across. Tex.

oculata: hort, name,

palmata. Finger C. Per. to 3 ft.: lvs. palmately 3-cleft to below middle: heads to 2½ in. across, rays bright yellow, toothed, disk yellow: achenes narrow-winged. Ind. to Neb. and La.

picta: C. Drummondii.

pubéscens. Per. to 4 ft.: lvs. oval, entire or with small lateral lobes: heads to $2\frac{1}{2}$ in. across, rays yellow, lobed, disk yellow: achenes winged. Va. to Fla. and La.

radiata: hort, name for a form with rolled-up ray-fis.

ròsea. Per. to 2 ft. with slender creeping rootstocks: lvs. linear, entire or 3-parted: heads to 1 in. across, shortstalked, rays rose-color, slightly toothed, disk yellow: achenes not winged. Mass. to Ga. Var. nāna is listed.

saxicola. Similar to C. grandsflora from which it differs only in its non-ciliate petioles, broader outer involucial bracts and achenes with fimbriately dissected wings. bracts and Ga. to Ala.

senifòlia: C. major.

Stillmanii (Leptosyne Stillmanii). Ann. to 1 ft., slightly fleshy, sts. leafy: lvs. with long linear lobes: heads 1½ in. or more across; pappus a cup. Calif.

tenuifòlia: C. verticillata.

tinctòria (C. bicolor. C. elegans. Calliopsis marmorata). Ann. to 3 ft.: lvs. divided into lanceolate or linear segms.: heads to 2 in. across, long-stalked, rays yellow, crimsonbrown at base, toothed, disk brownish-purple: achenes wingless. Minn. to Neb. and Ariz. Var. atropurpurea (C. nigra) has rays crimson-brown throughout. Var. flòreplèno has double fls. Var. nana is dwarf. Var. spléndens is offered as an improved form. is offered as an improved form.

trichospérma: Bidens coronata.

tripteris. Per. to 8 ft.: lvs. lanceolate and entire or lower 3-parted: heads 1½ in. across, rays yellow, entire, disk yellow: achienes narrow-winged. Ont. to Fla. and La.

verticillata (C. tenuifolia). Thread-leaf C. Per. to 3 ft.: lvs. ternately divided into thread-like segms.: heads to 2 in. across, rays deep yellow, entire, disk yellow: achenes narrow-winged. Md. to Ark. and Neb.

CORETHRÓGYNE. Compositæ. A few per. herbs of Calif., somewhat like Aster and differing in technical characters, the herbage cottonywhite when young: lvs. sessile, entire or serrate: heads with yellow disk and rays in the purple

californica. To 13/4 ft. high, the sts. prostrate or de-cumbent at base and then ascending: lvs. linear to spatulate or obovate, the lowest few-toothed: heads solitary on peduncles, to 1/3 in. high, rays purple to lilac.

CORIACEOUS: leathery, as of leaves that are thick and stiff.

CORIANDER: Coriandrum sativum.

CORIÁNDRUM. Umbelliferæ. Ann. herbs with pinnately compound lvs., small white fls. in compound umbels, and ovoid frs.; one species grown for the frs. or seeds which are

used as seasoning. It is of easy cult. in any garden soil. Propagated by seeds sown in autumn or spring, the latter time in the N.

sativum. Coriander. To 3 ft., strong-smelling: lvs. decompound, the upper divided into narrowly linear segms., the lower lvs. with ovate deeply cut segms. S. Eu.

CORIARIA, the only genus in the family Coriariaceæ. Herbs or shrubs with opposite or whorled lvs., small greenish fls. in racemes, with 5 sepals and 5 petals, 10 stamens, superior ovary, and berry-like fr.; the following species grown in S. U. S. and Calif. Propagated by seeds. cuttings of green wood, suckers and layers.

japônica. Shrub to 6 ft. or more: lvs. ovate to ovate-lanceolate, to 4 in. long, acute, 3-nerved: fis. greenish or reddish, in racemes: fr. red to blackish. Japan; hardy south of Washington.

myrtifòlia. Shrub to 10 ft.: lvs. ovate, to 2½ in. long: racemes 1 in. long; fr. black. S. Eu., N. Afr.

ruscifòlia (C. sarmentosa). Shrub or small tree to 25 ft.: lys. ovate. to 3 in. long: racemes to 1 ft. long, drooping: fr. purple-black. New Zeal.

sarmentòsa: C. ruscifolia.

terminalis. Herb or subshrub to 3 ft.: lvs. ovate, to 3 in. long: racemes 10 in. long: fr. black. China.

thymifolia. Suffrutescent herb 1-4 ft. high, sts. with winged angles, much branched: lvs. oblong-ovate, ovate to lanceolate, ½-1 in. long, acute: fls as in C. ruscifolia, but smaller. New Zeal., Peru.—Very variable as to If. size and outline.

CORKSCREW-FLOWER: Phaseolus Caracalla.

CORK-TREE: Phellodendron.

CORKWOOD: Leitneria floridana.

CORM: a solid bulb-like part, usually subterranean, as the "bulb" of crocus and gladiolus.

CORMEL: a corm arising from a mother-corm.

CORN as a horticultural subject implies sweet or sugar maize (Zea Mays var. rugosa) as distinguished from the field or agricultural corns, and also certain kinds grown for the striped ornamental foliage.

Sweet corn, grown for the edible immature car, is a tender annual, requiring warm "quick" land and full sun exposure. The first planting should be made in the home garden as soon as frost is past. It is well to plant early, intermediate and late varieties at the same time, then at intervals of two weeks until early summer, thus having a succession from the first erop until October. For late erop, corn may be started in pots and transplanted when peas and other crops are off. The soil for corn should be fertile, and the coarser manure left from the preparation of the ground for small crops may be used to good advantage. Corn for the garden is better planted in drills, the drills 3 to 4 feet apart, dropping the seed 10 to 12 inches apart in the drills. Some gardeners prefer to plant in "hills" 2-3 feet apart, of 3-5 stalks each. One quart of seed will plant 200 hills. The hybrid varieties such as Golden Cross are now in general use for home-garden, market-garden and canning-crop production.

Pop corn (Z. Mays var. everta) is grown the same as sweet corn.

CORNACEÆ. Dogwood Family. Shrubs and small trees, sometimes practically her-baceous, of about 10 genera most abundant in the northern hemisphere, having simple lvs., small bisexual or diocious fls. sometimes surrounded by a showy corolla-like involucre, with 4-5-lobed calyx, 4-5 petals or none, 4-5 stamens, inferior 1-4-celled ovary, and fr. a drupe or berry. The genera Aucuba, Cornus, Corokia, Griselinia, Helwingia, are grown for arnament

CORN, BROOM-: Sorghum vulgare var. Chicken-: Sorghum vulgare var. Drummondii. technicum. Cockle Agrostemma

CORNFLAG: Gladiolus segetum. CORNFLOWER: Centaurea Cyanus. CORN-SALAD: Valerianella.

Dogwood. Cornaceæ. shrubs and small trees with simple entire usually opposite and mostly decidous lvs., small white or greenish-white fls. in a terminal infl., and little drupaceous frs., sometimes with large showy involucre like a corolla.

Dogwoods are useful for shrubberies and sometimes as single specimens. They are of easy cultivation in any usual soil. Propagated by cuttings of mature wood, layers, or varieties by budding and grafting on common stocks. The following species are hardy in the North unless otherwise

álba. TATARIAN D. To 10 ft., with blood-red branches: lvs. ovate or elliptic, to 5 in. long, glaucous below: fls. in cymes to 2 in. across: fr. whitish or tinted blue. Siberia, N. China. Var. argénteo-marginàta (clegantissima variequals) has lvs. edged with white. In var Goúchaultii the lvs. are variegated with yellowish-white and pink. Var. sibírica (C. sibírica) has bright coral-red branches. In var. Spaéthii the lvs. are broadly edged with yellow.

alternifòlia. PAGODA D. To 25 ft.: lvs. alternate, oval or ovate, to 4 in. long, pale beneath: fls. in cymes about 2½ in. across: fr. dark blue, rarely yellow. N. S. to Ga. and Mo.

Amômum (C. sericca, C. carulea). Silky D. To 10 ft., with purplish branches: Ivs. ovate to ovate-lanceolate, to 4 in. long, usually silky-pubescent beneath: fls. in cymes to 2½ in. aeross: fr. pale blue. Newf. to Fla. and Tex.

argénteo-marginàta: C. alba var.

Arnoldiàna. Hybrid of C. obliqua and C. racemosa, differing from C. obliqua in its more erect habit, slenderer and grayer sts.: fr. white or pale blue.

asperifòlia. ROUGH-LEAVED D. To 15 ft., with reddishbrown branches: lvs. ovate to oval, to 4 in. long, rough above and pale beneath: fls. in cymes to 3 in. across; fr. white. Ont. to Fla. and Tex.

austrālis. Branches purplish or greenish: lvs. ovate, to 3 in. long, rough and hairy beneath; fis. in small dense cymes; fr. purplish-black. W. Asia.

autumnalis: hort. name.

Bàileyi. To 10 ft., with reddish branches: lvs. ovate to lanceolate, to 5 in. long, white beneath: fls. in cymes to 2 in. across: fr. white. Ont. and Pa. to Minn., mostly on

brachýpoda: C. macrophylla.

cærùlea: C. Amomum.

califórnica. CREEK D. Shrub to 15 ft., sts. glabrous, purplish-red: lvs. ovate to elliptical, to 4 in. long, acute, somewhat puberulent: fr. white Calif.

canadénsis (Chamæpericlymenum canadense). Bunch-Berry. Woody per. herb to 9 in.: lvs. whorled, oval to obovate, to 3 in. long: fis in deuse heads subtended by an involucre of 4-6 large white petal-like bracts: fr. bright red. Newf. to Alaska, south to W. Va., and E. Asia.

candidíssima: C. racemosa.

capitata (Benthama fragifera). To 40 ft., partially evergreen: lvs. leathery, oval-lance olate, to 4 in. long: fts. in dense heads subtended by 4-6 large creamy-white petallike bracts: fr. scarlet. Himalayas; to be grown only far S. circinata: C. rugosa.

coloradensis: C. stolonifera var. controversa. To 60 ft.: lvs. alternate, ovate, to 5 in. long, whitish beneath: fls. in cymes to 4 in. across: fr. bluish-black. Himalayas to Japan. Var. variegāta has lvs. edged with white.

Dúnbari. Hybrid between C. asperifolia and C. macro-phylla: lvs. ovate, to 6 in. long: fls. in corymbs to 2½ in. across: fr. blue.

elegantíssima: probably C. alba var. argenteo-marginata. flórida (Cynoxylon floridum). Flowering D. To 40 ft.: Ivs oyate, to 6 in. long: fis. in dense heads subtended by 4 large white petal-like bracts: fr. scarlet. Me. to Fla. and Tex. Var. álba is listed. Vars. frúcto-lúteo and xanthocárpa, fr. yellow. Var. multibracteàta, double-fid. Var. péndula has drooping branches. Var. plèna has double fis. In var rûbra (var. rosea) the bracts are pink or rose. Var. salicifòlia is listed as a small tree of "willowy" growth. Var. Wélchii, lvs. variegated red and yellow. fámina (C. and Svida stricta). To 15 ft., with purplish branches: lvs. ovate to ovate-lanceolate, to 3 in. long: fls. in cymes to 234 in. across: fr. pale blue. Va. to Fla. and Tex.; not hardy far N.

Gouchaultii: C. alba var.

Hémsleyi. To 12 ft.: lvs. ovate, to 3 in. long, hairy and pale beneath: fr. bluish-black. China.

Koùsa (Benthamia japonica). Kousa. To 20 ft.: lvs. ovste, to 4 in. long, glaucous beneath: fls. in dense heads subtended by creamy-white petal-like bracts 1-2 in. long: frs. grown together into a head. Japan, China. Var. chinénsis. Lvs. larger and often more pubescent, infl. with bracts about 2½ in. long. China.

lùtea: C. stolonifera var. flaviramea.

macrophfila (C. brachypoda). To 50 ft.: lvs. ellipticovate, to 6 in. long, glaucous beneath: fls. in panicle-like cymes to 6 in. across: fr. blush-black. Himalayas, China, Japan; to be planted in north-central regions.

más (C. mascula). Connectan regions.

más (C. mascula). Connectan Cherry. To 20 ft.: lvs. ovate, to 4½ m. long, essentially glabrous beneath: fls. yellow, before the lvs., in umbels about ¾ in. across: fr. scarlet, edible. S. Em., Orient. In var. aŭrea the lvs. are yellow and in elegantíssima (var. aureo-clegantíssima) the lvs. are varieșated with creamy-white and pink. Var. variegăta has lvs. bordered with white.

máscula: (! mas

Núttallii. To 75 ft.: lvs. ovate to obovate, to 5 in. long, glaucous beneath: fis. in dense heads subtended by white or pinkish bracts: fr. red or orange. B. C. to S. Calif.; hardy only far S.

obliqua. To 10 ft., the branches purple or yellowish-red: lvs. ovate to oblong, to 3 m. long, glaucous beneath: its. in cymes 2 in. across: fr. blue to nearly white. Que. to

officinalis. To 15 ft.: lvs. elliptic, pale and with brown axillary tufts of hair beneath: fis. yellow, before lvs., in umbels to about ¾ in. across: fr. scarlet. Japan, China.

paniculàta: C. racemosa.

paucinérvis. To 6 ft.: lvs. narrowly oval, to 4 in. long, more or less persistent: fis in cymes to 3½ in. across: fr. black. China: hardy in north-central parts of U. S.

pubéscens (Svida pubescens). To 18 ft., the branches purple: lvs elliptic, to 4 in. long, tomentose and glaucous beneath; fls. in cymes 2 in. across: fr. white. B. C. to Calif.; not hardy N.

racemòsa (C. candidissima. C. paniculata). To 15 ft.: lvs. ovate-lanceolate or lanceolate, to 4 in. long, pale beneath: fls. in panicles: fr. white. Me. to N. C. and Neb.

rugosa (C. circinata). To 10 ft: lvs. broadly ovate or orbicular, to 6 in. long, pale and pubescent beneath; fls. white, in dense cymes to 2½ in. across; fr. light blue. N. S. to Va. and N. D.

sanguinea. BLOODTWIG D. To 12 ft., with purple or red branches: lvs. ovate, to 3 m. long: fis. in cymes to 2 in. across: fr. black. Eu., Orient. Var. variegāta has lvs. variegāted with yellowish-white. In var. viridissima the branches and fr. are green.

sericea: C. Amomum

sibírica: C. alba var.

Spaèthii: C. alba var.

Spactnii: C. atba var.

stolonifera. Red-Osier D. To 10 ft., with dark red branches, spreading by underground sts.: Ivs. ovate or ovate-lanceolate, to 5 in long: fls. in cymes to 2 in across: frs white or bluish. N. Amer Var. coloradensis has brownish-red branches and bluish fr. Var. flaviamea (vars. aurea and lutea), Golden-twig D., has yellow branches. Var. Kélseyi is listed.

stricta: C. fæmina.

COROJO: Acrocomia.

CORÒKIA. Cornaceæ. Evergreen shrubs or trees native in New Zeal., with alternate entire small lvs., small yellow axillary fls. usually clustered, and drupaceous frṣ.; grown out-of-doors in Calif.

buddleoides. To 12 ft., much branched: lvs. lanceolate or linear-lanceolate, to 6 in. long, white-tomentose beneath: fts in terminal panicles: fr. dark red. Var. linearis has narrower lys.

Cheèsemanii. To 12 ft: lvs. oblanceolate to oblong-lanceolate, to 1½ in. long, silvery-white-tomentose: ffs. yellow, usually 4-5 in axillary fascicles or terminal panicles: fr. red.

Cotoneaster. To 10 ft., the branches numerous and interlaced: lvs. ovate, to 1 in. long, white-tomentose beneath: fr. red.

macrocárpa. To 20 ft.: lvs. oblong, to 4 in. long, white-tomentose beneath: fis. in axillary racemes: fr. dark red.

COROLLA: inner circle of floral envelopes; if the parts are separate, they are petals; if not separate, they are teeth, lobes or divisions. The corolla is commonly the colored showy part of the flower.

CORONA: crown, coronet; any appendage or intrusion that stands between the corolla and stamens, or on the corolla, as the cup of a daffodil, or that is the outgrowth of the staminal part or circle, as in the milkweeds.

CORONARIA: Lychnis.

CORONÍLLA. Leguminosæ. Herbs and shrubs with odd-pinnate lvs., papilionaceous fls. in long-stalked axillary umbels, and cylindrical or angled pods constricted between the seeds; grown out-of-doors and in the greenhouse. Propagated by seeds and division, or by cuttings under glass.

cappadócica (C. iberica). Per. to 1 ft.: lfts. 9-11: fls. vellow, large. Asia Minor.

crética. Per., sts. procumbent or ascending, radiating from a single crown, slender: lfts. 5–8 pairs, oblong-obovate, to nearly 1/4 in. long: fls. rose, with keel blotched purplish at apex, to 1/4 in. long, in umbels of 3–6. Greece to Balkans.—Although per. in native habitat, it is best treated as ann.

emeroides. Similar to C Emerus, with 7 or sometimes 5 lfts, fls. $\frac{1}{2}$ in long, and pods to 3 in long. S. E. Eu.

Émerus. Scorpion Senna. Shrub to 9 ft.: Ifts. 7-9: fls. yellow, ¾ in. long, the claw of the petals much longer than the calyx: pods 2 in. long. S. Eu.; hardy N.

glauca. Shrub to 4 ft.: lfts. 5-7: fls. yellow, ½ in. long, the claw of the petals about length of calyx. S. Eu. Var. variegata has variegated foliage.

ibérica: C. cappadocica.

jûncea. Shrub to 3 ft., gray-green, with nearly naked branches: Ifts 3-7: fis golden-yellow, the claw of petal about length of calyx. Medit. region.

mínima. Procumbent subshrub to 4 in., gray-green: lfts. 7-13; fls. golden-yellow, fragrant. Eu.

montana. Tall per.: Ifts. 11-13: fls. yellow. Caucasus.

Securidaca: Securidaca. Valentina. Shrub to 3 ft.: Ifts. 7-13: fls. deep yellow, fragrant. S. Eu.

varia. Crown Vetch. Straggling herb to 2 ft.: Ifts. 11-25: fls pinkish-white, ½ in. long, the claw of petals about length of calyx. Eu.; nat. in northeastern states.

CORÓNOPUS (Sencbiera). Wart-Cress. Cruciferæ. A few more or less weedy diffuse or procumbent small ann. and bien. herbs with strong odor, sometimes listed, perhaps useful for ground-cover: lvs. commonly pin-natifid: fls. minute, whitish, in little racemes: fr. or silicle very small, twin. C. procumbens (Carara Coronopus) is tufted and prostrate, glabrous, glaucous, the sts. a few in. long: foliage finely cut: pods crested. Eu.; sometimes escaped.

CORÒZO. Palmacex. One species as now named and understood, C. oleffera, American Oil Palm, in Cent. Amer., Panama, Colombia and the Amazon region, supposed at one time to have been the palm meant by Elxis melanococca, but that name belongs to a variant of E. guincensis. Monœcious low tree with part of the trunk reclining or lying on the ground, the erect part reaching 5 or 6 ft.: lvs. long, pinnate, spiny on the petiole: spadix dense axillary bodies close in the crown of the tree: fr. about 1 in. long, black at maturity, sitting in a shallow cup or enlarged floral parts, oblong, somewhat tapering at apex and broad at base, the exterior flesh yielding oil and early employed in the making of candles by European colonizers. Common about city of Panama, and elsewhere on Zone, but apparently little planted. As a vernacular name, Corozo is applied to species of Acrocomia and other palms.

CORPUSCULÀRIA (Schonlandia). Aizoacex. Succulent shrubby or stemless plants with prostrate branches, thick 3-angled lvs., solitary terminal fls.: stigmas 5-6. S. African, a Mesembryanthemum segregate.

algoénse: listed name.

Lèhmannii (M. Lehmannii). Sts. prostrate, to 10 in. long: lvs. to 1 in. long and ½ in. wide, gray-green: fls. pale yellow, to 2 in. across, with bracts inclosing the calyx.

CORRÈA. Rutacex. Australian shrubs or trees with opposite simple lvs., red, white or yellowish-green fls., 4-parted ovary and single style, and fr. of 4 carpels. Marked by the scurfy lvs. and branches.

Grown under glass or in the open in warm regions. Propagated by cuttings, or some species by grafting on C. aba. Shoots should be pinched back to induce bushy

álba. To 4 ft.: lvs. orbicular to ovate, white-tomentose beneath: fls. white, bell-shaped, ½ in. long.

bicolor: C. speciosa.

pulchélla: C. speciosa.

speciosa (C. bicolor C. pulchella). To 3 ft.: lvs. ovate to lanceolate, white-tomentose beneath; fls. red or yellowishgreen, tubular, 1-112 in. long.

ventricosa. Similar to C. speciosa, and by some treated as a variant of it, having bright crimson fls. with segms. tipped green.

CORRYOCÁCTUS. Cactaceæ. Columnar cacti branching at base, with strong ribs and very spiny areoles: fls. yellow or orange, with short tube and open throat: native Peru and Bolivia.

bolivianus: hort. name, possibly of Trichocereus macrogonus.

brachypétalus (Cereus brachypetalus). To 12 ft., much branched; ribs 7-8, arcoles large, ¾ in. apart; spines about 20, the longest to 6 in.: fls. deep orange, 3 in. across. Peru.

brevistylus (Cereus brevistylus). To 10 ft, much branched, light green or yellowish; ribs 6-7, very prominent, areoles large, 1½ in. apart; spines about 15, the longest to 10 in: fis bright yellow, 4 in across. Peru.

melanótrichus (Cereus melanotrichus). To 7 ft. high, sts. slender; ribs 7-8, shallow, areoles to ¾ in. apart; radial spines about 12, to ½ in long; central spines 1-3, to 2 in long; fls. glossy pink, to 2¾ in. aeross. Bolivia.

proctimbens: listed name.

CORTADÈRIA. PAMPAS-GRASS. Gramineæ. Large per. grasses with mostly basal foliage forming great clumps: lvs. rough on edges: spikelets diacious or sometimes bisexual, borne in panicles which are usually large, plumelike and very decorative; native in S. Amer.; not hardy N. See Grasses.

argéntea: C. Selloana.

jubata: C. rudiuscula.

Quila: C. rudiuscula.

rosea is listed as having rose-colored plumes; it is probably C. Selloana or a var. of it.

rudúscula (C. Quila. C. jubata. Gynerium jubatum). To 6 ft : lvs. to 4 ft. long and ½ in. wide: panicle yellowish or purplish, to 2 ft. long, branches drooping. Ecuador to Chile and Argentina.

Selloana (C. argentea. Gynerium argenteum). To 20 ft.: lvs. many ft. long and to 34 in. wide: panicles white or pink, silky-hairy, to 3 ft. long. Argentina.

CORTUSA. Primulacex. Per. hairy herbs with long-petioled orbicular lobed lvs. and rose or yellow fls. in umbels terminating the scape; a few species planted in rock-gardens. They do well in any good soil but require winter protection in the N. Propagated by division of roots.

Matthiolii. To 6 in.: fls. rosy-purple, nodding. Eu., N. Asia. Var. pubens (C. pubens) has deeply lobed lvs., the lobes coarsely toothed. Var. villèso-hrsuta is hairy with deeply lobed lvs.

pûbens: C. Matthiolii var.

CORYANTHES. Orchidacex. Epiphytic American orchids similar to Stanhopea from which they differ in having the lateral senals larger than the dorsal sepal and petals and the terminal lobe of lip helmet-shaped: not to be confused with the Asiatic genus Corysanthes, a relative of Pogonia and not known to be in cult. Members of the genus Coryanthes require warmhouse cult. as given for Stanhopea.

Bungerothii. Pseudobulbs ovoid-oblong, 21/2 in. long: Bungerotini. Pseudobulbs ovoid-oblong, 2½ in. long: scape 1½ ft. long, 1-fld.; fls. with whitish-green sepals and petals speckled with reddish-purple, lateral sepals to 6 in. long and 2 in. wide, dorsal one to 2½ in. long, petals very narrow and about 3 in. long; terminal lobe of lip or hood yellow, spotted with brown within. Venezuela.

hood yellow, spotted with brown within. Venezuela. macránta. Pseudobulbs to 6 in. long, narrowly subconical, usually strongly 8-ribbed, 2-lvd.: lvs. elliptic-lanceolate, to 1 ft. long, aruminate: peduncle usually 2-fld, to 6 in. long, arising from the base of the pseudobulb, pendent; sepals and petals membranaceous, pale yellowish or flesh-color dotted with red or purple; dorsal sepal oblong-lanceolate; lateral sepals lunate-semielliptic, 3-5 in. long, twisted; petals narrow, to 2½ in. long, undulate; lip fleshy, with a narrow claw about 1 in. long abruptly passing into a subglobose cup from which rises the helmet-shaped 3-lobulate terminal lobe which is orange-yellow spotted with red. Apr.-duly. Trinidad, Venezuela, British Guiana.

maculata. Pseudobulbs ovoid and somewhat conical, slender, to 6 in. long, 2-lvd.: lvs. lanceolate (often broadly so), to about 15 in long; scapes to 1½ ft. long, arising from base of pseudobulb, pendulous; sepals and petals pale ochraceous-yellow; terminal lobe of hip lemon-yellow spotted with purple within. May-July, Dec. British Guiana,

Venezuela. speciosa (Gongora speciosa). Pseudobulbs oblong-conic, to 5½ m. long, tapering slightly upward, deeply strate, 2-lvd; lvs. linear-lanceolate, to 16 m. long, tapering at each end; scape arising from base of pseudobulb, to about 20 m. long, pendent, 2-5-fild; fis about 2½ m. across, fragrant; sepals and petals clear yellow; dorsal sepal ovate-lanceolate, about 1¼ in. long, laterals semielliptic-lunate, twisted or undulate, to about 2½ m. long; terminal lobe of hip reddish to tawny yellow. Brazil, Cent. Amer., Tobago, Trinidad.

CORÝDALIS (Capnoides). Fumariacex. Herbs with pinnately cut lvs., irregular yellow, blue, purple or rose dicentra-like fls. in terminal racemes, and capsular frs.; sometimes grown for ornament. Of easy cult. in any garden soil. Propagated by division or seed; sometimes tuberous-rooted.

aurea. Ann. to 6 in. or more, plants many-stemmed,

airea. Ann. to 6 in. or more, plants many-stemmed, without basal tuber: lvs. tripnnate: fls yellow, with short gibbous spur, ½ in. or more long, subtended by toothed ovate to ovate-ollong bracts: pods curved, spreading or pendulous, usually 1 in. long; seeds glossy. N. Amer. bracteàta. Per to 10 in., robust, usually 1-stemmed and only 2-3-lvd, st arising from solid corm-like tuber: fls. sulfur-yellow, to 1 in. long, usually 10-20 in erect elongate terminal raceme, subtended by palmately-lobed bracts which are much longer than pedicel, spur straight or ascending about ¼ in. long. Siberia. ing, about % in. long. Siberia.

bulbòsa: a name here included in C. cava.

Capnoides. Bien. to 18 in., sts. erect or ascending, much branched, without basal tuber: fis. yellowish-white with yellow spot, about ½ in. long, spur long, bract of lowest fi. of infl. as long as corolla or longer: seeds glossy. Eu.

Caseana. Per to 3 ft., sts. several, without basal tuber: Ifts. broadly ovate-elliptic, mucronate: fls. pale yellow to white, occasionally tinged pink, spur straight and 1½-2 times as long as corolla, pedicels shorter than subtending lanceolate bract. Calif.

càva. Differs from C. Halleri in tuber having deep depression on lower side and subtending floral bracts ovate and entire. Cent. Eu. Var. albiflòra, fls. white.

cheilanthifòlia. Nearly sternless per. to 8 in. or more high: fis. yellow, ½ in. long. China. curvisiliqua. Per. to 2 ft., much branched, without basal tuber: lifts. linear to narrowly oblanceolate, acute or obtuse, less than ¼ in. long and ¼ in. wide: fis. yellow to cream-colored, about ¾ in. long, spur as long as fi. or nearly so, pèdicels shorter than subtending lanceolate bractes: pods to 1 in. long, curved, somewhat quadrangular. Tex.

decipiens: C. pumila.

densifòlia; C. Halleri.

flávula. Ann. or rarely bien. to 18 in., many-stemmed, without basal tuber: lfts. narrow, acute: fis. yellow, to ½ in. long, spur short and gibbous, floral bracts ovate to

ovate-oblong, toothed: fr. pedicel more than half as long as pod, latter drooping or spreading; seeds glossy. Ont. to Va. west to Minn. and La.

formòsa: Dicentra formosa.

glauca: C. sempervirens.

Hålleri (C. sohda. C. densifolia). To 8 in., 1-stemmed, borne from sohd corm-like tuber about 1 in. diam.: lvs usually only 2-3: fis. deep rose to purple, usually 10-20 in erect racemes bracts broadly wedge-shaped, palmately lobed and shorter than the fruiting pedicel. Eu. Var. álba is listed. Var. austrālis, fis. larger, earlier.

litea. Per. to 15 in., many-stemmed, without basal tuber: fis. golden-yellow, about ¾ in. long, spur short and gibbous, floral bracts ovate to ovate-oblong, toothed: fr. pedicel more than half as long as pod; seeds glossy. S. Eu.

micrantha. Differs from C. flavula in its more slender habit and shorter nearly sessile pod which is stilly ascending. Va. to Ha. west to Minn. and Mo.

montana (C. aurea var. occi.lentalis). Differs from C. aurea in its paler more finely divided lys. and ascending

nearly terete pods.

n6bilis. Per. to 10 in., robust, 1-stemmed, arising from solid corm-like tuber, usually only 2-3-ivd.: fis. white tupped with yellow and with purple spot, to 1 in. long, usually 10-20 in much condensed raceme, floral bracts broadly wedge-shaped and usually palmately lobed, longer than fr. pedicel. Siberia.

ochoténsis. Per. to 2 ft, many-stemmed, without basal tuber; fls. pale violet striped with black at apex, long-spurred, pedicels often longer than subtending and broadlyelliptic bract. Siberia.

ochroleùca. Per. to 15 in., many-stemmed, without basal tuber: fls. to % in. long, yellowsh-white with short gibbous yellow spur, bracts ovate to ovate-oblong, toothed: seeds dull, not glossy. Italy.

ophicarps. Ann. or been to 3 ft., many-stemmed, without basal tuber: fis. yellow, to 1₂ m. long, spur short and conspicuously constricted along basal half, bracts linear-lanceolate, entire: pods about 3₄ in. long or more, strongly torulose. Himalayas.

orthocárpa. To 8 in.: fis. 34 in. long, in racemes to 21/2 in. long. Formosa.

pállida. Per. to 114 ft., many-stemmed, without basal tuber: fls. golden-yellow with brown patch, to nearly 1 m. long, spur short, bracts linear-lanceolate, entire: pods nearly 1 in. long, strongly torulose. China, Japan.

pùmila (C. decipiens). Differs from C. solula in its smaller more delicate habit and lax 1-5-fid, inft. Eu.

ròsea. Per. to 2 ft.: fls. rose, 1 m. long. China rupéstris. Per. to 8 in , many-stemmed, without basal tuber: fls. yellow, spur short and swellen, bracts linear-lanceolate, entire: pods about ½ in. long, not torulose.

Scouleri. Per. to 4 ft., many-stemmed, without basal tuber: fls. rose, to 1 in. long, spurs very long: pods ovate-oblong. Wash., Ore.

sempérvirens (C. glanca). Roman Wormwood. Ann. or bien. to 2 ft., much branched, without basal tuber: fls. pale pink to nearly purple, tipped yellow, to 34 in long, spur very short, swollen: pods narrowly linear, erect, to 134 in long. N. S. to Ga. west to Alaska and Minn. Var. ròsea is listed.

sibfrica. Ann. to 16 in., sts. branched, without basal tuber: lfts. linear-oblong; fls. reddish tan striped red, lowest bracts lobed, upper ones entire. Siberia.

sólida: C. Halleri.

thalictrifolia. Per. to 18 in, with woody rootstocks but not corn-like tubers, many-stemmed: lfts. 1-3 m. long and long-petroled: fls. yellow, to 1 m. long, spur long, pedicels shorter than subtending lanceolate entire bract. China.

tuberòsa: confused name; plants so listed may be C. cava, C. pumila or C. Hallers.

Wilsonii. Per., with basal rosette of lvs.: fis. canary-yellow, 1 in. long, in branched and leafless racemes. China.

CORYLÓPSIS. WINTER HAZEL. Hamamelidacex. Asian deciduous shrubs with alternate toothed strongly veined lvs. and fragrant yellow fis. in nodding racemes before the lvs., caps. with 2 beaks; planted for ornament.

They thrive in a soil of peat and sand, and require protection in the North. Propagated by seeds, by greenwood cuttings under glass and by layers.

glabréscens (C. Go'oana). To 20 ft.: lvs. to 3 in long, pubescent on veins beneath; racemes 1 in. long. Japan.

Gotoàna: C. glabrescens.

paucifiòra. To 6 ft.: lvs. to 3 in. long, glaucous beneath and pubescent on veins: fis. to ¾ in. long, 2-3 together.

platypétala. To 8 ft.: lvs. to 4 in. long, ovate, glabrous, toothed, petioles glandular-bristly: fls. pale, to ½ in. long, racemes to 2 in. long. Cent. China. Var. lèvis has glabrous

sinénsis. To 15 ft.: lvs. to 4 in. long, obovate to oblong, finely toothed, pubescent on veins, grayish-green beneath: fls. to ¾ in. long, in racemes to 2 in. long with bracts silky outside, calyx pubescent. Cent. China.

spicata. To 6 ft.: lvs. to 4 in. long, pubescent and glaucous beneath; racemes to 1½ in. long with bracts glabrous outside, calyx pubescent. Japan.

Veitchiana. To 6 ft.: lvs. to 5 in. long, glaucous and glabrous beneath: racemes to 2 in. long. China.

Willmottie. To 12 ft.: lvs. to 3 in. long, glaucous and pubescent on veins beneath: racemes to 3 in. long. China.

CÓRYLUS. HAZELNUT. FILBERT. Betulaceæ. Deciduous monocious shrubs and small trees native in the north temp. zone, with alternate toothed generally ovate lvs., unisexual fls. before the lvs., the staminate in drooping catkins, and fr. a nut with leafy involucre borne in clusters at ends of branches; grown for ornament and the edible nuts. For cult, see Filbert.

americana. American H. To 10 ft.: lvs. to 5 in. long, pubescent beneath: frs. 2-6, the involucre about twice length of nut, with deep irregular lobes. E. N. Amer.

Avellana. European II. To 15 ft.: lvs. to 4 in. long, pubescent beneath: frs. 1-4, the involucre shorter than nut or only slightly longer, with deep irregular lobes. Eu. Hort. vars. are: aurea, lvs. yellow; contôrta, branches twisted; fúsco-rûbra (var. atropurpurea, var. purpurea), lvs. dull purple or brownish-red; grândis, Cobnur, nuts large; heterophfila (var. lacinata), lvs. pinnately lobed; pêndula, branches drooping; quercifòlia, lvs. with broad lobes resembling an oak.

californica. Similar to C. cornula but lvs. cordate at base and more pubescent beneath, and beak about length of nut. Wash, to Calif.

chinénsis. Chinéses H. To 120 ft.: lvs. to 7 in. long, pubescent: frs. 4-6, the involucre contracted above the nut into a tube, and divided into linear lobes. China.

Colúrna. Turkish H. To 80 ft.: lvs. to 5 in. long, pubescent on voins beneath: frs. in clusters, the involucre divided into linear lobes. S. E. Eu., W. Asia. cornita (C. .ostrata). Beaked H. To 10 ft.: lvs. to 4 in. long, pubescent on nerves beneath: frs. 1-2, the tubular bristly involucre much contracted above the nut into a long beak. Que. to Ga. and Mo.

heterophylla. Theo or shrub to 25 ft.: lvs. oval to obovate, to 4 in. long, apex acuminate to nearly nucronate, base obtuse to heart-shaped, margin somewhat serrate or partly lobed, smooth above, nerves beneath pubescent, petiole to ¾ in. long and glandular-hairy: frs. 1-3, involucre longer than nut, campanulate, hairy at base, lobes entire or dentate. N. E. Asia. Var. japónica is listed. Var. sutchuentais list truncate at parx glabrans or partly so énsis, lvs. truncate at apex, glabrous or nearly so.

maxima. FILBERT. To 30 ft.: lvs. to 5½ in. long: frs. 1-3, the tubular involucre lobed at top and about twice as long as nut. S. E. Eu. Var. purpurea has dark purple lvs. rostrata: C. cornula.

Sieboldiana. Japanese H. Large bush to 15 ft.: lvs. elliptic to obovate, to 4 in. long, hairy on veins underneath: frs. 1-3 in tubular-constricted setose involucre. E. Asia.

CORYMB: short and broad more or less flat-topped indeterminate flower-cluster; outer flowers opening first

CORYNOCÁRPUS. The only genus in Corynocarpaceæ. Evergreen trees with alternate simple lys., small bisexual fls. in terminal panicles having 5 sepals and petals, 5 stamens, 5 staminodia, and drupaceous fr. The following species, with poisonous seed (unless steamed, or steeped in salt water) but the pulpy part edible, is planted in Calif. In Melanesia are two other species.

lævigåta. To 50 ft.: lvs. oblong, to 8 in. long: fis. greenish, the panicles to 8 in. long: drupe 1½ in. long, orange. New Zeal.

CORYNOPUNTIA: Opuntia.

CORYPHA. Palmacex. About 8 ponderous hermaphrodite fan-palms in trop. Asia, monocarpic (flowering and fruiting once and then dying at the age of 20-80 years), unarmed

except for the spiny petioles, the immense panicled spadices terminal (above the crown): lvs. very large, stiff and heavy, deeply divided into many ridged segms.; petioles long, hard and stiff with strong spines or hooks on the margins: fls. small, produced in prodigious quantity; stamens 6: fr. a globose drupe size of a cherry. The true Coryphas are little planted within the limits of the U.S., the palms generally known under this name being Livistonas (a practice so far out of date that it should be discontinued); the name was once used for other fan-palms, as Sabal. For cult. see Palm.

australis: Linstona australis.

elâta (C. Gebanga). To 60 or 70 ft., the trunk bearing strong rough spiral ridges and furrows: lvs. 8-10 ft. diam., cut to about half the depth into 80 or 100 smooth hard segms. with rather obtuse bifd apex; petiole broad, 8-12 ft. long with black margins and widely spaced strong straight or curved spines: spadix much narrower than crown: fr. about 1 in. diam., olive-colored. Bengal and Burma.—The lvs. wither and fall when the plant begins to bloom

Gebánga: C. elata.

nàna: Cryosophila nana.

rotundifòlia: Livistona rotundifolia.

umbraculifera. Talipor Palm. To 40-80 ft., stocky, trunk ringed after lf.-bases fall: lvs. to 12 or 16 ft. broad, cleft to center into 80 or 100 linear-lanceolate stiff ridged acute or bifd segms; petiole to 10 ft., narrowly channelled, with rather short compressed spines often in pairs: spadix equalling or exceeding crown: fr. about 1½ in. diam. Ceylon and Malabar Coast.

CORYPHÁNTHA. Cactaceæ. Ball-like or cylindric solitary or cespitose small cacti, Cent. Mex. to S. Canada, covered with spine-bearing tubercles which (except when very young) are grooved on upper face: fls. mostly yellow but sometimes red or purple, showy, expanding, borne near top of plant, the perianth long-persistent. Sometimes grown as little pot specimens, mostly known in cult. as Mammillarias. See Cacti.

aggregata (Mammillaria aggregata). Solitary or in clumps, body globular or nearly so and very spiny; radial spines many and appressed, centrals several and more erect: fls. showy, 2-3 in. across, purplish. New Mex., Ariz., Mex.—Very showy when in clumps.

Alversonii. Subcylindrical, to 5 in. high and 4 in. diam.; spines 12-14, usually ½-½ in. long, spreading. Lower Calif.

Andrew (Mammillaria Andrew). Sts. globose to subcylindrical, to 3 in. diam., dark glossy green, woolly on
top; tubercles rounded, to ¾ in. high, woolly in groove;
spines yellowish-gray; radials about 10, to ½ in. long,
spreading; centrals 5-7, to 1 in. long, darker: fls. pale
yellow, to 2½ in. across, segms. linear, acute, toothed.

arizónica (Mammillaria arizonica). Sometimes in clumps 3 ft. across, each head or body globose or ovoid and to 4 in. diam., the tubercles deeply grooved; spines many, stiff and straight: fls. 2-3½ in. across, rose-colored. N.

Astèrias (Mammillaria Asterias). St. globular to briefly cylindrical, to 5 in. tall and about 3 in. thick; tubercles thick, groove not conspicuous; spines yellow, bulbous at base, radials 9, centrals 1-2, the lower one hooked: fls. white to pink. Mex.

Bergeriana. St. club-shaped, to 5 in. tall and 2½ in, diam.; tubercles conical, groove glandular; radials 18-20, to ½ in. long, gray; centrals 4, to ½ in. long, gray; centrals 4, to ½ in. long, yellowish often recurved: fis. white with yellowish center, to 1½ in. long. Mex.

bumámma (Mammillaria bumamma). Globular, with few very large bluish-green tubercles and 5-8 radial spines ¾ in. long: fis. yellow, 2 in. across. Mex.

Chaffey (Escobaria Chaffeyn). St. short-cylindric, to 5 in. tall, to 23% in. diam.; tubercles short; spines many, white, black-tipped, centrals slightly shorter than radials: fis. cream-colored, often tinged purple, to % in. long: fr. crimson, to 3/4 in. long. Mex.

chlorantha (Mammillaria chlorantha). Cylindric, to 10 in. high and 3 in. across; tubercles hidden by densely matted spines; centrals 3-5, white with brown tip: fla.

yellow or greenish-yellow, $1\frac{1}{2}$ in. across. Utah, Aris., Nev., Calif.

clava (Mammillaria clara). Club-shaped, deep green, woolly in axils and red gland at base of groove; central spine 1, radials about 7: fls. 3 in. or more across, pale yellow, outer parts tinged red. Mex.

cornifera (Mammillaria cornifera). Body globose and pale green, with short broad tubercles; radial spines 16 or 17 and central spine 1: fis. yellow tinged red, nearly 3 in. broad. Mex. Var. scolymoides (C. scolymoides, Mammillaria scolymoides) has the tubercles more densely packed together and radial spines more numerous.

Delactiana (Mammillaria Delactiana). Clump-forming, sts. club-shaped or cylindrical, spiny at top; tubercles to % in. long; radial spines about 15, to ½ in. long, base bulbous, mostly spreading, yellowish; centrals 1-2, to ¼ in. long, black: fls. clear yellow, to 1¾ in. long or more. Mex.

demonocèras. Similar to *C. cornifera*, differing in its smaller more compressed tubercles, and centrals 3-4 and longer. Mex.

déserti (Mammillaria deserti). Solitary or in clumps, to 8 in. high and 3 in. thick, densely covered with white spines: fls. pale pink, 1 in. across. Deserts, S. Calif. and Nev.

difficilis (Mammillaria difficilis). St. globular, flattened; tubercles rhomboidal; spines bulbous at base, radials 12-14, to 34 in. long, centrals 4, curved, to 34 in. long: fls. yellow.

Dyckiàna (Mammillaria Dyckiana). St. cylindrical; tubercles conical, compact, short; radials 16-18, to ½ in. long, white; centrals 2, yellow tipped red: fls. red. Mex.

echinoidea (Mammillaria echinoidea). Nearly globular, 2 in. across, very woolly at top, with conical tubercles and 20-25 radial spines ½ in. long: fls. rose, to 3 in. across. Mex

Echinus (Mammillaria Echinus). Globose to somewhat conic, 1-2 in. diam., with many closely appressed spines, the radials white, centrals often blackish: fis. 1-2 in. long, yellow. W. Tex.

elephántidens (Mammillaria elephantidens. Echinocactus elephantidens). Nearly globose, to 5 in. high and somewhat broader; tubercles obtuse and to 2 in. long, densely woolly in axils; spines 8 and all radial: fis. about 4 in. across, rose-colored. Mex.

erécta (Mammillaria erecta). Cylindric, yellowish-green to 12 in long; tubercles obliquely conic; spines 8-14, awl-like: fls. large and yellow, with very narrow segms. Mex.

exsudans (Mammillaria exsudans). Nearly cylindrical, 1½ in. across, with thick tubercles having pale yellow glands; radial spines 6-7, to ½ in. long, yellow: fls. yellow. Mex.

Geórgii. Globose, depressed and woolly at top, 2 in. high and 3 in. thick, with prominent tubercles; radial spines 8-9, spreading, ½ in. long: fls. white, 1½ in. across. Mex.

gladiispina (Mammillaria gladiispina). St. ovoid to ellipsoid, to 4 in. tall and 2½ in. diam., shining dark green, less spiny towards base; radials 17-20 with the 7-8 upper ones brush-like; centrals 4, to 1 in. long: fis. yellow, to 2½ in. across. Mex.

grandiflora: Neolloydia grandiflora.

jaumavénsis: listed name; the plant may be referable to C. Palmers.

macromeris (Mammillaria macromeris). Branching at base, body more or less cylindrical, to 8 in. long; tubercles soft and several in. long, grooved two-thirds their length; radials many and white, centrals black: fis. to 3 in. broad, purple. Mex., W. Tex.

macrothèle: C. octacantha.

missouriénsis: Neobesseya missouriensis.

Muehlbaueriana. Ovoid or cylindric, to 2 in. high and 1 in. thick, shining dark green; radial spines 15-20 and white; centrals about 6 and ½ in. long: fis. greenish-yellow striped with red, 1 in. across. Mex.

Muèhlenfordtii (Mammillaria Scheeri). Body nearly globular and commonly simple, to 8 in. long and 6 in. thick; tubercles to 1 in. long and very woolly when young; radials 6-16 and straight, centrals 1-4: fls. yellow, about 2½ in. long. W. Tex., New Mex., Mex.

2½ in. long. W. Tex., New Mex., Mex.

Néllieæ. Cylindric, to 2 in. high; ribs 8-14, tubercles grooved; spines 13-18, all radial, mostly straight, to ½ in. long, white or pinkish with yellowish base, bristle-like: fls. purplish, to ½ in. long. W. Tex.

neo-mexicana (Mammillaria neo-mexicana). Body globular or short-oblong, to about 4 in. long, covered with spines; radials needle-like and white; centrals stouter and brown or black toward apex: fls. to 2 in. broad, greenish, purplish inside. New Mex., W. Tex.

Nickelies (Mammillaria, Nickelies) Globular, and

Nickelsise (Mammillaria Nickelsise). Globular and cespitose, to about 3 in. high, pale green and glaucous,

becoming purplish; tubercles almost hidden by overlapping radial spines: fis. bright yellow with red center, 2-3 in. broad. S. Tex., Mex.

octacentha (Mammillaria octacantha, M. and C. macrothele). Cylindric, to 1 ft. high and 6 in. diam., whitewoolly in axils, the long tubercles with 1 or 2 red glands; radials 8 and rigid; centrals 1 or 2 and stouter: fis. straw-colored, 2 in. or more broad. Mex.

Ottonis (Mammillaria Ottonis). Nearly globular 5 in. high and 3 in. diam., glaucous or grayish, with 8-12 radial spines 1/2 in. long. Mex.

pállida. Solitary or clustered, globular, to 5 in. across, bluish-green; radial spines 20 or more and white: fis. lemon-yellow, greenish outside, 2½ in. across. Mex.

Pálmeri. St. globular to 4 in. diam.; tubercles conical, close; radials 11-14, spreading; central 1, hooked, to ¾ in. long: fls. pale yellow to nearly white, to 1¼ in. long. Mex.

pectinata (Mammillaria pectinata). Globose, 1-21/4 in. diam.; tubercles spiral; spines 16-24 and all radial, some of them arched over apex of areole and yellowish-white with black tip: fis. yellow, 2 in. long. S. Tex., Mex.

Poselgeriana (C. valida. Mammillaria valida. Echinocactus Poselgerianus. E. saltillensis). St. globular, apex often acutish; tubercles large, to \$\frac{3}{4}\$ in. long and \$1\frac{1}{2}\$ in across, grooves woolly, glandular; radials 5-7, to 2 in. long, base bulbous; central 1, to 2 in. long: fls. salmon-pink, rarely yellow, to 2 in. long. Mex.

pseudechinus. St. to 314 in. tall, dull green; tubercles conical; radials 18-25, stiff, about 1/2 in. long, grayish; central 1, to 1 in. long, base bulbous: fls. violet-pink, often yellowish-green in throat, to 3/4 in. long and about 1/4 in. across. Mex.

ràdians (Mammillaria radians). Globose, about 3 in. diam.; tubercles ovoid, the axils glabrous; spines 16-18, all radial and white or yellowish: fis. lemon-yellow, ringed red outside, 4 in. broad. Mex.

radiòsa: C. vivipara.

recurvata (Mammillaria recurvata and recurvispina). Body depressed-globose, 4-8 in. diam., often making large masses; tubercles not prominent; radial spines about 20, yellow and recurved; centrals 1 or 2: fls. about 1-13/8 in. long, brownish outside and lemon-yellow inside. Ariz., Mex.

retusa (Mammillaria retusa). St. depressed-globose, 2-4 in. diam., top woolly; tubercles large; spines all radial, 6-12, recurved or appressed: fls. yellow, to 1 ½ in. across. Mex.

robustispina (Mammillaria robustispina and M. Brownii). Solitary or clustered, body globular or nearly so, 2-6 in. high, almost hidden by spines, the radial 12-15 and 3 lower very stout, central 1: fls. salmon, about 2 in. long. Ariz., New Mex., Mex.

Rúnyonii. Forming clumps to 3 ft. across, with thick tap-root and irregular tubercles; radial spines 6 or more, 1 in. long; central spines to 2 in. long; fis. purple, 2 in. across. S. Tex., Mex.

Sáim-Dyckiàna (Mammillaria Salm-Dyckiana). Plants solitary or clustered; st. globular to club-shaped, to 6 in. diam.; radials usually 10-15, whitish, to ½ in. long; centrals 1-4, bulbous at base, to 1 in. long, black: fls. pale yellow tinged red, to 1½ in. long. Mex.

Scheèri: C. Muehlenpfordtri.

scolymoides: C. cornifera var.

símilis: Neobesseya similis.

sulcata (Mammillaria sulcata). Forming clumps, 5 in. diam., with rather large tubercles and white spines: fls. yellow with red center, 2 in. across. S. Tex.

sulcolanata (Mammillaria sulcolanata). Globose or depressed, 2 in. high and 2½ in. diam., clustered; spines 9-10 and all radial and ½ in. long; fls. yellow or white, 1½ in. long. Mex. válida: C. Poselgeriana.

Vaupeliana (Mammillaria Vaupeliana). Globose or ovoid, to 3 in. diam.; tubercles 3-angled; radial spines about 15 and yellowish-gray and horizontally spreading; central spines 4 and to 34 in. long; fls. yellow. Mex.

vivipara (Mammillaria nvipara. M. radiosa). Solitary or in mound-like clusters, body globular and to 2 in. diam.; tubercles prominent and woolly; radials about 16 and white; centrals 4-6; fls. nearly 2 in. long, purple, sepals fringed. Minn, Man., Alta. to Colo. and N. Tex.

Wérdermannii. Globose becoming elongated; radial spines 25-30 and to 1 in. long; centrals 4 and brownish-white: fis. golden-yellow, shining, to 3 in. across. Mex.

CORYTHOLÒMA. Gesneriaceæ. Trop. American herbs with tuberous roots, lvs. opposite or in 3's, fls. tubular and often 2-lipped, solitary or clustered in the axils, and fr. a caps.; one species grown under glass.

cardinalis (Gesneria cardinalis. G. macrantha). To 1 ft., hairy: lys. oyate-cordate, to 6 in. long. toothed; fls. red. to 3 in. long. Habitat unrecorded.

Warszewiczii (Liesneria Warszewiczii). Erect, stout, st. little branched: lvs. ovate, to 3 in. long, obtuse or acute, crenate, rough-lanry above, villous beneath: fis. to 1½ in. long, tube somewhat swollen. Guatemala.

OSMIDIUM: Thelesperma Burridgeanum,

CÓSMOS. Compositæ. Showy late-flowering ann. or per. herbs with opposite usually pinnately cut lvs. and heads solitary or in panicles, rays variously colored; pappus of awns or crown; native in trop. Amer. Closely allied to Dahlia.

Cosmos is cultivated in the flower-garden and is easily grown from seed but in the North it may be sown indoors in early spring if bloom is desired in late summer and early forms should be chosen. Sandy soil is preferred as the plants do not bloom well in rich soil in short-season climates.

atrosanguineus (Bidens atrosanguinea. B. dahlioides. Dahlia Zimpanni). BLACK C. Differs from C. diversifolius is heads smaller, with red disk and dark velvety-red rays.

Ann, to 10 ft.: lvs. 2-pinnate into linear segms: heads to 3 in. or more across, rays white, pink, crimson, disk yellow: achenes beaked Mex.—In the anemone- or double-fld. forms the disk is replaced by a compact crowded mass of petal-like parts the same color as the rays Early and late flowering strains of both the single and double forms are now sold.

diversifòlius. Per. to 16 in., grown as ann., with tuberous roots: lvs. entire or punnately parted into 5-7 lfts.: heads to 2 in. across, long-stalked, disk yellow, rays lilac to rose: achenes angled, not beaked. Mex. Var. niger is listed.

sulphûreus. Yellow C. Ann. to 7 ft.: lvs. 2-3-pinnate into lanceolate lobes: heads to 3 in. across, rays pale or golden-yellow, disk yellow: achenes beaked. Mex.

COSSÒNIA. Cruciferæ. Per. herbs of the Medit. region, with lvs. in basal rosettes and fls. in corymbs borne on solitary pedicels in axils of lvs.

africana. Tufted: lvs. lyrate-pinnatifid, fleshy, glaucous: fls. lilac-purple or yellow, petals ¼ in. long, in dense corymbs on pedicels 1 in. long. Algeria, Morocco.

COSTMARY: Chrusanthemum Balsamita.

CÓSTUS. SPIRAL FLAG. Zingiberacex. Stout trop. per. herbs, the sts. often spirally twisted, having leafy sts. and yellow, red or white fls. in dense spikes, the 1 staminode or lip petal-like.

They require tropical temperatures and rich moist soil. Propagated by cutting the stalks into about one-inch lengths and planting in sand and sifted moss or peat; also by division of the rootstocks. The plants are not often seen under glass as they require too much room. See Zingiberacea.

élegans: C. Malorticanus.

igneus. To 3 ft. high: lvs. to 6 in. long, oblong-lanceolate: fis. orange-red. Brazil.

Malortieanus (C. elegans. C. zebrinus). To 3 ft. high: ks. to 14 in. long and 7 in. wide, obscurely banded with green above: fls yellow, the lip marked with red, in spikes to 2½ in. long. Cent. Amer.

speciosus. To 10 ft.: lvs. to 8 in. long and 2½ in. wide: white with yellow center, in spikes to 5 in. long. E. Indies

zebrinus: C. Malorticanus.

CÓTINUS. Anacardiaceæ. Two woody deciduous species, one native in N. Amer. and the other S. Eu. to Cent. Asia and China, with simple lvs., small polygamous fls. in large loose terminal panicles, the sterile pedicels of the Old World species lengthening and clothed with spreading hairs and producing the "smoky" effect that gives the plant its common name, 5 stamens, fr. a small compressed drupe.

Cotinus requires well-drained and not too rich soil. Propagated by seeds, root-cuttings and layers.

americanus (Rhus americana and R. cotinoides). americanus (thus americana and R. cotholaes). Small tree to 30 ft. or more, with lvs. mostly obovate and cuneate or tapering at base: taller tree than the following and probably not as hardy, the panieles not showy but autumn lf.-color attractive. Tenn., Ala., to Tex.—Little planted. Coggýgria (Rhus Cotinus). SMOKE-TREE. Bushy shrub to 15 ft.: Ivs. oval, to 3 in. long: panicles much branched, to 8 in. long, usually purplish. June-July. S. Eu. to Asia. Var. purpireus (var. atropurpureus) has purplish lvs. and panicles with dark purple hairs. Var. péndulus has drooping branches.—Hardy N.

COTONEÁSTER. Rosaceæ. Shrubs or rarely small trees native in temp. regions of Old World, with alternate entire deciduous or persistent lvs., small white or pink fls. solitary or in clusters, and fr. a small red or black drupe. Some of them are more or less evergreen.

The genus has many ornamentals of first-class value in home gardens and landscape work, of attractive habit, interesting bloom and showy often persistent fruit. Most of them (unless otherwise noted) are hardy in the northern parts of the United States. Cotoneasters prefer sunny positions in well-drained soil. Propagated by seeds sown when ripe or stratified, by layers in autumn, by cuttings of young wood under glass late in summer, and rare kinds by grafting on stock of *C. integerrima* and the common quince or hawthorn. or hawthorn

acuminata. To 12 ft., deciduous: lvs. to 2½ in. long, pubescent on both sides: fis. pinkish, in 2-5-fid. clusters: fr. bright red. Himalayas.

acutifòlia. To 12 ft., deciduous: lvs. to 2 in. long, pubescent on both sides when young: fls. pinkish, in 2-5-fld. clusters: fr. black. China. Var. villósula, lvs. densely pubescent beneath.

adpréssa. Prostrate, deciduous: lvs. to ½ in. long, usually wavy at margins: fls. pinkish, 1-2 together: fr. bright red. China. Var. præcox (C. præcox) is more vigorous, with larger lvs.

affinis. Tall deciduous shrub; lvs. to 3 in. long, pubescent beneath when young: fls. white, in many-fld. corymbs: fr. brown or nearly black. Himalayas; adapted to S. Var. bacillaris (C. bacillaris) has lvs. soon glabrous.

ambígua. To 6 ft., deciduous: lvs. to 2 in. long, pubescent beneath: fls. pinkish, in 5-10-fld. clusters: fr. black. China.

amœna. To 5 ft., densely branched, deciduous: 1vs. about ½ in. long, densely pubescent below: fls. pınkish, in 6-10-fld. clusters: fr. orange-red. China.

angustifdlia: Pyracantha angustifolia.

apiculata. To 6 ft., deciduous: lvs. to ½ in. long, pale and nearly glabrous below: fls. pink: fr. bright red. China. applanàta: C. Dielsiana.

bacillàris: C. affinis var.

Bakeri: listed name of plant advertised as dwarf, with gray foliage and red fr.

bullâta. To 6 ft., deciduous: lvs. to 3 in. long, rugose, slightly pubescent: fls. pinkısh, in 3-7-fld. clusters: fr. red. China. Var. floribunda, clusters many-fld. Var. macrophylla, lvs. to 5 in. long.

buxifòlia. Low, densely branched: lvs. about ½ in. long, densely tomentose beneath, margins revolute: fls. white, in 2-6-fild. clusters: fr. red. India. Var. veilæa has smaller lvs. and often solitary fls.—The material usually cult. under this name is C. rotundifolia var. lanata.

cineráscens: C. Franchetti var.

congésta (C. microphylla var. glacialis). Differs from C. microphylla in lvs. glabrous beneath at maturity and more ovate in outline. Himalayas.

Coòlidgei: listed as a dwarf evergreen, perhaps referable to C. pannosa var. nana.

crenulata: Pyracantha crenulata.

Dámmeri (C. humifusa). Prostrate, the branches often rooting, evergreen: lvs. about 1 in. long, dark and shining above, pale beneath: fls. white, solitary: fr. bright red. China. Var. radicans has smaller lvs. and 1-2 fls. together.

Davidiana: C. horizontalis.

decora: listed name for a low spreading evergreen form with red berries.

Dielsiana (C. applanata). To 8 ft., deciduous: lvs. to 1 in. long, tomentose beneath: fis. pinkish, in 3-7-fid. clusters: fr. bright red. China. Var. elegans has smaller often persistent lvs. Var. major has larger and broader lvs.

disticha (C. rotundifolia of hort.). To 8 ft., semi-ever-green: lvs. to ½ in. long, slightly pubescent when young: fls. white tinged pink, usually solitary: fr. bright red. Himalayas, China.

divaricata. To 6 ft., deciduous: lvs. to ¾ in. long, dark and shining above, pale beneath: fls. pinkish, in 3-fld. clusters: fr. bright red. China.

formosana. Lvs. 3-5 at tips of branchlets, to 1 in. long,

gray-pubescent, notched at tip: fls. white, in corymbs. Formosa.

foveolata. To 10 ft., deciduous: lvs. to 4 in. long, pubescent and with prominent veins beneath: fls. pinkish, in 3-6-fld. clusters: fr. black. China.

Franchétii. To 10 ft., evergreen or partially so: lvs. to 1½ in. long, tomentose beneath: fls. pinkish, in 5-11-fld. clusters: fr. orange-red. China; not hardy N. Var. cineráscens is more vigorous.

frigida. To 25 ft., deciduous or semi-evergreen: lvs. to 5 in. long, tomentose beneath when young: fls. white, in dense tomentose clusters to 2½ in. across: fr. bright red. Himalayas; for southern states. Var. aldenhaménsis has oblong lanceolate lys.

Gibbsii: Puracantha Gibbsii.

glabrata. Evergreen: lvs. to 3 in. long, glaucous and nearly glabrous beneath: fis. white, in dense corymbs 1 in. across. China; not hardy N.

glaciàlis: C. congesta.

glaucophýlla. Half evergreen, to 7 ft., branches arching: lvs. elliptic to elliptic-oblong, to 2½ in. long. glaucous beneath: fls. in dense 6-20-fld. corymbs: fr. dull red, obovoid, to ½ in. long. W. China.

grācilis. To 10 ft, deciduous: lvs. to ¾ in. long, whitishtomentose beneath: fls. rose, in 3-6-fld. clusters. China.

Harroviana. To 6 ft., semi-evergreen: lvs. to 2 in. long, leathery, densely tomentose beneath when young: fis. white, in dense clusters to $1\frac{1}{2}$ in. across. China.

hebephfila. To 8 ft., deciduous: lvs. to 1 in. long, glaucous and becoming glabrous beneath: fls. white, in 6-16fld. corymbs. China.

Henryana. To 12 ft., semi-evergreen, the branches drooping: lvs. to 5 in. long, gray-tomentose beneath when young: fis white, in loose clusters to 2 in. across: fr. red. China; not hardy N.

horizontalis (C. Davidiana). To 3 ft., semi-evergreen, the branches spreading horizontally: lvs. to ½ in. long, slightly pubescent beneath: fls. pinkish, 1-2 together: fr. bright red. China Var. minor, a smaller form with smaller flag and bernes. Var. perpusilla has lvs. ½ in. or less long. Var. variegata luss lvs. marked with white.

humifusa; C. Dammeri.
humifusa; C. Dammeri.
hupehénsis. To 6 ft., deciduous, the branches arching:
lvs. to 1½ in. long, gray-tomentose beneath: fls. white,
in 6-12-fld. clusters; fr. bright red. Chma.

hymalàica. Large vigorous shrub: lvs. deciduous, oblong-elliptic, base wedge-shaped, to 4 in. long, obtuse, entire, villous when young becoming glabrous: fls. rose: fr. purplish-black, globose. Nativity not known.

ignava. To 7 ft, spreading, twigs pubescent when young: lvs. ovate to ovate-oblong, to 2 in. long, acute, mucronulate: fls. pinkish, in many-fld. pendulous cymes: fr. dark purple, to ½ in. across. Turkestan.

integérrima (C. vulgaris, C. pyrenaica). To 6 ft., deciduous: lvs. to 2 in. long, tomentose beneath: fls. pinkish, in nodding 2-4-fld. clusters: fr. red. Eu., N. Asia.

láctea. To 10 ft, evergreen or partially so: lvs. to 2 in. long, white- or yellow-tomentose beneath: fis. white, in corymbs 2 in. across: fr. red. China.

laxiflòra: C. melanocarpa var.

Lemdinei: listed name.

Lindleyi. Similar to C. racemistora but with longer lvs. and black fr. Himalayas.

lùcida (C. sinensis). To 10 ft., deciduous: lvs. to 2 in. long, shining above, pubescent beneath when young: fis. pinkish, in 3-8-fid. clusters: fr. black. N. Asia.

macrophýlla: C. bullata var.

melanocárpa (C. nigra). To 6 ft, deciduous: lvs. to 2 in. long, dark green above, white-tomentose beneath: fls. pinkish, in nodding 3-8-fld. clusters: fr. black. Eu., Asia. Var. laxiflora (C. laxiflora) has larger lvs. and many-fld. clusters.

Meyeri: see C. racemiflora.

microphfila. To 3 ft., evergreen, the branches spreading: lvs. to ½ in. long, dark and shining above, gray-pubescent beneath: fls. white, usually solitary: fr. bright red. Himalayas. Var. cochleata is prostrate, with lvs. somewhat spoonshaped. Var. glacialis is C. congesta. Var. minor is listed. Var. thymifolia (C. thymifolia) has narrower lvs. and 2-4-fld. clusters.

moupinensis. To 15 ft., deciduous: lvs. to 4 in. long, pale and pubescent beneath, the veins conspicuous: fis. pinkish, in many-fid. clusters: fr. black. China; needs protection N.

multiflòra (C. reflexa). To 6 ft., deciduous: lvs. to 2 in. long, becoming glabrous: fls. white, in many-fld. loose clusters: fr. red. Asia. Var. calocárpa has larger lvs. and fr.

nigra: C. melanocarpa.

nitens. To 4 ft., deciduous, the branches spreading:

lvs. to ¾ in. long, dark green and shining above, becoming glabrous beneath: fis. pink, in 3-fid. clusters: fr. purplishblack. China.

nummulària: C. racemistora.

obscura. Deciduous, to 10 ft.: lvs. elliptic to obovate or somewhat rhombic, to 2 in. long, gray underneath: fls. pinkish, in short clusters of 3-7: fr. somewhat pyriform, dark red. China.

pannosa. To 10 ft., semi-evergreen, the branches arching; lys. to 1 in. long, white-tomentose beneath; fis. white, in 6-20-fid. clusters; fr. red. China; not hardy N.; common in Calif. Var. nana is listed as a dwarf form.

Párnevi. Similar to C. Harrowana but with larger lys. and fewer larger red berries.

præcox: C. advressa var.

procumbens: listed name.

prostràta: C. rotundifolia.

Pyracántha: Pyracantha coccinea.

pyrenàica: C. integerrima, but the plant in cult. under this name may be C. conjesta.

racemiflora (C. nummularra). To 8 ft., deciduous: lvs. to 1½ in. long, gray-tomentose beneath, apex mucronate: fts. white, in 3-12-fld. clusters: fr. red. S. Eu, N. Afr., Asia. Var. microcárpa has glabre-cent lvs. to % in. long. Var. nummulāria (var. Meyert), lvs. brouder and obtuse. Var. Royleāna (var. orbicularis) is a low form with broad lvs. Var. soongorica has less pubescent lvs. Var. Veltchii has lvs. acute at ends, usually elliptic.

refléxa: C. multiflora.

rèpens: listed name.

above, white- or yellow-tomentose beneath: fls. white, in dense corymbs 1 in. across: fr. orange-red. China; not hardy N.

Rogersiana: Pyracantha crenulata var.

ròsea. To 6 ft., deciduous: lvs. to 2 in. long, grayish-green beneath: fis. pinkish, in 3-9-fid. clusters: fr. red.

rotundifòlia (C. prostrata. C. microphylla var. Uva-ursı). To 12 ft., evergreen, the branches arching: lvs. to ¾ in. long, dark and shınıng above, slightly hairy beneath: fls. white, in 1-3-fld. clusters: fr. red. Hımalayas; probably not hardy N. Var. lanata (C. Wheelerr), lvs. tomentose beneath.—Most of the material so listed is C. disticha.

rûbens. Deciduous or half evergreen, to 7 ft.: lvs orbicular to broadly elliptic, to 2s in. long, obscurely mucronulate, glabrous above, densely reddish-tomentose beneath: fls. red, solitary, terminal, calyx villous. Yunnan.

salicifòlia. To 15 ft., evergreen or partially so: lvs. to 3 in. long, rugose, tomentose beneath. fls. white, in tomentose clusters to 2 in. across: fr. bright red China Var. floccosa has lvs. shining above and var. rugosa dull green

Schneideri: probably synonymous with C. Dielsiana var. elegans.

serotina. Small tree, young shoots silky-pubescent; lvs. to 3 in. long, becoming glabrous: fls in clusters to 3 in. across: fr. red. China.—Perhaps a form of C. glaucophylla.

Simonsii. To 10 ft, semi-evergreen: lvs to 1¼ in. long, pubescent beneath: fls. white, in 2-4-fld. clusters: fr. bright red. Himalayas.

sinénsis: C. lucida.

soongdrica: C. racemistora var.

ténuipes. Shrub to 6 ft.: lvs. deciduous, clliptic-ovate, acute or obtuse, to 1 in. long, brown-pulescent beneath: fls. solitary or in pairs: fr. ovoid, to ¼ in. through. W.

thymifdlia: C. microphylla var.

tomentosa. To 10 ft., deciduous: lvs. to 2½ in. long, gray-tomentose beneath: fls. pinkish, in nodding 3-12-fld. clusters: fr. brick-red. S. E. Eu , W. Asıa.

turbinata. To 6 ft., semi-evergreen: lvs. to 1 3/4 in. long, silky-pubescent beneath: corymbs many-fld., tomentose: fr. bright red. China.

uniflora. Differs from C. integerrima in its smaller lvs. which are glabrous at maturity and solitary fls. Altai.

vulgăris: C. integerrima.

Wheèleri: C. rotundifolia var. lanata.

Wilsonii. To 4 ft.: lvs. pale and pubescent below: fis. white, in panicled clusters. Japan.

Zabelii. To 6 ft., deciduous: lvs. to 1¼ in. long, gray-tomentose beneath: fls. pinkish, in nodding 3-9-fld. clusters: fr. bright red. China. Var. miniata is a smaller form.

COTTON: Gossypium. Lavender-: Santolina Chamseyparissus. -Weed: Diotis candidissima. Wild: Thurberia thespesioides.

COTTONWOOD: Populus.

CÓTULA (Leptinella). Compositæ. Ann. and per. herbs, mostly of low stature and creeping or tufted, in the southern hemisphere but a few of them nat, elsewhere and one of them listed in this country as a rock-garden foliage subject: lvs. alternate, pinnatifid or rarely entire: heads small, peduncled, without rays; pappus lacking.

anthemoides. Ann. to 6 in., sts. pubescent, spreading and ascending: lvs. obovate, to ¾ in. long, pinnatifid, segms. apiculate: heads to ¼ in. across. Afr, India.

airea: Matricaria aurea.

barbàta. Ann., silky-hairy, cespitose: lvs. pinnate above n.udle, petioled, nearly all basal, in tufts, villous: heads about 1/3 in. across. S. Afr.

coronopifolia. Brass-Burrons. Per. somewhat decumbent, sts to 1 ft. long: lvs. linear-oblong, to 2½ in. long, glabrous, entire or toothed: heads bright yellow, to 3% in across. Afr.; nat. in S. Calif.—Prefers moist or wet Labitat along stream banks.

diolca. Sts. to 1 ft. long, creeping, tips ascending: lvs. linear-obovate, serrate to pinnatifid, to 2 in. long: heads about ¼ in. diam., yellow. New Zeal.

squálida. Per a few in. high, the branches creeping 12 in. or more, soft-hairy: lvs. narrow, to 2 in. long, deeply pinnatifid and fern-like, the segms. also cut: heads 1/4 in. or less diam. New Zeal.

COTYLEDON: seed-leaf; the primary leaf or leaves in the embryo; in some plants the cotyledon always remains in the seed-coats and under ground and in others (as common bean) it emerges on germination.

COTYLEDON. Crassulacex. Succulents with simple basal or st.-lvs. and yellow, red or greenish, campanulate fls. in terminal cymes, characterized by tubular corolla that is much longer than the calyx; natives of the Old World, particularly S. Afr. and Medit, region, cult. in greenhouses or rock-gardens. Cult. as for Sedum and Sempervivum; see Succulents.

agavoides: Echeveria agavoides.

ausana: C. orbiculata.

Bárbeyi. Plant nearly stemless, hoary-white: lvs. shovel-shaped, thick: fls. olive-green and red, 1 in. long. Abyssıma, Arabia.

cæspitòsa: Echeveria caspitosa. califórnica: Echeveria caspitosa. chrysántha: Sedum chrysanthum. Cooperi: Adromischus Cooperi. cymòsa: Echeveria cymosa.

decussata (C. Flanagani). Sts. leafy below: lvs. partially cylindrical, to 5 in. long, glaucous, thick: fis. red, 1 in. long, in many-fid, corymbs on peduncles to 11/2 ft. long. S. Afr.

densifiòra: Echeveria densifiora. élegans: Echeveria Harmsii. farindsa: Echeveria farinosa. fimbriata: Sedum fimbriatum. Flánaganii: C. decussata. gibbiflòra: Echeveria gibbiflora.

glauca: listed name, of doubtful status, perhaps referable to Echeveria glauca.

Hôveyi: Echeveria Hoveyi. lanceolàta: Echeveria lanceolata. láxa: Echeveria laxa.

lùrida: Echeveria lanceolata var.

Shrub to 21/2 ft.: lvs. obovate, fleshy, macrántha. margined with red: fls. red, greenish-yellow inside, 34 in. long. S. Afr.

macrophýlla: listed name. nevadénsis: Echeveria nevadensis. nudicaulis: Echeveria densiflora. oolyphýlla: listed name.

orbiculàta (C ausana) To 4 ft.: lvs. opposite, oblong to roundish, to 4 in. long, entire: fis. red, drooping. S. Afr. Vars compacta, major and minor are listed.

oregana: listed name.

ovifera: listed name, perhaps Pachyphytum oviferum.

Pachýphytum: Pachyphytum bracteosum.

papillaris. Sts. decumbent: lvs. ovoid-oblong, to 1 in. long, fleshy: fls. ½ in. long, in few-fld. cymes on peduncles 6 in. long. S. Afr.
papillosa. To 4 in.: lvs. obovate-spatulate, to ¾ in. long, fleshy, papillose: fls. pink, ¼ in. long, in many-fld. cymes. Afghanistan.

naraguavénsis: Grantonetalum paraguavense.

parvifòlia: listed name.

Plattiàna: Echeveria Plattiana. platyphýlla: see Sedum sempernvoides. pulverulenta: Echeveria pulverulenta. Purpusii: Echeveria Purpusii. rotundifòlia: var. of C. orbiculata. sectinda. Echeneria secunda

Semendvii: Sedum Semenomi.

septentrionalis: Echeveria septentrionalis.

simplicifòlia. To 6 in : lvs. roundish, irregularly and coarsely toothed: fls. yellow, drooping. S. Eu.

spindsa: Sedum spinosum.

teretifòlia. Sts. woody, to 8 in.: lvs. nearly cylindrical, to 5 in. long, hairy: fls. ½ in. or more long, in many-fld. corymbs on peduncles to 1½ ft. long. S. Afr.

Umbilicus: Umbilicus pendulinus.

undulata. To 3 ft., shrubby: lvs. opposite, obovate, 3-5 in long, 2 in, wide, undulate on margins; fls. orange or red, drooping, 1 in. long. Probably S. Afr.

Van de Héydenii: listed name.

Wickensii. Shrub to 7 ft.: lvs. obovate or oblanceolate, thick, almost flat, 2-3 in. long, ½-1 in. wide: fls. orangered, nodding. S. Afr.

Wightii: listed name. Winkleri: Sedum Winkleri. Witchmannii: listed name.

COULTERIA: Casalpinia spinosa. COURANTIA: Echeveria.

COUROUPITA. Lecythidacex. A trop. American genus of trees represented by about 9 species. planted in warm climates for shade or for the curiosity aroused by the large ball-like frs. borne on the trunk. One species is cult. C. guianénsis. Cannon-Ball Tree. Lvs. oblongobovate to broadly lanceolate, to 8 in. long or more, alternate, acute, entire or obscurely serrate: fls. tinged yellow or red on outside, crimson-lilac within, about 4 in. across, borne in racemes to 3 ft. long which arise from the trunk and larger branches: fr. nearly globose, to 8 in. diam., reddish and hard on outside, pulpy and illsmelling within.

COUTAREA. Rubiaceæ. Trees and shrubs, native Mex. to S. Amer., bearing opposite simple stalked lvs., and large (2-4-in. long) white or yellowish funnelform-campanulate pedicillate fis. mostly in small cymes; stamens 5-8; style filiform: fr. an ovoid or obovoid caps.

hexándra. To 15 ft. or more: lvs. ovate to oval, to about 5 in. long, sharp-pointed, entire: fls. mostly in 3's, the corolla white or yellowish and tinged purple toward base. Mex. to Argentina.

COVER-CROP. A crop grown primarily for the covering and protecting of land, par-ticularly in orchards, after the final tillage in summer until the following spring when tillage recurs. It may be a green crop not killed by-the winter as crimson clover, or a one-season crop that is killed by frost but remains on the land till spring, as peas. The crop is turned under in spring and then acts as an amendment to the soil. Many kinds of plants may be employed as cover-crops; crimson clover, vetch, rape, wheat, winter oats, soybean, cowpeas, buckwheat, beggarweed, crotalaria, peas, barley, millet are some of them. In this sense the term covercrop was first employed in 1892 (Cornell Bulletin 59), suggested by the author's observations of "cover" for game in Ireland.

COVILLEA: Larrea. COWAGE: Stizolobium pruritum.

COWÀNIA. Rosaceæ. Evergreen shrubs or small trees of Mex. and S. W. U. S., with leathery sticky lvs., solitary fls., and achenes with long feathery tails; not showy, but sometimes planted in native or similar regions.

mexicana (Geum dryadoides). Shrub to 7 ft., differing from C. Stansburiana in its brownish bark, lobes of lvs. entire and the calyx-tube campanulate. Mex.

Stansburiana. Shrub to 12 ft., bark grayish: lvs. to ½ in. long, 3-5-parted into toothed lobes: fis. white or pale yellow, ¼ in. long; calyx-tube funnelform. Colo. to Mex.

COWBERRY: Vaccinium Vitis-idæa, COW-HERB: Saponaria Vaccaria. COWITCH: Stizolobium pruritum. COWPEA: Vigna sinensis.

COW POISON: Delphinium trolliifolium.

COWSLIP: Primula veris; also Caltha palustris, Mertensia virginica. American: Dodecatheon. Cape-: Lachenalia

COYAL: Acrocomia. CRAB-APPLE: Pyrus. CRACCA: Tephrosia.

CRÁMBE. Cruciferæ. Herbs. sometimes woody at base, usually with large basal lys.. ann., bien. and per., mostly in Eurasia, sometimes grown for ornament and one as an esculent: lvs. mostly thick or fleshy, glaucous, often very large, lobed, cut, lyrate or pinnatifid: fls. small but numerous, in panicles: fr. a 2-pointed indehiscent pod or silicle, the upper joint 1-seeded and globular.

cordifòlia. Stout striking per. to 7 ft.: radical lvs. cordate, to 2 ft. and more across, somewhat lobed and stout-dentate, long-stalked, more or less hispid-harry: fls. in across, white, in great terminal leafless panicle. Caucasus.

Caucasus.

hispānica. Hispid much branched ann. to 3 ft.: lvs. with oval to nearly orbicular terminal part and lobed or lyrate below, to 3 in. across, margins sinuate: fls. small, white, in long open racemes. Medit. region.

maritima. Sea-Kale (which see). Stout stocky per. to 3 ft., with fleshy large glaucous-blue foliage: radical lvs. to 2 ft. or more long and nearly as broad, notched and shallowly lobed, stout-stalked: fis. white, in panicles: fr. a pea-like body. Seacoasts, W. Eu. to Asia Minor.

CRANBERRY. The trailing swamp cranberry, Vaccinium macrocarpon, is cultivated Jersey and Wisconsin, in artificial or developed bogs. The small or European cranberry, native in the northern parts of America, is a distinct species, Vaccinium Oxycoccus, not cultivated here; the mountain cranberry, brought to market from the wild in the northern parts of America and Europe is still another Vaccinium, V. Vitis-idæa.

The American cranberry is grown in acid peat bogs, which may be flooded. The area is kept under water during winter, largely to protect the plants from winter injury by the heaving and thawing of the bogs. Flooding may also be employed at other intervals to drown insects, mitigate drought, and protect against frost and fires. Every good cranberry bog should have facilities for flooding. The ordinary practice is to choose a bog with a creek running through it, or through which a creek or ditch may be diverted. At the lower side of the bog flood-gates are provided, so that when the gates are shut the water backs up and covers the area. It is best that the bog be comparatively flat, so that the water will be of approximately equal depth over the whole

area. At the shallowest places the water should stand about a foot above the plants. The water is usually let on the bog early in December and kept on until April or early May. No flooding is provided at other times unless there is some particular occasion therefor.

Before the vines are set all the wild and turfy growth should be taken off the bog. This is accomplished either by digging it off and removing it bodily, or by drowning it out by a years flooding. The latter method is generally considered to be the better. After the turfy growth is removed, the bog is smoothed and covered 2 or 3 inches deep with clean sand. The vines are then set, the lower ends of them being shoved through the sand into the richer earth with a dibble. Covering the bog with 1/2-1 inch of clean sand every three to five years is standard practice in well-kept fields. This resanding induces new rooting of the plants, increases yields, and helps to control insects.

Plants for setting are merely cuttings or branches of the vines 5-10 inches long. They are usually planted at distances of 12-18 inches each way, and the vines allowed to cover the entire ground as with a mat. In three years a good crop should be obtained if the weeds and wild growth are kept down.

Important varieties are the Early Black.

Howes, Centennial and McFarlin.

Berries are harvested with special rakes or scoops. An average yield to the acre is about 20 barrels with exceptional yields of 100 barrels or more. The fruit is carefully sized and graded and marketed in half-barrel boxes. The growing of cranberries is a highly specialized enterprise requiring considerable capital investment and much attention to detail.

CRANBERRY-BUSH: Viburnum Opulus and trilobum. CRANESBILL: Geranium. CRANTZIA: Alloplectus.

CRAPE-MYRTLE: Lagerstræmia.

CRASPÈDIA. Compositæ. Per. herbs with alternate or basal entire lvs. and small heads of disk-fls. crowded in dense compound involucral heads; pappus of plumose hairs; native in New Zeal., Australia and Tasmania, sometimes planted in Pacific region.

uniflora. To 1½ ft., usually tomentose: lvs. mostly basal, oblong or spatulate, to 8 in. long: compound heads to 2 in. across, solitary and terminal.

CRASSINA: Zinnia CRASSOCEPHALUM: Gynura.

CRÁSSULA. Crassulaceæ. Herbs and subshrubs, usually succulent, mostly S. African, with opposite fleshy lvs. and white, rose or yellow fis. in cymes or clusters, the petals little if at all united, sepals, petals and stamens 5 or sometimes 4. Grown in greenhouses and win-dows and out-of-doors in warm regions; in Calif. and similar climates other species may be found in the collections of fanciers. For cult. see Succulents.

acutifòlia (C. densifolia). Subshrub or subherbaceous, erect or decumbent, to 1 ft., branched: lvs. closely placed, awl-shaped, ½ in. long, connate: fls. white, very small, in terminal cymes on long peduncles. S. Afr. albiflòra. Subshrub with lvs. ovate or oblong, st. erect, simple, scabrous above. S. Afr.

Alstonii. To 4 in.: lvs. deeply imbricated, round, to ½ in. across, grayish-green: fls. white, small, in peduncled cymes. S. Afr.

arboréscens. Shrub to 10 ft.: lvs. roundish-ovate, obtuse, to 2½ in. long, covered with a grayish waxy bloom, copiously and distinctly punctate: fls. rose-red. S. Afr.

Archeri: listed name.

argentea (C. partulacea). Shrub to 10 ft. with opposite branching or forking habit: Ivs. oblong-spatulate, ovate or obovate, obtuse or subscute, to 1½ in. long, distinct at base, very thick, green and shining: fts. rosy-red. S. Afr.—Known sometimes under the erroneous names Sedum deultoudeum, N. arboreum and S. spectabile; popular as a fleshy shrub in S. Culif. where it blooms freely; frequent as a pot-plant in the N. but seldom blooms.

argyrophflla. Succulent subshrub to 8 in.: lvs. flattish, subrosulate, obovate-cuneate, obtusc, to 1 in. long: fls. whitish S. Afr.

barbata. Erect herb to 1½ ft.: radical lvs. cuneate, to 2 in. long, apex truncate and fringed with long white hairs: fis. in spike-like infl. S. Afr.

Bòlusii: C. Cooperi.

canariénse: listed name, perhaps Æonium canariense.

canéscens: C. cephalophora. cardiflora; listed name. cauléscens: listed name.

centauroides: plants listed under this name may be referable to C. lineolata, C. marginalis, or C. pellucida.

cephalophora (C. canescens). Per, herb branched from the base, st. thick: Ivs canescent, oboxate-cuneate, some-times oblanceolate or sublinear, obtuse or subacute, 1-3 in. long: fis in dense cymules, yellowish. S. Afr.

ciliàris: synonym of C. derecta but plants in the trade probably are C. obvallata.

clavifòlia. Erect, shrubby: lvs. oblong-spatulate, obtuse, fleshy: fls. small, in terminal head-like cymes 1/2 in. across. S. Afr.

coccines: Roches coccines.

Cóllinberi: listed name. columbària: listed name.

columnaris. To 4 in., the st. with closely imbricated orbicular obtuse fleshy lvs. to 1 in. across: fis. white, in terminal head-like cymes. S. Afr.

Comptonii; listed name.

congests (C. litteephala, C. pachyphylla), To 2 in.; lvs. loosely imbricated, ovate-luncolate 114 in. long, strongly deflexed; fls. white spotted with red-brown at tip, in dense heads 1 in across. S. Afr.

Cooperi (C. Bolusu). Tufted, to 5 in. high: lvs. opposite, elliptic-lanceolate, neute, to 1 in. or less long, with black blotches: fls. very small, in little terminal clusters, calyx red, petals pale flesh-color. S. Afr.—See also C. rupestris.

corállina. To 2 in , with many short decumbent branches rooting at the lower nodes: lvs closely crowded, 1/2-1/2 in. long, compressed-subglobose or ellipsoidal: fls. 5-parted. S. Afr.

cordata. Shrubby, to 3 ft: lvs. opposite, petiolate, cordate-kidney-shaped and obtuse, to 1 in. across, entire: fts. white or reddish, small, in peduncled cymes. S. Afr.— See C. spathulata.

cornuta. Sts short, covered with imbricated thick glaucous lvs.: fls. dull white, very small, in panicled cymes on peduncles to 2½ in high. S. Afr.

corymbulosa. Succulent per herb with lvs. subdistant, lanceolate or oblong, acute: fls. with petals recurved. S. Afr.

cultrata. To 3 ft., shrubby, sts. leafy: lvs. obovate-oblong, to $2\frac{1}{2}$ in long, curved, connate: fls. green, small, in panicles S Afr.

deceptrix. Sts. 2 in. long: lvs. deeply imbricated, ½ in. long and wide, 3-cornered, grayish-white: fis. white, in peduncled cymes S. Afr.

decipiens: C. tecta.

dejécta: see C. obrallata for plants in trade.

deltoides (C. rhomboides). Subshrub with st. and branches fleshy: lvs. connate, gravish-puberulent, sub-rhomboid, keeled on back, channelled above: fls. small, with petals 1% in. or less long. S. Afr.

densifòlia: C. acutifolia.

dentata (C. minimu). Weak herb, st. 3-6 in. long: lvs. kidney-shaped to round, 14-1 in. wide: fis. in cymes.

doméstica: listed name, perhaps Aichryson domesticum.

Dregeana. Sts. weak and branching: lvs. ovate-oblong, in long, connate: fls. whitish, small, in few-fld. head-like sessile cymes. S. Afr.

elàta. White-pubescent, to 2 ft.: lvs. opposite, oblong to nearly lanccolate, to 1½ in. long, somewhat acute: fis. small, white or whitesh, in small dense sessile clusters. S. Afr. Var. ròsea is listed.

falcata (Rochea falcata). Shrub to 8 ft.: lvs. oblong, falcate, nearly or quite obtuse, to 4 in long, joined at base, glaucous: fis. bright crimson, rarely white. S. Afr.

gigantèa: see C. perfoliata.

grácilis: C. Schmidtii.

grandis: hort. name.

hemisphérica. Lvs. closely imbricated, roundish, connate: fis. white. small, in spirate panicles. S. Afr.

heterôtricha: C. perfoliata.

Hoffmeyeriana: listed name. irapréssa: C. Schmidtii.

Iustus-Corderovi: plants in the trade under this name are referable to C. namaquensis.

lactea. Shrubby, to 2 ft.: lvs. connate, narrow-obovate, to 3 in. long, more or less acute or acuminate: fis. white. S. Afr.—Belongs in group with C. argentea and C. arborescens

laticéphala: C. congesta.

lineolata. Prostrate per. with branches ascending, to 4 in.: lvs. sessile, connate, pilose at base, to 1/2 in. long: fls. white or reddish-tinged. S. Afr.

longifòlia: see C. perfoliata.

lycopodioides. Sts. 1-2 ft. long, lopping or spreading, lycopodium-like, with slender brittle branches covered with appressed scale-like lys. in 4 ranks: fls. minute, greenish, 1 or few in axils. S. Afr.

marginalis. Prostrate per. with branches rooting at nodes: lvs. sessile, glabrous, with a row of spots along the margin, ½-¾ in. long: fls. white or reddish-tinged. S. Afr.

marginata: C. pellucida.

mínima: C. dentata.

monticola; C. rupestris.

multicaulis: listed name.

multicava (C. quadrifida). Low herb: lvs. oval, to 3 in. long, the bases of petioles joining: fis. white to pale pink. S. Afr.—Frequent in S. Calif. and in conservatories.

namaquénsis. Densely tufted: lys. partially cylindrical. 1 in. long, densely covered with short thick papillæ: fis. small, pink, in loose panicles on dark red peduncles having whitish hairs. S. Afr. Var. brevifòlia is dwarf, with lvs. 38 in. long.

nudicaulis. To 2 ft, sts. densely leafy: lvs. partially cylindrical, to 6 in. long: fts greenish, small, in dense cymes in panicles on scape-like peduncles. S. Afr.

obovata: probably a variation of C. ramuliflora.

obvallata. St. to 6 in. long, leafy, simple lvs. lance-oblong or knife-shaped, obtuse or nearly so, to 2½ in long, glabrous, chlate: peduncle scape-like, bearing a panicle of small green fis. S. Afr.—Said to be sometimes grown improperly as C. dejecta.

orbicularis. Per. succulent herb with runners: lvs. rosulate: petals curved outward below the middle, white at base, reddish towards apex. S. Afr.

pachyphýlla; C. congesta.

pèbra: listed name.

Pégleræ. Per, herb with shoots erect to 6 in.: lvs. ovate or ovate-lanceolate, with thick papille on margins; calyx-lobes subglabrous, nearly $\frac{2}{3}$ length of petals. S. Afr.

pellùcida (C. marginata). Per. succulent herb: lvs. sessile or subsessile, quite glabrous, without spots: petals about ¼ in. long. S. Afr.

perfoliàta (C. heterotricha). Like C. falcata but lvs. longer, lanceolate and acuminate, to 6 in. long, concave above: fls. crimson or white. S. Afr.—Said to be grown as C. gygantea and C. longyfolia.

perforata. To 2 ft., shrubby: lvs. ovate, joined at base, to 1 in. long, punctate: fls. in thyrsi forming panicles to 1 ft. long. S. Afr.

perfóssa: C. rupestris; name also has been applied to C. cordata.

portulàcea: C. argentea.

psenololy: listed name.

pseudolycopodioides. Similar to C. lycopodioides but with thicker stronger sts., more obtuse gray-green lvs. and numerous axillary fl.-clusters. A species of doubtful status. pulverulénta: listed name.

pulvinata: listed name.

punctata: this name has been applied variously to C. arborescens, C. ramulifora and C. rupestris.

purpuráscens: see Eonium arboreum.

pyramidàlis. Branched per. herb to 8 in.: lvs. triangular-ovate, subacute, in pairs close together and forming a dense column or pyramid: fls. whitish. S. Afr.

quadrifida: C. multicava.

radicans. Subshrubby, decumbent or with branches ascending to 1 ft.: lvs. flattish, glabrous or almost so: fis. white, in dense cymules. S. Afr.

ramuliflora (C. oborata). Erect per. herb: lvs. with marginal papille, ovate, oblong or obovate, acute or obtuse, fis. whitish or reddish, with sepals rough-edged. S. Afr.

reversisetòsa. Per. herb, decumbent or weakly ascending to ¾ in.: sts. and margins of lvs. and sepals retrorsely papillose: lvs. roundish: fls. white. S. Afr.

rhomboides: C. deltoidea.

rosularis. Herbaceous, with radical lvs. in a rosette, oblong-lanceolate to strap-shaped, to 5 in. or more long, acute, flat, ciliate: fls. small, white, in branching panicle.

rubicunda. Erect per. herb to 2 ft.: lvs. lanceolate, diminishing in size from below upwards; fls. deep red with sepals ciliate. S. Afr.—See note under C. Schmidti.

rupéstris (C. monticola, C. perfossa). To 1 ft. or more, glabrous: lvs. connate, ovate-acute, to ¾ in. long, glaucous: fts. small, pinkish, in short-peduncled terminal clusters. S. Afr.—Said to be grown sometimes under the name C. Cooperi.

sarcocaulis. Subdichotomously branched subshrub with fleshy sts.: lvs. lanceolate, acute: fls. white or pink. S. Afr.

sarmentosa. Per. weak-stemmed herb with lvs. flat, ovate, acute, and with margin rather coarsely crenate-serrate: petals white or tinged with red. Natal.

Schmidtii (C. impressa. C. gracilis). Dwarf, to 6 in.: lvs. opposite, linear-lanceolate, thick, convex on back, to 134 in. long, acute, punctate above, chate: fis. small, rose-colored, in little terminal clusters. S. Afr.—Much like C. Cooperi. Sometimes erroneously grown as C. rubicunda or as Sedum perfossum.

Schoenlandia: listed name.

spathulata. Shrubby, with trailing sts.: lvs. broadly cordate, wavy-margined, petioled: fis. pink. S. Afr.—Sometimes erroneously called C. cordata.

técta (C. decipiens). Much branched: lvs. partially cylindrical, thick, covered with white papillæ: fis. in head-like clusters. S. Afr.

tères. Dwarf herb with lvs. very fleshy and with a hyaline margin, forming a short subcylindrical column: fls. white S. Afr.

tetragona. Shrub to 2 ft: lvs. 3-sided, to 1 in. long, nearly joined at base: fls. white. S. Afr.

tomentòsa. To 2 ft, densely bristly-hairy: lvs. mostly basal, oblong or obovate, obtuse: fls. in dense clusters forming a long interrupted spike. S. Afr.

trachysantha. To 1½ ft, erect or spreading, densely hairy: lvs. awl-shaped, partially cylindrical, to ¾ in. long; fls. in flat-topped peduncled cymes; petals tipped with fleshy gland. S. Afr.

túrrita. Succulent per. herb with lvs. opposite, in 4 ranks, gradually reduced in size upwards, ciliate: fis. white or rarely pink, in sessile cymules. S. Afr.

CRASSULÀCEÆ. ORPINE FAMILY. culent herbs or pliable shrubs of about 25 widely distributed genera in temp. and trop. regions of both hemispheres, characterized by bisexual regular fls. having 4-5 sepals and petals which are free or united, 4-10 stamens and superior ovary of 4-5 carpels free or united below. Several genera are grown in the greenhouse or rock-garden or regularly in the open. as Æonium, Aichryson, Cotyledon, Crassula, Echeveria, Graptopetalum, Greenovia, Kalanchoë, Lenophyllum, Monanthes, Pachyphytum, Rochea, Sedum, Sempervivum, Sinocrassula, Umbilicus, Urbinia, Villadia.

CRATÆGOMÉSPILUS. HAW-MEDLAR. Rosacex. A group of hybrids between the genera Cratægus and Mespilus, of which a few forms are known; deciduous shrubs or small trees.

grandiflora (Cratagus grandiflora). Hybrid between C. Oxpaontha and M. germanica: shrub or tree: lvs. to 3 in. long, toothed, pubescent beneath: fis. white, 1 in. across, 1-3 together, May-June: fr. about ½ in. diam., nearly globose, pubescent. Old plant of European origin. Hardy N.

CRATÆGUS. HAWTHORN. THORNAPPLE. Rosacex. Spiny deciduous shrubs or small trees, often horizontally branched, with alternate toothed or lobed lvs., white or rarely red fls. in corymbs in spring and early summer,

and fr. a small pome with 5 or fewer 1-seeded nutlets: native in north temp. zone. The species of hawthorn are numerous and most of them are desirable ornamental subjects. In this account only those kinds are included that are most planted or are in trade-lists. The native American species should have greater attention from planters. Nearly all of them are hardy N. The English hawthorn, considerably planted in this country, is two species, C. monoguna and C. Oxyacantha.

Hawthorns are very ornamental and any of them are likely to be transplanted from the wild. They are attractive in habit, in bloom and in fruit. They prefer sunny locations and limestone or rich loamy soils. Propagated by seeds sown when ripe or stratified; the seeds should be separated from the pulp by allowing the fruit to decay or by soaking the fruit in water. Seeds will take two years or more to experience and should be sour in that and leave in a good. germinate, and should be sown in flats and kept in a cool cellar. Rure sorts may be budded or grafted on stock of *C. Ovyacantha* or other species.

apiifòlia: material so listed is C. Marshallii.

åprica. Shrub or tree to 20 ft spines to 1½ in. long: lvs. usually broadly ovate, to 1½ in. long, serrate above middle or slightly lobed, petioles short and densely glandular: fis. ½ in. across: fr. orange-red, to ½ in. across. Vs. to Ga. and Tenn.

arkansana. To 20 ft., spines to ½ in. long or wanting: lvs to 3 in. long, with shallow lobes; fls. 1 in. across; fr. bright red, to 1 in. long Ark.

Arnoldiana. To 20 ft., spines to 3 in. long: lvs. to 3 in. long, shallowly lobed, shining above: fis. to 34 in. across: fr. bright red, 34 in. long. Mass. to N. Y.

Azarolus. Azarolus. To 30 ft., spines small or wanting: lvs. to 3 in. long, deeply 3-5-lobed, pubescent beneath: fls. ½ in. across; fr. orange-red or yellow, to ¾ in. long. S. Eu., N. Afr., W. Asia.

Barryana. Shrub to 15 ft, with slender spines: lvs. broad-ovate, slightly lobed, double-serrate, glaucous below, to 3 in. long: fls. 34 in. across, anthers purple: fr. crimson, pale-dotted. W. N. Y.

Calpodéndron (C. tomentosa). Pear or Sugar II. To 20 ft., spines to 1½ in. long or wanting; lvs. to 5 in. long, sometimes slightly lobed, pubescent beneath; fls. ½ in. across; fr. dull orange-red, ½ in. long. Ont. to Gn. and Kans.

Cánbyi. Shrub or tree to 20 ft, with thick spines: lvs. oblong-obovate, to 3 in. long, coarsely toothed: fr. dark red, $\frac{1}{2}$ in. long. Pa., Del., Md.

Carrièrei: C. Lavaller.

cerrônis (C. crythropoda). To 15 ft., spines 1 in. long: lvs. 2 in. long, coarsely toothed: fls. 32 in. across: fr. black or brown. Colo, Wyo.

chippewaénsis. To 25 ft., spines to 1½ in. long: lvs. to 3 in. long, shallowly lobed: fis. ¾ in across: fr. crimson, 34 in. long. S. Ont.

chlorosárca. Small tree; lvs. triangular-ovate, to 31/6 in. long, 3-5-lobed: fls. 1/2 in. across: fr. black, 1/2 in. across. Manchuria.

chrysocárpa. Small tree with twigs villous becoming glabrous: lvs. ovoid to rhombic, obtuse, lobes 7-9, sharply glandular-serrate, dark green above: fis. in compound corymbs with 10 reddish to yellow stamens: fr. goldenyellow. Colo. Var. phœnicea (C rotundifolia) has lvs. broad-ovate to obovate and margins doubly serrate: fr. red with yellow flesh. N. S. west, south to Va.

coccinea: C. intricata.

coccinioldes. Tree to 20 ft., thorny: lvs. broad-ovate, glabrous, shallowly lobed, wavy: fts. ½-½ in. across: fr. subglobose and angular, bright crimson. Ill. westward.—Some of the material so listed may be C. Putnamiana.

coloradénsis. To 15 ft., spines to 2 in. long: lvs. to 2 in. long, toothed: fis. about 1/2 in. across: fr. scarlet, about 1/2 in. long. Colo.

colorata: C. macrosperma.

cordata: C. Phænopyrum.

crenulata: Pyracantha crenulata.

Crus-galli. Cockspur Thorn. To 25 ft. or more, spines several in. long: lvs. to 3 in. long, toothed: ffs. ½ in. across: fr. dull red. ½ in. long Que. to N. C. and Mich. Var. splendens, lvs. elliptic-oblance clate and glossy.

cuneata. Shrub to 5 ff, spines about ¼ in. long, slender: lvs. obovate to oblong, short-petioled, irregularly toothed: fls. about ¼ in. across, in few-fld. corymbs: fr. small, globose to pyriform. Japan, China.

diffusa. To 30 ft., spines to 1½ in. long: lvs. to 2 in. long, shallowly lobed, pale beneath: fls. ½ in. across: fr. dull red, about ½ in. long. N. H. to N. Y.

Douglasii. To 30 ft., spines to 1 in. long: lvs. to 3 in. long, toothed, shining above: fis. ½ in. across: fr. black, snining, ½ in. long. B. C. to Calif. and Minn.

dsungárica. Spines to ¾ in. long: lvs. to 3 in. long, 3-5-lobed: fls ¼ in. across: fr. black, shining, ¼ in. long.

Dúnbari. To 12 ft., spiny: lvs. nearly orbicular, slightly lobed: fls. ½ in. across: fr. crimson, ½ in. across. W. N. Y. Èganii: C. macrosperma.

Ellwangerians. To 20 ft, spines to 2 in. long: lvs. to 4 in. long, shallowly lobed: fis. 1 in. across: fr. bright red, shining, 1 in. long. Ont. to Pa. and Mich.

erythrópoda: C. cerronis.

flabellata: material so listed in trade is referable to

flàva. To 20 ft., spines about 1 in. long; lvs. 2 in. long, coarsely toothed; fls. ¾ in. across; fr. dark orange-brown, ½ in. long. Ga, Fla.

florentina: Malus florentina.

Fontanesiàna. Closely resembling C. Crus-gallis but with thinner lys. and brick-red frs. Pa.

formosa. To 10 ft, spines to 1½ in. long; lvs. to 2 in. long, doubly toothed, pale below; fis 1 m. across; fr. bright red, ½ in. long. N. Y.

geneseensis. Tree to 12 ft., spiny: lvs. obovate-oblong, prominently vened: fis. in many-fid. lax corymbs: fr. scarlet, ½ in across. N. Y.—Allied to C. Crus-gallii.

glabra: Photinia serrulata.

grandiflora: Cratagomespilus grandiflora.

Grayana (C. flabellata). Shrub to 18 ft., spines to 4 in. long: lvs ovate, to 3 in. long, toothed and lobed: fis. 14 in. across: fr. crimson, subglobose, dark, 14 in. across. Que. to N. Y. and Ill.

Heldreichii. Lvs. to 1 in. long, with nearly entire lobes, pubescent beneath; fr. red. Greece.

hupehénsis. To 18 ft., spines to ½ in. long: lvs. ovate, to 4 in long, petiole long and glabrous: fls. to ½ in. across, in many-fld. compact corymbs: fr. dark red, to 1 in. across, globose. W. China.

intricata (C. coccinea). To 10 ft., spines few: lvs. to 3 in. long, shallowly lobed: fls. 1 in. across: fr. reddish-brown. Mass. to N. C.

iracúnda. Shrub or tree to 25 ft.: lvs. ovate, to 234 in. long, toothed: fls. 1/4 in. across: fr. red, 1/4 in. across. Ga.

Lalandii: the plant advertised under this name is undoubtedly Pyracantha coccinea var. Lalandii.

Laneyi. To 10 ft., spines to 2 in. long: lvs. to 3 in. long, doubly toothed: fis. 1 in. across: fr. dark orange-red, shining. N. Y.

Lavállei (C. Carrieres). Hybrid probably between C. Crus-gallu and C. pubescens. to 20 ft., spines 2 in. long: lys. to 4 in. long, toothed, pubescent beneath: fis. with red disk, ¾ in. neross: fr. brick-red, ½ in. long.

macracantha. Shrub to 15 ft, spines to 5 in, long: lvs. elliptic or obovate, to 3 in. long, toothed, shining above: fts. 35 in. across: fr. dark red, shining, 35 in. across. Vt., N. Y., Pa.

macrantha: listed name, possibly an error for C. macracantha

macrospérma (C. colorata. C Eganii). Shrub or small tree to 25 it, spines to 1½ in. long; lvs. ovate, to 4 in. long, somewhat lobed, doubly serrate: fls. to ½ in. across, in few-fld glabrous corymbs: fr. to nearly ½ in. across. N. Y. to Ga. and Tenn.

Márshallii (C apiifolia). To 20 ft., spines about 1 in. long: lvs. to 1½ in long, pinnately 5-7-lobed: fls ½ in. across: fr. scarlet, about ¼ in. long. Va. to Fla. and Tex.

Másekii; trade name for a plant with double rose-pink fis. mexicana: (' pubescens.

móllis. To 30 ft, spines to 2 in. long; lvs. to 4 in. long, doubly toothed, pubescent beneath: fls. with red disk, 1 in. across: fr. scarlet, to 1 in. long. Ohio to S. D. and Kans.

monógyna. English H. To 30 ft., spines to 1 in. long: lvs. to 2 in. long, deeply 3-7-lobed and margins nearly or quite entire: fis 34 in across; style prevailingly 1: fr. bright red, 34 in. long, with 1 stone or seed. Eu., N. Afr. W. Asia.—Often confused with C. Oryacantha. Var. alba, fis. white. Var. pendula has drooping branches. Var. peridifòlia (C. Oryacantha var. filcifolia), lvs. deeply lobed. Var. rôsea, fis. rose-pink. Var. stricta, habit fastigiate. Some of the vars advertised under C. monogyna belong to of the vars C. Oxyacantha.

nftida. To 30 ft, spines to 1½ in. long: lvs. to 3 in. long, coarsely toothed, shining above: fis. ¾ in. across: fr. dull red, ½ in. long. Ill. to Ark.

Oxyacantha (C. oryacanthoides). English H. To 15 ft., spines 1 in. long: lvs. to 2 in. long, with 3-5 broad serrate

lobes: fls. ½ in. across; styles prevailingly 2: fr. bright red, ½ in. long, with 2 stones. Eu., N. Afr. Var. álba, fls. white. Var. coccinea, fls. crimson. Var. Paùlii (var. splenden.), fls. bright scarlet, double. Var. plèna (C. monogyna var. albo-plena), fls. white, double. Var. punicea, fls. dark red. Var. ròsea, fls. rose.

pedicellata. Tree to 30 ft., spines to 2 in. long: lvs. broad-ovate, to 4 in. long, toothed: fls. ½ in. across: fr. bright scarlet, shining. Ont. to Pa.

pentfandra. Tree to 15 ft., with many thorns: lvs. oval to ovate, to 2½ in. long, with many short sharp lobes: fls. to ¾ in. across, anthers red-purple: fr. short-oblong, dark crimson and shining. Vt., Conn., N. Y.

peregrina. Tree: lvs. with 4-6 pairs of narrow lobes, pubescent beneath: fr. dull purple, about 1/2 in. long. Probably W. Asia.

persistens. Like C. Crus-gallii and perhaps a hybrid, the stamens more numerous (15-20): tree to 12 ft. or more, thorny: lvs oblong to obovate, to 3 in. long, serrate, glossy above and remaining green to winter: fls. ¾ in. across: fr. persistent.

Phenopyrum (C. cordata). Washington Thorn. To 30 ft., spines to 3 in. long: lvs. to 3 in long, 3-5-lobed, shining above: fls. ½ in. across: fr. bright red, ¼ in. long. Va. to Ala.

pinnatfida. To 20 ft., spines small or lacking: lvs. to 4 in. long, pinnately 5-9-lobed, dark and shining above: fts. ½ in. across: fr. red, ¾ in. long, edible. N. E. Asia. Var. måjor has larger lvs. and fr.

procèra. To 20 ft., spines 1 in. long; lvs. to 2 in. long, doubly toothed: fls. to 1 in. across: fr. bright red, ½ in. across. N. Y.

pruindsa. To 20 ft., spines to 1½ in. long: lvs. to 2 in. long, shallowly lobed: fls 1 in. across: fr. dark purple, ½ in. long. Vt. to Va. and Ill.

prunifòlia. To 30 ft.: lvs. to 3 in. long, doubly toothed: fls. with pink anthers: fr. red. Origin unknown.

pubéscens (C. mericana). To 30 ft., spines to 1½ in. long or wanting: lvs. to 3 in. long, finely toothed, pubescent beneath: fts. ¾ in. across: fr. greenish-yellow or orange, 1 in. long. Mex.

punctata. To 30 ft., sometimes unarmed: lvs. to 4 in. long, toothed, pubescent beneath: fls. ½ in. across: fr. dull red, to ¾ in. long. Que. to Ga. and Ill. Var. aurea, fr. yellow.

punicea: plants so listed are probably C. Oxyacantha var. Putnamiana (C. cocciniodes, in part). Differs from true C. cocciniodes in lvs. scabrous above and pubescent on veins beneath, margins sharply and unevenly serrate: fis. about \(^3\xi\) in. diam.: fr. subglobose, rounded, bright red, about \(^8\xi\) in. dam. Ky. to S Ind.

Pyracántha: Pyracantha coccinea.

rivulāris. To 20 ft., spines to 1½ in long: lvs. to 3 in. long, doubly toothed, pale beneath: fls. ½ in. across: fr. dark red, becoming black and shining, to ½ in. long. Wyo.,

rotundifòlia: C. chrysocarpa var. phænicea.

saligna. To 20 ft., spines to 1½ in. long; lvs. to 2 in. long, dark and shining above, pale beneath: fls. ½ in. across: fr. dark red and shining, ¼ in. long. Colo.

Sárgentii. To 20 ft., spines to 1½ in. long: lvs. to 3 in. long, shallowly lobed, pale beneath: fis. to 1 in. across: fr. yellow flushed with red, ½ in. long. Ga. to Ala.

spathulata. To 25 ft., spines 1 in. long or wanting: lvs. to 2 in. long, often 3-5-lobed at apex: fls 1/2 in. across: fr. bright red, shining, 1/4 in. across. Va. to Fla. and Tex.

stipulòsa. Tree: lvs. to 3 in. long, finely toothed, pale and pubescent beneath: fls. 1/2 in. across: fr. orange-red, to 1 in. long. Mex.

submöllis. Tree to 25 ft., spines to 3 in. long; lvs. ovate, to 3 in. long, doubly serrate, leathery; fls. white, to 1 in. aeross, stainens 10; fr. orange-red, pyriform. Que. to Mass. and E. N. Y.

succulenta. To 15 ft., spines to 2 in. long; lvs. to 3 in. long, coarsely toothed, shining above: fis. $\frac{1}{2}$ in. across: fr. bright red, $\frac{1}{2}$ in across, pulpy. Que. to III.

tanacetifolia. Shrub or small tree to 40 ft., branches mostly erect, tomentose when young: lvs. pinnatifid, to 2 in. long, villous-pubescent on both sides, lobes 5-7, glandular-serrate, veins to the points of the segms. and to the sinuses: fis. to 1 in. across, usually in corymbs of 5-8: fr. yellow or reddish, to 1 in. across. W. Asia.

tomentosa: botanically rejected as an ambiguous name and the next valid name is C. Calpodendron which see.

venústa. Shrubby tree to 25 ft., spines branched, to 6 in. long: lvs. mostly ovate, to 2½ in. long, glabrous, dull green above, paler beneath, acute, base rounded, lobed, serrate; fls. to 1 in. across, in 4-9-fld. corymbs: fr. dull red or reddish-brown, to ¾ in. diam. Ala.

viridis. Tree to 40 ft., spines to 1½ in. long: lvs. oblongovate to elliptic-lanceolate, to 2½ in. long, glossy above, base cuneate, margins serrate: fls. to nearly ½ in. across, in many-fld. corymbs: fr. red, about ¼ in. across, spherical. Md. to Fla. west to Iowa and Tex.

Wattiana. Small tree to about 20 ft., branches reddishbrown, glossy, few-spined or spineless: lvs. ovate, glabrous, glossy, to 3½ in. long, acute, base truncate to broadly cuneate, lobes serrate: infl. to 3½ in. across, fis. white, stamens whitish: fr. orange- or reddish-yellow, to ½ in. across. N. China west to Beluchistan.

yunnanénsis: plants cult. under this name are presumably Pyracantha Gibbsii var. yunnanensis.

CRATÓXYLON. Hypericaceæ. Trop. Asiatic trees or shrubs with entire papery lvs. and white or pink fls. in axillary or terminal cymes; allied to Hypericum and differing in caps. dehiscing loculicidally (midway between the partitions) and the seeds winged. One species may be cult. C. polyánthum (Hypericum pulchellum). Shrub, aromatic, branchlets compressed: lvs. ellipticoblong, to 4 in. long but usually less, pellucid-punctate and black-dotted beneath: fls. pink, to ½ in. across, in 1-3-fld. axillary cymes: seeds 1-winged, about ¼ in. long. China to Borneo.

CRAWFÚRDIA. Gentianaceæ. Glabrous twining herbs native in Asia, having opposite 3-nerved lvs. and showy tubular fls. solitary in the axils; allied to Gentiana.

Blumii: C. trinervis.

japónica. Climbing: Ivs. cordate-lanceolate, to 3 in. long: fls. greenish-yellow, to 1¼ in. long: berry ellipsoid, red. Mts., Himalayas to Japan.—Yellow-fruited forms are known but may not be cult.

trinérvis (C. Blumi) Clumbing to 5 ft.: lvs. ovate-lanceolate, 1½ in long: fls yellow striped with purple, 1½ in. long. Mts., Java, Sumatra.

CREAM-CUPS: Platustemon californicus.

CREEPER: a trailing plant or shoot that takes root mostly throughout its length; sometimes applied to a tight-clinging vine.

CREEPING CHARLEY: Pilea nummularin folia. Charlie: Lysimachia Nummularia. Jennie: Lysimachia Nummularia.

CREMNOPHILA: Sedum nutans.

CRENATE: shallowly round-toothed or obtusely toothed, scalloped.

CREOSOTE BUSH: Larrea.

CRÈPIS. HAWKS-BEARD. Compositæ. Herbs with pinnate toothed or lobed lvs. and solitary or panicled heads of yellow, orange or red ray-fls.; pappus of soft white hairs; native mostly in the northern hemisphere, a few grown in the flower-garden. Propagated by seeds.

aurea. Per. to 1 ft · lvs. black-pubescent, lower ones statulate, toothed, glossy: fls. orange, heads usually solitary. Alps.

barbata: Tolpis barbata.

Dioscoridis. Ann, branching: basal lvs. obovate or oblong, toothed or lyrate, upper linear, entire: heads solitary, yellow. Greece.

grandiflora. Per to 1 ft: lvs. linear-lanceolate, toothed, white-hairy: heads 2-5, golden-yellow, 2 in. across. Eu.

occidentalis. Per. to 18 in, pubescent or scabrous: lvs. oblong-lanceolate, to 10 in long, pinnatifid, acute, upper ones sessile and clasping: heads yellow, corymbose, to 1 in. across, involucre canescent. Mont. to B. C. south to Neb. and Calif.

rubra (Barkhousia rubra). Branching ann to 1½ ft.: lvs toothed or lobed, nearly glabrous heads solitary on long peduncles, red. Italy, Greece, Var. álba has white or flesh-colored fis. Var rosea has pink fis.

virens. Ann. to 1½ ft.: lvs. toothed or pinnate, glabrous: heads yellow, the outer florets tinged pink. Eu.

CRESCENTIA. Bignoniacex. Trop. American trees with simple usually clustered lvs., large tubular 5-lobed fls, and hard-shelled globose frs.; grown in the tropics for the fr. which is used for water-gourds, as well as for ornament.

Cujète. CALABASH-TREE. To 40 ft., with long spreading branches and broad head: lvs. oblanceolate, to 6 in. long, nearly sessile: fls. yellowish-purple, 2 in. long, the lobes cut: fr. to 1 ft. or more across, like a hard-shelled gourd, nearly or quite globular, smooth. Trop. Amer.

CRESS. Cruciferæ. Several plants are known as cress, the piquant basal leaves used as salad, seasoning, or garnishing, but the usual kinds are of three very unlike genera and they should

not be confused. See also Cardamine.

The usual or common garden cress is a peppergrass, Lepidium sativum. It is a quick-growing hardy upright annual, native in western Asia but now sometimes escaped as a weed. Seeds may be sown in the open as soon as the ground can be made ready, usually in drills about 1 foot apart; leaves may be had in five to eight weeks, and new ones arise if the cutting is not too close. New sowings may be made every two or three weeks for succession, although the product is not so much prized in midsummer and the plants quickly run to seed in hot weather. In August sowings may be begun for autumn use in the North, while in mild regions plantings may be made at intervals during fall and winter. The curled variety is most prized for garnishing, like parsley. Cress thrives in any good garden soils, those retentive of moisture being preferable.

Upland-cress, sometimes called winter-cress, is a hardy biennial, Barbarea verna (præcox), native in Europe and sometimes run wild in this country. Seeds of it may be sown in very early spring in the open, and considerable tutts of leaves are formed by midsummer or a little later; if left in the ground, the plant persists the winter even in the northern states and in the spring goes to seed. A closely related plant is the common weedy yellow-rocket (B. vulgaris) that is conspicuous in spring in fields with its light yellow flowers. Upland-cress is a rather coarse plant, and is not largely grown.

Water-cress is a prostrate or trailing plant whose brittle soft shoots root in the water and mud. It is Nasturlium officinale of botanists, although it carries other Latin names, as Roripa Nasturlium-aquaticum and Sisymbrium Nasturlium-aquaticum. It is native in Europe and is extensively naturalized in other parts of the world. The plant thrives in ditches, pools and stream margins, but it can be grown readily in frames or other places where the ground can be kept wet. It is usually propagated by planting pieces of the stems, although it is readily grown from seeds. It is perennial and hardy everywhere, and takes care of itself when once established. It may be colonized in a clear clean pool or stream.

CRESS, BITTER: Cardamine. Blister: Erysmum. Indian: Tropwolum. Mouse-ear: Arabidopsis. Penny: Thluspn. Rock-: Arabis. Stone-: Ethionema. Wart: Coronopus.

CRESTED: bearing elevated and irregular or toothed ridge or protuberances.

CRINKLE-BUSH: Lomatia silaifolia,

CRINODÉNDRON (Tricuspidaria). Elwocarpaceæ. Two Chilean trees with simple toothed alternate or opposite lvs., solitary axillary fls. and leathery capsular frs.; grown for ornament in S. Calif. and sometimes under glass.

depéndens (C. Hookerianum). To 30 ft.: lvs. obovate or elliptic, to 2½ in. long: fls white, about ¾ in. long.

Hookerianum: C. dependens.

Patágua (T. lanceolata). To 30 ft.: lvs. elliptic, to 5 in. long: fis. red, 1 1/4 in. long, urn-shaped, hanging.

CRINODÓNNA. Hybrids between Amaryllis and Crinum. C. Córsii was raised from seeds of Amaryllis Belladonna fertilized by Crinum Moorei, produced in Italy and probably not in cult. in N. Amer. but interesting as being an older name for the hybrid known here as Amarcrinum (which see): it is an evergreen autumn-blooming bulbous plant, the many attractive fits. rose-colored.

CRINUM. Amaryllidaceæ. Herbaceous plants from a large bulb, grown for the showy lily-like white, pink or red fls., native in trop. and warmtemp. regions in both hemispheres; mostly spring and summer bloomers, grown seldom indoors in the N. because they require much space but popular outdoors in the southernmost states, and two or three of them are hardy in protected ground as far north as N. Y. Čity. The fls. appear with the lvs. or after the foliage is well grown.

Is well grown.

These plants are sometimes called "crinum hlies," although belonging to another family. They are of simple culture and usually remain without change for several years, often forming large clumps. Some of the species are evergreen, the leaves remaining all the year; in others the leaves perish in summer or autumn. The large showy flowers are borne in an umbel topping a strong solid scape or pedincle that arises at or near the ground. If taken up for the winter they are treated as domant bulbs, or the evergreen species as semi-domant in pots or boxes. In the early growing season they should have plenty of moisture and fertility. For the most part, crinums are merely planted out-of-doors in the South and allowed to remain.

Propagation is by the natural offsets from the bulbs. Sometimes the plants fruit, and seeds may then be employed although good flowering plants are not to be expected before two or three years.

The crinums bear a general resemblance to amaryllis and hippeastium but are distinguished by the long slender flower-tube, which equals or exceeds the segments or "petals" of the flower.

amábile. Stout plant with rather small bulb with neck about 1 ft. long. lvs. many, 3-4 in. broad and 3-4 ft. long; fts. 20-30, powerfully fragrant, bright red outside and lighter within, tube 3-4 in. long, segms. nearly linear, 1/2 in. or so broad. scape 2-3 ft. high. Sumatra.

americanum. Southern Swamp Crinum. Scape 18-24 in., mostly preceding ivs. which are few and very narrow, bearing 2-6 white showy fis. with linear segms. Fla. to Tex.—Winter and spring.

asiaticum. Poison-Bulb. Lvs. many and broad, forming a big clump: fls. many, white with greenish tube, fragrant, the very narrow segms. diooping. Trop. Asia.—Frequent in Fla. and Gulf Const region. Calif.

augustum. Sturdy plant with bulb sometimes 6 in. thick and neck 1 ft. long: lvs. many, 3-4 in. broad: fls. many on scape 2-3 ft. high, differing from C. amable in broader lanceolate segms. and deeper wine-red color outside and milder fragrance. Mauritius, Seychelles.

campanulatum. Lvs. linear, channelled, 3-4 ft.: fls. few, funnelform, light red, tube curved and 2 in. or less long, the bell-shaped limb of similar length and with connivent obtuse segms. S. Afr.

capénse: C. longifolium.

erubéscens. Lvs. many, thin, strap-shaped, slightly scabrous on edges. fls. a dozen or less, salverform, the erect tube 5-6 in. long, segms, half that length and recurving, white inside and purplish outside. Trop. Amer.

fimbriatulum. Lvs. rather narrow, 2-3 ft., cliate on margus: fls. few, funnelform, greenish-white with red stripe in center of the broad segms., tube 4-5 in. long. Angola (Afr.).

fimbriatum: catalogue name, probably an error for C. fimbriatulum.

floridanum: probably C. americanum.

gigantèum. Lvs. lanceolate, 3-4 in. broad at middle, 2-3 ft. long, fis. pure white, mostly 4-6, sometimes more, the slender curved tube to 7 in. long. Trop. Afr.

hýbridum: C. asiaticum.

Kirkii. Lvs. strap-shaped, 3-4 ft.: fls. a dozen or so, funnelform, tube somewhat curved and greenish and about 4 in. long, the segms. longer and keeled bright red. Zanzibar.

Kunthianum. Lvs. star-shaped, 2-3 ft.: fis. few, salver-

form, with slender tube 5-8 in., segms. lanceolate and about 2½ in. long, white or purple. Trop. Amer.

about 2½ in. long, white or purple. Trop. Amer. longifolium (C. capense. Amaryllis longifolia). Lvs. relatively narrow, usually less than 3 in. broad, rough to the finger and sometimes minutely denticulate on the edges: fis. a dozen or less, funnelform, white or pink, about 3 in. across, tube 3-4 in. long and curved, segms. of similar length and 1 in. or less broad. S. Afr. Vars. álbum and rôseum are listed.—Probably the commonest crinum in this country, hardy in parts of the N. and much planted S.

Modrei. Larger plant than C. longifolium with much broader smooth-edged lvs.: fls. 4 in. or more across, funnel-form, rose-red. S. Afr. Var. álbum has white and roseum pulk fls.

pedunculatum. To 3 ft.: lvs. to 4 ft. long and 4 in. broad, glaucous, thick. fls. about 25, with green tube to 4 in. long and linear white segms. 2½ in. long. Australia.

podophýllum. To 1 ft.: lvs. oblanceolate, to 1 ft. long and 2 in. wide, usually 5-6. fls. white, the tube to 6 in. long, pedicels very short or absent. Trop. Afr.

Powellii. An old hybrid between C. longifolium and C. Moores, doubtfully in cult. in this country.

Sanderianum. Lvs. thin, 2 ft. or less long, crisped and denticulate on edges. fls. few, funnelform, white with red keels, the curved tube 5-6 in. long, segms. less than 1 in. broad and 3-4 in. long and not spreading. Trop. Afr.

scabrum. Lvs. narrow, 2 in. or less, with rough edges: fls. few, funnelform, white with crimson keels, the greenish curved tube 3-5 in. long and limb shorter. Trop. Afr.

virginicum: a name for a hort. var.

zeylánicum. Lvs. broad, often 4 in., with slightly rough edges: fls. many, funnelform, fragrant, whitish with broad red keels, the curved tube 3-4 in. or more long, segms. 1 in. broad. Trop. Asia and Afr.

CRISTÀRIA. Malvaceæ. Herbs, often prostrate, native in Chile and Peru, with lobed or dissected lvs. and usually violet fis. solitary or in racemes; one species intro. in S. Calif.

glaucophýlla. To 2 ft. or more, glaucous: lvs. 3-lobed with middle lobe much larger than lateral ones, to 2 1/4 in. long, broadly toothed. fls. 3/4 in. long, in panicles. Chile.

CRISTATE: crested.

CRÍTHMUM. Umbelliferæ. One species, native on seashores of Eu., is sparingly grown as a salad plant or for ornament. C. marítimum. Samphire. Per. 1-2 ft.: lvs. 2-3-ternate into linear fleshy glaucous segms. ½ in. long: fls. very small, white or yellowish, in compound umbels: fr. ovoid, ¼ in. long.—Does best in sandy or gravelly soil. Propagated by seed sown as soon as ripe, and by division of roots.

CROCÁNTHEMUM. Cistacex. About 25 species of shrubs or low suffrutescent herbs of the New World, confined mostly to N. and Cent. Amer. and by many authors formerly united with the Old World genus Helianthemum from which it differs in the fls. having short straight styles, and from the related genus Halimium in lvs. alternate and in the production of cleistogamous fls. For cult. see Helianthemum.

canadense (Helianthemum canadense). Per. with rarely branched erect sts. to 20 in.: lvs. elliptic-lanceolate, to 1 in. long, densely pubescent beneath, margins revolute: fis. yellow, to 1 in. across, solitary. E. N. Amer.

rosmarinifolium (Helianthemum rosmarinifolium). To 2 ft.: lvs. linear, to 1 in. long, white-tomentose below: fis. of two kinds, with and without petals, the former ½ in. across. S. C. to Fla. and Tex.

scoparium (Helianthemum scoparium). Rush-Rose. Tufted subshrub to 1½ ft.: lvs. narrow-linear, to 1½ in. long, soon falling: fls. yellow, ½ in. across. Calif. Var. vulgare, sts. rush-like.

CROCÍDIUM. Compositæ. One small ann. native B. C. to Ida. and Calif., of the Arnica relationship. C. multicatle. To 6 in: lvs. in basal tuft, obovate or spatulate, to ½ in. long, woolly when young: heads solitary, goldenyellow, rays ½ in. long; pappus of bristles.

CROCÓSMIA. Iridacex. One African cormous herb, blooming in autumn, and grown like gladiolus. In the N, the corms should be set out after frost and stored over winter in peat or sphagnum. Propagated by offsets or seeds. C. aurea. Coppertip. To 4 ft., the sts. branching and with few lvs.: fls. bright orange-yellow, to 2 in. long, in panicled spikes. See Tritonia.

Iridaceæ. Spring- and autumn-CRÒCUS. blooming cormous herbs with no evident st., basal grass-like lvs. and white, yellow or lilac fls., the expanded segms. raised above ground by the long slender perianth-tube.

Crocuses should be planted 3-4 inches deep in good well-drained soil. As new corms form on top of the old ones and so push the plants out of the soil, it is well to replant every few years. Propagated by offsets and seeds, the latter blooming in about three years. They are of simple culture and popular; most of them are hardy, but a winter mulch is desirable.

aèrius. Fls. lilac, segms. to 1 in. long, throat yellow, in winter. S. E. Eu.

Altchisonii: C. speciosus var.

astùricus. Fls. hlac, segms. 11/2 in. long, in autumn. Spain.

aureus: C. masicus.

Balánsæ. Fls. orange-yellow, segms. to 11/4 in. long, outer tinged brown on back, in spring. Smyrna.

biflorus. Fls. tinged with purple, segms. 1½ in. long, the outer with 3 stripes of purple, throat tinged yellow, in spring. Italy to S. W. Asia. Var. Adamii, fls. pale purple, outer segms. sometimes striped. Var. argénteus is more robust and fls. deeper purple. Var. pusillus is a smallerfld. form and var. Wéldenii has uniform slaty-purple segms.

Bòryi. Fls. white or tinged lilac, segms. to 1½ in. long, throat yellow, in autumn. Greece. Var. marathoníseus has less divided style-branches. Var. Tournefórtii has

byzantinus (C. iridiflorus). Fls. purple, segms. to 2 in. long, the inner ones blac or white, in autumn. S. E. Eu.

Cambessédesii. Fls hlac to white, segms. to 1 in. long, outer buff lined with purple, in autumn. Majorca, Minorca.

cancellatus. Fls. white or hlac, segms. to 134 in. long, throat yellow, in autumn Asia Minor. Var. albus, fls. white. Var. cilicicus, fls. hlac veined with purple.

cáspius. Fls. white, segms, to $1\,\%$ in, long, throat yellow, in autumn. Near Caspian Sea.

chrysanthus. Fls. orange-yellow, segms. to 114 in. long, winter. Asia Minor. Var. fúsco-tínctus, fis. tinged in winter. brown outside.

etrúscus. Fls. lilae or cream-colored, segms. to $1\frac{1}{2}$ inlong, throat yellow, in winter. Italy.

Fleischeri. Fls. white striped hlac, segms. to 11/4 in. loug, throat yellow, in winter. Asia Minor.

hadriáticus. Fls. pure white, segms. 1½ in. long, throat white or purple, bearded, in autumn. Greece. Var. chrysobelénicus has yellow throat. Var. Wilhelmii has purple markings.

hyemalis. Fls. white striped with purple, segms. 11/2 in. long, throat yellow, in spring. Palestine.

Imperati. Fls. hlac or white with 3 dark purple stripes on outside, segms. 114 in. long, in very early spring. Italy. Var. albus has white fis.

iridifldrus: C. byzantinus.

Karduchòrum. Fls. lilac, segms. to $1\frac{1}{4}$ in. long, in autumn. S. W. Asia.

Korolkòwii. Fls. orange-yellow, segms. 1 in. long, in spring. S. E. Eu.

lævigàtus. Fls. white, segms. 1 in. long and outer striped lilac, in autumn. Greece. Var. Fontenàyl is tinted buff and later blooming.

longiflorus: Fls. bright lilac, segms. 1½ in. long, throat yellow, slightly bearded, in autumn. S. Eu. Var. meliténsis, fls. veined yellow at base.

marathoniseus: C. Boryi var.

mèdius. Fls. bright lilac, segms. to 2 in. long, throat whitish, in autumn. S. France, Italy.

minimus. Fls. violet, segms. to 1 in. long, outer buff lined with purple outside, in spring. Corsica, Sardinia.

mæsicus (C. aureus). Fls. bright yellow, segms. 1½ in. long, in spring. S. E. Eu., Asia Minor.

nudiflorus. Fls. lilac, segms. to 2 in. long. S. W. Eu.

obovatus: a form of C. vernus.

ochroleucus. Fls. pale cream tinged with orange, segms. 11% in. long, throat orange, slightly bearded, in autumn. Asia Minor.

Olivieri. Fls. orange-yellow, segms. to 11/2 in. long, in spring. Greece to Asia Minor.

pulchéllus. Fls. bright hlac, indistinctly striped, segms 13% in. long, throat bright yellow, in autumn. Greece to Asia Minor.

purpureus: C. Sicberi var.

Sálzmannii. Fls. lilac, segms. to 2 in. long, throat yelowish, bearded, in autumn. Morocco. Var. erectophfilus, fls, clear purple-lilac.

sativus. Saffraon C. Fls. hlac or white, segms, to 2 in. sativus. Safricon C. Fis. mac or white, segms, to 2 m. long, throat bearded, in autumn. Asia Minor. Var. Pállasii has a yellow throat. Var. Cartwrightiànus is striped. Var. Elwesii has hlac fis. somewhat veined with purple, stamens longer than scarlet pistil and perianth-segms, wide.

Sièberi. Fls. lilac, segms. 134 in. long, thront yellow, spring. Greece, Crete. Var. purpureus has darker in spring. purple fls.

speciòsus. Fls. lilac tinged with purple, segms. 2 in. long, in autumn. S. E. Eu, Asia. Var. Aitchisonii is larger and has pale bluish-hlac fls. Var. Albus has white fls. Var. globòsus has dark blue fls.

stellaris. Lvs. banded with white: fls. bright orange striped with brown on back, segms. to 1½ m. long, in spring. Hybrid.

susiànus. Cloth-of-Gold C. Fls. bright orange-yellow tinged with brown outside, segms. 1½ m. long, in spring.

Taùri. Fls. pale purple, to 114 in. long, throat yellow, in spring. Asia Minor.

Tomasinianus. Fls. pale reddish-blue, sometimes with dark spot at tip, segms. 1½ in. long, in spring. Dalmatia, Serbia.—Like C. vernus, but throat not bearded.

Tournefortii: C. Borni var.

vérnus. Fls. lilac or white often striped with purple, segms. 1½ in. long, throat bearded, in spring. Eu. Var. álbus, fls. white.

versicolor. Fls. purple sometimes striped with darker purple, segms, 1½ in. long, throat whitish or yellowish, in spring. S. France. Var. picturatus is listed as white outside with purple feathering

vitellinus. Fls. orange-yellow, segms. to 1 in. long and outer tinged brown, in winter. Asia Minor. Var. graveolens has outer segms. tinged black.

zonatus. Fls. rose-lilac veined with purple and spotted inside with orange, segms. 2 in. long, throat yellow, bearded, in autumn. Cilicia.

CROCUS, AUTUMN: Colchicum.

CROSNES DU JAPAN: Stachys Sieboldvi.

CROSSÁNDRA. A can thace x.Herbs and shrubs with opposite or whorled lvs. and white, yellow or red tubular fls. with split limb, borne in dense bracted spikes; native in tropics of Old World. Grown under glass or out-of-doors in warm countries and the tropics. Propagated by cuttings over heat.

infundibuliformis (C. undulwfolia). Shrub to 3 ft.: lvs. ovate to lanceolate, to 5 in. long, somewhat wavy-margined: fls scarlet-orange, ¾ in. long and 1 in. across, in an angled mile. Ludwin spike. India

undulæfdlia: C. infundibuliformis.

CROSS-VINE: Bignonia capreolata.

CROSSWORT: Crucianella.

CROTALÀRIA. RATTLE-Box. Leguminosæ. A very large genus of herbs and shrubs mostly native in trop. regions, a few grown as cover- or green-manure crops in the S. and sometimes for ornament under glass: lvs. simple or pinnate: fls. papilionaceous, usually in racemes: pods inflated. Propagated by seeds which should first be soaked in warm water, and the shrubby species by cuttings under glass.

agatiflora. Shrub to 3 ft.: lvs. of 3 ovate lits. to 2¾ in. long: fls. greensh-yellow with tip of keel brownish-purple, standard 1½ in. long, in terminal racemes to 14 in. long. E. Afr.

anagyroides. Shrub to 8 ft.: lvs. of 3 ovate or lanceolate lfts.: ffs. yellow with darker lines, ¾ in. across: pods 1½ in. long. Trinidad, Venezuela.

argyræa. Shrub to 6 ft.: lvs. with lfts. to 1½ in. long, oblanceolate, fleshy, glaucous: fis. bright yellow, in lax elongated lateral racemes: pods ½ in. long, oblong. Trop.

cándicans. Shrub covered with silky brown hairs: lvs. ovate-oblong, acute: fls. yellow, 1 in. and more long: pods to 11/4 in. long. India.

capénsis. Shrub to 5 ft.: lvs. of 3 obovate obtuse lfts.: fls bright yellow, I in. and more long. S. Afr.

júncea. Sunn Hemp. Shrub to 8 ft., branches slender, silky: lvs. simple, to 3 in long, linear to oblong, brown-villous on each side: fis. bright yellow, in 12-20-fid racemes to 1 ft. long; pods to 1½ in. long, stellate-pubescent. India.

laburnifòlia. Low shrub: lvs of 3 obovate-oblong acute Ifts.: fls. bright yellow, 1 in. long: pods to 2 in. long. Trop. Asia.

lanceolata. Herb to 3 ft : lvs. of 3-5 narrow-lanceolate acute lits.: fis yellow veined with purple, 1/4 in. long: pods 1 m. or more long. S. Afr.

mucronata (C. striata). Woody per. to 8 ft: lvs. of 3 elliptical obtuse lfts: fls. yellow striped with brown, ½ m. long: pods 1½ in long. Tropics—Much planted in Fla. for green-manuring.

retusa. Ann. to 3 ft., pubescent: lvs. oblanceolate, obtuse: fls. yellow with variegated standard, to 1 in. long: pods to 1½ in. long. Asia; nat. in trop. Amer.

Rétzii: C spectabilis. sericea: C. spectabilis.

specifical: C. specialnus, specifibilis (C. Retru. C. sericea). Subshrub to 4 ft., branches stout: lvs. entire, oblanceolate, to 6 in. long, base cuneate, glabrous above, villous beneath: fts purplish, in 20-40-fild. racemes to 1 ft. long, usually terminal: pods stalked, to 2 in. long. India.

striata. C. mucronata

CROTON: Codiarum.

CROWBERRY: Empetrum. Broom: Corema Conradii. CROWFOOT: Ranunculus.

CROWN: coronn; also, as a common-language word, that part of the stem at the surface of the ground; also a part of a rhizome with a large bud, suitable for use in propagation; sometimes used for head of top of a tree.

CROWN IMPERIAL: Fritillaria imperialis.

CROWN-OF-THORNS: Euphorbia splendens.

CRUCIANÉLLA. Crosswort. Rubiaceæ. Ann. and per. herbs from the Medit. region and W. Asia, with opposite or whorled lvs. and small tubular 4-5-lobed fls. having bracts at base; grown in rock-gardens where they thrive in partial shade. Propagated by division and by seeds.

angustifòlia. Ann. to 1½ ft: lvs. all linear-subulate, in whorls of 4-6, margins recurved, very scabrous: fls. white. minute. Cent. Eu. and Medit. region.

Ann. to 1 ft. or more: lvs. ovate-oblong or upper linear; fls in dense linear spikes to 2 m. long Egypt.

latifòlia. Ann. to 1½ ft.: lower lvs. obovate to oblong, upper lvs. linear-lanceolate: fls. whitish, in slender linear spikes. Medit. region.

stylosa. Prostrate ann. with sts. to 9 in.; lvs. lanceolate: fls. deeprose, in globose heads $\frac{1}{2}$ in. across, the styles long-exerted. Persia. Var. carminea is listed as a color form.

CRUCÍFERÆ. MUSTARD FAMILY. A large natural assemblage of herbaccous plants, a few of them subshrubs, probably upwards of 1800 species, distributed mostly in temp. and cold regions. They are of various habit, but agree in general in the 4-sepalled and 4-petalled fls. and stamens commonly 6 of which 2 are shorter than the others, and in the characteristic dry pod (silique when elongated, silicle when short and broad): lvs. prevailingly alternate, entire, dissected or essentially compound: fls. white, yellow, orange, lilae, purple, mostly not large but abundant. The family abounds in peppery and piquant qualities. It yields useful plants to the flower-garden and the vegetablegarden, and many of the species are cosmopolitan weeds. Genera entered in this book are Æthionema, Alyssum, Anastatica, Arabidopsis, Arabis, Armoracia, Aubrieta, Barbarea, Berteroa, Bis-

cutella, Brassica, Bunias, Cardamine, Caulanthus, Cheiranthus, Cochlearia, Coronopus, Cossonia, Crambe, Dentaria, Diplotaxis, Draba, Eruca, Erysimum, Farsetia, Goldbachia, Heliophila, Hesperis, Hutchinisia, Iberis, Ionopsidium, Isatis, Kernera, Lepidium, Lesquerella, Lobularia, Lunaria, Malcomia, Mathiola, Moricanda, Morisia, Nasturtium, Notothlaspi, Parrya, Peltaria, Petrocallis, Physaria, Raphanus, Ricotia, Schivereckia, Schizopetalon, Smelowskia, Stanleya, Stenodraba, Thelypodium, Thlaspi, Vesicaria.

CRUNOCALLIS: Montia Chamissoi.

CRUPINA. Compositæ. Ann. herbs with pinnately cut lvs. and long-stalked few-fld. purple heads of ray- and disk-fls.; pappus of bristles and scales; native from S. Eu. to W. Asia. Sometimes grown in flower-gardens.

vulgàris (Centaurea Crupina). To 2 ft.: lvs. cut into fine linear segms.: heads 3-5-fd., the fls. scarcely longer than the pale acuminate bracts of involucre. S. Eu.

One of the CRÝÓPHYTUM. Aizoaceæ. genera separated from the old genus Mesembryanthemum: ann. and bien., often prostrate: lvs. opposite or scattered or sometimes alternate at base of plant: fls. solitary, white, yellow, or red, the petals many and very narrow; stigmas usually 5. Several species, in S. Afr., Medit. region, S. W. Asia, Calif., one of them commonly grown. For cult, see Mesembryanthemum.

Aitonis (M. Artonis, M. angulatum, M. lanceolatum), Decumbent: lvs. lanceolate, flat, somewhat obtuse, the peduncles and calyx with shining watery pustules: fls. white. S. Afr.

crystállinum (M crustallinum) ICE-PLANT. crystállinum (M. crystallinum). Ice-Plant. Ann., readily grown from seeds in warm sunny exposure, fleshy, sts spreading and prostrate, plant covered with glistening watery pustules: early Ivs. broad-ovate, to 6 m long and 3 in. or more broad, eventually perishing: Ivs on flowering shoots much smaller: fls. small, whitish to rose S. Afr., Medit. region, coasts of S. and Lower Calif.—Grown in window-gardens and elsewhere for the glistening herbage, and sometimes weathers. and sometimes used as a pot-herb.

nodiflorum (M. nodiflorum). Ann., somewhat crystal-line: lvs. linear, nearly cylindric, to 1 in. long: fis. very small, white, axillary. S. Afr., Medit. region, S. W. Asia,

CRÝOSÓPHILA. Palmacex. Four species in Mex. and Cent. Amer., as at present understood, with which Acanthorrhiza is now combined: small or medium fan-lyd. palms with rootspines closely covering the trunk: fls. hermaphrodite: fr. small, globular to oblong, drupe-like. Probably none of the species is regularly planted in our area, but the following, from S. Mex., may be in lists under its various names: C. nana (Corypha nana, Copernicia nana, Chamærops Mocinii, Acanthorrhiza Mocinii and A. aculeata).

CRYPTÁNTHA. CRYPTANTHA. Boraginacex. Ann. hispid herbs mostly in W. N. Amer., with alter-Boraginaceæ. nate, simple and entire lvs. and inconspicuous white fls. in coiled spikes or racemes, the throat of corolla commonly closed by scales; rarely sown in the wild-garden in the regions where they grow.

barbigera (Eritrichium barbigerum, Krynitzkia barbigera). To 1 ft., covered with long whitish stiff hairs: lvs. broadly linear, to 1½ in long; ffs. ½ in. long, calyxlobes to ½ in. long. Utah to Calif.—The plant cult. as C. barbigera may be C. intermedia.

intermèdia. To 1 ft., covered with spreading white hairs: lvs. lanceolate or linear, to 1 in. long: fls. 1/4 in. across, calyx-lobes 1/2 in. long. S. Calif.

CRYPTÁNTHUS. Epiphytic Bromeliacex.stoloniferous S. American herbs with flattened rosettes of stiff prickly-margined lvs. and white fls. borne in a little head amongst the foliage; grown as foliage plants under glass. Cult. as for *Bromeliacex*.

acaùlis (C. undulatus. Tillandsia acaulis). Lvs. to 6 in. long and 1½ in. wide, with wavy prickly margins, in shades of green, white-scuriy beneath; small foliage plant in many vars. Brazil. Var. bromelioïdes has a tall st. with elongated somewhat spinulose remotely undulate lvs.; var. diversifòlius has medium st, with strap-shaped lvs. deep green above and scurfy beneath; var. genuinus is nearly stemless with lvs. strongly undulate, elliptic-lanceolate; var. rôseus has lvs. tinged rose-pink; var. rûber has a branching st. with lvs. short, rededink and undulate.

Beúckeri. Lvs. to 5 in. long and 2 in. wide, narrowed to a petiole about 2 in. long, brownish-green or rosy spotted or striped with light green. Brazil.

bivittatus. Stemless or nearly so: lvs. strongly acuminate, arching, spiny, green above, brown beneath, with 2 reddish-brown longitudinal stripes above: fls. white. S. Amer.

ròseus: probably C. acaulis var.

terminalis: hsted name.

undulatus: C. acaulis.

zonatus. Lvs. to 9 in. long and 1½ in. wide, crinkly, with transverse bands of white, green or brown above, and white-scurfy beneath. Brazil. Var. zebrinus is listed.

CRYPTOCÀRYA (Bellota). Lauraceæ. Trees and shrubs mostly of the southern hemisphere, with leathery lvs. and small bisexual fls. in panieles, and small dry fr. inclosed in the calyx; sometimes planted in S. Calif.

Miesii. Tree to 50 ft.: lvs. opposite, oblong or oblongovate, entire, thin, glabrous, shining above, veins prominent beneath. Chile.

Peúmus: C. rubra.

rúbra (C. Peumus). Tree 50-60 ft.: lvs. nearly opposite or alternate, ovate, thick, glabrous, glaucous beneath. Chile.

CRYPTOCORÝNE. Aracex. Aquatic Asian herbs with creeping and monoccious fls. without perianth, the staminate on upper part of spadix and pistillate on lower portion, inclosed by spathe; rarely grown in aquaria.

Willisii. Lvs to 6 in long and 1 in. wide, wavy-margined, when young reddish-brown marked with greenish-black.

CRYPTOGRÁMMA. ROCK-BRAKE. Polypodiacex. Small alpine and boreal ferns of both hemispheres, the fronds of two types, both compound, the segms. of the fertile ones podlike due to the folding back of the edges over the fruit-dots; sometimes in rock-gardening and similar undertakings. See Ferns.

acrosticholdes: C. crispa var.

crispa var. acrostichoides. American Parsley-Fern. Fronds clustered, many, on straw-colored stalks to 6 in. long, 2-3-pinnate, fertile with linear segms. Lake Huron and Lake Superior northward, southward in western mts.

dénsa: Pellwa densa.

Stélleri (Pellica graculis). SLENDER R. Differs from C. crispa var. acrostichoides in the creeping rootstocks, scattered foliage and fertile fronds with broader segms. N. N. Amer. and Asia.

CRYPTÓLEPIS. Asclepiadaceæ. Twining or erect shrubs in warm parts of Old World, one sometimes planted in Calif.: lvs. opposite: fls. in terminal or axillary umbel-like cymes or sometimes practically solitary; corolla tubular, with spreading limb, crown of 5 fleshy lobes: follicles smooth, mostly terete and spreading.

longifiora. Erect, 3 ft.: lvs. willow-like, long-pointed, to 5 in. long, clustered toward top of st, often tinted red: fls. white, among the folinge or just above it, very slender, 1 in. or more long. Nativity in doubt.

CRYPTOMÈRIA. Taxodiacex. One Japanese evergreen tree of pyramidal habit, magnificent when mature and particularly when in avenues, the trunks and root-flanges being distinctive.

japónica. To 125 ft. or more: lvs. to 1 in. long, keeled on both sides, blush-green: staminate fis. yellow, in short racemes: cones globose, to 1 in. across, having thick wedgeshaped scales with pointed processes at apex. Hardy at Washington and somewhat northward, in S New England the foliage usually browning in winter but may recover following season; grown mostly in warner climates. Some of the hort. vars. are: araucarioides, branchlets drooping, lvs. small, bright green; compácta, of compact habit; cristâta (var. monstrosa), branches coxcomb-like; dacrydioides, lvs. brownish, closely set; élégans, low tree with drooping branchlets and longer lvs.; Lóbbii, compact form with lighter green lvs.; nâna, dwarf, spreading or procumbent form; púngens, compact form with stiff sharppointed dark green lvs.; spirâlis, shrub with lvs. twisted spirally. Var. Vilmoriniana is listed. Var. Wóhlertii is listed and is probably a form of var. compacta. A form from China is var. sinénsis, a tree of looser habit and longer lvs. For cult. see Conjers.

CRYPTOSTÈGIA. RUBBER-VINE. Asclepia-daceæ. Three woody vines from trop. Afr. and Madagascar, with opposite large lvs. and large funnel-shaped fis. in terminal clusters, the calyx with many glands at base; follicles winged or angled; jujec furnishes caoutchouc.

They are grown under glass in loamy soil, and in the open in warm countries as southern Florida. Propagated by cuttings over bottom heat.

grandiflora. Lvs. oblong, to 4 in. long, thick and glossy: fls. purplish, about 2 in. across. Afr.; cult. in India.

madagascariénsis. Differs in its lvs. being pubescent below and the corolla-segms, of the pink or whitish fis. divided. Madagascar.

CRYPTOSTÉMMA. Compositæ. Tomentose herbs with toothed or pinnatifid lvs. and solitary fl.-heads, the ray-fls. yellow and disk darker; pappus scale-like. They may be grown in the flower-garden.

calendulàceum (Arctotis calendulacca). Ann. to 2 ft. or sometimes prostrate: lvs. pinnatifid: fl-heads 1 in. or more across. S. Afr., Australia.

CTENANTHE. Marantaceæ. Brazilian per. herbs with basal and st.-lvs. and fls. borne under bracts in terminal spikes or racemes; greenhouse foliage plants requiring the same treatment as Calathea, and differing in technical botanical characters.

Kummeriana. To 11/4 ft, stoloniferous; lvs. 6 in. long and 21/2 in. wide, green veined with white above, purple beneath.

Lubbersiàna (Phrynium Lubbersii). To 2 ft.: lvs. to 9 in long and 2½ in wide, green variegated with yellow above, pale green beneath.

Oppenheimiana (Calathea Oppenheimiana). To 3 ft.; lvs. to 1½ ft. long and 5 in. wide, light green above, purple beneath. Var. tricolor has lvs. variegated purplish-red and yellow.

set5sa (Phrynium setosum). To 3 ft., stoloniferous: lvs. to 1½ ft. long and 4 in. wide, green.

CUBEB: Piper Cubeba.

CUCKOO-FLOWER: Cardamine pratensis, Lychnis Flos-cuculi.

CUCKOO-PINT: Arum maculatum.

CUCUMBER (Cucumis sativus). Fruit of an annual tendril-bearing vine, used for pickles in the young state or when small and also extensively eaten raw as a salad and in some countries from the hand without dressing. The cucumber is characteristically a warmweather plant, being frost-tender and making rapid growth. An early crop requires a warm quick soil, with readily available fertility. The only particular difficulty in its culture out-of-doors is to control certain diseases and insects, and for the treatment of them the grower should have the latest issues of books and bulletins devoted to the subject. The striped beetle, which is most damaging when the plants are young, may be kept away in the home garden

by covering the hills tightly at first with mosquito-netting; in fields the plants may be sprayed or dusted with arsenical or nicotine preparations. Some of the commoner diseases may be checked

with bordeaux mixture.

Cucumbers are grown directly from seeds, and commonly planted in the field as soon as the weather is warm and reliable. They do not transplant well unless turned out of pots, berry-boxes, or started on inverted sods. Four or five plants are usually left at each stand or hill after the ravages of early pests are past; the hills are about 4 x 4 feet apart for early kinds and 4 x 6 feet for the later longer-running varieties. In commercial plantings it is more common to sow the seeds in drills and to thin to single plants 1½-2 feet apart after they have become well established. One ounce of seed plants fifty or more hills. Well-rotted manure may be worked into the hills if the garden soil is not fertile or well prepared. One hundred or more bushels of pickling cucumbers should be produced on an acre. The vines should be picked over frequently to prolong the bearing life.

The White Spine group of varieties is the main reliance for both field and garden work, but there are special small pickling kinds and also early varieties. The small pickling cucumbers are sometimes called gherkins; the West Indian or bur cucumber is another species. Cucumis Anguria, which is more grown in the United States for ornament than for pickles.

Horned cucumber is C. metuliferus.

The growing of cucumbers under glass, or so-called forcing, is of two very distinct types,
—the growing of a commercial crop of the ordinary or White Spine type and mostly following a winter crop of lettuce or other stock. and the raising of the long nearly or quite spineless English frame or forcing cucumber as a regular winter crop and usually for home use. The former or commercial practice usually produces the crop in spring and early summer. The plants are started in pots about a fortnight before the house is to be ready for them; they are then transplanted to the beds, and in six to eight weeks thereafter the plants should be bearing. They are set in rows about 3 feet apart, bearing. They are set in rows about 3 feet apart, and 18-24 inches in the row. The vines are trained to cords or wires, so that the fruit hangs. Good soil and plenty of water are required. good plant yields 100 or more cucumbers, if it is stocky and kept free of pests and diseases.

English frame cucumbers, as Telegraph, Sion House, Jasper Queen and others, may be grown for winter crop being started in autumn 80-100 days before fruit is wanted, or for spring and summer crop in frames and started in February or March. It is commonly necessary to hand-pollinate in winter when bees are not

available.

CUCUMBER, BUR-: Sieyos angulatus. Mock-: Echino-cystis lobuta. -Root, Indian: Medeola virginiana. Squirting-: Ecballium Elaterium. Star-: Sicyos angulatus. -Tree: Magnolia acuminata and macrophylla. Wild-: Echinocystis

CUCUMIS. Cucurbitaceæ. Herbs of Afr. and S. Asia, ann. tender running species of which several are grown with us for the edible or interesting frs.: mainly monœcious: lvs. angled, lobed or divided: tendrils simple: fls. yellow or whitish, of good size, solitary in the axils or somewhat clustered.

Anghria (C. grossulariæformis. C. erinaceus). West India or Bur Gherkin. Sts. slender, angled, rough: lvs. to 3½ in. long, with 3 main rounded lobes and open sinuses: fr. ovoid or oblong, about 2 in. long, prickly, on long sts. Fla. and Tex., far S.—Frs. curious and used for pickles; the gherkins of mixed pickles are cucumbers; sometimes called "gooseberry gourd."

Chito: C. Melo var.

Cónomon: C. Melo var

dipaceus. Hedgehog or Teasel Gourd. Slender, sts. prickly: lvs. broad-ovate to reniform-ovate, not lobed: fr. a hard bristly bur 1-2 in. long. Arabia.—Grown for curiosity and ornament.

Dudàim: C. Melo var. erinàceus: C. Anguria. flexuòsus: C. Melo var. grossulariæfórmis: C. Anguria.

grossulariæfórmis: C. Anguria.

Mèlo. Melon (which see), Muskmelon. Sts. trailing, soft-hairy: lvs. round-ovate to nearly reniform, obtuse, angled but not lobed as a rule: fls. about 1 in. across: fr. globular to oblong, pubescent or becoming glabrous, in many sizes, usually musky-flavored. Probably S. Asian, now widely cult. in many forms in N. Amer, mostly under the erroneous name "cantalupe" which is properly applied to a race (var. cantalupénsis) with hard and scaly or warty rinds and seldom grown with us. Var. Chito, Manso Melon, lvs. mostly smaller, fr. size and shape of lemon or orange and sometimes called "orange melon" and "lemon-cucumber," flesh white and firm and not fragrant, employed in the making of preserves and pickles, but grown mostly as an ornamental. Var. Cónomon, Oriental Pickling Melon, lvs. tending to be oblong and somewhat lobed on sides, fls. large, fr. globular to oblong-cylindric to club-shaped and sometimes constincted midway, turbanshaped, flesh white or green and not fragrant, used in preserving; little grown by Americans. Var. Dudàim (C. odoratissimus), Dudaim Melon, plant small, fr. size of orange and more or less flattened endwise, marbled, highly perfumed and for this purpose sometimes grown. Var. Havudsus. Snake or Serpent Melon, fr. 1½-3 ft. or more orange and more or less flattened endwise, marbled, highly perfumed and for this purpose sometimes grown. Var. flexuosus, Snake or Serpent Melon, fr. 1½-3 ft. or more long and 3 in. or less thick, mostly crooked or colled; grown as a curiosity and perhaps used in preserves. Var. inodorus, Winter or Cassaba Melon, very strong vine, lvs. large and sometimes prominently lobed, fls. large, fr. large and only mildly scented, keeping late. Var. agrestis is a small-fluited less run wild in S. La and Tex. only mildly scented, keeping late. Var. fruited race run wild in S. La. and Tex.

metuliferus. Horned Cucumber. Ann. with hispidhairy sts.: lvs. broadly cordate-ovate, more or less 3-lobed, toothed: fls. much like those of C. Melo frs. 3-5 in. long, oblong, spiny, red when ripe. Trop. and S. Afr.

odoratíssimus: C. Melo var. Dudaim.

prophetarum. Grayish vine, hairy-seabrid: lvs. small, reniform to 3-5-palmately lobed, cordate, margins either entire or toothed: fr. broad-ovoid, 1½ in. or less long, green with paler stripes, bearing slender spines. Trop. Afr.—Plant cult. under this name may be a small-fruited form of C. Melo.

sativus. Cucumber (which see). Rough-hairy trailing vine: lvs. trangular-ovate, pointed, often somewhat 3-lobed; fls. 1½ in or less across, short-stalked; fr globular to oblong to short-cylindric, prickly. S. Asia.—Cult. in many kinds for eating raw and for puckles; some of the small kinds are known as "gherkins" (see C. Anguria). Var. anglicus, English Forcing Cucumber, very strong Var. anglicus, English Forcing Cucumber, very strong grower, lvs. very large, fr. to 2 and 3 ft. long and nearly or quite spineless.

CUCÚRBITA. Cucurbitacex. Monœcious tendriliferous herbaceous plants, running and commonly rooting except in certain "bush" cultural vars., grown mostly for the great edible frs. but some of them for ornament and curiosity, with per. or ann. roots: lvs. large, simple but variously angled or lobed: fls. large, yellow, solitary or the staminate perhaps fascicled: eastern and western hemisphere. The origin of pumpkins and squashes is yet undetermined. There is a native gourd in Tex., C. texana, that may have some relation to prehistoric stocks; there is another C. okeechobeensis, in the Everglades of Florida but it is not closely related to the cult. kinds. See Gourd and Pumpkin.

argyrospérma: see under C. ficifolia.

ficifòlia (C. melanosperma). Malabar Gourd. Long-running, per in warm countries: lvs. orbicular-ovate to nearly reniform, lobed and with obtuse sinuèes or merely sinuate: corolla-lobes large and spreading: fr. oblong to

nearly spherical, to 12 in. long, green with white stripes, flesh white; seeds black or nearly so. E. Asia.—Grown for ornament. C. argyrospérma is allied to this species and perhaps an offshoot from it, with very large white strongly

perimps at one of the transport of the strongly bordered seeds, lighter colored fr., less lobed Ivs. foetidissima (C. perennis). Calabazilla. Per., long-running: Ivs. cordate-triangular, stiff, grayish, crenate: fis. large: fr. size and shape of orange, green and yellow,

not edible. Neb. to Calif. and Mex.

máxima. Autumn and Winter Squash. Ann. vine, only slightly prickly: lvs. orbicular or reniform, very obtuse, mostly not lobed: corolla-lobes soft and spreading or droopmostly not lobed: corolla-lobes soit and spreading or drooping and mostly obtuse: fr. spherical to oblong or turbanshaped, often very large, its st. spongy and not ridged nor prominently enlarged at apex. Nativity unknown.—Here belong Hubbard, Boston Marrow, Mammoth Chile, and similar squashes. Var. turbaniformis comprises the turban squashes, a "squash-within-a-squash."

melanospérma: C. ficifolia.

squashes, a "squash-within-a-squash."

melanospérma: C. ficiolia.

Melopèpo: C. Pepo var.

moschàta. Cushaw, Canada and Winter Crookneck Pumpkins. Ann. vine, rather soft-hairy: lvs. broadovate to nearly orbicular-ovate, for the most part not
lobed, often with whitish marks: corolla with wide spreading crinkly mostly acute lobes and often very large, calyxlobes often leafy: fr. of many shapes, commonly oblong or
big-crookneck, autumn and winter, its st. angled and much
expanded at top. Nativity unknown.—Includes Sweet
Potato, Quaker Pie, Japanese Pie pumpkins (or squashes).

ovífera: C. Pepo var.

Pèpo. Summer and Autumn Pumpkins. Harsh ann.
with prickly sts. and petioles: lvs. triangular or ovatetangular, often prominently lobed: corolla-lobes erectand sharp-pointed: fr. of many kinds, usually orange,
furrowed, mostly not long-keeping, its st. strongly angled
and enlarging upward. Nativity unknown.—Here are
found the common field pumpkins, Vegetable Marrow, and
others. Var. Melopèpo (C. Melopepo. C. Pepo var. condensa). Bush Pumpkins or Squashes. Mostly summer
kinds, not running, including Pattypan, Scallop, Summer
Crookneck, Cocozelle. Var. ovífera. Yellow-Flowereb
Gourds (as distinguished from the white-fid or Lagenarias).
Running vines, producing many forms and colors of small
hard-shelled ornamental durable frs.; wild in Tex. and Mex.
perénnis: C. fatidissima. perénnis: C. fætidissima.

CUCURBITÀCEÆ. GOURD FAMILY. CUCUR-BITS. Important hort. family including plants grown for edible frs. and as ornamental vines, as pumpkins, squashes, gourds, melons, water-melon, cucumbers and gherkins, chayote. The family includes some 90 genera and probably 700 species, mostly of trop. or subtrop. regions. The family comprises herbs and erect shrubs; but the hort, kinds are herbaceous and most of them tender annuals and all but one (Ecballium) are naturally running tendril-bearing vines. The plants of the Cucurbitaceæ are monœcious or diœcious: lvs. alternate, palmately veined, lobed or dissected: fls. prevailingly yellow or greenish, gamopetalous or the petals 5, the corolla sometimes large and showy but of short duration; stamens mostly 3: fr. a pepo, inde-hiscent or irregularly bursting, mostly fleshy in the cult. kinds and often large and edible. The species are of the easiest cult., but the pumpkins, gourds, melons and cucumbers are frost-tender and must make their growth rapidly in the northern parts of the country, requiring a warm quick soil. They come from seeds. The genera of Cucurbitaceæ included in this Hortus are Benincasa, Bryonia, Bryonopsis, Citrullus, Coccinea, Cucumis, Cucurbita, Cyclanthera, Ecballium, Echinocystis, Lagenaria, Luffa, Melothria, Momordica, Sechium, Sicana, Sicyos, Thladiantha, Trichosanthes.

CUDRANIA (Vanieria). Moracex. plants native from China to Australia, having alternate simple lvs., unisexual fls. in axillary heads, and fr. a fleshy syncarp; planted for ornament in the S. and the lvs. fed to silkworms in China. Propagated by cuttings of young wood under glass in summer.

javanénsis. Scrambling spiny shrub: lvs. oblong-obovate or lanceolate, to 3 in. long, fleshy: fr. orange, ¾ in. across. Asia, Australia, Afr.

tricuspidata. To 25 ft. or more, armed with slender thorns: lvs. ovate, to 3 in. long, sometimes 3-lobed at tip: fr. red, nearly globose, 1 in. across. China, Korea, Japan.

CULINARY HERBS are those employed in a secondary way in cookery, as for flavoring and seasoning, and also as garnishes for viands. They do not constitute a single cultural group. Some of the plants falling under this denomination are anise, caraway, chervil, chive, coriander, dill, fennel, parsley, as well as the sweet herbs, which are mostly of the mint family.

CULTIGEN: plant or group of apparent specific rank known only in cultivation, with no determined nativity; presumably originating (in the form in which we know it) under domestication; contrast with indigen. Examples are Zea Mays, Cucurbita maxima, Phaseolus vulgaris, Citrus paradist. Not synonymous with horticultural variety. Term proposed by Bailey in Science, n. s. xlvii, 306, 1918.

CULTIVAR: a variety or race that has originated and persisted under cultivation, not necessarily referable to a botanical species, and which is of botanical or taxonomic importance.

CULVERS-ROOT: Veronicastrum virginicum.

Umbelliferx.CUMINUM. One ann. herb native in the Medit. region, the frs. of which are used as flavoring. C. Cyminum (C. odorum). Cumin. To 6 in.: lvs. cut into thread-like divisions: fls. small, white or rose, in compound umbels: fr. narrowly oblong. Propagated by seeds in spring.

CUNEATE: wedge-shaped; triangular, with the narrow end at point of attachment, as of leaves or petals.

Labiatx.Tufted per. herbs or small shrubs with small opposite lvs. and white or purplish 2-lipped fls. in whorls, the 2 stamens long-exserted; grown in the border and hardy.

mariana: C. origanoides.

origanoides (C. mariana). Maryland Dittany. Stone-Mint. To 1 ft.: lys ovate, to 1½ in long, toothed, nearly sessile: fls. purplish-pink, ½ in. long, in terminal cymose cluster, early autumn. S. N. Y. to Fla. and Tex.

CUNNINGHÁMIA (Belis). CHINA-FIR. Taxodiacex. Two evergreen trees native in E. Asia, allied to Cryptomeria, having stiff sharp-pointed flattened linear-lanceolate lvs. with broad white bands beneath, fls. in terminal clusters, and roundish cones with thick pointed scales. For cult. see Conifers. To be grown only in the lower S. and Calif., although in sheltered places C. lanceolata may persist as far north as Pa.

Konishii. To 100 ft.; lvs. to 1 in. long; cones to 1 in. long. Formosa.

lanceolata (C. sinensis). To 80 ft.: lvs. to 2½ in. long: cones to 2 in. long. China.

sinénsis: C. lanceolata.

CUNONIACEÆ. CUNONIA FAMILY. and shrubs of 21 genera native in the southern hemisphere, having opposite or whorled, entire or pinnate lvs., small bisexual or unisexual fls. with 4-5 sepals and petals, 4 or more stamens, 2-celled superior ovary, and usually capsular frs. Ackama, Callicoma, Ceratopetalum and Weinmannia are occasionally planted in Calif.

CUPANIA. Sapindacex. Trees and shrubs bearing alternate pinnate lvs., small fls. in panicles, and capsular frs.; one species sometimes planted for ornament in warm climates. They are native in trop, and semi-trop, regions, mostly in Amer.

anacardioldes. Tree to 40 ft.: lvs. of 6-10 leathery very obtuse entire lfts. to 4 in. long; fts. white: fr. leathery, 3-lobed, about 34 in across. Australia.

Cunninghamii: Diploglottis Cunninghamii.

sápida: Blighia samda.

CÙPHEA (Parsonsia), Luthracex, American herbs or shrubs with alternate or whorled lvs., irregular mostly axillary fls. that are often showy or in abundance, with corolla-like often gibbous or spurred calyx, the petals 2 or 6 on the calvx-tube or lacking, and capsular fr.

Cucheas are greenhouse subjects, or grown out-of-doors in the South. As glasshouse plants they are mostly treated as tender annuals and are of easy cultivation. Propagated by seeds or the shrubby kinds by cuttungs.

capsularis: listed name.

compácta: C. Llavea var.

cvanea (C. strigulosa). To 6 ft.: lvs. ovate, to 3 in long: fls. with red and yellow calyx and 2 small petals. Mex.

heterophysia. To 2 ft.: lvs. mostly ternate, ovate to oblong-lanceolate, to 4 in. long; fls. with purplish or reddish calyx and 6 red unequal petals, in racemes. Mex.

Hookeriana. To 2½ ft.: Ivs. lanceolate or linear-lanceolate, to 4 in long; fls. with reddish calyx, 2 large deep purple petals and 4 very small petals, in terminal racemes. Mex.

hyssopifòlia. To 2 ft.: lvs linear to lanceolate, about ¼ in. long, crowded: fls. with green calyx and 6 purple, pink or white petals, in axils. Mex. and Guatemala.

ignea: C platycentra.

jorullénsis (C. tricolor). To 3 ft.; lvs. lanceolate to ovate, to 2 in. long; fls. with red and green culyx and small whitish petals, in racenes. Mex.—The plant grown under this name may be C. micropetale.

lanceolata (C. Zimapanii). Sticky ann. to 4 ft.: lvs. lanceolate, to 3 in. long: fls with purplish calvx and 2 lange purple petals and 4 smaller ones, solitary. Mex. Var. silenoides (C. silenoides) is smaller; 2 large petals purple, white-margined.

Lièvea. Shrubby, sts. strigose lvs. ovate, to 3 in. long: fls. with green and purplish calyx and 2 large bright red petals, in racemes. Mex. Var. alba has white fls. Var. compacts is a compact form. Var. minièta (C. miniata), the usual form in cult., has sts. hirsute.

micropétala. To 2 ft.: lvs. lanceolate, to 5 in. long: fls. with vellow and red calyx and 6 small petals, in terminal leafy racemes Mex.

miniàta: C. Llavea var.

petiolàta. Wax-weed. Tarweed Ann. to 216 ft.; lvs.
ovate-lanceolate, to 1/8 in. long: fls. rose-purple, upper
2 petals larger than others. N. H. to Ga., west to Kans. and La.

platycentra (C. ignea). CIGAR-FLOWER To 1 ft.: lvs. lanceolate or broader, to 2½ in. long: fis. with slender bright red calyx with white mouth and dark ring at end, without petals, solitary. Mex.

procumbens. Ann. to 1 ft, sts. procumbent, viscid with purplish hairs: lys. ovate-lanceolate, to 3 in. long: fls. purple tipped with green, upper 2 petals larger. Mex.

purpurea. Reported as a hybrid of C. Llavea var. miniata and C. viscosa.

Roézlii. To 3 ft.: lvs. elliptic-lanceolate, to 3 in. long: fls with cinnabar-red and yellowish calyx and 2 very small petals, in racemes. Mex.

silenoides: C. lanceolata var.

striguldsa: C. cyanea.

tricolor: C. jorullensis.

viscosa. Ann to 1½ ft.: lvs. ovate-lanceolate, to ¾ in. long: fls. with 2 deep purple petals and 4 smaller whitish petals, in sticky-pubescent racemes. Mex.

Zimapánii: C. lanceolata.

CUP-FLOWER: Nierembergia. -Plant: Silphium per-

CUPIDS-DART: Catananche.

CUPRESSÀCEÆ. CYPRESS FAMILY. than a dozen genera of resinous usually evergreen trees and shrubs of wide distribution. This group has been treated until recently as a subfamily of Pinaceæ, but several fundamental differences warrant its recognition as a separate family. It is distinguished from the Pinaceæ and Taxodiaceæ by usually flattened and scalelike lvs. which are opposite or whorled, woody,

leathery or berry-like cones in which the ovules are borne erect and not inverted, and the seedling with usually 2 cotyledons. In Juniperus the fr. is berry-like becoming blue at maturity and the lvs. are often sharply needle-like, while in Fitzrova the lvs. and cone-scales are ternate with appressed scale-like lobes. In most other genera the scale-like lvs. are opposite. family contains several valuable timber trees and many ornamental subjects. The cult. genera include Actinostrobus, Callitris, Cham-æcyparis, Cupressocyparis, Cupressus, Fitzroya, Juniperus, Libocedrus, Tetraclinis and Widdringtonia.

CUPRESSOCÝPARIS. Cupressaceæ. Hybrid between Cupressus and Chamæcyparis, only 1 kind known. C. Léylandii. Hybrid between Cupressus macrocarpa and Chamacyparis nootkatensis, resembling the latter in habit and foliage, but differing in cones to ¾ in. across and usually 5 seeds to each scale. Of hort. origin.

CUPRÉSSUS. Cypress. Cupressacex. Evergreen trees or shrubs with small scale-like lvs. or linear in young plants, minute fls. and globular cones with woody scales; native in N. Amer., Eu. and Asia.; adaptable to mild or warm regions. For cult. see Conifers. These are the true cvpresses, to which Chamæcyparis is closely related. Except C. Macnabiana, the species can be grown satisfactorily only in the lower S. and Calif.

arizônica. Tree to 40 ft. and more: lvs. pale or glaucous-green, acute: cones to 1 in. across, glaucous Ariz., New Mox, Mex; much planted in the S. W. Var bonita (C. glabra) has larger cones and is very glaucous when young. Var. compâcta is a low roundish form. Var. glauca is a juvenile silvery-gray stage

Bénthamii: C. lusitanica var.

califórnica: C. Govennana.

cashmeriana. Tree with drooping branchlets: cones 1/2 in. across. Kashmir.

Duclouxiana. Tree: Ivs. obtuse, somewhat glaucous: cones 1 in. across. China.

excélsa: C. lusitanica var. Benthamii.

Flétcheri: Chamæcuparıs Lawsoniana var.

Fórbesii. Slender tree to 30 ft, back smooth, reddish, exfolating: foliage gray-green: cones to 1½ in. long. S. Calif.—Some of the material listed as C. guadalupensis belongs here.

Fiaseri: Chamæcyparis Lawsoniana var.

funèbris. Mourning C. Tree to 60 ft., with drooping branches and flattened branchlets: lvs. acute, light green: cones to ½ in. across. China.

glàbra: C. arizonica var. bonita.

glaùca: C. lustamca.

Goveniàna (C. californica, C. pygmxa). Shrub or rarely tree to 75 ft.: lvs. acute, dark green: cones to 34 in. across, Calif. Var. aùrea, foliage yellowish-green.

guadalupénsis. Tree to 40 ft. or more, the branchlets bright red: Ivs. acute, light bluish-green: cones to 11/2 in. across. Guadeloupe Isl., Calif. and Lower Calif. Var. glaûca, folnage deeper blue.

horizontàlis: C. sempervirens var.

Knightiàna: C. lustanica var.

Lambertiàna: C. macrocarpa.

Lawsoniana: Chamæcyparis Lawsoniana.

Léylandii: Cupressocyparis Leylandii.

Líndleyi; C. lusitanica,

lusitánica (C. glauca. C. Lindleyi. C. sinensis). Portuguese C. Tree to 50 ft. with somewhat drooping branchlets: lvs. acute, glaucous-green: cones ½ in. across, glaucous. Mex. Var. Bénthamii (C. Benthamii. C. excelsa). Branchlets pinnately and regularly branched in one plane. Var. Knightiana (C. Knightiana) is more regularly branched.

Macnabiana. Shrub or tree to 20 ft.: lvs. obtuse, fragrant, dark green or glaucous: cones 1 in. across. Calif., Ore.; hardy in parts of New England. In var. sulphurea the tips of the branchlets are golden.

macrocárpa (C. Lambertiana). Monteret C. Tree to 40 ft. and more: lvs. obtuse, dark or bright green: cones to 1½ in. across. Calif. Var. adrea is listed. Var. Críppsii is a juvenile form with tips of branchlets silvery-white and spreading sharp-pointed lvs. Var. fastigiata has a compact fastigiate head. Var. lutea has yellow lvs. when young.

nootkatensis: Chamæcuparis nootkatensis.

obtusa: Chamæcuparis obtusa. pisifera: Chamæcyparis pisifera.

pygmæa: C. Goveniana. Röylei: C. sempervirens var. indica.

Asgrenti (C. Goveniana var. Sargentii). Shrub or tree to 16 ft.: lvs. acute, dark green, fragrant: cones to 1 in. across. Calif.

across. Calif.

sempérvirens. ITALIAN C. Tree to 80 ft.: lvs. obtuse, dark green: cones to 1½ in. across. S. Eu., W. Asia. Var. horizontalis (C. horizontalis) has horizontally spreading branches. Var. indica (C. Royle). Columnar form with globose cones. Var. Sikesii is listed as of very narrow habit. Var. strícta (var. pyramidalis and fastigiata) is of columnar habit; var. Worthiana is listed.

sinénsis: C. lusitanica.

thursfera. Perhaps only a variant of C. lusitanica, from which it differs in its non-winged seeds and lvs. not tightly appressed to the branchlets. Mex.

thvoldes: Chamæcuparis thuoides.

torulosa. Bhutan C. Tree to 150 ft., with drooping branchlets: lvs. somewhat acute, bright or bluish-green: cones to ¾ in. across. Himalayas. Var. Corneyâna has drooping branches. Var. majéstica is in the trade.

CURCAS: Jatropha Curcas.

CURCULIGO. Amaryllidaceæ. Stemless plants with short thick rootstocks and long plicate lvs. which conceal the small fls. borne near the ground in dense heads or spikes.

Greenhouse foliage plants, or grown out-of-doors in the South for the attractive clumps. They require abundant moisture and high temperatures. A good greenhouse soil is one of 2 parts loam to 1 of sand and rotted cowmanure. Propagated by division.

capitata: C. capitulata.

capitulata (C. recursata). Lvs. to 3 ft. long and 6 in, wide, recurving: fls. yellow, ½ in. across, in heads on brown-hairy scapes which are bent downward at end. Trop. Asia, Australia.

latifòlia. Lvs. to 2 ft. long and 5 in. wide, curving: fls. bright yellow, in heads on short erect scapes. Asia.

recurvàta: C. capitulata.

CÚRCUMA. Zingiberaceæ. Robust per. herbs with tuberous roots, short leafy sts. and bracted fls. in dense spikes topped by a tuft of colored bracts, the lateral staminodia and also filament of fertile stamen petal-like.

Grown in a warm greenhouse in rich moist soil and rested during the winter, and planted in the open in warm countries; sometimes seen in collections of economic plants, as they yield dyes and curry products. Propagated by division of tubers in spring. See Zingiberaces.

16nga. Lvs. to 1½ ft. long and 8 in. broad: fls. pale yellow, in spikes to 7 in. long tipped by pale pink bracts. India—Root yields turmeric used as a condiment and dye.

petiolata. Lvs to 10 in. long and 6 in. broad: fls. yellow-ish-white, in spikes to 6 in. long tipped by purple bracts.

Zedoària. Lvs. to 2 ft. long and 6 in. broad, with very long sheaths: fls. yellow with whitish sepals and green bracts, in spikes to 4 in. long. India.

CURMERIA: Homalomena Wallisii.

CURRANT AND GOOSEBERRY. fruits are so similar in cultural requirements that they may be considered together in this Hortus. They belong to the same genus, Ribes, according to former prevailing usage, but latterly the gooseberries have been segregated by some writers in the genus Grossularia. The red and white currants are Ribes sativum, the black currant R. nigrum; the gooseberries of American origin, such as Houghton, Downing, Pale Red, are forms of the native Ribes hirtellum (Grossularia hirtella) or hybrids from it; and the European gooseberries, which are much subject to mildew in this country, are Ribes Grossularia (or Grossularia reclinata). In localities where white pines are important, the growing of these fruits is restricted by law because they are an alternate host for the white pine blister-rust.

Currant and gooseberry are fruits of exceptional hardiness, their culture extending nearly to the Arctic circle. They reach their best development in a cool somewhat humid climate and, therefore, are not well adapted to the warme, or drier parts of the United States. Cool moist clay loams or silt loams of high fertility are more satisfactory for these fruits than the lighter soil types; but the land must be well drained. Because they are among the hardiest and most productive of fruits and able to live even under neglect, the currant or gooseberry patch is often allowed to become foul with grass. never thinned or trimmed, the worms eating the leaves until, in the course of time, the plants yield only a small and indifferent product; yet no fruits respond more readily to good care and sufficient fertilizing.

Propagation of currants and some gooseberries is by means of stem-cuttings. Vigorous shoots of the seasons growth are cut from the bushes late in autumn and either planted in the nursery row immediately or stored in moist sand and planted in the spring. Gooseberries are usually propagated by mound-layering. Soil is heaped about the bases of the stems, which send out roots. The rooted shoots thus formed are removed and set in the nursery row. To succeed best with this method, the plant should have been cut back to the ground so that all the shoots are but one season old.

Planting may be either in early spring or late autumn except in the colder climates where spring planting is advisable. Goose-berries and currants may be planted in hills 5 x 5 or 6 x 6 feet, or in rows 6-7 feet apart, plants 4 feet apart in the row.

Clean tillage followed by cover-crops late in the season are advisable for these fruits. A thick mulch of straw or coarse manure is very valuable especially in the home planting, provided that mice do not cause serious damage. Stable manure is the best fertilizer, but when it is not available a complete commercial fertilizer may be applied. The partial shade afforded by a young orchard suits the current well, and if the ground is in good condition no bad results will follow to the orchard provided the currants are removed before the trees need the entire feeding space. A current or gooseberry patch should continue in good bearing for ten to twenty years, if properly handled.

The red and white currants and the gooseberry bear mostly on two-year-old or older wood. A succession of young shoots should be allowed to grow to take the place of the old bearing wood. It is very important to keep the old weak canes cut out, and a succession of three to seven new ones coming from the root each year. This results in a low bush, very different from the tall awkward bushes with spurry parts that one sees in old yards.

The black current makes a large and stronger plant. It bears mostly on wood of the previous year, and therefore it is important to have new wood constantly coming on. After a few years

in neglected plantations that make little new growth the yield becomes small and poor.

Both currants and gooseberries are picked by hand, commonly into quart berry-boxes. Ripe gooseberries for the table are little known in the United States. Green gooseberries for the cannery are stripped from the vines with the hands protected with leather mittens; they are then cleaned in a fanning mill. For market they are picked into quart baskets and sold in berry crates. Yields of 2 to 4 tons an acre of currants and gooseberries may be expected.

Following are some of the prominent varieties, the most popular kinds being starred (*); *Varieties of currants—*Cherry, Diploma, *Fay, *Perfection, *Wilder, *White Grape, Red Lake.

European gooseberries—Chautauqua, *Industry, *May Duke. American gooseberries—Carrie, *Downing, Red Jacket, Oregon, *Poorman. Poorman is much the best of the American varieties.

Pests and diseases should receive prompt attention. Both currants and gooseberries should have a dormant spray of lime-sulfur 1-15 for the control of scale and mildew. When the fruit is well formed, bordeaux mixture, 4-4-50 with 1½ pounds arsenate of lead powder added may be applied to control mildew and currant-worms. If these pests are troublesome near harvest time, pyrethrum sprays or other non-poisonous material should be used.

CURRANT. INDIAN: Symphoricarpos orbiculatus.

CURTONUS. Iridaceæ. A monotypic genus of Natal, S. Afr., allied to Antholyza and differing from it in the peduncle definitely terminated by the infl., and not continuing beyond as a naked stalk bearing some barren bracts at apex; from other related genera (Chasmanthe and Anapalina) it differs in the infl. distinctly branched. The one known species is C. paniculatus (Antholyza paniculata). To 4 ft.: lvs. to 2 ft. long and 3 in. wide: fls. red-yellow, to 1¼ in. long, curved.—Cult. as for Gladiolus.

CURUBA: Sicana odorifera. CUSH-CUSH: Dioscorea trifida. CUSTARD-APPLE: Annona reticulata.

CUTHBÉRTIA. Commelinacex. Herbs native in S. U. S., separated from Tradescantia by the cymes subtended by small bracts rather than a leaf-like involucre.

graminea. To 8 in., tufted: lvs. filiform, half-round or canaliculate, erect: fis. pink or purplish, 1 in. across. N. C.

ròsea. Erect, unbranched or sparingly tufted: lvs. narrowly linear, flat, loosely spreading: fls. pink, to 1% in. across. N. C. to Fla.

CUTTINGS: see Propagation.

CYANÁNTHUS. Campanulacex. Low herbs of Asian mts., with small alternate lvs. and blue fls. terminating the sts., sometimes grown in the rock-garden; related to Codonopsis, but not climbing and differing in floral characters. They are late summer and autumn bloomers, with narrow or almost tubular corollas.

Delavayi. Per. to 8 in., decumbent: Ivs. nearly orbicular, to 14 in. long, angled or 5-lobed, white-hairy beneath: fis. to 1 in. long, throat hairy. Yunnan. incânus. Per. to 4 in., with wiry sts.: Ivs. oblong, to 36 in. long, hairy: fis. to 1 in. long, throat densely hairy. Himalayas.

lobatus. Per. to 5 in. and more: lvs. obovate-oblong, to in. long, lobed: fis. to 1 in. across, throat somewhat hairy.

longiflorus. Per. to 10 in., much branched: lvs. lanceo-

late, white-hairy below, margins revolute: fis. to 2 in. long, hairy in throat. Himalayas.

CYANOCOCCUS: Vaccinium Mursinites. CYANOPHYLLUM: Miconia magnifica.

CYANÒTIS. Commelinaceæ. Per. herbs with creeping or weak sts., sheathing lvs., and blue or reddish fls. in scorpioid cymes or clusters; native in warm parts of Old World, and grown in greenhouses. Propagated by cuttings.

cristata. To 18 in., slender branched st. with erect or ascending branches: lvs. ovate-oblong, to 4 in. long, hairy or glabrous: fls. in cymes inclosed by imbricated lf.-sheaths. Malasia to Trop. Air.

somaliénsis. Flowering sts. to 9 in. long; lvs. narrow-triangular, 1½ in. long, hairy: fis. in dense heads not longer than lf.-sheaths. Trop. Afr.

CYÁTHEA. TREE-FERN. Cyatheacex. Treeferns with trunks 50 ft. or more high; fronds evergreen, very large, usually 2-3-pinnate; sori on back of segms., the indusium bursting and persistent as a fringe: tropics and sub-tropics. Propagated by spores. See Ferns.

dealbata. Trunk to 30 ft. high and 1½ ft. diam.: fronds spreading horizontally, to 12 ft. long and 4 ft. broad, yellowish-green above and powdery-white beneath. New Zeal, Lord Howe Isls—Frequently cult.

Drégei. Fronds bipinnate, glabrous. Afr.

insignis. Fronds very large, pinnæ to 8 ft. long and secondaries to 8 in. and pinnatifid, the ultimate lobes oblong-obtuse and ¼ in. long. Jamaica.

medullàris. Sago-Fern. Trunk to 50 ft. high and 21/2 ft. diam.: fronds curving, to 20 ft. long and 5 ft. broad, dark green above, paler green beneath. New Zeal.

meridénsis. Fronds 3-pinnatifid into narrow-lanceolate segms, scaly on ribs beneath. Colombia.

CYATHEÀCEÆ. TREE-FERN FAMILY. Five genera of ferns with distinct trunks or sts. native in warm regions on both sides of the world: fronds pinnately compound, with sori on backs or margins: differs from Polypodiacew in technical characters of the sporangia. A few genera are grown under glass, as Alsophila and Cyathea. These are planted in protected places in the open in the warm parts of the country.

CYATHÒDES. Epacridacex. Shrubs from Australia to Pacific Isls., having imbricated or scattered lvs. and small fls. solitary in the axils; planted in Calif.

aceròsa. To 15 ft.: lvs. linear or lanceolate, to 3% in. long, stiff and pungent-pointed, margins recurved, glaucous beneath.

parvifòlia. To 4 ft.: lvs. linear to lanceolate-subulate, about ¼ in long, very sharply pointed, glaucous or white beneath, margins recurved; fis. to ½ in. long, on short recurved pedicels, bracts few. Tasmania.

CYCADACEÆ. CYCADS. Stiff evergreen plants of slow growth and mostly with an unbranched trunk at least when young, and stiff pinnate or bipinnate lvs. in a basal rosette or crown at top, and diocious fls. of which the staminate are in thick cones and the pistillate usually in heads. The family is rich in fossil species. There are The family is rich in fossil species. 9 trop, and subtrop, genera of which the following are known to hort.: Ceratozamia, Cycas, Dion, Encephalartos, Macrozamia, Microcycas, Zamia. In morphology cycads are considered to be nearest the fern-allies of any of the sporophytes or flowering-plants. The classification is with the gymnosperms. They are of slow growth and maturity, and are grown for their interest as well as for ornament. They are more or less palm-like. In Cycas the seeds are mostly 4 or more to each carpophyll whereas in the other genera they are 2. Virgin plants in cult. may be difficult to determine.

CYCAS. Cycadaceæ. About 16 species in the Old World tropics, two of them well known in cult. for the stiff glossy evergreen long foliage which is pinnately divided and more or less fernlike; pinnæ with strong midrib. The lvs. are often cut for house decoration. See Cycadaceæ.

Cycads are grown in greenhouses or as specimen plants out-of-doors in warm regions. They should be given abundant moisture and partial shade. Propagated by suckers which are taken when dormant and the leaves removed; also by seeds sown in shallow boxes or benches and covered with sand and potted off after germination. Slanting sections of the trunk 2-3 inches thick may be used for propagation; they should be dried a few days, then planted, and when new plants form they should be repotted separately.

circinàlis. Trunk to 12 ft. high: lvs. to 8 ft. long; lfts. to 1 ft. long, flat on edges: fr. about size of walnut. Old World tropics.

mèdia. Australian Nut-Palm. Trunk to 18 ft.: lvs. to 4 ft. long; lfts very many, to 8 in. long, straight or somewhat curved, obtuse or pointed, keeled beneath or nargins flat: staminate infl. scales tapering into long spine. Australia.

Micholitzii. Trunk subterranean: lvs. to 10 ft. long, pinnæ 8-10 in., plane, twice forked. Cochin-China.—Has been grown as Pseudocycas Micholitzii.

Normanbyana. Trunk to 10 ft. or more: lfts. to 8 in. long, flat on edges. Australia.

revolùta. Trunk to 10 ft. high: lfts. revolute or rolled on edges: fr. about 1½ in. long, somewhat flattened, red. Japan.—Sometimes called "sago-palm," but it is not a palm.

Rúmphii. Trunk to 20 ft.: lvs. similar to C. media but shorter and with fewer lits.: stammate infl scales truncate or shortly acuminate. N Australia, Malasia.—Differs from C. circinalis in its paler and thinner lanceolate lits. and rarely attains maximum height in cult.

CÝCLAMEN. Primulaceæ. Low herbs with large hard tuberous roots, heart-shaped basal lvs., solitary nodding fls. borne on scapes, with purple, rose or white corolla-lobes strongly reflexed; native in the Medit. region and Cent. Eu., one a popular florists plant and a few others sometimes grown out-of-doors.

Cyclamens respond best in a soil composed of 2 parts leaf-mold, 1 part sand, and 1 part loam. They are very sensitive to moisture conditions and will not thrive if allowed to dry out or if water stands around the roots. A moist atmosphere is beneficial. Red-spider may be eliminated by syringing the leaves on both sides several times a week.

Tubers large enough to flower the first year may be purchased from seedsmen. Seeds may be sown in September, wintered in a cool house, repotted in May, and in July transferred into 5- or 6-inch pots in a shaded frame. Before frost they should be taken indoors and grown in a cool house through the flowering period.

africanum. Lvs. mottled above, pale beneath: fls. white tinged rose or purple, purple at base, 1 in. long. Algeria.

Atkinsii. Hybrid between C. coum and C. ibericum: lvs. spotted with silvery-white: fls. pink or white marked with red.

cilicicum. Similar to C. europæum but with larger pale rose fls. purple in the throat. Sicily.

coum. Fls. purple with spotted throat, the corollalobes ovate, small, odorless, in autumn. S. Eu. to Persia.

europæum. Fls. bright red, the corolla-lobes oblong or ovate, very fragrant, on scapes 4-5 in. high, blooming in summer and autumn. Cent. and S. Eu. Var. rôseum has pinkish fls.

græcum. Lvs. obcordate, somewhat dentate: fls. rose, deep purple at center, autumn-flowering, corolla-lobes oblong-lanceolate. S. E. Eu.

hederæfðlium: C. indicum.

ibéricum. Lvs. sometimes marked with white above: fls. purple with darker throat, the corolla-lobes ovate. Caucasus.

indicum (C. persicum. C. hederæfolium. C. macrophyllum). FLORISTS C. Lvs. usually variegated with white: fls. large, odorless, white or in shades of purple and rose, dark purple at the mouth, the corolla-lobes oblong-lanceolate, on scapes 6-8 in. high. Greece to Syria. Var. gigantèum has larger fls. and many named forms are in the trade.

macroph fllum: C. indicum.

magnificum: a form of C. indicum with large white fis. spotted red.

neapolitanum. Fls. red or white (var. album), appearing mostly before the lvs. in summer or autumn, the corollalobes ovate and eared at the base. Cent. and S. Eu.

pérsicum: C. indicum.

purpureum: a var. of C. indicum having large purple fls. marked with bluish.

repandum. Fls. purple with darker throat, the corollalobes oblong or linear-oblong. Medit. region.

CYCLANTHACEÆ. CYCLANTHUS FAMILY. Six trop. American genera comprise the family: more or less herbaceous palm-like plants, acaulescent or nearly so, with long-stalked lvs., unisexual fls. in dense spadices subtended by bract-like spathes resembling an aroid infl., and fr. composed of cohering carpels. Carludovica and Cyclanthus are grown in greenhouses in cold countries; the genera differ in technical botanical characters.

CYCLANTHÈRA. Cucurbitaceæ. Herbaceous vines, ann. or per., above 30 species in the warm parts of Amer. and extending north as far as Kans., two of which are sometimes grown for ornament and as screens, both ann. or grown as such: monorcious: lvs. lobed or compound: fls. very small, yellow, white or greenish, the pistillate solitary in axils and staminate racemose or paniculate: fr. small, scarcely fleshy, mostly spiny or setose. Grown from seeds, as for gourds.

explòdens. To 10 ft. or so, nearly glabrous: lvs. ovatetriangular to broad-oblong, 2-3 in. long, 3-angled or -lobed: fr. 1 in. or more long, usually curved, stout-spiny on one side, bursting forcibly. N. S. Amer.

pedata. Glabrous, to 10 ft. and more: lvs. with 5-7 narrow crenate-dentate lifts.: fr. about 2 in. long, oblong, with scattering prickles. Mex. south.

CYCLÁNTHUS. Cyclanthaceæ. Stemless milky-juiced herbs resembling palms, the fis. fragrant; 4 species in trop. Amer. Cult. as for Carludovica.

bipartitus. Lvs. entire or 2-lobed to base, the stalks to 6 ft. long; spathes of 4 yellow lvs. Guiana.

CYCLOBOTHRA: Calochortus barbatus.

CYCLÓPHORUS. Felt-Fern. Polypodiaceæ. Asian and Malayan ferns with usually simple and entire fronds tomentose on back, leathery; sori naked, covering back of fronds; much like Polypodium and often so listed; for cult. see Ferns.

Lingua (Niphobolus Lingua. Polypodium Lingua). TOMOUE-FERN. JAPANESE F. Fronds, including stipes, to 15 in. long, entire, lanceolate or ovate-lanceolate, rusty beneath. China, Japan and south. Var. corymbiferus, CRESTED F., has fronds forked at the apex. Var. variegatus is variegated.

CYCNÒCHES. SWAN ORCHID. Orchidaceæ. Trop. American epiphytes with clongated pseudobulbs bearing plaited lvs., and lateral racemes: fls. of two sexes, sometimes similar, often very different, the male fls. often with a clawed lip having finger-like projections. Grown in warm greenhouse; see Orchids.

chlorochilon. Lvs. elliptic-lanceolate, about 12 in. or more long: racemes usually about 3-fid.; fis. large, about 5-6 in. across, yellow-green; lip ovate, convex, green or whitish with dark green spot at base. July-Dec. Cent. Amer., Colombia, Venezuela, British Guiana.

CYDÍSTA. Bignoniaceæ. One woody climber native from W. Indies to Brazil and grown in subtrop. regions. C. æquinoctiàlis (Bignonia æquinoctialis). Lvs. of 2 ovate leathery wavymargined lfts. to 6 in. long, and often a terminal

tendril: fls. showy, white or purplish, to 3 in. long, funnelform with rounded lobes, in racemes: fr. linear, to 1 ft. long.

CYDONIA. QUINCE. Rosacex. One deciduous small much branching tree from Persia and Turkestan grown for its edible fr. For cult. see Quince. C. oblonga (C. vulgaris. Pyrus Cydonia). To 20 ft.: lvs. ovate to oblong, to 4 in. long, densely tomentose beneath: fls. white or pale pink, to 2 in. across, solitary at the end of leafy shoots of the season: fr. a pear-shaped or apple-shaped tomentose pome to 3 in. or more across, fragrant. For other names listed as Cydonia see Chænomeles, the Japanese or Flowering quince.

CYLINDROPHÝLLUM. Aizoaceæ. Verv succulent S. African plants separated from Mesembryanthemum, having long nearly round lvs. and solitary terminal short-stalked yellow or red fls.; stigmas 6-8.

Bàinii: listed name.

calamiforme (M. calamiforme). Sts. to 2 in., branched: lvs. to 3 in. long and 1/2 in. wide, curved and spreading, grayish-green, finely punctate: fis. pale pink, yellowish-white at base, to 3 in. across.

Comptonii. Plants compact, often 10 in. through and 5 in. high: lvs. to 3½ in. long and ½ in. thick, erect: fis. yellowish-white.

CYLINDROPUNTIA: see Opuntia.

CYMBALÀRIA. Scrophulariaceæ. Creeping herbaceous perennials, native in the Old World. often united with Linaria but differing in the fls. axillary and solitary and the lvs. palmately veined; a few are grown as ground-cover in the greenhouse or in the open, or in vases and hanging-baskets.

These plants are tender in the North but seed themselves freely; they thrive in moist and partially shaded positions, as in greenhouses and about yards. Propagated by division of the long stems, and by seeds.

equitriloba (Linaria equitriloba). Lvs. mostly opposite, entire or slightly 3-5-lobed: fls. pale mauve with reddishpurple throat. S. Eu.

hepaticæfölia (Linaria hepaticæfolia). Lvs. mostly opposite, with 3-5 short or indistinct lobes: fis. lilac-blue with yellowish throat, about ½ in. long: caps. shorter than sepals. Corsica.

muralis (Linaria Cymbalaria). muraiis (Linaria Cymbalaria). Kenliworth Ivr. Sts. trailing and rooting at the nodes: lvs mostly alternate, irregularly 3-7-lobed, glabrous: fis. hlac-blue, throat yellowish, ½ in. long: caps. longer than sepals. Eu., nat. Ont. to Pa.—Common about greenhouses. Var. álba, fis. white; globosa is not stoloniferous; máxima, fis. large; rôsea, fis. pale pink.

pallida (Linaria pallida). Sts. trailing or erect only at first, to 4 in. high: lvs. opposite, reniform or rotund, entire or shallowly 3-5-palmately lobed, to ½ in. across, short-pilose beneath and on petioles: fls. blue-violet with golden-yellow palate, about ½ in. long: caps. as long as or shorter than callys. Italy.—Some of the material in cult. may be C. muralis var. maxima.

pilòsa (*Linaria pilosa*). Pubescent: lvs. opposite and alternate, 3-11-lobed: fis. lavender with yellow throat: caps. longer than sepals. Italy.

CYMBIDIUM. Orchidaceæ. Mostly epiphytes with short pseudobulbous sts. and fls. in lateral racemes, the sepals and petals similar, the lip entire or 3-lobed and commonly with 2 keels. Cult. in greenhouse mostly with intermediate and often with cool temperature; sometimes planted out. See Orchids.

albanénse. Hybrid between C. erythrostylum and C.

Alexanderi. Hybrid between C. Veitchii and C. insigne. Vars. aureum, roseum and splendens are hybrids of similar parentage.

aloifòlium. Lvs. linear, broadly obtuse, to 1½ ft. long: fis. in many-fid. pendulous racemes to 23 in. long; sepals

and petals brownish-yellow with purple median stripe; lip 3-lobed, brownish-red with yellow center. July-Aug. India, Indo-China, Malaya.

brugense. Hybrid between C. insigne and C. Cooperi. Coningsbyanum. Hybrid between C. grandiflorum and C. insigne

Cooperi. Hybrid between C. insigne and Cyperorchis Schroederi

schroeders. cyperifolium. Lvs. very narrowly linear-lanceolate, to 30 in. or more long and ½-½ in. wide, somewhat canaliculate, acute: racemes shorter than lvs., 3-7-fd.; fs. to 1½ in. across, fragrant; sepals and petals green becoming yellow, lanceolate, spreading; lip green, streaked and blotched with reddish-purple. Sikkim-Himalayas.

Devonianum. St. 2-5-lvd.: lvs. oblanceolate, acute, long-petioled, the blade to 14 in. long: infl. pendent, about as long as the lvs., many-fld.; sepals oblong-lanceolate, to nearly 1 in. long, green or buff-yellow streaked with brownish-purple; petals little shorter, lanceolate-elliptic, similarly colored; lip obscurely 3-lobed, deep or light rosepurple with a pair of darker spots near each margin. Mar.-July. Himalayas.

ebúrneo-Lowianum: C. Veitchii.

eburneum. Lvs. linear, to 2 ft. long and ¾ in. wide: fls. to 4 or 5 in. across, in 1-3-fld. racemes to 8 in. long, fragrant, ivory-white, the lip with yellow center and 3-4 hairy keels. Mar.-June. Himalayas, Indo-China.

ensifolium. Lvs. linear, acute, to almost 3 ft. long: fls. in 3-12-fld. racemes to 20 in. long, greenish-yellow veined with red-brown lines (rarely whitish), the lip with red-brown spots. Oct.-Feb., May, Aug. India, Indo-China, China, Japan, Malaya.

erythrostylum. Pseudobulbs ovate-oblong, about 1 in. long, several-lvd.: lvs. linear, acute, to 15 in. long, arching: scape to 1½ ft. long, 4-7-fid., suberect; sepals white, about 1¾ in. long; petals a little shorter, white; lip yellowish-white, lined or dotted with red-purple; column about 1 in. long, crimson. Nov. Indo-China (Annam).

Finlaysonianum. Lvs. strap-shaped, to 40 in. long and almost 2 in. wide, obtuse: fls. in many-fld. pendent racemes to 40 in. long; sepals and petals brownish-yellow sometimes with a median red stripe; lip 3-lobed, spotted and marked with brownish-red and with white and yellow on the disk. Mar.-July, Sept.-Nov. Malaya, Indo-China, Philippines. Var. atropurpureum has longer narrower lvs. and purplish seems and petals. sepals and petals.

gattonense. Hybrid between C. Lowianum and C. Tracyanum.

gigantèum. Lvs. linear, acute, to 30 in. long: fis. to 4 in. across, fragrant, in 7-13-fid. arching racemes somewhat longer than lvs.; sepals and petals green- or brownish-yellow lined with dark red-brown; lip 3-lobed, yellow marked with red, the middle lobe wavy-margined. Sept.—Oct., also winter months. Himalayas, Indo-China, China.

Gottianum. Hybrid between C. eburneum and C. insigne. grandiflorum (C. Hookertanum). Lvs. ligulate, acute, to 25 in. long; fls. to 5 in. across, in racemes 2-4 ft. long; sepals and petals olive-green; lip 3-lobed, bright yellow dotted with purple-brown. Sept.-Dec. Himalayas, China

Hanburyanum. Hybrid between C. erythrostylum and C. Tracyanum.

Holfordianum. Hybrid between C. eburneum and C. grandiflorum.

Hookerianum: C. grandiflorum.

I'Ansonii. Hybrid between C. Lowianum and C. Tracyanum.

insigne (C. Sanderi). Lvs. oblong-linear, acute, to 3½ ft. long and about ¾ in. wide: fls. about 3½ in. across, in 10-15-fld. racemes to 5 ft. high; sepals and petals pale rose; lip 3-lobed, light rose spotted with purple-red and with 2 yellow thickened lines. Feb.-Mar. Indo-China.

Lowgrinum. Hybrid between C. Lowianum and C. tiorinum.

Lowianum. Lvs. linear, acuminate, to 2 ft. long: fis. about 4 in. across, in 10-25-fid. arching racemes; sepals and petals greenish-yellow with red-brown lines; lip 3-lobed, yellow with crimson mid-lobe edged with pale yellow. Feb.-July. Burma. Var. concolor lacks the crimson on the mid-lobe of the lip. Var. Mandaianum has yellow fis.

Lòwi-Schroèderæ. Hybrid between C. Lowianum and Cyperorchis Schroederi.

Mastersii: Cyperorchis Mastersii.

Paúwelsii. Hybrid between C. Lowianum var. concolor and C. insione.

rosefieldénse. Hybrid between C. grandiflorum and C. Tracyanum.

ròseum. Habit of *C. insigne*: lvs. ligulate, about 16 in. long: fis. about 2 in. across; sepals and petals white dotted with soft rose arranged in longitudinal lines; lip 3-lobed,

white with violet streaks and spots, to about 1 in. long, blunt and tomentose. Java.—A confused name, another C. roseum being described from Annam.

Sánderi: C. insigne.

Schlègelii. Hybrid between C. insigne and C. Wigan-janum.

Schroederi: Cuperorchis Schroederi.

tigrhum. Lvs. elliptic-lanceolate, acute, to 6 in. long and 1/2 in. wide: fls. in 3-6-fld. racemes longer than the lvs.; sepals and petals olive-green; lip 3-lobed, the side lobes yellow marked with red, the mid-lobe white spotted with red. Burma, Indo-China.

Tracyanum Very similar to C. giganteum and C. grandiforum but with fis. to about 6 in. across and darker colored than either. Oct.—Nov. Burma, Indo-China. Var. supérbum is listed.

Veitchii. Hybrid between C. eburneum and C. Lowianum. Wiganianum. Hybrid between C. eburneum and C. Tracuanum.

Winnianum. Hybrid between C. giganteum and Cyperorchis Mastersii.

Woodhamsianum. Hybrid between C. Lowianum and C. Veitchii.

CYMBOPÒGON. Gramineæ. Mostly per. grasses of tropics of Old World grown for the oil from herbage and roots and sometimes for ornament, differing from Andropogon in technical characters. See Grasses.

citratus. Lemon-Grass. Differs from C. Nardus in the sterile spikelets linear rather than lanceolate. Known only in cult.

Nárdus. Citronella-Grass. Per. to 6 ft.: lvs. fragrant, to 3 ft. long and 3/2 in. wide, glaucous: infl. to 21/2 ft. long. Trop. Asia; nat. in trop. Amer.

Schonanthus. Camell-Hay. Per. to 2 ft.: differs from C. Nardus in the joints of the raceme hairy and concealing the spikelets. N. Afr., S. Asia.

CYME: a broad more or less flat-topped determinate flower-cluster; with central flowers opening first.

CYMOPHYLLUS: Carex Fraseri.

CYNÁNCHUM. Asclepiadaceæ. Per. herbs, often shrubby and twining, with opposite lvs., wheel- or bell-shaped fls. in clusters, and milk-weed-like frs.; native in Eu., Asia and Afr. Propagated in spring by division of roots. Grown in any good garden soil.

acuminatifolium (Vincetoxicum acuminatum. V. ja-ponicum). Mosquito-Trap. Erect, the tips of the sts. perhaps with a viney habit: Ivs. arrow-shaped, gray-pubescent beneath: fls. white, in summer. Japan. Var. violaceum is a dwarfer form.

açûtum. Per. vine, or erect when young, to 4 ft.: lvs. ovate-acuminate, deeply cordate-lobed at base, to 1½ in. long: fls. white, fragrant, ¼ in. across. Eu., W. Asia, N. Afr. erfectum: Marshenia crecta.

fuscatum (Vincetoxicum fuscatum). Similar to C. nigrum, but of much smaller habit, briefly pubescent throughout except on corolla and fr. Portugal to Asia

nigrum (Vincetoricum nigrum). BLACK SWALLOW-WORT. Per. twining or at first erect, to 4 ft.: lvs. ovate to ovate-lanceolate, entire, pubescent on veins: fls. reddishbrown, to nearly 1/2 in. across, pubescent within. Eu., escaped from cult. in N. E. U. S.

Vincetóxicum (Vincetoxicum officinale). Differs from C. nigrum chiefly in its greenish-white and glabrous fis.

CÝNARA. Compositæ. Coarse herbaceous thistle-like per. or bien. herbs with large lobed or pinnately cut lvs. and large terminal heads of violet, blue or white disk-fls.; pappus plumose; native in Medit. region and Canary Isls.

Two species are grown as garden vegetables. They need rich soil and abundant moisture. The cardoon is blanched in much the same way as celery or endive. It is increased by seeds and by suckers. The artichoke is propagated also by division in early spring. Seeds give more variable results; if sown early enough edible heads may be obtained the same year, but usually not until the second year.

Cardúnculus. Cardoon. To 6 ft. or more, cult. for its edible root and thickened lf.-stalks: lvs. grayish-green

above, white-tomentose beneath, spiny: heads purple, the bracts of involucre spine-tipped. S. Eu.

Scólymus. Artichoke. To 5 ft.: lvs. white-tomentose beneath, scarcely spiny: heads purple, the receptacle enlarged and fleshy and edible as are the thickened bases of the unarmed involucial bracts. Probably derivative of C. Cardungulus.

CÝNODON (Capriola). Gramineæ. Per. grasses, creeping and stoloniferous, and valuable for pastures and lawns in warm regions: lvs. short: spikelets one-sided, in slender spikes borne in digitate clusters at ends of sts.: native in Eu., Asia and Australia but now widely spread and nat. See Grasses.

Dáctylon. BERMUDA-GRASS. To 1 ft.: lvs. to 2 in. long and ½ in. wide, rough above: spikes to 2 in. long, spreading, in clusters of 3-5.—Much used for lawns in southern states.

CYNOGLÓSSUM. HOUNDS-TONGUE. Boraginacex. Rather weedy mostly stiff-hairy herbs, ann., bien. and per., mostly in the temp. zones, with alternate simple lvs. and blue, purple or white small fls. in terminal one-sided racemes: fr. a bur or "stick-tight": sometimes grown in the flower-garden. Propagated by seeds.

amábile. Bien. to 2 ft.: lvs. lanceolate-oblong: fls. blue, $\frac{1}{2}$ in. long. E. Asia.

apenninum: Solenanthus apenninus.

cheirifolium. Bien to 1½ ft.; white-woolly: lvs. oblong-spatulate, white-woolly on both sides: fis. reddish-violet to whitish. S. W. Eu. and Medit. region.

cœlestinum: Adelocaryum cælestinum.

furcatum: C. zeylanicum.

glochidiatum: C. Wallichii.

grande. Per. to 3 ft.: lvs. mostly basal, ovate or oval: fls. blue or purple with white center, ½ in. long. Wash. to Calif.

linifolium: Omphalodes linifolia.

nervosum. To 3 ft.: lvs. lanceolate or oblong: fls. blue, 3% in. across. Himalayas.

nóbile: Myosotidium Hortensia.

virginianum. Per. to 2½ ft.: lvs. oval or oblong: fis. blue, about ½ in. across. N. J. to Fls. and La.

Wallichii (C. glochdatum). Ann. to 2 ft.: lvs. oblong or lanceolate: fls. blue, ½ in. long. Asia.

zeylánicum (C. furcatum). To 3 ft.: lvs. oblong, silky-hairy: fis. blue, ½ in. long. India.

CYNOSÙRUS. Graminex. Old World ann. and per. tufted grasses with flat lvs. and spikelets in clusters forming a dense spike-like infl.; one species sometimes grown in pastures. See Grasses.

cristatus. Crested Dogs-Tail. Per. to 2½ ft.: lvs. to 5 in. long and ½ in. wide: spikes to 4 in. long, appearing crested because of the ciliate lemmas. Eu.; escaped in E. N. Amer.

CYNTHIA: Krigia virginica.
CYNOXLYON: Cornus florida.

CYPÉLLA. Iridaceæ. Bulbous herbs with both basal and st.-lvs. and yellow, orange or blue fls. in clusters, the perianth-segms. free; native of S. Amer. Differs from Iris and Moræa in characters of stigma and anthers.

These bulbs may be grown in the greenhouse or set out in spring and stored indoors over winter. Propagated by offsets or seed.

Hérbertii. To 3 ft.: lvs. linear, 1 ft. long, plaited: fis. yellow, 3 in. across, style appendages spur-like. Brazil, Uruguay, Argentina.

peruviana. To 3 ft.: basal lvs. disappearing before blossoming, st.-lvs. 2-3, linear, to 9 in. long and ¾ in. wide at middle: fis. yellow spotted red-brown at base in narrow transverse bands, to 3½ in. across, style appendages petallike and flat. Peru.

platénsis: name of no known botanical standing; the material so listed is usually referable to C. plumbea.

plümbea. To 4 ft.: lvs. sword-shaped, plaited, glaucous: fis. bluish tinged with yellow, lasting only few hours. Trop. 8. Amer.

CYPERACEÆ. SEDGE FAMILY. Grass-like herbs with slender solid usually 3-angled sts., lvs. with closed sheaths, small green fls. borne in spikes, perianth when present represented by bristles or scales, 2-3 stamens, 1-celled ovary, and fr. an achene. Fls. not showy, but many of the plants are attractive in form and habit. The family comprises about 75 genera, many of them inhabiting swamps and low places. Only a few are cult., as Carex, Cyperus, Eriophorum, Scirpus.

CYPERÓRCHIS. Orchidacex. A small genus of epiphytes formerly included in Cymbidium, but differing in having numerous distichously imbricated lvs., narrow perianth-segms. which are very little spreading, small terminal lobe of lip, elongate column somewhat grown to the lip and pyriform pollinia.

Mastersii (Cumbidium Mastersii). Lvs. linear, acute, to Mastersn (Cymbuluum Mastersn). Lvs. linear, acute, to 30 in. long; fls. in 6-10-fld. short racemes; sepals and petals linear-oblong, ivory-white, about 2 in. long; lip 3-lobed, white with few rose-purple spots and orange-yellow central part of disk which bears 2 longitudinal ridges. Oct.—Dec. Himalayas.

Schroederi (Cymbidium Schroederi). Lvs. linear, obtuse, to 24 in. long: fis. about 5, in racemes to about 1 ft. long; sepals and petals green sometimes marked with red-brown; lip 3-lobed, bright yellow striped with red-brown, Indo-China.

CYPÈRUS. GALINGALE. Cyperaceæ. Ann. and per. herbs with grass-like lvs. and bisexual fls. borne in spikelets which are assembled in heads or racemes and these in turn often in large terminal umbels; about 600 species of wide distribution.

Grown in ponds, as pot-plants and the chufa for its edible tubers. Propagated by division or by seeds sown in spring or early full. In C. alternifolius the crown of leaves may be cut off and set in sand or moss, and new plants will form from the leaf-axils. The species in cultivation are

adenophorus. Sts. to 2 ft., leafy below: spikelets stalked, on secondary or tertiary rays in the umbel. Brazil.

on secondary or tertiary rays in the umbel. Brazil.

alternifolius. Umbrella-Plant. Sts. to 4 ft., lvs.
reduced to sheaths; spikelets sessile, on primary rays to
5 in. long, the umbels subtended by long lvs. giving an
umbrella-like effect. Afr.; nat. in trop. Amer.—Requires
much moisture at the root. Var. gracilis is a smaller plant
with shorter involueral lvs. Var. nanus is advertised. Var.
variegatus has lvs. and sts. lined with white.

esculentus. Chufa. Earth-Almond. To 3 ft.: spikelets sessile, the large umbels subtended by long broad involucnal lvs. N. Amer. Eu., Asia.—Propagated in spring by planting the little tubers or chufas; the tubers are eaten when dry and are food for chickens and pigs.

grácilis: C. alternifolius var.

Háspan. Sts. to 3 ft, slender and tufted; basal lvs. much reduced, involucial lvs. usually 2, to 31½ in. long and 3¼ in. wide. Atlantic coast from Va. southward, trop. Amer, Medit. region, S. Asia and Australia, usually in swamps.

natalénsis. Sts. to 2 ft., often nearly leafless: spikelets on rays to 7 in. long, the involucral lvs. short. Natal.

Papyrus (Papyrus antiquorum). Papyrus. Sts. to 8 ft., lvs reduced to sheaths: spikelets sessile, with many drooping thread-like rays to 1) ½ ft. long which are longer than the involueral lvs. S. Eu., Syria, Afr.—This is the paper plant of the Egyptians; a stately plant for ponds, growing sabelle up the state. in shallow water.

végetus. Sts. to 3 ft., branching: lvs. long, keeled be-neath, rough: fls. in umbels subtended by 4-7 lvs. Spain, Portugal.

virens. Sts. to 3 ft., with long lvs. to ½ in. wide: spikelets sessile, the rays from ½-8 in. long. S. U. S. to S. Amer.

CYPHOMÁNDRA. Solanaceæ. Big herbs, shrubs or small trees with large entire 3-lobed or pinnately cut lvs., wheel- or bell-shaped fls. in racemes or cymes, and fr. a 2-celled many-seeded berry; native in S. Amer.

One species is grown for its edible fruit in the open in subtropical parts and occasionally in conservatories in the

North. Propagated by seeds sown under glass and the plants treated as eggplants; also by cuttings of growing

betacea. Tree-Tomato. Somewhat woody tree-like shrub to 10 ft., mostly soft-hairy: lvs. cordate-ovate, to 1 ft. long: fls. pinkish, ½ in. across, fragrant: fr. egg-shaped, dull red, to 3 in. long, smooth, with slightly acid tomatolike flavor. S. Amer.

fragrans: Solanum ınæquale.

CYPRESS: Cupressus, Taxodium. False-: Chamæcyparis. Standing-: Gilia rubra. Summer-: Kochia scoparia. -Vine: Quamoclit pennata.

CYPRIPÈDIUM. LADY-SLIPPER. MOCCASIN-FLOWER. Orchidaceæ. Terrestrial orchids native in the north temp. zone, with broad plicate lvs., fls. solitary or in few-fld. terminal racemes, with an inflated sac-like lip, column with 2 fertile anthers, and 1-celled ovary. Grown in rockgardens or moist borders; see Orchids for cult. The greenhouse "Cypripediums" belong to other genera, as Paphiopedilum and Selenipedium, which see.

acaùle (Fissipes acaulis). PINK L. To 10 (rarely to 17) in. high, having 2 basal lvs. to 8 in. long and 3 in. wide (rarely to 11 in. long and 4½ in. wide): fls. solitary, to 5 in. across; sepals and petals greenish-brown; lip rose veined with darker crimson. May-July. Newf. to N. C. and Minn. Var. álbum has lip white, usually veined with pink.

arietinum. RAMS-HEAD L. To 1 ft. high, with leafy sts.: lvs. 3-5, to 3½ in. long and about 1½ in. wide. fls. solitary, with greenish-brown sepals and petals and crimson and white lip which is inverted-conical in shape. May-June. Que. to Mass., N. Y. and Minn.; also China.

Que. to Mass., N. Y. and Minn.; also China.

Calcèolus (the yellow Lady-Slipper of Eurasia) var.

pubéscens (C. parvilorum. C. parvilorum var. pubescens.

C. pubescens). To about 22 in. high, sts. leafy: lvs. to 8 in.
long, oval to elliptic-lanceolate: fls. 1-2; sepals and petals

purplish-brown to green, petals more or less twisted; hp

yellow veined with madder-purple. Apr. (in S.)-Aug. (in

extreme N.). N. Amer.—The form called C. parvilorum

is characterized by being usually smaller with smaller fls.,
deeper madder-purple sepals and petals, more twisted

petals. The form called C. parvilorum vai. pubescens or

C. pubescens is usually larger and more hairy than C.

parvilorum, with larger fls., greener sepals and petals and

less twisted petals. less twisted petals.

californicum. To 28 in. high, with leafy sts.: lvs. to 6 in. long, elliptic-ovate to ovate-lanceolate. fls. to 1½ in. across, 3-7 in the axils of leaf-like bracts, with brownish-yellow sepals and petals and white or rose lip spotted with brown. May-July. Ore., Calif.

cândidum. SMALL WHITE L. To 1 ft. high, with leafy sts.: lvs. 3 or 4, to 5½ in. long and 1½ in. wide: fts. solitary, sepals and petals greenish veined with blown-puiple, lip white with purple spots round the mouth and within. May-June. N. Y. and N. J. to Minn., Mo. and Ky.

fasciculatum. Brownie or Clustered L. To 16 in. high: lvs. 2 to a st., opposite, to 4½ in. long and 3 (rarely) in. wide: fls. about 1½ in. across, in 1-5-fld. congested racemes; sepals and petals greenish veined with brown; lip greenish-yellow veined with brown-purple. Apr.-Aug. Mont., Colo., west to Calif., Ore., Wash.

Mont., Colo., west to Cann, Cre., Trash.
hirshum: C. Reginæ.
japónicum. To 18 in. tall: lvs. 2 to a st., transversely
rhombie-ovate, to 6 in. long, commonly broader than long:
fls. solitary, about 2½ in. across; sepals and petals greenish
spotted with red at base; lip whitish or rose spotted with
red. May-June. Japan, China.

macrántum. To 16 in. high, the sts. with 3-4 elliptical lys.: fls. solitary; dorsal sepal, petals and lip pink to purple; lateral (united) sepals greenish-brown. May-July. Siberia, China, Japan, Formosa.

montanum. MOUNTAIN L. To 21 in. high, sts. leafy: lvs. to 6½ in. long and about 3 in. wide: fls. 4 in. across, in 1-3-fld. racemes; sepals and petals reddish-brown; lip white veined with purple. May-July. W. N. Amer.

parviflòrum: C. Calceolus var. pubescens.

passerhum. Small White L. To 13½ in. tall, st. leafy and hairy: lvs. 4-6, lanceolate-elliptic, sticky-hairy, to 6 in. long: fls. solitary; sepals greenish, shorter than lip; lip white, spotted with purple within, about ½ in. long. June-July. Canada and Alaska.

pubéscens: C. Calceolus var.

Reginse (C. spectabile. C. hirsutum). Showy L. To about 30 in. tall, densely hairy, sts. leafy: lvs. to 8½ in. long and 4½ in. wide: fls. about 3 in. across, 1-2, together; sepals and petals white; lip white striped with rose or purplish. June-(rarely) Aug. E. N. Amer. west to Minn. and Mo. speciosum. To 16 in. tall: lvs. about 4-6 in. long and 2-3 in. wide, pubescent: fis. whitish or pink veined with rose; sepals and petals 1¾-2¼ in. long. Japan.

spectábile: C. Reginæ.

CYRÍLLA. Cyrillacex. One shrub or tree to 30 ft., native from Va. to W. Indies and S. Amer. and planted for ornament in the S. Propagated by seeds and cuttings under glass. C. racemiflora. Southern Leatherwood. Deciduous or more or less evergreen: lvs. oblong, to 3 in. long, shining above: fls. small, white, in narrow axillary racemes to 6 in. long. June-July.

CYRILLÀCEÆ, CYRILLA FAMILY. Three American genera of shrubs and trees bearing alternate entire lvs. and small bisexual fls. with 5 sepals and petals, 5 or 10 stamens, superior 2-4-celled ovary, and angled or winged frs. Cliftonia and Cyrilla are planted.

CYRTÁNTHUS. Amaryllidacex. S. African bulbous herbs with red or white fls. borne in umbels, the perianth-tube two or three times as long as segms.; may be grown out-of-doors in S. U. S.

flámmeus: listed name of form said to have fiery-red fls , but not known botanically.

lutéscens: C. ochroleucus

Mackenii. Lvs. to 1 ft. long and ½ in. wide: fls. pure white, 2 in. long, the umbels on stalks 1 ft. high. Var. Codperi (C. lutescens var.) has umbels of 5-10 yellow or cream-colored fls.

O'Brienii. Lvs. to 1 ft. long and ½ in. wide: fls. bright scarlet, 1½ in. long, tube curved, the umbels on stalks longer than lvs.

ochroleùcus (C. lutescens). To 15 in.: lvs. linear, to 14 in. wide and 1 ft. long: fls. yellow, to 2 in. long, in umbels of 2-3, on pedicels to 34 in. long.

parviflorus. I.vs. 1 ft. long, linear: fls. bright red, to 11/4 in. long, the umbels on stalks to 1 ft. long.

CYRTÒMIUM. Polypodiacex. Half hardy or greenhouse ferns with simply pinnate fronds; sori large, scattered; native in Asia, Afr., Pacific Isls.; differs from Polystichum in venation. They are known with us mostly as glasshouse ferns of simple cult. See Ferns.

Bútterfieldii: a form of C. falcatum with cut segms.

caryotideum (Aspidium falcatum var. caryotideum). Differs from C. falcatum in the drooping habit and larger toothed segms. Japan, India.

falcatum (Aspidum falcatum. Polystichum falcatum), HOLLY-FERN. Stiff, erect. fronds dark green, glossy, to 2½ ft. long and 8 in. wide, segms. to 4 in. long, ovate, edges entire or slightly wavy. Asia, 5 Afr., Polynesia; frequent in conservatories. Var. compáctum is dwarf.

Fortunei (Aspidium falcatum var. Fortunei). Similar to C. falcatum but fronds dull and with smaller lanceolate segms. Japan.

Rochefordianum: a form of C. falcatum with deeply

CYRTOPÒDIUM. Orchidaceæ. Epiphytic or terrestrial orchids with long plaited lvs. and fls. in lateral racemes or panicles, the sepals and petals nearly equal, the lip 3-lobed. For cult. see Orchids.

punctatum. Epiphyte with fusiform pseudobulbs up to 3 ft. long: lvs. to about 2 ft. long and almost 2 m. wide: sepals and petals greenish-yellow or bright yellow, strongly undulate, irregularly spotted with madder-brown; lip with narrow claw, yellow edged with red or madder-purple. Feb -May. Fla. and trop. Amer.

CYRTOSIA: Galeola.

CYRTÓSTACHYS. Palmacex. Cespitose unarmed monœcious ringed feather-palms mostly with showy red petioles, sometimes grown under glass and to be expected in S. Fla.; species about 5, Malaya and Pacific Isls.: spadices below the lvs., or with the lower ones, paniculately branched, the stout branches 1-2 ft. long; fls. in 3's, the 2 staminate at the sides; stamens 6-12-15; fr. small and ovoid or long-ovoid. Attractive as young specimens, making good clumps, in trop regions. See Palm.

Lákka. Trunks to 15 ft., slender, smooth: lvs. 4-5 ft. long, grayish or glaucescent underneath; pinnæ about 50, to 1½ ft. or more long, 1½ in. or less broad, gradually long-pointed, with strong midrib and secondary veins prominent; petiole and rachis red: drupe narrowly ovute-conic, attenuate, about 3½ in. long, black with scarlet base; seed ovoid. Borneo.

Rénda. To 30 ft.: fr. ovoid or scarcely elongate, 35 in. long; seed round; otherwise much like C. Lakka. Var. Duvivierianum has bright red rather than dark brownishred petiole and rachis. Sumatra.

CYSTÓPTERIS (Filix).BLADDER-FERN. Polypodiaceæ. Rock-ferns with delicate foliage useful for rockeries and damp rocky protected banks: fronds 2-4-pinnate; sori on back on veins, the indusia disappearing with age: native of the north temp, zone. See Ferns.

bulbifera. BERRY B. BULBLET B. Fronds to 214 ft. long and 5 in. wide, dark green, 2-3-pinnate, long tapering, segms, deeply incised, bearing bulb-like bodies on under surface from which new plants may be propagated. Newf. to Ga. and Ariz.

frágilis. BRITTLE-FERN. Fronds gray-green, to 10 in. long, short-pointed, 2-3-pinnate, segms. deeply cut. Widely distributed and variable; Greenland to Ga. and Ala. and westward, and elsewhere.

CYTHEREA: Calupso.

CÝTISUS. Broom. Leguminosæ. with simple or trifoliolate deciduous or persistent lys., sometimes the branches almost leafless, papilionaceous mostly yellow but sometimes purple and white fls. usually in terminal racemes, and flattened pods; they differ from Genista in the presence of an appendage or slight protruberance on one side of the seed base. Grown out-of-deors where hardy and some forced in the greenhouse for early spring bloom; many of them are very showy.

Brooms succeed in sunny positions in soil not too rich. In the greenhouse they should be kept cool until ready for forcing in January. Propagated by seeds, greenwood cuttangs under glass, layers or grafting.

acutángulus. To 6 in., gray-pubescent, with many stiff sharp-angled branches: lvs. simple, clustered, small: fls. white, solitary or twin, before the lvs. Asia Minor.

Albus (C. leucanthus, C. schipkarnsis, C. lustanicus). To 1 ft.: lfts. to ¾ in. long: fls. yellowish-white to white, in terminal heads, in summer. S. E. Eu. Var. pállidus has pale yellow fls.—Some of the material in the trade under this name is C. multiflorus or C. pracoz.

alpinus: Laburnum alpinum.

Andreanus: C. scoparius var.

Ardoinii. Prostrate shrub to 1 ft.: lfts. 3, linear-oblong. to 1/4 in. long, pubescent: fls. golden-yellow, to 1/4 in. long, usually 1-3 at ends of lateral branchlets: pod to 1/4 in. long, very pubescent. S. France.—Not hardy N.

Attleyànus: C. canariensis var. ramosissimus.

austriacus. To 3 ft.: lfts. to 1 in. long; fls. bright yellow, in terminal heads. July-Aug. S. E. Eu. Var. Heuffelii, a more slender shrub with smaller lfts.

Battandièri. Spincless shrub, branchlets appressed silvery-pilose becoming glabrous: ivs. on petioles 1 in. long, densely silvery-hairy; ifts. broadly obovate, to 1½ in. long, obtuse, often mucronulate: fls. yellow, about ½ in. long, in dense elongated racemes: pod ascending, linear-lanceolate, laterally compressed, to nearly 2 in. long, silveryvillous. Algiers.

Beanii. Hybrid between C. Ardoinii and C. purgans, partly prostrate, to 16 in. high, lvs. simple, linear, to ½ in.

Burkwoodii. Listed as growing to 4-5 ft., fls garnet-red, in long sprays. Probably a hort, hybrid.

canariénsis (Genista canariensis). GENISTA of florists. Evergreen, much branched, to 6 ft.: lfts. to ½ in. long: fls. bright yellow, fragrant, in terminal short racemes,

232 Cutisus

spring and summer. Canary Isls. Var. ramosissimus (C. ramosissimus. C. Attleyanus) has very small lits.

capitatus: C. supinus.

Carlièri: C. nigricans var. elongatus.

ciliatus. Similar to C. hireutus but less pubescent on lvs. and pods. S. E. Eu. Var. Grisebachii (C. ponticus) is more pubescent than type.

Dállimorei. Hybrid between C. multiflorus and C. scoparus var. Andreanus: fis. yellow, tinted with pink, wings crimson.

dalmáticus: Genista silvestris var. pungens.

decúmbens (C. humifusa. Genista prostrata). Prostrate, to 8 in.: lfts. to ¾ in. long: fis. yellow, axillary along branches. May-June. S. Eu.

diffusus. Similar to C. decumbers but nearly glabrous throughout and taller. S. Eu.

elongatus. To 5 ft.: lfts. to 1 in. long: fts. yellow marked with reddish-brown, axillary. Cent. and S. E. Eu.

emerifidrus (C. glabrescens). Shrub to 2 ft., rarely 31/2: Ifts. to % in. long, elliptical-oblong: fis. golden-yellow: pod to 13/4 in. long. Alps.

fflipes (C. palmensis). Branches thread-like: fis. white, fragrant, axillary along the branches, in spring. Teneriffe.

fragrans (Genesia fragrans. Spartocytisus nubigenus). Lits. densely pubescent: fis. white, fragrant, axillary, in spring. Tenerifie.

fülgens: probably C. scoparius var.

glabrescens: the true C. glabrescens is probably not in cult.; see C. emeryforus.

Grisebachii: C. cılıatus var.

hirsùtus (C. leucotrichus). To 2 ft.: lfts. to ¾ in. long, hairy above: fls. yellow, axillary, May-June: pod villous. S. E. Eu.

humifùsa: C. decumbens.

kewénsis. Hybrid between C. Ardoinii and C. multi-florus: procumbent to 1 ft. high: lvs. sometimes simple but usually of 3 lnear-oblong soft-pubescent lits.: fis. creamy-white or pale yellow. ½ in. long, on slender branches. May. Var. púrgans is C. puryans.

Laburnum: Laburnum anagyroides.

leucánthus: C. albus.

leucôtrichus: C. hirsutus.

linifòlius. To 3 ft.: líts. to 1 in. long, silvery-pubescent beneath: fls. bright yellow, in racemes, in spring. Spain, N. Afr., Canary Isls.

lusitánicus: C. albus.

maderénsis. Evergreen, to 20 ft.: lfts. to ¾ in. long: fis. bright yellow, slightly fragrant, in terminal and lateral racemes, spring. Madeira. Var. magnifoliòsus (C. stenopetalus) has larger lvs. and racemes.

monspessulanus. Evergreen, to 10 ft.: lfts. to ¾ in. long: fis. bright yellow, fragrant, in short racemes at the tips of lateral branchlets, in spring. S. Eu.

multiflorus (Spartium multiflorum). WHITE SPANISH B. To 3 ft.: Ifts. to ½ in. long: fls. white, axillary, in spring. Spain, N. Afr. Var. álbus is listed. Var. incarnatus has fls. slightly blushed.

newreyensis: listed name of a form with creamy-yellow and mahogany-red fis., probably a hort. hybrid whose generic position is in doubt as it may be a Genista.

nígricans. To 4 ft.: líts. to 1 in. long: fis. yellow, in long slender terminal racemes. July-Aug. Cent. and S. E. Eu.

Var. elongàtus (var. longespicatus, C. Carlieri) blooms again in fall.

palménsis: C. filipes.

pilòsa: Genista pilosa.

pónticus: C. ciliatus var. Grisebachii.

præcox. Hybrid between C. multisforus and C. purgans: to 10 ft.: lfts. to ¾ in. long: fls. yellow, numerous along the branches, in May. Var. albus, fls. white. Var. luteus, fls. yellow.

prénticus: listed name.

procumbens. Differs from C. decumbens in being more pubescent and growing to 214 ft. high. S. Eu.

proliferus. To 12 ft.: lfts. to 134 in. long: fis. white, axillary, spring and early summer. Canary Isls.

purgans. To 3 ft., much branched: lvs. simple, to 1/2 in. long: fis. yellow, fragrant, axillary. May-July. S. Eu., N. Afr.

purpureus. To 2 ft., procumbent: lfts. to 1 in. long: fis. purple, white or pink in some forms, axillary along the branches, in May. S. Austria. Var. elongatus (var. pendulus), branchlets long and slender. Var. erectus, upright habit. Var. incarnatus is listed assemi-trailing with purple fis.

racemosus (Genista racemosa). Evergreen, to 6 ft.: lfts. to ¾ in. long: fls. yellow, in long racemes, late spring. Probably hybrid.

radiatus: Genista radiata.

ramosissimus: C. canariensis var.

ratisbonénsis. To 6 ft.: lfts. to 1½ in. long: fis. bright yellow, axillary along the branches. May-June. Eu., W. Asia.

ruthénicus of lists is probably C. hirsutus.

sagittàlis: Genista sagittalis.

schipkaénsis: C. albus.

Scoparius (Genista scoparia. Spartium scoparium). Scotch B. To 10 ft.: Ifts. to ½ in. long: fls. yellow, solitary or in pairs in the axils, spring and summer. Eu.; nat. in N. Amer. Var. Andreanus (Genista Andreana) has yellow fls. with dark crimson wings. Var. fúlgens, fls. bright copper-orange. Var. prostratus (var. pendulus) branches prostrate. Var. strictus is of more columnar habit. Var. suecicus is listed as more hardy than type.

sessilifòlius. To 6 ft.: lfts. to ¾ in. long: fis bright yellow, in short racemes at tip of lateral branchlets, in June. S. Eu., N. Afr.

Spachianus (Genista Spachiana). Differs from C. canariensis in its taller habit, obovate-acuminate lfts., and somewhat more elongated racemes. Canary Isls.

spinòsus: confused name.

stenopétalus: C. maderensis var. magnifoliosus.

supinus (C. capitatus. C. uralensis). To 3 ft., twigs villous, sometimes procumbent: lfts. to 1 in. long: fis. yellow fading brownish, in terminal heads, in summer. Eu.

triflòrus (C. villosus). To 8 ft., sts. striate-angular becoming terete: lfts. elliptic to obovate, mucronate, villous beneath, stipules absent: fls. axillary, nodding in clusters of 1-3, spring: pod to 1 in. long. W. Medit. region.

uralénsis: C. supinus.

versicolor. Hybrid between C. purpureus and C. hirsutus: to 3 ft.: fls. with light purple keel, yellowish wings and whitish standard.

villòsus: C. triflorus.

Watereri: Laburnum Watereri.

Wéldenii: Petteria ramentacea.

DABOÈCIA. Ericaceæ. One evergreen heathlike little shrub suitable for rock-gardens but requiring winter protection in the N. It does best in a peaty soil. Propagated by seeds and by cuttings of half-ripened wood under glass. D. cantábrica (D. and Menziesia polifolia). IRISH-HEATH. To 2 ft.: lvs. elliptic, to ½ in. long, shining above, white-tomentose beneath: fls. purple, ½ in. long, nodding, in terminal racemes from June-Oct. W. Eu. In var. **âlba** the fls. are white, atropurpurea deep purple, bicolor (var. versicolor) striped with white and purple, pallida (var. rosea) rose-pink. Var. nana is dwarf with smaller lvs.

DACRÝDIUM. Podocarpacex. Evergreen trees or shrubs with scale-like lvs. or linear on young specimens, dioccious fls., and nut-like seeds surrounded by an aril; about 16 species in the southern hemisphere; grown in Calif. cult. see Conifers.

cupréssinum. RIMU. Tree to 100 ft., with long graceful drooping branches when young: lvs. ½ in. and less long and decurrent in young state, about ½ in. long on mature parts: nutlet about ½ in. long, in an aril. New Zeal.

Franklinii. Huon-Pine. Tree to 100 ft., with short horzontal branches and drooping branchlets: lvs. scale-like and imbricated, about ½4 in. long: cones very small, with 4-8 scales. Tasmania.

DÁCTYLIS. Gramineæ. Tall per. grasses with flat lvs. and spikelets in dense clusters DÁCTYLIS. borne in open branched panicles; native of Eu. and Asia and one grown as hay, forage and pasture grass. See Grasses.

glomerata. Orchard-Grass. Cocks-Foot. To 4 ft., tufted: lvs. to 9 in. long and ½ in. wide: panicles to 8 in. long. Widely nat. in N. Amer. Var. variegata has lvs. striped with silver and may be grown for ornament.

DACTYLÓPSIS. Aizoaceæ. One succulent plant from S. Afr. D. digitata (Mesembryanthemum digitatum). Stemless, forming clumps: lvs. alternate and sheathing at base, cylindrical, to 3 in. long and 34 in. thick, soft and pulpy: fls. solitary, terminal, white, to 34 in. across, the petals stiff and filiform; stigmas 5.

DEDALACANTHUS: Eranthemum.

DÆMÓNOROPS. Palmaceæ. Many palms of trop. Asia and beyond, most of them climbing, probably not successfully grown within our territory. They differ from Calamus in technical characters of spathes and fls.; very spiny.

DAFFODIL: Narcissus.

tender per. herbs, sometimes tall and tree-like in form, much branched, with large under-ground tubers, from mts. of Mex. and Guate-DÁHLIA (Georgina).Compositæ. Strong mala, popular for the showy heads in red, purple, yellow and white, characteristic ornamentals of autumn and late summer: lvs. pinnate to 3-pinnate, differing on the same plant: rays large and showy, pistillate or neutral, now developed into narrow, rolled and quilled forms; heads often full double, compact and ball-like.

Dahlias require a full seasons growth, and if the soil is very rich they may not give much bloom before frost in northern regions; rather open "quick" soil, as a light loam suitable for corn or general garden purposes, produces good results, and any fertilizer that may be employed in the year of cultivation should be quickly available. Water must be supplied freely.

The customary propagation by the home gardener is by planting separately each tuber in the cluster. Care must be taken not to injure the crown. Only one stalk or trunk should be allowed, after danger from cutworms and early accidents is past. The cluster of tubers is carefully lifted in autumn as soon as the bloom is past, dried in the lifted in autumn as soon as the bloom is past, dried in the sum after the tops are removed, and stored in the cellar as are potatoes. The tubers are laid on the side when planted and covered about 6 inches deep. Plants are commonly set about 3 or 4 feet apart. The tall varieties may need staking, as they are likely to be tipped over and broken by wind; but if the tip or center of the plant is pinched out after two or three joints have grown, it may stand alone.

Some of the races of dahlia are grown readily from seeds, which, in the North, may well be started under glass. The single dahlias come well by this method and give good bloom the same year in late summer and autumn. The plants produce tubers, and these may be employed for further propagation, or a new lot may be grown each year from seed.

from seed.

For more rapid propagation and particularly for the perpetuation of named varieties, cuttings may be employed. These cuttings may be made of strong stems, cut just below a joint, or by the sprouting of tubers; in either method, the work should be carried under glass and the young plants kept growing until time for setting out in spring. The stemcutting produces shoots, which should be severed from the cutting when 4 or 5 inches high and treated as independent plants. If roots are employed, they may be placed whole in heat and the shoots taken off and grown independently.

The named varieties are now very many, and there is a special literature about them. Fanciers may be associated with the American Dahlia Society. repetuation of named varieties, cuttings may be employed.

with the American Dahlia Society.

arbòrea: D. excelsa.

coccinea. Rather slender, 3-4 ft., st. glaucous: pinnæ or ultimate lits. ovate-acuminate and sharp-serrate, the rachis narrowly bordered or wingless: rays typically 8 (single), short, broad and nearly or quite obtuse (about 1½ in. or less long), scarlet on upper surface and lighter underneath. Mex.

excéisa (D. arborea). Flat Tree D. To 20 ft. or more, st. somewhat woody and glaucous: ultimate lifts. ovate-acuminate, coarsely few-toothed or practically entire: heads erect, opening flat, 4-5 in. across, rays about 8, purplish or crimson-pink. Mex.—Little known within our limits.

glabrata: D. Merckii.

imperialis. Bell Tree D. Candelabra D. Sts. few. imperians. Bell Tree D. Candelabra D. Sts. few, often single and not greatly branched, to 20 ft., more or less woody: ultimate lfts. ovate, rather sharply and finely serrate or toothed; heads nodding, 4-7 in. across, bright lilac or light reddish, rays about 8 and forming a bell-shaped corolla-like bloom. Mex.—Thrives in S. Calif., and can be fld. in the N. if tubbed and taken inside in

Juarézii. Cactus D. To 4 ft. or so: double or semi-double, most or all the long rays with recurved margins, irregular in length and overlapping, usually brilliant scarlet. Intro. from Mex; commonly said to be a hybrid, but this origin is undetermined; see D. Popenovii.

Máxonii. Tree dahlia, to 18 ft., becoming more or less maxonii. Tree daniia, to 18 it., becoming more of less woody: ultimate lits. lanceolate and conspicuously long-acuminate, dentate: heads erect, rays 8, opening flat, lavender-pinkish or liliac, ovate, to 2 in. long. S. Mex., Guatemala, where it is used for hedges.—Runs into white and also double; has bloomed in S. Calif.

Mérckii (D. glabrata). Bedding D. Slender and glabrous, 2-3 ft., with finely cut foliage: ultimate lifts or segms. 1-2 in. long and nearly as broad, mostly few-toothed or serrate, more or less blunt: heads erect, 1-2 in. across, rays (single) lilac, short and nearly or quite obtuse. Mex.

pinnata (D. rosea. D. variabilis). Common or Garden D. Bush dahlia to 4 or 5 ft.: ultimate pinnæ ovate, crenate-dentate, grayish underneath, rachis more or less winged: heads horizontal or somewhat nodding, 2-4 in. or more across, much doubled and modified and various in color; rays probably originally 8 and rose-color or bilar. Mex.—Now runs into numerous forms in several classes.

Popenovii. A single-fid. bush dahlia, 3-4 ft.: ultimate lfts. or segms. ovate to oblong-ovate, sparsely hairy, dentate: heads erect or at length recurved or nodding, to 3½ in. across; rays 8, single and of the cactus type, long and narrow-revolute, scarlet or cardinal. Guatemala.—Supposed ancestor of the cactus dahlias (D. Juarezii); it has been raised in this country.

ròsea: D. pinnata.

variábilis: D. pinnata.

Zimapánii: Cosmos atrosanguineus.

DAHLIA, CLIMBING-: Hıdalgoa Wercklei. Sea-; Coreopsis (Leptosyne) maritima.

DAHOON: Ilex Cassine.

DAIS. Thymelæaceæ. Deciduous shrubs with simple lvs. and bisexual fls. in terminal heads, the tubular calyx corolla-like; one species is grown out-of-doors in S. Calif. and S. Fla. Propagated by cuttings of half-ripened wood.

cotinifòlia. To 18 ft.: lvs. obovate or oblong, 2½ in. long: fis. pink, fragrant, ¾ in. long, hairy outside, the heads long-stalked. S. Afr.

DAISY: Chrysanthemum. African: Arctotis stæchadifolia, Lonas inodora Barbeton: Gerberia Jamesonu. Blue;
Felicia amilloides. Carmel: Scabiosa prolifera. Dahlberg:
Thymophylla tenuilola. English: Bellis perennis. GlobeGlobularia trichosantha. Michælmas: Aster Orange: Erigeron auruntiacus. Seaside: Erigeron glaucus. Swan River:
Brachycome therulifolia. Tahoka: Macharanthera tanacetfolia. Transvaal: Gerberia Jamesonu. True: Bellis perennis.
Turfing: Matricura Tchihatchewu. White: Layia glandulosa. Yellow: Rudbeckia hirta.

DAISY-TREE: Oleania

DALBÉRGIA. Leguminosæ. Trop. trees or climbing shrubs with alternate pinnate lvs., small papilionaceous fls. in terminal or axillary panieles, and flattened pods; many species furnish valuable timber. Only one intro. into the subtrop. parts of the U. S. Propagated by seeds or cuttings.

Sissoo. Sissoo. Deciduous tree to 80 ft.: lvs. of 5 nearly orbicular abruptly acuminate lfts.: fls. yellowish-white, in short axillary panicles: pods to 4 m. long. India.

DÀLEA (Parosela). Leguminosæ. Herbs or shrubs native to N. and S. Amer., mostly in dry and sometimes desert locations: lvs. pinnate or simple, glandular-dotted: fls. papilionaceous, purple, white or yellow, in spikes or racemes. Sometimes transferred to grounds.

aurea. Per. to 1½ ft., pubescent: lfts. 5-9, to ¾ in. long, silvery, the upper reduced: fls. yellow, in spikes to 3 in. long. S. D. to Tex.

enneándra. Per. to 3 ½ ft.: lfts. 5-11, ½ in. long, glabrous: fls. white, in spikes to 4 in. long. N. D. to Tex.

frutéscens. To 2 ft., shrubby: lfts. 13-17; fls. violet, in spikes to 34 in. long. Tex. to Mex.

Schöttii. To 8 ft., shrubby, somewhat spiny: lvs. simple, linear, to 1¼ in. long: fls. dark blue to purplish, in raceines to 4 in. long. Colorado desert, Calif. to Lower Calif.

spindsa. Smoke-Tree. Characteristic ash-gray shrub or small tree of the Colorado desert, to 25 ft, with few lvs. that soon fall leaving a bare very stiff-spiny effect: fls. violet-purple.

DALECHÁMPIA. Euphorbiaceæ. Trop. monceious shrubs, usually elimbing, with alternate simple lvs. and small fls. without petals borne in dense clusters with 2 colored involueral bracts; one species grown in the greenhouse. Propagated by cuttings.

Roezliana. To 4 ft., erect, much branched: lvs. oblanceolate, 6 in or more long, entire or with coarse teeth above middle: fls yellow; bracts rose, to 2½ in. long, toothed. Mex. Var. álba has white bracts.

per. herb native in N. E. N. Amer., with stature of a violet, sometimes transplanted to the rockgarden or border where it grows well in sheltered positions in rich or woodsy soil. D. rèpens (Rubus Dalibarda). Tufted and creeping, pubescent: lvs. heart-shaped, to 2 in. across, wavytoothed: fls. white, to ½ in. across, 1-2 at tip of scape. June-Sept.

DAMNACÁNTHUS. Rubiaceæ. A small genus of Asiatic shrubs with rigid much branched spiny sts., small subsessile lvs., and white funnel-

shaped 4-5-lobed fls. solitary or in pairs in axils of lvs. **D.** indicus. To 5 ft.: lvs. ovate, $\frac{1}{2}$ - $\frac{3}{4}$ in. long, acuminate, nerves obscure: fls. to $\frac{3}{6}$ in. long, on short pedicels: fr. a small globose drupe to $\frac{1}{6}$ in. diam. E. India to Japan.

DÀNAË. Liliacex. One evergreen shrub native in S. W. Asia and sometimes planted as an ornamental. D. racemòsa (Ruscus racemosus). Alexandrian-Laurel. To 3 ft.: lvs. scale-like, the apparent lvs. being modified branches to 4 in. long and 1 in. wide: fls. white, small, in short terminal racemes: fr. a red berry. For D. androgma, see Semele.

DANDELION (Taraxacum officinale). The common dandelion is often gathered for greens. Improved large-leaved horticultural forms are grown as an autumn and spring vegetable, the plants attaining a large size and the leaves more tender. The seed may be selected from the best field-growing plants, but it is better to purchase the French seed of seedsmen. Sow in spring in well-manured soil, either in drills or in hills I foot apart. A cutting of leaves may be had in September or October, and some of the stools may stand until spring. The delicacy of the leaves may be improved by blanching them, either by the use of boards or earth. The plant is usually not left the second year.

DANGLEBERRY: Gaylussacia frondosa.

DÁPHNE. Thymelæaceæ. European and Asian shrubs, sometimes evergreen, with alternate (unless noted opposite) simple and entire lvs., white, purple or lilac bisexual fls. in short racemes or clusters, often preceding the lvs., and fr. a little drupe; grown out-of-doors or under glass; some of them are very low and good for borders or rockeries. Most of them are hardy to N. Y. and New England.

A well-drained light soil is best or for forced plants a compost of peat and loam. Propagated by seeds sown at once or stratified; by softwood cuttings or the evergreen species by hardwood cuttings taken in fall and carried till spring in a cool greenhouse; or by grafting in winter on seedling stocks or roots. Layers may also be employed; compost should be used in place of soil for 2 or 3 inches about the plant, removed the following spring and the small white buds planted in pots of fine soil.

alpina. From 6 in. to 1½ ft., deciduous: lvs. to 1½ in. long, pubescent: fls. white or pinkish, fragrant, in terminal clusters. May-June. Eu.

altàica. Small deciduous shrub: lvs. oblanceolate to oblong, to $2\frac{1}{2}$ in. long, glabrous: fis. white, little scented, few in terminal clusters. May and June. Siberia.

arbúscula. Shrub to 6 in., differing from D. petræa in its redder branchlets, lvs. to 1 in. long, margins revolute, and fls. to $\frac{5}{6}$ in. across. Hungary.

Blagayana. To 1 ft., evergreen: lvs. to 1¾ in. long: fls. creamy-white, fragrant, in terminal clusters in early spring. Mts. of Eu.

Bürkwoodii (D. Burkwoodii Somerset). Hybrid of D. caucusica and D. Cneorum, a compact bush with oblanceolate or narrowly oblong lvs. and profusion of blush-white fragrant fis. in spring; hardy.

cannábina. To 8 ft, branchlets soon becoming glabrous: lvs. oblanceolate to linear-lanceolate, short-petioled, glabrous: fs. white, purple or yellowish, in terminal and lateral bracted heads, fragrant: fr red or orange. Himalayas.

caucásica. To 5 ft. or more, deciduous: lvs. oblanceolate to lanceolate, to nearly 2 in. long: fis. white, pubescent outside, fragrant, in terminal heads. Caucasus.

Cneorum. To 1 ft., with trailing branches, evergreen: lvs. to 1 in. long: fls. pink, fragrant, in terminal clusters in early spring. Mts. of Eu. Var. álba, fls. white. Var. måjor has larger fls. Var. variegåta, foliage variegated.

collina. Erect shrub to 3½ ft., evergreen: lvs. obovate to oblanceolate, to nearly 2 in. long, smooth above, pubescent beneath: fis. deep rose, to ½ in. across, in 10-15-fid. heads. Italy, Asia Minor. Var. neapolitana (D. neapolitana) lvs. glaucous beneath, fis. fragrant: considered by some as

a hybrid of D. collins and D. Cneorum, but found throughout the range of the typical form.

Dauphinii: D. hybrida.
Fioniana: D. hybrida.
Fortunei: D. Genkwa.

Génkwa (D. Fortune:). To 3 ft., deciduous: lvs. opposite, to 2 in. long: fls. lilac, in clusters along branches of previous year, before the lvs.: fr. white and attractive. China.

Gnfdium. To 6 ft., evergreen: lvs. linear-lanceolate: fls. yellowish-white, fragrant, in terminal panicles. S. Eu.

h\$brida (D. Dauphinii. D. Fioniana). Hort. hybrid of D. odora and D. collina: lvs. to 3½ in. long, elliptic-oblong, usually glabrous beneath: fls. very fragrant.

índica ribra: D. odora var. rubra.

Laurèola. Spurge-Laurell. To 3 ft., evergreen: lvs. oblanceolate, to 3 in. long; fls. yellowish-green, in almost sessile racemes, in early spring. S. Eu., W. Asia. Var. Philippii (D. Philippii) has obovate lvs. to 2 in. long; fls. violet on outside, fragrant. Pyrenees.

Mezèreum. To 4 ft., deciduous: lvs. to 3 in. long: fls. lilac-purple, fragrant, in clusters along branches of previous year, in early spring before the lvs.: fr. scarlet. Eu, W. Asia. Var. álba has white fls. and yellow fr. Var. grandi-flòra has larger fls. Var. rùbra, fls. reddish-purple.

neapolitàna: D. collina var.

odòra. To 4 ft., evergreen: lvs. to 3 in. long: fls. white to purple, very fragrant, in dense terminal clusters, very early. China, Japan. In var. marginata the lvs. are bordered with yellow. Var. álba, fls. white. Var. ribra has wine-red fls. Var. variegata, lvs. edged yellow, fls. pale pink.

oleoldes. To 3 ft., pubescent, evergreen: lvs. elliptic, obovate to lanceolate, to 1½ in. long, becoming glabrous above: fls. white or pale lilac, pubescent outside, about ½ in. long. Medit. region; not hardy N.

petræa. To 6 in, much branched, evergreen: lvs. ½ in. long, margins entire and not revolute: fls. rose, fragrant, to 3% in. across, in terminal clusters, in June. S. Tyrol. Var. grandiflora has larger fls.

Philippii: D. Laureola var.

rethsa. Shrub to 3 ft., evergreen: lvs. oblanceolate, obtuse or more often enarginate, glabrous, to 3 in. long: fls. white, tinged rose or violet, to ¾ in. long, fragrant, in many-fld. terminal heads: fr. red. W. China.

serfcea. Shrub to 2 ft, evergreen: lvs. lanceolate to oblanceolate, to ¾ in long, glabrous above, usually pubescent beneath, crowded at branchlet ends: fls. rose, to ¾ in long, in 3-8-fld. heads. Sicily, Crete, Asia Minor—Plants cult. under this name are usually D. collina, from which this species is distinguished by its shorter lvs. and heads of fewer fls.

striata. Shrub to 9 in.: lvs. oblanceolate, at ends of branchlets: fls. rose-pink, usually 8-12 in terminal heads. Eu.

sures. To 9 ft. or more, sts. ascending, twigs white-tomentose becoming glabrous: lvs. lanceolate to oblong-lanceolate, to 5 m. long, acute, base wedge-shaped, margins somewhat wavy, petiole nearly ½ in. long: fls. ivory-white to 1 in. long, usually 12-20 in fax head, lobes triangular with revolute margins: fr. orange-red, to ½ in. long. India.

DAPHNIPHYLLUM. Euphorbiaceæ. Smooth evergreen small trees or shrubs with simple leathery lvs., diocious fis. without petals borne in axillary racemes, and fr. a 1-seeded drupe.

The one species mostly planted in this country (D. macropodum) withstands several degrees of frost but requires winter protection; it is a small tree or shrub for the southern states and California. Propagated by cuttings or seeds if procurable.

hùmile. To 5 ft.: lvs. elliptic to oblong, to 5 in. long: fr. dark blue. Japan.

macrópodum. To 30 ft. and more: twigs red: lvs. oblong, to 8 in. long: racemes to 4 in. long: fr. black, with a bloom. China, Japan.

DARLINGTÔNIA. Sarraceniaceæ. One per. insectivorous herb native in Calif. and Ore., sometimes grown as a curiosity. It requires a moist cool atmosphere and abundant water at the roots. It may be grown out-of-doors in the N. with winter protection. Propagated by division of roots or by seeds. D. californica (Chrysamphora californica). California (Chrysamphora californica). California Tricher-Plant. To 3 ft.: lvs. or pitchers in basal rosettes, tubular, with an arched white-

spotted hood and a 2-forked appendage: fls. vellowish to dark purple, 1½ in, long, solitary.

DARNEL: Lolium temulentum.

DARWÍNIA. Myrtaceæ. Evergreen shrubs native in Australia and sometimes planted in Calif.: lvs. opposite or scattered, small and entire: fls. red or white, small, sometimes subtended by showy bracts. Propagated by cuttings taken from tips of side shoots, in spring or fall.

citriodora. To 2 ft., diffuse: lvs nearly opposite, oblong to ovate-lanceolate, to $\frac{1}{2}$ in. long: fls. in terminal heads with involucre of bracts slightly colored.

Scheurmannii. Much branched procumbent shrub: Ivs opposite, linear, 12 in. or less long: fis. solitary on very short pedicels in axis.

thymoides. Diffuse and much branched low shrub: lvs. commonly opposite, lanceolate or narrower, margins revolute, 14 in. or less long: fls. in terminal heads of 4-8, the bracts shorter than fls. and soon falling.

DASHEEN: Colocasia esculenta.

DASIPHORA: Potentilla fruticosa.

DASISTOMA: forms known to be in cult. belong to

DASYLÍRION. SOTOL. Liliaceæ. Stiff desert tree-like plants having linear usually spinymargined lvs. and small whitish fls. in dense panieled racemes; useful in desert work, or in formal plantings in dry warm regions; sometimes seen under glass as curiosities. The lvs. are utilized for thatching and baskets, the fiber is made into cordage, the heads are eaten, and an alcoholic beverage is extracted from the trunks. Of easy cult. as for yucca, to which they are related; propagated by seeds and cuttings.

acrótriche. Trunk 3 ft. or more: lvs. to 3 ft. long, ½ in. wide: infl. to 15 ft. high. Mex.

glaucophýllum. Tiunk short: lvs. 3 ft. or more long, ½ in. wide, glaucous: 1aft. to 18 ft. high. Mex.

graminifòlium. Lvs. about 3 ft. long and ½ in. broad, green and glossy, prickles very short and yellowish-white. Mex.

longifòlium: Nolina longifolia.

longissimum (D. quadrangulatum). Trunk to 6 ft.: lvs. 6 ft. long and 1/4 in. wide: infl to 20 ft. high. Mex.

quadrangulatum: D. longissimum.

serratifòlium. Stemless or nearly so: lvs. to 3 ft. long and 1½ in. wide, glaucous. Mex.

texanum. Trunk short or underground: lvs. 2-3 ft. long and ½ in. broad, glossy-green, the prickles yellow turning brown: infl. to 15 ft. high. Tex, Mex.

Wheèleri. Trunk to 3 ft.: lvs. to 3 ft. long and 1 in. wide: infl. to 16 ft. high. Tex., Ariz., Mex.

DASYSTEPHANA: Gentiana.

DATE (Phænix dactylifera). A fruit of very ancient cultivation by the Arabs and others in the arid regions of the Old World, principally northern Africa, where moisture is supplied by spring or underground water or by irrigation. High temperatures are required in the growing and ripening season and rain at harvest time is a decided detriment. The date of commerce is the naturally dried drupe of the palm, borne in heavy clusters. Dates are now grown in considerable plantations in southern California and Arizona, and possibly adapted to some parts of Texas and other regions. The date palm is also widely planted as an ornamental tree in semi-arid tropics and subtropics. When well established the tree withstands several degrees of frost.

The date is diocious,—the male or staminate flowers on one tree and the females or pistillates on another tree. Seedless dates may be produced

without pollination but they are inferior. Although adapted to wind pollination by nature, hand pollination has been practiced for centuries. One male tree to about 100 females is sufficient. This process consists in tying a piece of staminate inflorescence a few inches long, bearing 30 or more flowers, to the female cluster; as not all the female flowers in a cluster open at the same time, this operation needs to be repeated. The time of ripening and characteristics of the fruit can be considerably influenced by the choice of nollen varieties.

Propagation is by seeds and suckers, the latter being the prevailing method for the multiplication of particular or named varieties; and without as careful attention to varieties as with oranges or apples the rewards of date culture are small or negligible. The suckers arise about the base of the tree mostly before it reaches full bearing age. The sex of the sucker will of course be that of the tree from which it arises. The suckers are moved when three to six years old, mostly in spring when the ground is warm, the tops being headed back. Experience is required to assure uniform successful results. The cutting of offshoots extends through the first five to ten years of the mother palms life. If many suckers are removed at one time, it may require two years for the parent to recover, with consequent loss of fruit; and leaving the suckers on the tree also retards fruiting.

Trees grown from suckers should bear first crops in five or six years, depending on soil, location and treatment. At ten to fifteen years the tree should be in full bearing and continue indefinitely, yielding 100 to 200 pounds annually. Trees may be planted about 30 feet apart.

Certain dates under good conditions ripen naturally on the tree, but the fruits are likely to cure unevenly and for the most part the bunches are cut intact and matured in a warm place, not unlike the handling of bananas. Special ripening processes have been developed for superior results.

Many types and varieties, mostly of foreign origin, are grown. In the United States the kinds most commonly planted are Deglet Nur, Saidy, Khadrawi, Hayany and Fard.

DATE, JERUSALEM: Bauhinia monandra.

DATÍSCA. Datiscaceæ. Per. herbs resembling hemp in habit, one sometimes planted for ornament: lvs. alternate, compound: fls. diccious, in clusters or the pistillate in racemes. Propagated by seeds and division

cannábina. To 7 ft.: lvs. pinnate, lfts. 7-11, linear-lanceolate, to 4 in. long, toothed: fis. yellow, small. Asia Minor to India.

DATISCACEÆ. DATISCA FAMILY. Three genera of trees or herbs in Asia, Eu. and W. N. Amer.: lvs. simple or compound: fls. mostly diœcious, of 4-9 sepals, no petals, 4-25 stamens, 1-celled ovary: fr. a caps. Placed near the Begonia family in the systematic schemes, although the plants lack such external resemblances. Datisca is rarely cult.

DATURA (incl. Brugmansia). Solanaceæ. Big bushy coarse erect annuals, or shrubs or small trees, mostly strong-smelling, sometimes grown for ornament, also medicinal: lvs. large, simple, entire or coarsely toothed: fis. large, trumpet-shaped, erect or drooping, red, white,

yellow, violet: fr. a mostly prickly or spiny caps. There are two groups: one with the calyx breaking apart near base and left as cup or crown on the fr. (circumscissile); the other with calyx splitting lengthwise down one side (spathe-like).

The annual daturas are propagated by seeds usually sown indoors in the spring in the North; the perennials from seed and from cuttings, the latter preferably taken with a heal.

mountiaca: D. Metel.

arborea. Angeles-Trumper. Small tree; lvs. ovate-lanceolate, to 8 in. long, soft-hairy, in pairs: fis. white nerved with green, to 9 in. long, hanging, solitary, with musk-like odor; callyx spathe-like: fr. unarmed, 2½ in. long. Peruvian Andes.

ceratocalla. Fleshy, with thick st. and horn-like branches: Ivs. pinnately lobed, mealy beneath; fis. large, erect, white stained blue; calyx spathe-like; fr. more or less pendent, smooth. Aquatic plant of Mex. and Cent. Amer.

chlorántha. Shrub: lvs. broad-ovate: fls. yellow, drooping: fr. prickly. Habitat unknown.—Probably a form of D. Metel.

coccinea: D. De Noteri.

cornigera (D. Knightii). To 4 ft., branches downy: lvs. ovate: fis. drooping, very fragrant at night, white or creamy-white; calyx with a long spur. Mex.

cornucòpia: D. Metel.

De Nôteri (D. coccinea). Probably ann., 3 ft.: fls. fragrant, bright red, freely produced. S. Afr.—Of uncertain botanical identity.

fastudsa: D. Metel.

fèrox. Sts. red at base: lvs. ovate, angled: fis. light blue. S. Eu.

grandiflora: hort. name probably for form of D. Metel.

hùmilis: D. Metel.

inérmis: a form of D. Stramonium with spineless pods. Knightii: D. cornigera.

Mêtel (D. fastuosa. D. cornucopia. D. æguptiaca).
Ann. to 5 ft.: lvs. ovate-lanceolate, to 8 in. long, solitary
or upper ones paired: fis. to 7 in. long, whitish within,
violet outside to yellowish, often double; calyx purple,
circumscissile: fr. spiny, nearly globose, 1½ in. diam.
India; nat. in tropics of both hemispheres. Var. Alba, fis.
white; cærtilea, fis. blue; Huberiana, fis. blue, yellow and
red. D. humilis flava fi.-pl. also belongs here.

meteloides (D. Wrighti). Per. cult. as ann., to 3 ft., grayish-pubescent: lvs. ovate, to 7 in. long: fis. erect, to 8 in. long, white tinged with rose or violet, fragrant; calyx circumscissile: fr. nearly globose, 2 in. across, with sharp spines. Tex. to Calif. and N. Mex.

quercifòlia. Ann. to 5 ft., sts. green, somewhat pubescent when young: Ivs. deeply sinuate-pinnatifid, becoming glabrous at maturity: fls as in D. Stramonium: caps. with prickles to ½ in. long. Mex.

règia: listed name of unknown botanical standing.

sanguinea. Tree-like shrub to 12 ft.: lvs. narrow-oblong, clustered, 7 in. long, soft-hairy, shining green above: fls. droping, to 10 in. long, brilliant orange-red with yellow nerves, not fragrant; calyx spathe-like: fr. unarmed, 3½ in. long, top-shaped; seeds with narcotic properties. Peru.

Stramonium. Jimson-Weed (Jamestown-weed). Ann. to 5 ft.: lvs. ovate, to 8 in. long, lobed: fls. erect, white or violet, 4 in. long; calyx circumscissile: fr. 2 in. long, very prickly. Tropics; nat. in N. Amer.

suaveolens. Tree-like shrub to 15 ft.: lvs. ovate-oblong, to 1 ft. long: fls. nodding, white, to 1 ft. long; calyx spathelike: fr. unarmed, spindle-shaped, 5 in. long. Brazil.—Usually cult. as D. arborea.

Tátula: the purple-fid. form of D. Stramonium. Wrightii: D. meteloides.

DAUBENTÒNIA. Leguminosæ. Shrubs or trees with pinnate lvs., yellow or rose papilionaceous fls. in axillary racemes, and 4-winged or -angled pods; grown out-of-doors in warm climates.

grandiflòra: see Agati grandiflora.

punicea (Sesbania punicea). To 6 ft. or more: Ifts. 12-14, to 1 in. long: fls. red-purple, to 34 in. long, in showy racemes to 4 in. long: pods to 4 in. long, 4 winged. Fls. to Miss., intro. from S. Amer.

Tripètii (Sesbania Tripetii). To 6 ft.: fis. orange-red with scarlet standard yellow-spotted at base, in drooping racemes. Argentina.

DAUCOPHYLLUM: Musineon.

DAUCUS. Umbelliferæ. Herbs with pinnately decompound lvs., small white or yellowish fls. in compound umbels, and ovate or oblong frs.; one grown for the edible root.

Carôta var. sativa. Cultivated Carrot. Ann. or bien., to 3 ft., with thick fleshy orange-colored roots: lvs. finely cut into many narrow segms.: umbels usually globose, thus differing from the flatter umbels of the common wild form, subtended by leaf-like bracts which are pinnately cut into fine divisions. See Carrot.

DAVÁLLIA. Polypodiaceæ. Mostly small trop. ferns of the Old World, with finely divided foliage, chaffy creeping rhizomes that often spread on the surface of the soil or cling over the side of the pot; sori at or near margins of segms. Often grown in hanging-baskets or as fern-balls. Old plants may be divided; ordinarily grown in shallow pans in temperature 60–65°; it is often necessary to fasten the rhizomes down. See Ferns.

affinis: the plant grown in gardens under this name is D. dissecta.

bullâta. Squirrels-foot-Fern. Ball-Fern. Creeping brown-hairy rhizomes: fronds to 10 in. long and 6 in. wide, deciduous, 4-pinnatifid, segms. sharp-toothed, often sold as fern-balls. Malaya, India, Japan.

canariénsis. Rhizomes pale brown, crooked, fronds to 1½ ft. long and 1 ft. wide, 4-pinnatifid, segms. not sharptoothed at apex. Canary Isls. to Spain and N. Afr.

denticulata. Fronds to 2 ft. long and 15 in. wide, 3-4-pinnatifid, leathery and shining. Trop. Asia and Afr.

dissécta. Rhizomes extensively creeping: fronds to 1½ ft. long and 1 ft. wide, 4-pinnatifid, segms. sharptoothed. Java.

élegans: the plant known to hort, under this name is D. dissecta.

fejeénsis. Fronds evergreen, to 1 ft. long, triangular, 4-pinnatifid into linear segms., drooping with age. Fiji Isls. Var. plumòsa is feathery and more gracefully drooping.

Griffithiana. Rhizome creeping, covered with white or yellowish scales: fronds to 1 ft. long and 8 in. wide, 3-4-pinnatifid, segms. to othed or cut. India, S. China.

lùcida: D. solida.

Mooreana: D. pallida.

pállida (D. Mooreana). Fronds to 3 ft. long, on strawcolored stalks to 1½ ft. long, 4-pinnatifid, segms. triangular. Aneiteum and Borneo.

pentaphýlla. Fronds 1-pinnate into 5 or more wavy-toothed segms, to 6 in. long and ½ in. wide. Java, Polynesia.

pyxidata. Fronds about 1 ft. long and 9 in. wide, 3-4-pinnatifid, leathery and shining. Australia.

sólida (D. lucida). Fronds to 2 ft. long and 11/2 ft. across, 3-pinnatifid. Malaya.

tenuifòlia: Odontosoria chinensis.

DAVÍDIA. Nyssacex. One Chinese deciduous pyramidal tree to 50 or 60 ft., hardy as far north as Mass. D. involucràta. Dove-Tree. Lvs. alternate, broad-ovate, to 6 in. long, toothed: fls. monœcious or essentially so, without petals, in dense heads ¾ in. across subtended by 2 unequal creamy-white drooping showy bracts, the larger to 6 in. long, in May or June: fr. a green bloomy drupe to 1½ in. long. Var. Vilmoriniàna differs in having lvs. glabrous instead of silky-pubescent beneath.—Propagated by seeds, cuttings of half-ripened wood, and by layers.

DAVIÈSIA. Leguminosæ. Australian shrubs of the Chorizema group with alternate entire stiff lvs. and yellowish or red fls. having conspicuous bracts.

latifòlia. Large shrub: lvs. orbicular or ovate-lanceolate, to 3 in. long, reticulated: fis. in long axillary racemes.

DAYN-FLOWER, BLUE: Ipomæa Leari.
DAY-FLOWER: Commelina.
DAY-LILY: Hemerocallis.

DÈAMIA. Cactaceæ. A small genus of Cent. and S. Amer., once believed to be monotypic but now divided into 2 or more species, allied to Mediocactus and differing in fls. diurnal with areoles of ovary and fl.-tube hairy.

testhdo (Cereus testudo). Elongated st.-rooting elambering jointed plant hanging from rocks or ascending living trees; joints 1 ft. or more long and to 4 in. diam., wings usually 3, sometimes ribs 5-8; spines 10-25, bristly when young becoming stiffer, to 3/4 in. long: fis. white, to 11 in. long: fir. red, spiny.

DEBREGEÀSIA. Urticaceæ. Shrubs and trees native in Asia and Afr., with alternate toothed lvs., unisexual fls. in clusters and fr. a syncarp composed of small fleshy drupes; one species is sometimes grown as an ornamental in the S. Propagated by seeds or by cuttings of young wood under glass.

longifòlia (D. velutina). To 20 ft.: lvs. lanceolate, to 6 in. long, rough and dark green above, white-tomentose beneath: fr. orange or red, about ½ in. across. S. Asia.

velùtina: D. longifolia.

DECAÌSNEA. Lardizabalaceæ. Two Asian shrubs with odd-pinnate lvs., polygamous fls. in panicled racemes, and fr. of 3 fleshy follicles; one species is grown in U. S., being hardy to N. Y.

Fargèsii. To 16 ft.: lvs. of 6-12 pairs of ovate entire lfts. to 6 in. long, glaucous beneath: fls. greenish, 1 in. long, drooping: fr. blue and bloomy, to 4 in. long. China.

DECIDUOUS: falling, shedding as the leaves of non-evergreen trees.

DECKÈNIA. Palmacex. A single feather-lvd. unarmed palm, **D. nóbilis**, probably not regularly grown in the U. S., allied to Dictyosperma. It grows to a great size; native in the Seychelles.

DÉCODON. Lythracex. One per. somewhat woody herb, native in swamps and about ponds from Me. to Fla. and La., and sometimes planted in wet locations and borders of ponds. D. verticillàtus (Nesxa verticillata). WATER-WILLOW. SWAMP LOOSESTRIFE. Sts. recurved, to 8 ft. long: lvs. to 5 in. long and ½ in. wide: fls. rose-purple, 1 in. across, in axillary cymes. July-Sept.

DECOMPOUND: more than once compound.

DECUMARIA. Saxifragaceæ. Shrubs climbing by aërial rootlets, having opposite lvs. that are deciduous or partially persisting, and small white fls. in terminal corymbs.; hardy in the N. only with protection. Propagated by cuttings of young wood under glass or rarely by seeds.

barbara. Tall climber: lvs. ovate, to 4 in. long, glabrous and shining above: corymbs to 4 in. across. May-June. Va. to Fla. and La. along streams and in low grounds.

DECUMBENT: reclining or lying on the ground, but with the end more or less erect or ascending.

DECURRENT: running down along the stem, as the leaf of mullein.

DECUSSATE: opposite leaves at right angles, therefore in four rows up and down the stem; alternating in pairs.

DEERBERRY: Vaccinium stamineum.

DEER-BRUSH: Ceanothus integerrimus. -Foot: Achlys triphylla. -Weed: Lotus scoparius.

DEERÍNGIA. Amaranthaceæ. Herbs and subshrubs, some of them climbing, with alternate ovate lvs. and inconspicuous fis. in terminal panicles; native in Madagascar, Australia and the Pacific Isls.; about a half dozen species, one sometimes planted for ornament.

amaranthoides (D. baccata. D. celosioides). Woody

climber to 15 ft.: fls. greenish-white: fr. a red globular berry ¼ in. across. Australia; grown in S. Calif. Var. variegata has variegated lvs.

Amherstiana: Rosea Amherstuna. baccata: D. amaranthoides.
celosioldes: D. amaranthoides.

DEGUELIA: Derris.

DEHISCENCE: the method or process of opening of a seed-pod or anther.

DEILANTHE: Cheiridonsis Peersii.

DEINÁNTHE. Saxifragaceæ. Two Asian species related to Hydrangea, one sometimes grown in rock-gardens. D. cærûlea. Per. to 1½ ft.: lvs. 4 at top of st., ovate, to 4 in. or more long, toothed: fls. in terminal panicles, the fertile ones with blue petals and stamens. China.

DELÒNIX. Leguminosæ. African trees with 2-pinnate lvs., showy orange or scarlet fls. in corymbose racemes, calyx-lobes valvate, and great flat woody pods; one very showy species is commonly planted in frostless regions. Cult. as for Cæsalpinia.

règis (Poinciana regia. Casalpinia regia). Royal Poinciana. Peacock-Flower. Flamboyant. Wide-branching tree to 40 ft or more: lits. numerous and small: ils bright scarlet, 3-4 in. across, mostly in summer: pods to 2 ft. long and 2 in. or more broad. Madagascar.—Differs from the true Poincianas in its much larger fis. and the calyx-lobes meeting edge to edge, and not strongly overlapping.

DELOPYRUM: Polygonella articulata.

DELOSPÉRMA. Aizoaceæ. Segregate from Mesembryanthemum (which see for cult.), native in S. Afr.: per., with lanceolate or narrower sessile soft lvs., the branches matted or plant sometimes stemless and with branching tuberous rootstock: fls. either rather small and white or yellow, or in some species large and purple; stigmas 5.

aberdeenense (M. aberdeenense). Plant pubescent, papillose with spreading pubescence, branches crowded, becoming decumbent: lvs to 1 in. long and 35 in. wide and thick: fis. reddish-purple, 32 in. across.

abyssinicum (M. abyssinicum). Shrubby with ascending sts: lvs 1½ in. long, cylindrical, pubescent, papillose: fls rose, small Abyssinia.

Brunntháleri (M. Brunnthaleri). Branches 1 ft. or more high: lvs. spreading, 1½ in long, papillose, edges fringed: fls. violet-rose, 34 in. across.

cùpreum: hort. name.

Davyi. Sts. weak, to 1 ft. long: lvs. to 2 in. long and 1/3 in. wide and thick: fls. white, 1/2 in. across, in loose

echinatum (M. echinatum). Erect or spreading, 1 ft.: lvs to ½ in. or more long, hispid, thick, papillose: fis. solitary, yellowish or white, ½ in. across, on hispid pe-

Ecklonis (M. Ecklonis). Diffuse, more or less trailing: lvs. pubescent but a nearly or quite glabrous form in cult, linear, to 1 in. long, papillose: fls. ½ in. and more across, glistening-white.

Klinghardtianum (M. Klinghardtianum). To 6 in., forming cushions: lvs. $\frac{1}{3}$ in. long, papillose: fls. solitary, white or rose, $\frac{3}{4}$ in. across.

Lèhmannii: probably Corpuscularia Lehmannii.

millefòlium; listed name.

Pátersoniæ (M. Patersoniæ). Shrubby: lvs. 3-angled, ½ in long and ¼ in wide and thick, pubescent: fis. solitary or in 3's, whitish, small.

pergamentaceum. To 1 ft., branches crowded, glabrous: lvs ascending, to 1 % in. long, % in. wide and thick at base, bluntly keeled, glaucous: fis. solitary, white, 1 % in.

robústum. Much branched shrub to 10 in., the branches pale: lvs. usually spreading, to 1 in. long and 1/4 in. wide and thick, keeled on back: fls. reddish-gold above, red below, 34 in. across.

Steytleræ. To 4 in., compact, the branches rough with papillæ: lvs. to 1½ in. long and ½ in. wide and thick: fis. white, 1 in. across, in cymes.

testaceum (M. testaceum). Shrub to 3 ft.: lvs. to 1 in. long and 1/2 in. wide, 3-angled, gray-green and finely papillose: fis. copper-colored, 1/2 in. across, in cymes.

DELÓSTOMA. Bignoniacex. S. American trees or shrubs with simple leathery lys., funnelform 5-lobed fls. in terminal racemes or panicles, and oblong woody frs.; one species is sometimes grown in S. Calif.

ròseum. Lvs. oval or orbicular, to 6 in. long, tomentose beneath: fis. rose or pink, 1½ in. long, in panicles to 8 in. long: fr. dark purple, about 2 in. long. Ecuador, Colombia.

DELPHÍNIUM. LARKSPUR. Ranunculaceæ. Ann., bien. and per. herbs mostly of the north temp. zone around the world, of probably 300 or more species, a number of which are interof more species, a number of which are metricial and showy flower-garden subjects; lvs. palmate, variously cut and divided. The fls. have a large spur; they are mostly blue, but vary to pink, blush and white in garden races; in some they are naturally scarlet and red and in one of the cult. species are yellow. There are double-fid. strains. The showy outer part of the larkspur fl., including the spur, is the calyx (5 sepals). The petals are smaller interior parts, 2 or 4 in number, the upper pair (sometimes united into 1) having spurs that project into the calyx spur; sometimes the petals are small and crowded in the throat of the fl. like a bee, as in some of the common garden kinds. Some of the species are known as cattle poisons. The Latin names are much confused in Delphinium, particularly in hort. material. There is an American Delphinium Society and interest in the group is active.

Many of the species of Delphinium are grown as border or wild-garden perennials, not having been developed into modified or striking horticultural forms. They are sometimes called "botanical" larkspurs, as D. Andersoni, bi-color, Bulleyanum, carolinanum, decorum, exaliatum, Menziesu, scaposum, tricorne, wirvegatum, virescens. Some of these species are native; other natives may be worthy of cultivation but are not entered here unless they have been introduced to gardens. These larkspurs are of simple cultural requirements where hardy. Some of them are spring and early supmer bloomers and then go dormant. spring and early summer bloomers and then go dormant, usually with fleshy or tuberous roots. Others are continuous growers, and bloom in summer and autumn.

Some of the attractive larkspurs are annual, and bloom readily the first year from seed and then perish, as D. Ajacis now much modified and available in many statures and colors, as well as doubles. Other annuals are D. cardiopetalum, Consolida, divaricatum, halteratum, orientale,

paniculatum.

nanculatum.

The man highly developed horticultural delphiniums fall into three groups: (1) Bouquet larkspurs, product of D. grantiforum, short-lived perennials and often treated as biennials, or even as annuals where seasons are long; (2) Garland larkspurs, associated with D. cheilanthum, diffuse open growers; (3) Candle larkspurs, from D. clatum and probably related species, known by the tall commanding habit and the flowers in long thick spikes, the leading group amongst the special delphinium growers and to which most of the garden literature is devoted. A class of red larkspurs, under the name D. Ruusii, has lately

and to which most of the garden literature is devoted. A class of red larkspurs, under the name D. Rujsii, has lately come into prominence, into which the Californian D. nudicaude has apparently entered by means of hybridity. Larkspurs are mostly hardy North, and require no very special attention as to soil and position, but thrive best in open exposure. They come readily from seeds, those of the perennials mostly blooming the year following the sowing. Of the perennial kinds the clumps may be divided in autumn or spring, or cuttings may be made of young shoots in spring or from second growth in summer after the flower-stems have been cut down. Asexual propagation of these kinds is essential in named garden varieties, but otherwise it is well to have fresh stock coming on from seed. As soon as the flowers are gone and before seeding, cut away the flower-stems (unless seeds are desired for sowing); frequently new flower-stems arise and give a second although usually inferior bloom in late summer or autumn. It is well to place sand or sifted coal-ashes about the crowns for winter protection, particularly on moist or heavy soils. for winter protection, particularly on moist or heavy soils. The stately Candle larkspurs of the *D. elatum* type, with long erect spike-like racemes, are suitable for massing and for back borders, while the lower and loosely branching

Bouquet and Garland kinds are adaptable for beds and front borders.

Delphiniums are subject to diseases and insects. Plant Delphiniums are subject to diseases and insects. Plant in uninfected soil and take care not to import diseases in soil that comes with the plants, and do not propagate from infected stock. If the scierotium rot develops, when the leaves become yellow and plant suddenly wilts, the only procedure is to prevent the spread to other plants. The infected stock should be dug up and burned, and the soil should be removed to an area of 18 inches broad and 12 inches deep; and organic matter in the soil should be avoided. Mites are often troublesome on delphinium plants and are difficult to control. Rotenone sprays are promising; the grower should keep in touch with the latest information from the research institutions. from the research institutions.

In the following enumeration the species are perennial unless otherwise stated.

Aiàcis. ROCKET L. Erect branching ann. 1-4 ft., root Algcis. ROCKET L. Erect branching ann., 1-4 ft., root simple or branched: Ivs. finely divided, mostly bunched at nodes: fs. blue, white, violet, pink, in long simple racemes, often double: follicle normally 1 but often more in cult. forms, pubescent. S. Eu.; popular in flower-gardens and somewhat escaped.

albéscens: D. virescens.

alpinum: D. elatum var.

Andersonii (D. Leonardii). Erect to 2 ft. or less, several sts. from thickened root: lvs. to 3 in. or less broad, deeply cleft, slightly harry: fls. deep blue, in open racemes to 10 in. long, spur short and curved at tip: follicles 3. Sierras and other mts., Calif., Nev., Utah.

atropurpureum: D. elatum.

azureum: D. carolinianum; the name is likely to be applied to any blue-fld. hort. kinds.

Bárbeyi (D. subalpinum). Stout and mostly simple, 2-3 ft. and more, usually pubescent: lvs. with few and broad divisions: fls. dark blue, in short and dense raceme, the sepals acuminate and mostly exceeded by the spur, upper petals yellow with blue tinge: follicles 3, glabrous. Wyo., Colo., Utah.—Sometimes planted.

Bárlowii. The plant now grown under this name is of the D. chelanthum group, but the original Barlown figured in 1837 is a very double form regarded as D. elatum X D. grandiflorum, not now in cult.

Belladonna: D. cheilanthum var. formosum.

Bellamdsum: D. cheilanthum var. formosum.

bicolor (D. glareosum). Erect, few-lvd., to 20 in., with thick fascicled root, the narrow lf.-divisions obtuse: fls. blue, in a short open raceme, spur somewhat exceeding sepals. upper petals brownish-yellow: follicles 3, glabrous or pubescent. S. D. north and west.—Sometimes planted in collections.

Brownii. Leafy-stemmed, 3 ft.: lvs. with about 5 divisions and again cleft into acute lobes: fts. dark blue or purple, in a lax raceme, spur straight and less than ½ in. long: follicles 3. Mont. to Alaska.

Brunonianum. Musk L. To 18 or 20 in , musk-scented: lower lys. reniform and 5-parted, upper 3-parted: fis. large, light blue with much darker margins and center, spur very short: follicles 3 or 4. Himalayas.—Little grown.

Bulleyanum. To 4½ ft.: lvs. deeply cut, somewhat pubescent: fls. deep blue, spur strongly hooked or nearly horse-shoe-shaped: follicles 3, lightly pulose. China.— Little grown.

californicum. Coast L. Root tuberous, st. to 7 ft. high, lightly pubescent: Ivs. to 6 m. across, deeply parted and cut: fls. white or whitish, sometimes purplish inside, pubescent, in long dense racemes: follules 3. Calif., near coast.

candelabrum: form of D. Ajacis.

canonuum. Dwart, slightly hairy: lvs. 5-lobed, to 5 in. across, strongly toothed but not much cut: fls. usually 3 on a branch, 2½ in. across, fragrant, white with purple anthers, spur to 2 in. long, ascending and recurved: follicles 3, densely tomentose. Mts. of trop. E. Afr.; recently intro. to N. Amer.

cardinale. Scarlet L. Erect or flexuose, 2-3 ft. and often much more, from branching woody roots, finely pubescent, making long sta: ivs. thick, cut into narrow often linear lobes: fls. long-spurred, in very open racemes, bright scarlet with yellowish petals, sepals often 1/2 in. long: follicles mostly 3, glabrous. S. Calif.

cardiopétalum (D. halteratum var. cardiopetalum). Tap-rooted ann. to 20 in.: lvs. divided into linear or oblanceolate segms: fis. blue, less than 1 in. across, in short terminal racemes, with upwardly projecting spur, petals heart-shaped: follicles 3, nearly or quite glabrous. S. France.

carolinianum (D. azureum of botanists). Erect, 1-2½ ft., pubescent: lvs. cleft into narrow or linear segms.: fls. blue, pedicelled in open racemes, about 1 in. across, the long spur horizontal: follicles 3, pubescent; seeds strongly winged. Ga. south and west. Var. Nortonianum (D. Nor-

tonianum) is a taller plant, more pubescent, with large lvs.: fis. deep bluish-purple, spur ascending. Ozarks, Mo.

cashmerianum. To 20 in., leafy: lvs. cordate-orbicular in outline, broad-lobed and sharply toothed: fis. blue, pubescent, 1-2 in. long, few and showy in a terminal broad or corymbose cluster, the spur shorter than sepals, slightly curved, obtuse or nearly so: follicles 3-5, harry. High Himalayas.—Little cult., but distinct; rock-garden plant.

caucásicum: D. elatum in hort., but to botanists D. anecioaum

speciosum.

cheilánthum. Garland L. Tall, leafy, diffusely much branched above: lvs. with 3 or more deep widely separated mostly narrow divisions (except perhaps the radical ones): infl. open and loose, scarcely spicate; fls. blue, varying to whitish, large and open, at tull expansion usually 1½-2 in. across in cult. forms, lightly pubescent, commonly not horizontal, spur ½-1 in. long and stout and nearly or quite straight, petals open or spreading, blue or full yellow, lower ones barbate and entire or nearly so: follicles 3, glabrous or pubescent; seeds 3-angled winged on margin, not scaly or only slightly so. Siberia, China. Var. formosum is the usual cult. form, with large rich blue fis, to 2 in across. To this var. belong the hort, races Belladonna and Bellamosum; fls. varying to white in var. Moerheimii.

chinénse: D. grandiflorum.

cinereum. Ann. larkspur of Asia Minor with small erect 3-5-lobed lys. and small fis. with long spurs. Probably not in cult., but there has been listed a "cinerea," "cineraria," with large blue spurless fis. that apparently is a sport from D. grandiflorum.

collectinum, collectis: hort. names, probably belonging to D. cheilanthum var. formosum.

columbianum: D. Nuttallii.

Consolida. Forking L. Tap-rooted ann. to 1½ ft., forking rather than racemose: lvs. scattered, with linear divisions: fls. few, terminating the branches, 1 in. or more across, blue or violet: follicle I, glabrous. Eu.—Little cult., the stock usually going under this name being D. Ajacis.

the stock usually going under this name being D. Ajacis.

corymbosum. To 2 ft. or more, pilose, late-blooming; lower lvs. palmatifid or 5-lobed, those on branches deeply 3-parted; fls. pale violet and greenish on back, in a broad infl., spur straight or slightly incurved and about ½ in. long and equalling remainder of fl.; follicles densely pubescent. Mts., Turkestan.

crassifòlium. To 1½ ft., simple, from short thick root, pilose: lvs. mostly basal, thickish, rounded in outline, to 4 in. across, cut to half or more their depth into cuneate lobes: fis. light blue, in open terminal racemes, spur curved: follicles 3. Turkestan, Siberia, China.—Perhaps not now cult. in N. Amer.

cucullatum. Sts. many, to 6 or 8 ft. tall: lvs. like those of D. clatum, 6-7 in. across, pubescent: fls. small, yellowishwhite to somewhat blue, about 3/4 in. long, in a spike-like raceme: follicles 3. Wyo.

cultorum. A collective name proposed by Voss in 1896 for the florist or garden larkspurs, that cannot be readily referred to botanical species; many of them bear double or semi-double fls. The name has been applied to the hort. races of D. chellanthum and D. clatum, and is too diverse to be of much service at present.

dasyanthum. To 1½ ft., leafy, sts. usually simple, more or less pubescent: lvs. about as broad as long, deeply divided, the divisions 3-lobed and cut: fls. pubescent, light blue and splashed, spur short and straight: follicles 3, hairy. Turkestan, W. India.

decorum. Slender or lax., 6-24 in., root a tuberous cluster, nearly or quite glabrous: lvs. few, cut or parted into narrow lobes, the basal ones shallowly cleft into broad segms.: fls. blue, petals tinged yellow, in loose often somewhat panicled racemes; follicles 3, glabrous Cahf.—Little cult.; useful in rock-garden. The name decorum has been applied to a hort. form of the D. elatum group.

Delavayi. Tall and leafy with hairy st.: lvs lobed to base and the lobes variously cut: fis. blue, pubescent, in long narrow racemes, spur about 1 in. long and mucronate: follicles 3. W. China.—Plant so called in cult. is probably one of the elatum ,roup.

depauperatum. To about 18 in., nearly simple, from tuberous root cluster, viscid-pubescent: lvs orbicular to reniform, 1-2 in. across, 3-5-lobed: fls. dark blue to purple, 1½ in. or less long; follicles 3. Ida., Ore., Calif.

dictyocarpum. To 2 ft. or more, leafy, sometimes hairy-pubescent: lvs. 5-7-lobed and the lobes cut: fis. blue, in open branched infl., spur straight: follicles 3, reticulate. Siberia.—Name of plants in cult. likely to be erroneous.

discolor: one of the elatum forms.

divaricatum. Very diffuse mostly simple-rooted ann., to 2 ft. lvs. few, much divided into short narrow segms.: fls. purplish, ¾ in. across, terminal on the branches, spur long and straight and acute: follicle 1, pubescent. S. W.

Dùhmbergii. To 2 ft., leafy, hairy on lower part: lvs. 5-7-parted: fls. blue or white, glabrous, in a straight manyfid. raceme, spur 1½ in. long, straight, bracts usually colored. Russia, Siberia.

colored. Russia, Siberia.

elâtum. Candle L. Bee L. Tall and very erect, to 6 ft. and more, the branches usually fastigiate: lvs. with broad mostly close or contiguous divisions that are sharply cut at the top: infl. a long more or less close spike-like raceme, the fls. on ascending not elongated pedicels; lower bracts very narrow, entire; fls. blue, little or not at all pubescent, usually not opening widely, I in. or less across, spur equally or slightly exceeding the sepals and slender and slightly curved and usually horizontal, petals small and closing the throat, brownish-purple, the lower pair bifid and yellowharbate; follicles 3, lightly pubescent to glabrous; seeds widely winged, not scally. Germany to Mongola.—Presumed parent of the tall larkspurs with elongated spikelike clusters and relatively small fls.; it often persists in old yards. Plants cult. as atropurpureum and caucascum are to be associated here, as also D. palmatum. Var. alphnum (D. alpnum). Leafy up to infl: bracts under lower pedicels divided and spike often leafy. Eu., Asia.

elongatum, Tall, hairy on upper part: lvs. about 7-

elongatum. Tall, hairy on upper part: lvs. about 7-parted, glaucous underneath: fis. dark blue, about ½ in. long: follicles 3. Colo., Alta.

exaltitum. Slender, to 5 or 6 ft., late-blooming, nearly or quite glabrous: lvs. with 3-5 narrow divisions usually cleft or toothed toward apex: fls. blue or purple, 3/4 in. long, in long mostly dense terminal racemes, spur about 1/4 in. long and straight: follicles 3, pubescent. Woods, Pa. to Minn., Neb, Ala.—Seldom planted; not showy.

fissum. Slender, 2-3 ft., pubescent, from thick clustered root: lvs. orbicular in outline, cut to base into many very narrow divisions: fls. azure, with straight spur, in a close terminal spike: follicles 3. S. E. Eu.—Perhaps not now planted in N. Amer.

formosum: D. cheilanthum var. The formosum of botanists, probably not in cult., from the Caucasus, is much like D. elatum, with purple-blue fis. and short spur.

Gayanum: alternative name for D. Ajacis.

Gèyeri. Erect, to 2½ ft.: lvs. mostly near base, much divided into linear lobes: fis. deep blue, sepals ½ ¼ in. long, upper petals yellow: follicles usually 3, pubescent. Colo., Wyo., Utah.—Little planted; one of the cattle poisons.

glaredsum: D. bicolor.

glaucum: D. scopulorum var.

glaucum: D. scopulorum var. grandiflorum (D. chinense. D. sibiricum). Bouquet L. Much branched forked per. but often blooming first year from seeds, to 2 or 3 ft. or more: lvs. cut into many linear segms. making a fine feathery foliage: infl. open, diffuse, and fis. scattered or sometimes short-racemose on ends of main branches and on long spreading pedicels; fis. blue, opening wide, 1-1½ in. across, the slightly curved or straight spur equalling or exceeding the sepals, upper petals color of sepals or sometimes yellowish: follicles 3, pubescent. Siberia. China. Var. álbum, white-fid., and var. pumilum, very dwarf, are listed. Var. nanum, also dwarf.—One of the commonest garden larkspurs.

halteratum. Ann., like D. cardiopetalum but usually less leafy and less forked, and lower petals truncate. Medit. region.

Hánsenii. Mostly 2-4 ft. tall from a cluster of tubers, thinly hairy: Ivs. mostly basal, much divided into narrow parts: fls. pale blue, lavender or pink to white, about 1 in. long, spur curved toward tip, in slender racemes: follicles 3. Cent. Calif.

hespérium. To 3 ft., from woody clustered root, usually simple: lvs. divided into narrow parts: fls. blue to white, in a rather dense raceme, spur straight or nearly so: follicles 3. Calif.

Asin.

hybridum. Hort. name for variants, perhaps hybrids, in the Candle larkspur group, D. elatum; this application cannot hold both because the assemblage is not definable and the name hybridum has earlier usage. The plant mostly known to botanists as hybridum is here included in D. fissum. The hybrid or ameliorated group known to hort, as hybridum may be called D. cultorum although there is no gain to designate it by a Latin name.

intermedium; native plant included in the species

Lamartínii: blue-fid. hort. var. of D. cheilanthum var.

laxifldrum: D. villosum.

Léonardii: D. Andersonii.

leucophaum: D. Menziesii var. ochroleucum.

likiangénse. Small nearly glabrous plant to 8 in. or lecs tall, from long deep roots: lvs. mostly radical, many-parted: fls. blue to lilac, more or less pubescent, nearly bell-shaped, 2-5 on the st., spur straight and thick, about 1 in. long: follicles 3. Likiang Mts., W. China.—Rock-garden or alpin-garden series. alpine-garden.

liteum: color race of D. nudicaule.

Mackianum. Branched, mostly leafy, to 3 ft.: lobes of lvs. blunt and in this respect differing from D. elatum: fis. blue, in panieles rather than spikes, spur straight or curved: follicles 3. E. Siberia.—Plants in the trade under this name are apparently hort, forms of Candle and Garland larkspurs.

macrocéntron. To 5 ft., hairy, leafy below: lvs. 5-7 parted, the lobes acute: fis. large, hanging, hairy, blue-and-green or yellow-and-green with whitish tips, spur very large and erect: follicles 3. High mts., E. trop. Afr.

Ménziesii (D. Nelsonii). Small per. with a cluster of thickened roots although sometimes reaching 2 ft., white-puberulent at least above: lvs. small, cut into linear divipunerment at least above: IVS. Small, cut into linear divisions: fis. blue, 1 in. across, more or less pubescent outside, scattered or few in a loose raceme, spur about equalling the sepals: follicles 3, pubescent or glabrous, spreading. Rocky Mts., B.C., Calif. Var. ochrolecum (D. leucophæum) has cream-color fis. with blue inside. Ore.

Moerheimii: white Belladonna, D. cheilanthum var.

montanum. Low, usually simple, mostly 20 in. or less: lvs. divided to near base, pubescent both surfaces: fls. pale blue, borne few together on ends of branches, spur straight or at apex curved. Mts., S. Eu.—The name montanum in cult. is apparently not this plant.

Nélsonii: D. Menziesii.

Nortonianum: D. carolinianum var.

nudicable. Red L. Slender, to 2 ft., told from D. cardinale by the broad mostly obtuse divisions of the lvs., which are few on the sts.: fis. long-spurred, red, sepals ½-½ in. long, petals mostly yellow: follicles 3, mostly puberulent, becoming glabrous. Calif. Var. lûteum. Fls. pale yellow, often or mostly larger.

Núttallii (D. columbianum). Slender, 6-18 in., with tuberous root: Ivs. small, little more than 1 in. broad, with deep linear lobes: fls. small, in racemes, blue, sepals ½ in. long, upper petals whitish: follicles 3, glabrous. Ore., Wash.

occidentale. Tall, to 3 ft. or more, pubescent in top; lvs. to 6 in. across, 3-7-cleft, pubescent both surfaces: fis. dark blue, viscid, about ¾ in. long, spur straight or sometimes curved at tip: follicles 3. Rocky Mts.

ochroleùcum: D. Menziesii var.

orientale. Ann. much like D. Ajacis but fis. smaller and violet-purple, spur short and declined. Fields, S. Eu., N. Afr., Asia.

oxysépalum. St. simple and erect, 12-20 in., very leafy: lvs. palmately 5-parted into incised lobes: infl. 10-12-fid., racemose; fls. pale blue, spur incurved and shorter than the long-acuminate sepals (about 1 in. long), petals brownish; follicles 3, glabrous or nearly so. E. Eu.

nalmatum: D. elatum.

paniculatum. Much branched ann. to 3 ft. or more: lvs. small, cut into linear parts: fls. blue or blue-violet, 1 in. long, spur straight or upwardly curved, sharp-pointed: follicle 1. S. E. Eu., S. W. Asia.

Párishii. To 30 in. or so, glabrous, simple or nearly so, from a forked thick root: lvs. mostly basal, thickish, 2 in. or less across, twice parted: fls. azure to whitish, about ¾ in. long, spur lightly curved: follicles 3. S. Calif.

Párryi. To 3 ft., mostly simple and very finely pubescent, from a hard straight or forked root: lvs. cut into narrow or even filiform parts: fls. purplish or deep blue, about 1 in. long, pubescent, spur straight or nearly so: follicles 3. S. Calif., in coastal regions.

Penárdii: D. virescens var.

Przewiskii. Little glabrous plant to 10 in. high in its native place: lvs. deeply 3-5-parted, with obtuse lobes: fls. blue, usually terminal, spur straight or nearly so and about ½ in. long: follicles 3, hairy. W. Mongolia.—Rockgarden plant. Name has been misapplied in gardens.

pùmilum: D. grandiflorum var.

Pylzòwii. Dwarf, silky-pubescent, leafy, to 10 in., from a long woody root: lvs. orbicular to reniform, divided, lobes nearly or quite obtuse: fis. deep purple, 2½ in. long, only 1-3 on a st., spur straight or at end curved: follicles 5. Limestone mts., W. China, at high altitudes.—The true plant probably not in cult. with us.

Requiènii. Erect bien to 20 in., nearly simple: lower lvs. 5-parted, upper 3-parted, the segms. oblong or linear; raceme loose, the bracts narrow-lanceolate or linear, peduncies pubescent and bracted at middle; fis. blue, the curved spur about equal to the ovate white-hairy sepals; upper petals pale yellowish usually with bluish tinge; follicles 3. Medit. region.—Sometimes regarded as form of D. Staphisogria, differing in longer spur and bracts on peduncies, and less stature. Name often misapplied.

reticulatum. To 3 or 4 ft., leafy, glaucous on lower part: lvs. pubescent, 3-5-lobed and acutely cleft: fis. small, dark blue and sometimes streaked yellow, viscid, in small racemes: follicles 3. Wyo., Ida.

Rûysii. Derivative from D. nudicaule and hort. races, in many forms. Pink Sensation now introduced and known as the Red larkspur belongs here; this plant is per. with fibrous root, 2 ft. and more high with fl. 1½ in. long standing crosswise, light pink.

scaposum. To 30 in. from clustered hard root: lvs. 2 in. or less across with blunt lobes: fis. dark blue, about 1 in. across, standing crosswise in open raceme, spur short and nearly straight; follicles 3. Colo. to New Mex. and Ariz.

scopulorum. Tall and very leafy, to 4 ft. and more, nearly or completely glabrous, not glaucous: lvs. large, parted into 3 divisions and again cut into sharp points: fis. blue to purplish, about ½ in. long, in spike-like racemes, spur straight or a little curved: follicles 3. Ariz., New Mex. Var. glaucum (D. glaucum). Plant more or less glaucous. High mts., S. Calif. to Alaska.

sibiricum: D. grandiflorum,

simplex. Erect and simple, mostly tall, to 3 ft., pubescent: lvs. divided into linear parts: infl. spike-like and narrow; fls. blue, pubescent outside, sepals obtuse, spur reflexed at tip, upper petals with brownish-white apex: follicles 3, pubescent. Wyo., Ore., Wash.—Seldom cult.

sinénse: D. grandiflorum.

specifosum (D. caucasicum). Much like D. elatum in looks but seeds scaly while in elatum they are only indistinctly wrinkled or puckered; little branched, to 30 in. or more: lvs. hairy-pubescent, 3-parted and then cut into sharp points: fis. blue, 1½ in. or more long, spur bent or hooked; follicles 3. S. E. Asia; plants in cult. may be some of the D. elatum forms. Var. glabratum is glabrous.

spléndens: hort. form of Candle larkspur, D. elatum set.

Staphiságria. Tall stout bien to 3 ft. or more, soft-hairy, st. thick: lvs. 5-7-palmatifid, the segms. broad-lanceolate and acute: raceme many-fid, simple or branched at base, bracts at base of peduncles, the upper ones linear; fis. blue, often greenish-striped, sometimes pale or white, the obtuse spur much shorter than sepals, upper petals whitish and prominent: follicles 3, swollen. S. Eu, Medit. region.—Seldom cult. with us; it yields the drug delphinine.

subalpinum; D. Barbeyi.

sulphureum: the cult. plant is probably D. Zalil.

tatsienense. Much like D. grandiflorum but the infl. tatsienense. Much like *D. granafforum* but the inn. widely corymbose rather than axially racemose; to 2 ft. or more, diffuse; fls. violet-blue, about 1½ in. long, standing crosswise, spur slender and curved or hooked at the end; follicles 3. Tatsien-lou region, W. China; name sometimes but incorrectly written tatsiense .- Grows quickly from seeds.

tenuiséctum. To 3 ft, leafy, from thick more or less woody root: lvs. divided into linear parts: fls. intense blue, in a raceme, spur short and stout: follicles 3. N. Mex., New Mex.

tiroliénse: form or range of D. villosum.

tricerne. Soft-stemmed simple per, 1-3 ft., roots a tuberous cluster: Ivs. with many lobes nearly linear to lance-oblong: fis. blue, lilac, lavender to white, prominently pedicelled in a terminal raceme, 1-1½ in. across, spur about equalling sepals: follicles 3, light-pubescent to glabrous. Pa. to Minn., Ark., Ga.—A semi-succulent species sometimes planted for early spring bloom; often called "staggerweed."

triste. To 3 ft., pubescent, nearly simple: lvs. 3-5-parted and sharply cut: fls. brown to brown-purple, gray-pubescent, about 1½ in. long, spur rather short: follicles 3, densely pubescent. Mts., Siberia.

trolliifolium. Coarse, to 6 ft., leafy: lvs. orbicular in outline, large, 5-7-parted and again cut or lobed: fls.deep blue, small, spur very slender, infl. a long raceme. N. Calif.,

truncatum: hort. var. of the D. elatum group.

tyrolénse: erroneous spelling of D. tiroliense.

uliginosum. About 15-24 in. from a short tap-root, glabrous or nearly so: lvs. mostly basal, later ones parted to the base: fls. blue or pink, about 1 in. long, spur straight or only slightly curved: follicles 3. Calif.

urceolatum. Old name, probably not now represented in our cultures: to 5 ft, leafy: lvs. deeply 5-lobed, cut into acuminate parts: fls. blue suffused dull red, spur somewhat curved: follicles 3. Nativity not recorded.

variegătum. Royal L. Root tuberous; st. simple or branched, to 18 in.: lvs. much parted or divided into oblong mostly obtuse segms., with spreading hairs: fis. royal purple varying to lavender, in a few-fid. loose raceme. Coast ranges, Calif.

vestitum. Tall, to 3 ft., hairy: lvs. divided to middle into 5-7 cuneate crenate lobes: fls. pale blue, densely hairy, spur somewhat curved: follicles 3, hairy. High Himalayas.

villosum (D. lariforum). Tall, erect: lvs. 3-7-parted, the segms. lanceolate-acute: raceme loose, the main bracts oblong or linear; fis. blue, the spur about equalling the

sepals, petals brownish-purple: follicles 3 or 4, pubescent or hairy. Siberia, Turkestan, Russia.

vimineum: a form of D. virescens.

viréscens (D. albescens). To 3 ft. or less, glandular-pubescent on upper part, root clustered and thickened: lvs. 4 in. or less across, divided into many narrow acute parts: fls. white or bluish-white, somewhat pubescent, 1½ in. long, spur straight or curved: follicles 3. Wis. to Mont. and Tex. Var. Penfedii has lower part of st. glandular-pubescent and upper part only pubescent. Neb. to Colo. and Tex

Wéibyl. To 2 ft.: lvs. rather small, 5-parted and the parts acutely lobed: fls. blue, pubescent, 2 in. across, in a short raceme, spur upright: follicles 3. Abyssinia.

yunnanénse. To 3 ft.: lvs. 5-7-parted, orbicular in outline, obtusely but deeply cut-lobed: fs. deep blue, in a long raceme, spur slender: follicles 3, glabrous. W. China, Tibet.—Plants under this name in gardens may be erroneous.

Zalil. To 2 ft., nearly simple, from a thick woody root: lvs. deeply divided into stiffish very narrow acute segms. with recurved margins: fs. primrose-yellow, about 1 in. across, spur nearly or quite straight: follicles 3, glabrous, ribbed. Persia, where known as Zalil; fls. used in dyeing.—
Little known in cult. D. sulphureum of lists appears to be this species.

DELTOID: triangular; delta-like.

DEMAZERIA: Desmazeria. DENDRIUM: Leionhullum.

DENDRÒBIUM. Orchidacex. Epiphytes of various habit and leaf form, the fls. in racemes or sometimes solitary, dorsal sepal and petals often similar, lateral sepals forming a more or less prominent sac or spur, lip entire or 3-lobed. Popular greenhouse orchids: for cult. see Orchids.

acuminatum (Sarcopodium acuminatum). Pseudobulbs about 2 in. high, bearing 2 lvs. to 6 in. long; fls. white or yellow and white (sometimes with red), about 2½ in. across, in loose racemes about 5–20-fld.; lip 3-lobed. Feb.— May. Philippines.

aggregatum. Pseudobulbs about 2 in long, with 1 lf. to 3 in. long; fis. golden- or orange-yellow with deeper colored base to lip, in 3-12-fid. racemes. Mar.-May. Himalayas, Burma, Indo-China, Malaya.

Ainsworthii. Hybrid between D. nobile and D. heterocar mim.

álbo-sanguíneum. Sts. subcylindric, to 1 ft. high, leafy at extremity: lvs. to 6 in. long: fts. in 2-7-ftd. racemes, yellowish-white with 2 reddish-purple spots on lip, about 2 in. long. Apr.-May. Burma.

amplum (Sarcopodium amplum). Pseudobulbs to 2 in. long on a long creeping rhizome: lvs. to 6 in. long and 2 in. broad: fis. white to greenish-brown spotted with darker brown, mid-lobe of lip dark purple, in few-fid. racemes. Trop. Himalayas.

anceps. Sts. to about 3 ft. long, densely covered with distichous triangular-ovate lvs. to 1½ in. or more long; fls. in lateral few-fld. racemes, greenish-yellow, lip sometimes edged with purple. Apr.-May. Himalayas, Burma, Indo-

Armstrongii. Hybrid between D. heterocarpum and D. nobile var. cærulescens.

Ashworthise. Pseudobulbs to 10 in. long, tapering toward base, 2-lvd. at the apex: lvs. ovate-oblong, to nearly 5 in. long, subobtuse, leathery: racemes 4-5-fld.; fis. cream-white, streaked with purple at base of lip, about 2½ in. across. Jan., Apr. New Guinea.

atroviolaceum. Pseudobulbs clavate, to 12 in. high, with 2 apical lvs. to about 5 in. long: fls. about 2-3 in. across, in 2-8-fid. racemes; sepals and petals whitishyellow with violet spots; lip dark violet streaked with white and green on outer surface. Dec.-July. New Guinea.

aurantiacum. Sts. to 24 in. high, cylindric: lvs. to 4 in. long: racemes on leafless sts., 1-3-fld.; fls. golden-yellow. Apr. Himalayas, Burma, China.

aureum: D. heterocarpum.

barbátulum. Sts. to 1½ ft. long: lvs. to about 4 in. long: fls. white, about ½ in. across, in dense 8-15-fld. racemes. Mar. India.

bellátulum. Sts. about 2 in. high: lvs. to 2 in. long: fls. white with an orange or purple-red lip. Nov.-Apr. Indo-China, China.

Bénsonis (D. signatum). Sts. to about 3 ft. high, leafless at flowering time: fls. white, the yellow lip orange-yellow at bese and with purple spots in throat, 2 in. across, 1-3 together. May-June. Siam, Burma.

bigfbbum. Pseudobulbs to 11/2 ft. long: lvs. leathery,

to 5 in. long: fis. purple-red, 2 in. across, in 2-12-fid. racemes to 1 ft. long; lip 3-lobed. Sept.-Nov. Australia.

Brónckartii. Pseudobulbs to 3 ft. long: fis. pale rose with orange spot on lip, 2 in. across, in many-fid. pendulous racemes. Indo-China.

Brymerianum. Sts. to 2 ft. long: lvs. to 5 in. long: fls. golden-yellow, about 2½ in. across, in few-fld. lateral racemes, the lip deeply fringed. Oct.-May. Burma, Indo-China.

burfordiénse; D. dulce.

Calceolària: D. moschatum var.

Cambridgeanum: D. ochreatum.

cariniferum. Pseudobulbs to 10 in. long: fis. 1½ in. across, with white sepals and petals and red-orange lip tipped with white or pale orange, long-spurred. Himalayas, Burma.

chessingtonénse. Hybrid between D. heterocarpum and D. Wiganiæ.

chlorostèle (D. ranthocentron). Hybrid between D. Linawianum and D. Wardianum.

chrysanthum (D. Paztonu). Sts. to 7 ft. long, leafy: lvs. to 9 in. long: fls. 1-6, golden-yellow with 2 dark brown spots on throat, 1-2 in. across, lip toothed. Mar.-July, Sept.-Dec. Himalayas, Burma, Indo-China, China.

chrysodiscus: D. melanodiscus.

chrysotóxum. Sts. clavate or fusiform, to 15 in. long with 3-8 lvs. at the summit: lvs. linear to oblong-elliptic, to 6 in. long: racemes pendulous, loosely 8- or more-fld., about 6-9 in. long; fls. golden-yellow, about 2 in. across, lip orange in throat, fringed. Mar.-July. Burma, Indo-China, China. Var. suavissimum (D. suavissimum) has large chestnut spot on lip.

ciliatum. Sts. to 1½ ft. high: lvs. to nearly 5 in. long: fls. in 5-17-fld. racemes to 10 in. long; sepals and petals greenish-yellow; lip 3-lobed, yellow veined with red, the middle lobe fringed. Oct.-Nov. Burma, Indo-China.

Ccológyne (Sarcopodium Calogyne). Pseudobulbs on a long creeping rhizome, 2 in. high, bearing 2 leathery lvs. to 6 m. long: fl. solitary, large, 2 in. or more wide; sepals and petals yellowish-green densely spotted with purple; lip dark purple. Oct.—Dec. Burma.

crassindde: D. pendulum

crepidatum. Sts. cylindric, to 1½ ft. long: lvs. linear-lanceolate, to 6 in. long: racemes 2-3-fld.; fls. about 1-1½ in. across, white suffused with rose or lilac, center of lpg golden-yellow. Feb.-Mar. Himalayas, Burma, Indo-China.

cretaceum. Sts. thickened, to almost 15 in. long, pendulous: fls. solitary, cream-white with disk of lip yellowish streaked with orange-red or purplish. May-July. Burma, Himalayas, Indo-China.

crumenatum. Sts. to 3 ft. or more long, with basal fusiform pseudobulbous thickening to 6 in. long: lvs. about 4 in. long: fls. lax, solitary on the leafless upper part of the sts., white or pale rose-suffused, with yellow patch on lip. Indo-China, Burma, Malaya, Philippines.

crystfillinum. Sts. to about 1½ ft. long, leafless when flowering: lvs. to 6 in. long. fls. in clusters of 1-3, about 2 in. across; sepals and petals white tipped with rose; lip golden-vellow at base. Apr.-June. Himalayas, Burma, Indo-China.

cupreum: D. moschatum var.

Curtisii. Hybrid between D. Cassiops and D. heterocarpum.

cymbidioides. Pseudobulbs ovoid, 4- or 5-angled, about 1½ in. high, 2-lvd. at the summit: lvs. oblong or elliptic, to 6 in. long, leathery: infl. 6-14-fld., to about 10 in. high, fls. pale yellow, about 1½ in. across; sepals and petals narrowly oblong; lp 3-lobed, white marked with purple and yellow. Feb.-Aug. Java, Sumatra.

Dalhousieanum: D. pulchellum.

Dèarei. Sts. to 3 ft. high: lvs. to 3 in. long: racemes 3-8-fld.; fls. large, white with yellowish-green in center of lip, to 2½ in. across. Dec.-May, July-Aug. Philippines.

densifiòrum. Sts. clavate, to 20 in. high, with 3-5 leathery lvs. about 6 in. long near the summit: fls. pale or golden-yellow with orange-yellow lip, about 2 in. across, in dense many-fid. pendulous racemes to about 9 in. long. Mar.-May. Himalayas, Burma, Indo-China.

Devonlanum. Sts. to 3½ ft. long: lvs. to 4 in. long: fls. about 2 in. across, usually solutary or 2 on leafless sts., white tipped with rose, the fringed lip with 2 large orange-yellow spots. May-Aug. Himalayas, Burma, Indo-China.

dixanthum. Sts. subclavate, to about 3 ft. high: fis. yellow with orange spot on lip, in 1-5-fld. racemes. Burma, Indo-China.

Dominianum. Hybrid between D. Linawianum and D. nobile.

dracònis. Sts. to 18 in. high: lvs. to about 3 in. long: racemes axillary on upper part of st., 2-5-fld.; fls. about 1½ in. across, ivory-white with 3 golden-yellow or orangered ridges on lip. May-July. Burma, Indo-China.

dulce (D. burfordiense). Hybrid between D. heterocarpum and D. Lingwanium.

endôcharis. Hybrid between D. heterocarpum and D. mondiforme (the latter being D. Linawianum).

eriæflörum. Sts. to 14 in. long: lvs. oblong-lanceolate: fls. usually green or greenish-white veined with red, in many-fld. racemes. Himalayas.

eu6smum. Hybrid between D. nobile and D. endocharis.

Fálconeri. Sts. much branched, swollen at nodes, to 3 ft. long: Ivs. to 6 in. long: fls. 2-3 in. across, solitary, white or pale rose tipped with violet, the lip with dark purple throat surrounded by orange-red. May-July. Burma, Himalsyas.

Farmeri. Sts. clavate, to 1½ ft. high: fls. about 2 in. across, in many-fld. pendulous racemes; sepals and petals white, yellowish-white or pale rose; lip golden-yellow tipped with rose. Apr.-June. Himalayas, Burma.

fimbriatum. Sts. cane-like, to about 5 ft. long: lvs. to 6 in. long: racemes pendulous, to about 6 in. long, 6-12-fdd.; fls. to almost 3 in. across, deep yellow; lip orange-yellow, finged. Mar.-Apr. Himalayas, Burma. Var. oculatum has a large dark brown or purple blotch in throat of lip.

Findlayanum. Sts. to 2 ft. long with club-shaped internodes: lvs. 3 in. long: fls. about 2-3 in. across, 1 or 2 together on leafless sts.; sepals and petals white tinged with rose; lip deep yellow in throat fading to white near edges. Feb.—May. Burma.

formosum. Sts. to 1½ ft. high: Ivs. to about 5 in. long: racemes 2-4-fld., near apex of st.; fls. snow-white with center of lip orange-yellow, to 4 in. across. Jan.-May. Himalayas, Burma. Var. giganteum has larger growth and fls. to 5 in. across.

Friedricksianum. Sts. thick, much furrowed: infl. a 3-4-fid. slender arching raceme; sepals and petals light yellow; lip bright yellow with purplish blotch, tomentose at base. Stam.

fusifórme: D. speciosum var.

Goldiei: D. superbiens.

Griffithianum. Sts. fusiform, to 1½ ft. high, furrowed, 3-5-lvd.. infl. a many-fld. pendent raceme; fls. bright yellow, to nearly 2 in. across; sepals oblong, petals nearly orbicular; lip orange, orbicular, fringed. May-June. Burma.

heterocarpum (D. aureum). Sts. stout, to about 30 in. long: lvs. to over 7 in. long: fts. 2½-3 in. across, in clusters of 2 or 3; sepals and petals cream-colored; lip yellow marked with red or reddish-purple. Blooms all year. Himalayas and Ceylon, to Java and Philippines.

Hildebrandii. Sts. slender below, thickened above, to 2 ft. long. If. elliptic-oblong, to 5 in. long: racemes axillary, 3-4-fld.; sepals and petals pale green, whitish-yellow or creamy-pink, the lip yellow, sometimes with 2 brown blotches in throat. Apr. Burma.

Hillii: D. speciosum.

Höllrungii. Sts. leafy, to 2½ ft. long: lvs. ovate-lanceolate to elliptic-lanceolate, to about 6 in. long: racemes densely fld.: fls. yellowish-white, having a lip with a dark green tip. New Guinea.

infundfbulum. Sts. cylindrical, to 2 ft. long: fls. about 3-4 in. across, snow-white with orange-yellow spot on lp. May-Aug. Burma. Var. Jamesianum (D. Jamesianum) has lateral lobes of lip roughened and disk of lip cunabar.

Jamesianum: D. infundibulum var.

Jénkinsii. Plant dwarf; pseudobulbs crowded, to 1½ in. long, 1-lvd.: If. oblong-oval, about 1 in. long: fis. solitary or 2, orange-yellow with darker disk of lip, to 1½ in. across, sepals oval, petals rhomboid much broader. Assam and Burmes

Kingianum. Pseudobulbous sts. up to 6 in. long, with 2-5 lvs. to about 4 in. long: racemes 3-12-fld.; fls. rose or whitish striped with violet, the 3-lobed lip marked with a greenish-yellow callus. Mar.-Apr. Australia.

Linawianum (D. monthforme). Thickened sts. clavate, to 1½ ft. long: fts. in 2's or 3's, about 2 in. across, rosepurple fading to white at base, the lip obscurely 3-lobed. China, Japan.

lituiffòrum. Sts. thickened, to 2 ft. long: lvs. to 4 in. long: fls. 2-2½ in. across, in groups of 1-5 on leafless sts.; sepäls and petals amethyst-purple; lip curved like a trumpet, maroon-purple or violet in throat surrounded by a broad white zone. Mar.—June. Burma.

Lyonii. Similar to *D. acuminatum* from which it differs in larger lvs., longer floral bracts and larger rose-carmine fls. with wine-red'lip. May-June. Philippines.

macrocárpum: listed name.

macrophyllum. Sts. clavate-thickened above, to 1 ft.

high, with 2-3 lvs. to 10 in. long at the summit: fls. about 2 in. across, in 4-many-fid. racemes to about 14 in long; sepals greenish-yellow, petals whitish; lip 3-lobed, greenish-yellow marked with purple. Nov.-Dec. Pacific Isls.

melanodiscus (D. chrysodiscus). Hybrid between D. Findlayanum and D. Ainsworths.

micans. Hybrid between D. Wardianum and D. lituiflorum

monilifórme: D. Linawianum.

moschatum. Sts. cylindric, leafy throughout, to 6 ft. high: lvs. to 6 in. long: racemes to 12 in. long, pendulous, 8-15-fdd.; fls. reddish-yellow with a pair of red-brown spots near the base of the calceolate lip, about 3-4 in. across. May-Aug. Himalayas, Burma. Var. Calceolaria (D. Calceolarua) has smaller more intensely colored fls. Var. cupreum (D. cupreum) has copper-colored fls.

chreum (D. cupreum) has copper-colored fls.

nobile. Sts. cylindrie, nodose, to nearly 3 ft. high: lvs. to about 4 in. long: fls. to about 3 in. across, in 2's (rarely 3's); sepals and petals rosy-purple fading to white at base; lip white tipped with rose and with dark purple throat. Jan.—June. Himalayas, Burma, China. Runs into various color forms, such as: album with pure white sepals and petals; Amesiæ with large pure white fls. and lip with maroon disk; Arnoldianum; Ashworthianum with greenish-white fls.; Ballianum with pure white fls. slightly tinged with rose-pink on disk of lip; Cooksonianum with petals colored like the lip; murrhinlacum, fls. white tinged with violet, the throat deeper; nobilius with larger deeper colored fls; Owenianum; Rothwellianum; Sanderianum, sepals and petals intense rose-purple, lip rose with large black-purple spot surrounded by narrow white zone; summiténse; virginale, with pure white fls. slightly tinged with primrose on lip. on lip.

ochreatum (D. Cambridgeanum). Sts cylindric, nodose, to 12 in. long: racemes short, 1-3-fld.; fls. 2-3 in. across, rich golden-yellow with chestnut or purple throat to the lip. Mar.-May. Himalayas, Burma.

Owenianum. Hybrid between D. Linawianum majus

and D. Wardianum

Párishii. Sts. thickened, to 1 ft. long: lvs. to 5 in. long: racemes 1-3-fid; fts. rose to lilac-purple, with a pair of dark purple blotches in the throat of the lip, about 2 in. across. May-July. Burma.

Páxtonii: D. chrysanthum.

pendulum (D. crassnode). Sts. cylindric, nodose, to 2 ft. long: Ivs. to about 5 in. long: racenies short, 1-3-fld.; fls. to 2½ in. across, white tipped with purple, the lip with a yellow throat surrounded by a white zone and tipped with purple. Burma.

Phalemópsis. Sts. 2 ft. or more high: racemes to 2 ft. long, 4-18-fid.; fls. to over 3 in. across, rose, purple or whitsh-rose with dark purple throat to the lip. May-Nov. Australia to New Guinea and Timor. Var Schroederianum has white sepals and petals, and lip deep violet or white. Var. Statterianum has deep violet fls.

Pierardii. Sts. cylindric, to 3 ft. long: lvs. to 5 in. long: fls. to 2 in. across, in 2-3-fld. racemes; sepals and petals pale rose; lip whitish-yellow with carmine or purplish lines at base. Feb.-May. Himalayas, Burma, China. Var. latifolium has broader lvs and sts.

Pitcherianum (D. Rolfex). Hybrid between D. nobile and D. primulinum.

platycaulon. Pseudobulbs strongly compressed, to 7 in. long, bearing 3-5 lvs. to about 6 in. long; fis. straw-colored, in short 3-6-fld. racemes. Philippines.

plumptonénse. Hybrid between D. Cybele var. nobilius and D. nobile var. nobilius.

primúlinum. Sts. cylindric, to 18 in. long: lvs. to 4 in. long: racemes 1-2-fid, on leafless sts.; fls. to 3 in. across; sepals and petals pale rose or pale lilac; lip primrose-yellow with purple-striped throat. Feb.-May. Himalayas, Burma, China.

pulchéllum (D. Dalhousieanum). Sts. cylindric, to 4 ft. long: racemes pendulous, 6-12-fld.; fls. about 3 5 in. across, pale yellow tinted with rose, with a pair of large dark purple spots in throat of the lip. Mar.-May. Himalayas, Burma, Indo-China.

'ramòsum. Pseudobulbs slender, to 20 in. tall: fls. solitary or in 2's, pale printrose-yellow; lip 3-lobed, the lateral lobes white streaked with rose-purple. Himalayas.

règium. Sts. cylindric, to 12 in high: lvs. to 4 in. long: racemes 1-3-fid.; fis. about 3-4 in across; sepals and petals rose edged with cream-white; lip rose with golden throat. July. India.

Roeblingianum. Hybrid between D. nobile and D. Ruckeri (the latter being D. ramosum).

Rolfes: D. Pitcherranum.

rubens. Hybrid between D. Ainsworthii and D. nobile.

Sánderæ. Very similar to D. Dearei but with larger fis. having a purplish striped throat to the lip. May-Aug. Philippines.

Schneiderianum. Hybrid between D. Findlavanum and D. heterocarpum

secundum. Sts. cylindric, to 40 in. high: lvs. to almost 5 in. long: racemes densely many-fid., secund; fis. rose with orange-yellow disk to the lip. Blooms all year. Burms, Indo-China, Pacific Isls.

Seymouriæ. Hybrid of unknown parentage.

signatum: D. Bensoniæ.

speciosum (D. Hillin). Sts. clavate, to 14 in. long, with 3-4 lvs. to 12 in. long: racemes many-fld., to 30 in. long; fls. straw-color or yellow with white lip spotted with red or violet. Feb.—Mar. Australia. Var. fusiforme (D. fusiforme) has fusiform sts.

spectabile. Pseudobulbs erect, clavate or fusiform, to about 16 in. high, 2-5-lvd.: terminal racemes of about 12 fls. or less; fls. to about 3½ in. across; sepals and petals greenish-yellow veined with deep reddish-brown or violet; lip whitish-yellow with more intense purplish veining. Jan.—Apr. New Guinea.

splendidíssimum. Hybrid between D. heterocarpum and D. Findlayanum.

suavissimum: D. chrysotoxum var.

supérbiens (D. Goldiei). Sts. cylindric, to 3 ft. or more high: racemes nodding, loosely many-fid; fis. about 2 in. across, crimson-purple with white ridges on lip. Sept.— Nov , Apr. Australia.

supérbum. Sts. cylindric, to 4 ft. long: fls. rose-purple with 2 large dark purple spots in throat of lip, to 4 in. across, solitary or in 2's (rarely in 3's). Jan.-Apr., Oct. Borneo, Celebes to Philippines. Var álbum has white fls. with pale purple lip. Var. Dèarei has pure white fls. with faint yellow flush on lip.

tetragonum. Pseudobulbs slender, club-shaped, pendulous, 4-sided, to 16 in. long, usually 2-lvd, at the summit: lvs. elliptic-lanceolate, acute, to 4 in. long: racenes 1-3-fld.; fls. to 4 in. across; sepals and petals yellowish spotted or suffused with reddish-brown; lip cream-white, transversely, barred with red and strongly recurved. Nov. Australia.

Thwaitesiæ. Cross between the hybrids D. Ainsworthii and D. Wigania.

thyrsiflorum. Perhaps only a form of *D. densiflorum* with longer rounded (not angulate) sts. and white sepals and petals. Burma.

Tôftii. Pseudobulbs 4-5 ft. tall, fusiform, with purple ribs: fts. in racemes to 1)4 ft. long; sepuls and petals whitish, the latter lined with violet; lip whitish, veined and suffused with violet. Australia.

tortile. Pseudobulbs or sts. club-shaped, to 12 in. high, 2-3-lvd.; lvs. oblong, obtuse, to about 4 in. long; fls. in 2's or 3's from the nodes, to 3½ in. across; sepals and petals white tinged with rose; lip lemon-yellow with purple streaks at base. June-July. Burma. Var. rôseum has sepals and petals rose.

undulatum. Sts. to 4 ft. high racemes to over 1½ ft. long, many-fld.; fls. about 2 in. across, yellowish-brown, lip lined with reddish-brown or violet, sepals and petals twisted. June, Sept.-Nov. Australia.

Veitchii. Hybrid between D. mondiforme and D.

Wardianum. Sts. cylindric, nodose, to about 3 ft. long: lvs. to 5 in. long: fls. in clusters of 2-3, on leafless sts., to 4 in. across; sepals, petals, and lip white tipped with rosepurple, lip with a yellow throat marked by 2 dark purple blotches. Feb.—May. Himalayas, Burma.

Wiganiæ. Hybrid between D. nobile and D. signatum (the latter being D. Bensonia).

Wiganiæ aureum is said to have the same parentage as D. Wigania.

xanthocéntron: D. chlorostele.

DENDROCÁLAMUS. GIANT BAMBOO. Graminex. Tree-like bamboos of S. Asia and Malaya, the spikelets borne in globose clusters or heads in long panicles, stamens 6. See Bamboo.

Hámiltonii. To 80 ft.: lvs. to 15 in. long and 21/2 in. wide, rough on edges: heads many-fid., to 11/2 in. across, in branching panicles. Himalayas.

latifiòrus. Tall: Ivs. to 10 in. long and 2 in. wide: heads few-fld., about ¾ in. across. India, Cochin-China.

membranaceus. To 80 ft.: lvs. to 10 in. long and ¾ in. wide: heads many-fld., 1 in. across. India.

strictus. Male Bamboo. To 50 ft., sta. becoming yellowish: lvs. to 1 ft. long and 1½ in. wide: heads many-fid., 1½ in. across. India, Java.

DENDROCÈREUS Cactaceæ. Monotypic genus from Cuba. D. nudiflòrus. Tree to 35 ft. Monotypic

with woody trunk to 3 ft. long and much branched top, although small plants may be erect or becoming bushy or semi-prostrate; branches weak when young; ribs 3-5, acute and wing-like, short-jointed, to 3 in. high on large branches; arcoles woolly, 1/4-2 in. apart; spines, when present, in clusters of 2-15, to 13/4 in. long, black-tipped, needle-like: fls. greenish-yellow outside becoming white at center, to 5 in. long, nocturnal and short-lived: fr. subcylindric. green, to 6 in. long, with rind to 5% in. thick.

DENDROCHILUM (Platuclinis). acex. Epiphytes with small pseudobulbs bearing 1 narrow evergreen lf. and small fls. in long often pendulous racemes, sepals and petals similar, the lip 3-lobed. Warmhouse plants; for cult. see Orchids.

Cobbianum. To about 20 in. tall: fls. whitish or yellowish with orange-yellow lip, about ½ in. across, in long-stalked racemes. Apr.-Nov. Philippines.

cucumerinum. Lvs. to almost 5 in, long and 1/2 in, wide: fis. very small, green and transparent. Hab.?

flifforme. Lvs. 6 (rarely 8) in. long: scape to 18 in. long: fis. numerous, minute, less than 1/4 in. across, greenishyellow or greenish-brown. Mar.-July. Philippines.

glumaceum. Fls. white to yellow, about ½ in. across, in long-stalked racemes. Aug.-June. Philippines.

latifolium. Lvs. to about 17 in. long including petiole: fls. whitish, greenish-yellow or orange, about ½ in. across, in long-stalked racemes. Feb.-July. Philippines.

uncatum. Similar to D. glumaceum from which it differs in its somewhat smaller habit and in having the arms of the column near the middle (not basal). Sept.-Jan., May-July. Philippines.

DENDROMÈCON. Papaveracex. One Californian glabrous evergreen shrub planted for ornament in warm climates. Propagated by seeds which are very slow in germinating.

D. rígida. Bush-Poppy. Tree-Poppy. To 10 ft.: lvs. leathery with prominent veins, lanceolate to ovate-lanceolate: fls. golden-vellow. 2 in. across: fr. linear, to 4 in. long.

DENDROPANAX: Gilibertia japonica. DENDROPOGON: Tillandsia usneoides. DENEA: Howea Forsteriana.

DENMÒZA. Cactacex. Founded as a monotypic genus. D. rhodacántha (Echinopsis rhodacantha. Cereus rhodacanthus and erythrocephalus. Pilocereus erythrocephalus). Globular when young but becoming 5 ft. high; ribs 15-30, areoles close together on old plants and with long bristle-like spines; spines 6-12, white or reddish, 1½ in. long: fis. at top of plant, scarlet, 2 in. long, stamens red and exserted. Argentina.— The plant advertised as D. smaragdiflora is probably Cleistocactus smaragdiflorus.

DENNSTAÉDTIA. CUP-FERN. Polypodiacex. Large or medium-sized ferns with 1-3-pinnate fronds, hairy creeping rhizomes and marginal sori; native in the tropics and subtropics, one in N. N. Amer. Of easy cult.; see Ferns.

adiantoides. GLossy C. Fronds to 4 ft. long and 3 ft. wide, 3-pinnate, glabrous and shining, on bright brown stipes to 3 ft. long. W. Indies, N. S. Amer.

supes to 3 ft. long. W. Indies, N. S. Amer. cicutaria (Dicksonia cicutaria. Stolobium cicutarium). Common C. Fronds to 6 ft. long and 3 ft. wide, 4-pinnate, shining and glabrous, on yellowish-brown stipes to 3 ft. long. W. Indies, N. S. Amer. punctilóbula (Dicksonia pilosiuscula and punctilobula). HAY-SCENTED-FERN. Hardy: fronds to 3 ft. long and 9 in. wide, 3-pinnate pubescent beneath. N. S. to Ga. and Ark.—Sometimes planted in the wild-garden.

DENTÀRIA. TOOTHWORT. Cruciferæ. Little spring-blooming woods herbs of the northern hemisphere, useful in the wild-garden, rock-garden, and for colonizing: per., with toothed or scaly rootstocks, and few divided or compound lys. high on st., the radical lys. often of different character: fls. white, rose or purple, in terminal corymb-like racemes: fr. or silique elongated and beaked.

califórnica: D. integrifolia var.

digitàta: Cardamine pratensis.

diphylia. Erect, 6-12 in. from a long continuous root-stock: st.-lvs. mostly 2 and opposite, ternate, the divisions or lifts. ovate and toothed or shallowly lobed: fls. white, in a glabrous cluster. N. S. to Minn. and S. C.

heterophfila. To 14 in., rootstock jointed near surface: basal lvs. trifoliolate, lfts. ovate, obtusely toothed; st.-lvs. linear to lanceolate, to 1½ in. long, entire or shallowly dentate: fls. light purple, to 1 in. across: fr. about 1 in. long. Mts. of N. J. to Ga.

long. Mts. of N. J. to Ga.

integrifòlia. Milk-Maids. To 20 in.: basal lvs. simple
to trifoliolate, segms. ovate to reniform, to 2½ in. long; st.lvs. 3-5-foliolate, segms. orbicular to linear: fls. white, to
½ in. across, in simple racemes, style to ¼ in. long. Calif.
to Ore. Var. californica (D. californica) has larger and
denticulate lvs. which are often purplish beneath with
white to pale rose fls. Var. Tracyi (D. Tracyi) has smaller
lvs. which are dark purple beneath and smaller deep roseroll fle. pink fls.

laciniata. To 1 ft. or so from a jointed rootstock: st.-lvs. commonly 3, approximately verticillate, the divisions very narrow: fls. white or purplish, in a somewhat pubescent cluster. Que. to Minn. and Fls.

macrocarpa. Differs from D. integrifolia in having style to 1/4 in. long: fis, rose-purple, Calif. to Ore.

tenella. To 18 in., rootstock tuberous: basal lvs. simple, cordate-orbicular, to 1½ in. long, crenately or sinuately lobed; st.-lvs. trifoliolate, segms. narrow and entire, to 1½ in. long: fis. rose-purple, in short racemes. Ore, Wash.

Tràcvi: C. integrifolia var.

DENTATE: with sharp spreading rather coarse indentations or teeth.

DÉRRIS (Deguelia). Leguminos x.woody climbers with alternate pinnate lys., papilionaceous purple or white fls. in racemes, panicles or clusters, and flattened pods; some-times planted out-of-doors in warm regions.

The deris-root of commerce, used as a contact insecticide, is obtained from the roots of three species (D. elliptica, D. uliginosa and D. malaccensis) of which the first is reported to yield the greatest quantity of the active ingredient, rotenone. These species are cultivated largely in the Malay States and the East Indies for their rotenone-containing roots. A secondary source of rotenone comes from the South American plants Lonchocarpus Nicou, L. Lincus and Tenhresis torrogies. Urucu and Tephrosia toxicaria.

scândens (D. timorensis). Malay Jewel Vine. Lvs. of 9-18 oblong lifts. to 2 in. long: fis. pale rose, in axillary racemes often twice as long as lvs.; pods to 3 in. long. Malaya, China, Australia.

timorénsis: D. scandens.

DESCHÁMPSIA. HAIR-GRASS. Gramineæ. Ann. or per. grasses with glossy pale yellow to purplish 2-fld. spikelets in narrow or open panicles, differing from Aira in the lemmas tapering into the slender teeth and not truncate. One species, D. flexudsa (Aira flexuosa), CRIN-KLED H., is occasionally grown for ornament. Per. to 21/2 ft.: lvs. involute, 3-6 in. long: panicles to 8 in. long, open, the branches flexuous. Eu., E. N. Amer.—A form with variegated foliage is sometimes grown.

DESERT-CANDLE: Eremurus.

DESFONTAÎNEA. Loganiacex. One glabrous little shrub in the Andean regions of S. Amer., intro. in Calif. D. spinosa. To 3 ft., with opposite coriaceous spiny-tooth holly-like elliptic-oblong lvs.: fls. tubular, scarlet and yellow, terminal, with 5-lobed somewhat trumpet-shaped corolla, and 5 stamens: fr. a globose or ovoid berry.

DESMANTHUS (Acuan). Leguminosæ. American per. herbs or sometimes shrubs with bipinnate mimosa-like lvs. and small regular greenish or whitish fls. in heads or spikes; one species is rarely offered.

brachflobus: D. illinoensis.

illinoénsis (D. brachylobus. Mimosa illinoensis). To 3 ft.: lfts. numerous and very small: pods in dense heads, oblong, to 1 in. long, curved. Ohio to Fla. and New Mex.

DESMAZÈRIA (erroneously spelled *Demazeria*). Graminex. Ann. and per. grasses with flattened many-fld. spikelets borne in spikes; one is sometimes grown for ornament. In 1822 Dumortier published the genus Demazeria but in 1823 corrected it to Desmareria, in honor of his friend and agrostologist Desmazières. See Grasses.

sícula (Brizopyrum siculum). SPIKE-GRASS. Ann. to 1 ft.: lvs. to 6 in. long and ½ in. wide: spikelets to ½ in. long, in spikes 2-3 in. long. Medit. region.

DESMÒDIUM (Meibomia). TICK TREFOIL. TICK CLOVER. Leguminosæ. Herbs, often woody at base, with lvs. mostly of 3 lfts, small papilionaceous fls. in racemes or panicles, and flat pods consisting of several joints which separate readily and often adhere to clothing like burs. They are sometimes transferred to borders and the wild-garden. Natives in dry woods and fields.

bicolor: Lespedeza bicolor.

bractedsum: D. cuspidatum.

canadénse. Per. to 8 ft.: lfts. oblong or oblong-lanceolate: fls. purple, to ¾ in. long: pods 1 in. long, 3-5-jointed. N. S. to N. C. and Okla.

ciliàtum: Rhunchosia nuberula.

cineráscens. Procumbent per., sts. to 4 ft. long, gray-pubescent: lfts. elliptic-oblong: fis. purple, about ½ in. long. pods 6-8-jointed. Mex.

cuspidatum (D. bracteosum. Meibomia grandiflora). Erect per. to 5 ft.: Itts. to 6 in. long, ovate-lanceolate, glabrous: fls. lilac-purple. Me. to Minn., south to Fla. and Tex.

Dillènii. Per. to 3 ft.: Ifts. oval to oblong-ovate: fls. purple, ¼ in. long: pods to 1 in. long, 2-4-jointed. Ont. to Fla. and Tex.

floribundum (D. sambuense). Sts. woody: lfts. obovate-oblong: fls. purple, ½ 1n. long: pods to 1 in. long, 6-8-jointed. Himalayas.

formosum. Plant erect, pubescent, sts. angular: Ifts, nearly sessile, ovate to oblong, rarely glabrous, apex emarginate to mucronulate, occasionally white-spotted: fls. purplish-pink, in axillary racemes. China.

gangéticum (Hedysarum gangeticum). Per., sts. woody, ascending or erect, to 4 ft. high, hairy above: lfts. oblong, 3-6 in. long, acute, stalked: fls. 1/4 in. long, in lax racemes to 1 ft. long, short-pedicelled: pods falcate, to 1/4 in. long, 6-8-jointed. Old World tropics. A dwarf form growing to 1 ft. high with obtusely cordate lfts. to 1 in. long is var. maculatum.

gyrans: D. motorium.

japónicum: Lespedeza japonica.

marylándicum. Per. to 3 ft.: lfts. ovate or orbicular: fis. purplish, ½ in. long: pods very small, 1-3-jointed. Ont. to Fla. and Tex.

motorium (D. and Codariocalyz gyrans). Telegraph-Plant. Per. to 4 ft.: terminal lft. oblong, the lateral ones very small and moving in all directions: fls. purple or violet, ¼ in. long: pods to 1½ in. long, 6-10-jointed. Trop. Asia.—Grown as a curiosity in greenhouses. Treated as an ann. Propagated by seeds.

nudiflorum (Meibomia nudiflora). Erect to 3 ft.: Ifts. oval, pale green beneath, nearly glabrous: fls. rose-purple, in few-fid. narrow panicles. July-Aug. Que. to Minn., south to Fla. and La.

penduliflorum: Lespedeza Thunbergii.

purphreum (D. tortuosum). Beggarweed. Per., but grown as ann., to 8 ft.: lits. ovate or oblong: fis. blue or purple, 1/6 in. long: pods to 1 in. long, twisted, 2-6-jointed. W. Indies.—Grown in S. U. S. as a forage and cover-crop. Seeds should be sown on rather moist land, in spring. No care will be needed after first year as it will reseed itself.

rigidum. Per. to 3 ft., stiff: lfts. ovate or oblong: fis.

purplish, to $\frac{1}{16}$ in. long: pods very small, 1-3-jointed. N. H. to Fla. and La.

sambuénse: D. floribundum.

tiliæfðlium. To 7 ft., sts. woody: lfts. obovate, to 4 in. long, long-petioled: fls. purple, ½ in. long, Aug.—Oct.: pods to 3 in. long, 6-9-jointed. Himalayas.

tortudsum: D. purpureum.

DESMÓNCUS. Palmaceæ. Climbing or clambering monoccious very spiny palms of the American tropics, of the Bactris relationship; probably not established in our territory.

DESMOTHAMNUS: Luonia lucida.

DETÀRIUM. Leguminosæ. Trop. African trees with pinnate lvs., small fragrant white fls. without petals borne in panieles, and pod round and indehiscent resembling a drupe; one species has been intro. into S. Fla. for ornament and interest.

senegalénse. Lita 6-12 or more, ovate-oblong, to 3 in. long; panicles to 6 in. long; pods to 214 in. across.

DEÙTZIA. Saxifragacex. Attractive and popular floriferous shrubs with opposite usually deciduous serrate lvs. and white, blush or purplish fls. mostly in panicles and racemes in early summer; native in E. Asia and the Himalaya region. Most of them are hardy N.

Deutzias thrive in any well-drained soil. Potted plants may be forced in a temperature of not over 50° for conservatory and greenhouse decoration, but they cannot be forced again. They are propagated by both greenwood and hardwood cuttings, also by divisions, layers, and by seeds sown in boxes or pans in spring.

candelabrum. Hybrid between D. gracilis and D. Sie-boldiana, having ovate-lanceolate lvs. and fis. in panicles. Var. fastuosa (D. gracilis fastuosa) does not differ materially from the type.

cándida. Hybrid between D. Lemoinci and D. Siebold-iana, having oyate lys. and fis. in panicle-like corymbs.

candidíssima: D. scabra var.

corvmbifldra: D. setchuenensis var.

crenata: D. scabra.

discolor. To 6 ft.: lvs. oblong-lanceolate, to 4 in. long, densely hairy beneath: fls. white, ¾ in. across, in many-fld. corymbs. Cent. China. Var. candidissima has pure white fls.; var. elegantissima is D. elegantissima; var. major has fls. about 1 in. across, rosy outside.

elegantissima (D. discolor var. elegantissima). Hybrid between D. purpurascens and D. Sieboldiana: lvs. ovate or oblong-ovate, pubescent beneath: fis. pink, $\frac{3}{4}$ in. across, in loose corymbs.

excellens (D. discolor var. excellens). Hybrid between D. Vilmoriniæ and D. rosea var. grandiflora: lvs. ovate-oblong, to 4 in. long, gray-pubescent beneath: fis. ¾ in. across, in loose corymbs.

Fortunei: D. scabra var.

globosa. Resembling D. discolor but with smaller lvs. and fis. which are creamy-white. Cent. China.

gracilis. To 6 ft., branches slender, wide spreading or arching: lvs. lanceolate, to 2½ in. long, nearly glabrous beneath: fis. pure white, ¾ in. long, in open simple or compound racemes. Japan. Var. aùrea has yellow lvs.; var. campanulâta is D. rosea var.; var. camminea is D. rosea var.; var. tembinei is D. Lemoinei; var. rosea is D. rosea.

grandiflors. To 6 ft.: lvs. ovate, to 2 in. long, white-tomentose beneath: fls. white, 1-3 together, 1 in. and more across. Apr.-May. N. China.

hypoglatica. To 6 ft.: lvs. ovate-oblong to oblong-lanceolate, to 3½ in. long, glabrous and glaucous beneath: fls. white, to ½ in. across, in many-fld. corymbs. Cent. China.

kalmissflora. Hybrid between D. purpurascens and D. parvifora: lvs. ovate-oblong, to 2 in. long, slightly hairy beneath: fls. white with outside carmine, 3/4 in. across, in loose corymbs.

Kosteriana: listed name, probably a hort. form of D. gracilis.

laxifidra: D. Schneideriana var.

Lemoinei (D. gracilis var. Lemoinei). Hybrid between D. gracilis and D. parniflora: lvs. elliptic-lanceolate, to 4 in. long: fis. pure white, ¾ in. across, in large corymbs or broad panicles. Var. compacta is a dwarf form with smaller fis.

longifòlia. To 6 ft.: lvs. lanceolate, to 5 in. long, pale and densely hairy beneath: fis. light purple, to 1 in. across, in many-fid. corymbs. W. China. Var. Veitchii, fis. larger, bright rose.

magnifica. Hybrid between D. scabra and D. Vilmoriniæ: Ivs. ovate-oblong, to 3 in. long, tomentose and grayish-green below: fls. double, white, in short panicles. Var. eburnea has campanulate fls. Var. formòsa is essentially similar to the type.

maliflora. Hybrid between D. Lemoinei and D. purpurascens: Ivs. ovate-oblong, to 1½ in. long, serrulate, acuminate: fis. purplish outside, whitish within, to ¾ in. across, in corymbs to 2½ in. across. The white-fid. hort. form "Avalanche" belongs here.

myriantha. Hybrid between D. parviflora and D. setchuenensis: lvs. oblong-ovate to -lanceolate, to 3½ in. long, hairy beneath: fls. white, ¾ in. across, in loose corymbs.

ningpoénsis. To 7 ft.: lvs. ovate-oblong, broadly cuneate, entire or slightly toothed: fis. white, in panicles to 4 in. long, petals oblong, to 1/2 in. long. E. China.

parviflora. To 6 ft.: lvs. ovate to ovate-lanceolate, to 4 in. long, somewhat hairy: fls. white, about ½ in. across, in many-fld. corymbs. N. China.

púlchra. Lvs. oblong-ovate, to 3½ in. long, acuminate, stellate-hairy, base wedge-shaped to rounded, margin remotely serrate: fls. yellowish, in terminal corymbs to ¾ in. across, calyx-teeth triangular. Philippines.

purpuráscens. To 6 ft., slender curving branches: lvs. oblong-ovate to -lanceolate, to 2½ in. long, pubescent beneath: fls. white inside, purplish outside, ¼ in. across, in 4-10-fid. corymbs. W. China.

reflexa. Similar to D. discolor but with simple hairs and smaller fls. Cent. China.

nd smaller hs. Cent. China.

ròsea. Hybid between D. gracilis and D. purpurascens:
lvs. ovate-oblong to -lanceolate, slightly hairy: fls. pinkish
outside, ¾ in. across, in short panicles. Var. campanilata
(D. gracilis var.), fls. white, 1 in. across; var. carminea,
fls. purplish outside; var. eximia, fls. only shightly pinkish
outside; var. floribūnda, infi. dense; var. grandilora, infi.
less dense; var. multiflora, fls. white; var. venústa, fls.

white.

scabra (D. crenata). To 7 ft.: lvs. oblong-lanceolate to ovate, to 3 in. long, pubescent on both sides: fls. white or blush, to 3/2 in. long, in narrow erect panicles. Japan, China. In the trade are also offered the vars.: candidissima (D. Wellsii), fls. pure white; Fórtunei, fls. larger; mirábilis, a vigorous form with large panicles; plena, fls. double, white tinged with rose outside; Pride of Rochester, very large fls. faintly tinted with rose outside; rôsea, fls. rose; staphyleoldes has very large fls. in drooping panicles; Thúnbergii listed as fls. white with orange center; Watereri, fls. white tinted carmine outside; Wéllsii is var. candidissima.

Schneideriana. To 6 ft.: lvs. elliptic-ovate, to 2½ in. long, grayish-tomentose beneath: fls. white, in broad loose panieles. Cent. China. Var. laxiflora (D. laxiflora) has narrower lvs. and broader panieles

setchuenénsis. To 6 ft.. lvs. lanceolate, to 3 in. long, densely pubescent beneath: fts. white, ½ in. or less across, in loose corymbs. China. Var. corymbiflòra (D. corymbiflora) has larger lvs. and fts.

Sieboldiana. To 6 ft.: lvs. ovate, to 3 in. long, pubescent beneath: fls. white, ½ in. across, in loose panicles. Japan.

taiwanénsis. Lvs. lanceolate or elliptic, to 5 in. long, hairy on both sides: fls. resembling D. Siebolduana. Formosa.

Vilmorinise. To 6 ft.: lvs. oblong-lanceolate, to 3½ in. long, densely pubescent beneath: fis. white, to 1 in. across, in loose corymbs. China.

Watereri: D. scabra var.

Wéllsii: D. scabra var. candidissima.

Wilsonii. Hybrid between D. discolor and D. mollis: lvs. oval to oblong-lanceolate, to 5 in. long, pubescent: fis. white, ¾ in across, in loose corymbs.

DEVIL-FLOWER: Tacca Chantrieri. -Tree: Alstonia scholaris. -Wood: Osmanthus americanus.

DEVILS-CLUB: Oplopanax horridum. -Paintbrush: Hieracum aurantiacum. -Tongue: Hydrosme Rivieri. -Walking-Stick: Aralia spinosa.

DEWBERRY. The dewberries of American gardens and plantations are forms of native species of running trailing blackberries that root at joints or tip; probably they are mostly Rubus flagellaris. Dewberries commonly mature fruit earlier in the season than the highbush or nontrailing blackberries, the difference amounting perhaps to one or two weeks.

The culture is like that of the blackberry, but support should be given to the canes, as they are very slender and rank growers. A wire trellis or large-meshed fence-wire answers admirably; or they may be tied to stakes. The fruits are large and showy, which, combined with their earliness, make them desirable; but they are usually deficient in flavor. The Lucretia is the leading variety. Lay the canes on the ground in winter in rigorous climates. In spring tie all the canes from each plant to a stake. After fruiting, cut the old canes and burn them (as for blackberries). In the meantime, the young canes (for next years fruiting) are growing. These may be tied up as they grow, to be out of the way of the cultivator. See Blackberry, Boysenberry and Loganberry.

DIÁCRIUM. Orchidaceæ. Trop. American epiphytes with pseudobulbs or thickened sts. bearing a few lvs. and mostly white fls. in racemes, the sepals and petals similar, the lip free and 3-lobed; separated from Epidendrum by the presence of 2 horns on the lip. For cult. see Orchids.

bicornitum (Epidendrum bicornutum). Sts. to 12 in. long, with 3-5 lvs to 10 in. long: racemes (with peduncles) up to about 28 in. long, 5-20-fid.; fls. about 2 in. across, white finely spotted with purple. Dec.-Apr. Tobago, Trinidad, British Guiana. Var. indivisum (D. indivisum. Epidendrum indivisum). Plant smaller, lip undivided or minutely biauriculate at base.

indivisum: D. bicornutum var.

DIAMOND-FLOWER: Ionopsidium.

DIANÉLLA. Liliaceæ. Rhizomatous perennials with fibrous roots, grass-like sheathing lvs., blue or whitish fls. in loose panicles, the perianth-segms. distinct, and blue berries.

The plants succeed in a cool greenhouse or outdoors in mild climates. Propagated by division or seeds sown in spring with heat.

ensifòlia (Dracæna ensifolia). To 6 ft.: lvs. to 1 ft. long and 1 in. wide: fis. blue or whitish, to ½ in. long. Asia, Australia, Hawaii.

intermèdia. Rootstocks creeping, bearing the lvs. at top which are 3 ft. long and ¾ in. wide: fts. greenish or purplish-white, about ⅓ in. across, in panicles to 2 ft. long. New Zeal.—Mondo Jaburan has been cult. under this name.

revolùta. To 3 ft.: lvs. in rosette, to 1½ ft. long and ¼ in. across, purplish at edge and base. Australia, Tasmania.

tasmánica. To 5 ft.: lvs. to 4 ft. long, broadly sword-shaped, margins revolute, armed with short sharp teeth: fls. pale blue, to ¾ in. across when fully expanded, drooping segms. reflexed, in large lax much branched panicles: berries deep blue, oblong, to ¾ in. long, often persisting for many weeks on hair-like pedicels, very ornamental. Tasmania.

DIÁNTHUS. PINK. Caryophyllaceæ. Per. and ann. herbs, mostly of the northern hemisphere of the Old World, grown for the ornamental and often fragrant bloom. They are mostly tufted or mat-forming hardy evergreen plants, thriving best in the northern parts of the country; many of the smaller alpine and boreal species are attractive in the rock-garden. The fis. are prevailingly pink or rose, but they run also to red, white and even yellow. They may be large (to 1 in. or more across) and borne singly, or much smaller and compacted into heads. Probably one-half the names in cult. are erroneous.

Pinks are common outdoor subjects but the carnation is mostly a glasshouse flower in North America, grown for winter and early spring bloom; in Europe the border varieties or races are highly developed. See Carnation. Aside from Carnation, eight classes of pinks have horticultural importance: Rainbow pinks, D. chinemeis, short-lived perennial but grown as an annual or biennial, not fragrant, passing the first winter in the open ground if not spent with

bloom; Cottage and Hortulan pinks, progeny or offshoots of D. plumarius, hardy border perennials in many forns; Cheddar pinks, D. gratianopolitanus, hardy small perennials not greatly modified under cultivation; Maiden pinks, D. deltoides, creeping hardy and persisting small-flowered perennials; Sweet Williams, D. barbatus and latifolius, with small flowers in bracteate heads; Clusterheads, D. carthusianorum and related kinds, with long stiff stems bearing very dense heads of small flowers; general garden pinks of many species, with open growth and heads mostly single or in loose clusters; rock-garden pinks, comprising species of low and tufted growth, making attractive durable mats of foliage, including Neglo pinks of the D. neglectus kind.

kind.

Pinks are of simple cultivation. Many of them are spring-bloomers. Even the perennials should be renewed every two or three years either by division, cuttings, layers, or preferably by seeds when named varieties are not involved. Sowings in spring or summer should give good blooming plants the following year, and the second year of bloom is often the best. The perennial mat-forming kinds may be renewed by the cutting back in autumn of all the long growths; and the prompt plucking of flowers, removing the stems far down, is essential for best results. Consult the comments under some of the leading species; the plants are perennial unless otherwise stated.

acadis: hort. name for dwarf pinks of different species, some of which may be D, furcatus and D. sylvestris.

acicularis. Cespitose, to 10 in. high, the sts. 4-angled and branched: lvs. long-linear and acute, less than 1 in. long: fls. rose or white, the petals digitate-multifid; bracts 4, short, appressed. Russia, Rumanna.

Allwoodii. A class of hybrids between D. plumarius and D. Caryophyllus by Allwood Bros, England: per, hardy, in many colors, petals entire to variously fringed, mostly with firm broad more or less glaucous foliage and good tufted habit.—Named kinds or particular strains may be propagated any time in summer by means of cuttings and layers.

alpestris. Low alpine, to 8-10 in., with very short narrow lvs. overtopped by inodorous fis. that are solitary or paired and about 1 in. across: petals notched or somewhat fringed and pink or rose. S. Eu.

alpinus. Cespitose: 18. Idark green, the radical ones broad, short and obtuse: fis. to 1½ in. across, mostly solutary on sts. 2-4 in. high, inodorous, deep rose to purplish and crimson spotted and an eye; petals broad; handsome. Switzerland to Greece and Russia. Vars. álbus, carmíneus, rubicándus are known in gardens.

anatólicus. Cespitose, roughish, sts. 1 ft., 1-fld.: lvs. linear, about 1 in. long, acuminate, radical ones 3-nerved: fls. rose, the obtuse dentate petals yellowish underneath, calyx-teeth acute. Asia Minor, N. W. India.—Cult. stock not likely to be true to name.

arboreus. Very tall, to 3 and 4 ft., branching, woody at base: lvs. 2-3 in. long, ¼ in. or less broad: fls. 2 in. across, rose, fragrant, in corymb-like but not compact clusters. E. Medit. region.—The true plant probably not grown with us.

arenàrius. Cespitose, sts. many, very slender, 6-15 in. tall, bearing several long-pedicelled white fls. with slender calyx and somewhat fragrant: petals finely cut beyond middle. Finland to Dalmatia.—Good species, like a small very deeply fringed only faintly fragrant D. plumarius.

áridus. Glabrous, with simple diffuse sts.: lvs. narrowlinear, not stiff, acuminate: fls. in showy lax fascicles, white, the obovate petals greenish or purplish underneath. S. E. Eu.

Armèria. Weedy ann., nat. in old fields in this country, seldom cult.: sts. crect, forked, to 2 ft.: fis. rose or pink, many and small, in close heads with long pubescent bracts. Eu.

arvernénsis. A name in the trade for a small cespitose plant with 2 or 3 pink fls. on sts. 2-4 in. high, petals denticulate: lvs. mostly basal, narrow, about ½ in. long. France; reported as a natural hybrid, of which D. monspessulanus is one parent.—Probably the cult. stock is wrongly named.

atrococcineus, "dark scarlet," atrosanguineus, "dark blood-red": color races of D. barbatus or D. lattfolius.

atrorubens: confused name in cult., commonly a dark red race of D. carthusian orum.

banáticus. Glaucous, sts. simple, 1 ft. high; fls. red, 10 or 12 of them in a head subtended by acuminate reddish dry bracts; petals obovate, bearded. S. E. Eu —Plants grown under this name are likely to be forms of *D. carthus-ianorum*; the true plant is stouter than that species.

barbàtus. Sweet William. Glabrous, to 2 ft.: lvs. green, broad and flat: fls. in large bracted heads, inodorous, red, purple, rose, white, particolored, in some forms double. Pyrenees to Russia and China; run wild in E. U. S.—There are named vars., as Newport Pink. It is per. but would better be treated as bien. for the improved kinds; the so-called ann. sweet williams bloom first year from seed.

Garden vars. are álbus, atrococcíneus, compáctus, Dunnéttii, marginàtus, nànus, nigréscens, oculàtus, ròseus, Salamònii.

Boissièri. Glaucous, to 20 in., with very narrow lvs.: fis. rose-color, 1 or 2 to a st., petals dentate. Spain, Portugal.—Forms of *D. plumarius* may be cult. under this name.

brachyanthus. Tufted little plant, 9 in. or less: lvs. very short and narrow: fis. small, rose, petals nearly entire. Spain.—Rock-garden subject.

brevicaulis. Compact cespitose glaucous plant with sts. about 1 in. high and surpassing the lvs.: fls. solitary, about 1/4 in. long, calyx reddish, petals purple, dentate. Mt. Taurus, Cilicia.—Alpine or rock-garden subject.

cæsius: D. gratianopolitanus.

callizonus. Glaucous and glabrous plant with 1-fld. terete sts. 4-14 in.: lvs. rather short and broad, spreading: fls. 1 in. across, the petals broad and contiguous, purple and spotted above, rose underneath, zoned in center, dentate; calyx-bracts 4, purplish, spreading. S. E. Eu.

calocéphalus. Clusterhead, to nearly 3 ft.: fis. brick-red and spotted, in dense small heads. S. E. Eu. to Armenia.

campéstris. Much branching, 1 ft. or more high, sometimes pubescent, stoloniferous: fis. bright rose with light center, petals jagged. Russia, Siberia.

capitatus. Glaucous, pubescent or woolly, sts. simple, to 1 ft. or more: fls. small, 6-8 together in a mucronate-bracteate head, petals purple and spotted. Balkans to Siberia.—Likely to be confused in cult. with D. carthusianorum.

carhusianòrum. Clusterhead P. Widely variable cespitose glabrous green or seldom somewhat glaucous plant with 4-angled erect simple sts. to 20 in. high terminating in a dense few- or many-fld. head with mucionate or aristate bracts, the fls. small, incororus, rose, purple or dark red. Denmark and the Urals to Portugal and Egypt.—Cult. in several forms, as vars. atròrubens, gigantèus, moesiacus, nànus, Pontedèræ, phmilus (D. subneylectus), rupícolus, subfastigiàtus, tenuifòlius.

Caryophfilus. CLOVE P. CARNATION. Tufted glabrous and glaucous plant, 1-3 ft. high, of stiff habit. fls. solitary or few on a st., showy and very fragrant, I in. and more across, the petals not bearded and irregularly dentate. S. Eu. to India.—Under cult. has given rise to many sizes, colors, races and forms, the petals from entire to shallowly cut; colors pink, rose, purple, white, yellow, known in this country mostly as a glasshouse cut-flower, but there are hardy border and marguerite races; the picotee belongs here. See Carnation.

caucásicus: D. Seguieri.

chinénsis (D. sanensis. D. Fischeri). RAINBOW P. Glabrous green tufted plant of rather strict habit, 12-18 in. high, sts. more or less branching: fis. solitary or loosely assembled, slightly if at all fragrant, lilac, red or white, to 1 in. across. Portugal to China and Japan.—Little cult. (if the European D. Seguieri is excluded). Var. Heddewigii comprises the hardy ann. pinks of gardens, blooming first year from seed although bien. to per.; Ivs. broad, bracts under calyx spreading; fis. in many colors and markings and often of great size and petals much cut and frilled. Var. laciniàtus, petals cut and fringed to ½ or more their depth. D. stellaris is a form with narrow petals, sometimes almost linear.

ciliàtus. Cespitose, glabrous, glaucous, st. simple, to 2 ft., branched above: fls. long-peduncled, rose-color, fragrant, petals dentate or entire. Austria, Italy to Egypt.

cinnabarinus. Glabrous many-stemmed Clusterhead woody at base, 5-6 in. high, sts. 4-angled and simple: lvs. 2-3 in. long, sharp-pointed, basal ones 7-nerved: fls. few, capitate, the contiguous obovate petals cinnabar-red above and yellowish underneath. Greece.

collinus. Glaucous, pubescent, 1-2 ft., slightly branched except near apex: lvs. many on the st., erect, rather broad, 1-2 in. long: fis. 3-5 together in an open fascicle, about \$\frac{3}{4}-1\$ in. across, deep pink or darker. Pyrenees to Asia Minor.

compáctus. Glabrous, to about 20 in.: lvs. plane, lanceolate: fis. purple, scentless, in dense 3-forked fascicles. S. E. Eu.—Perhaps a montane or alpine form of *D. barbatus*.

connâtus: erroneous name.

controvérsus. Like D. monspessulanus but sts. 4-angled, lvs. short and very acute, fls. rose-color but petals not contiguous; cespitose. Switzerland.

córsicus: confused name.

crinitus. Sts. somewhat woody at base, erect, 4-18 in., often sparingly forked, sometimes pubescent: lvs. narrow, about 1 in. long: fls. solitary, white, slender-cylindrical, 1½-2 in. long, petals cut into hair-like divisions. Algeria to N. W. India.

croaticus. The plant grown under this name has small red or rose fis. in a compact head, after the manner of D. carthusianorum.

cruéntus. Cespitose, glaucous, sts. to 18 in., forked, terete, terminating in a small head of blood-red fis.: petals dentate. E. Eu.—One of the *D. carthusianorum* group, to which the cult. plants may belong. Forms are *D. orbelicus* and *D. Velenorsky*.

Cyrl. Ann. but surviving the winter if sown in mid-summer, much branched, to 2 ft.: fls. solitary but many, each subtended by long-pointed bracts exceeding the tur-binate calyx, corolls ¾ in. across, rose, chentate, opening in sun. S. W. Asia, Egypt.—Weedy, and little known in cult.

delicatus: hort, forms of D. Caryophyllus and D.

deltoides. Maiden P. Mat- or sod-forming, green, with radical lys and those on runners 1 in. or less long and obtuse, those on st. acute: fis. 34 in. or less across, red or pink with crimson eye (a white-fid. form), borne on forks of sts. that ruse 4-15 in. Great Britain to Japan; nat. in U. S.—Known also as D. procumbens. Var. glaticus has prominently glaucous foliage. Varietal garden names are albus, eréctus, magnificus, montânus, rôseus, spléndens, supérbus. Var. serpyllifolius is a very low mat-forming race with lower lys. not more than ½ in. long. This or similar forms are known as D. Grisebachti, Peristeri (improperly), Prichardii, pyrenaus, Richardii, supinus.—D. deltoides is a hardy invading plant that is likely to persist behind labels when other species have perished, with resultdeltoides. MAIDEN P. Mat- or sod-forming, green, with behind labels when other species have perished, with resulting confusion in names.

dentatus. dentosus: garden names.

diadematus: hort. form of D. chinensis.

diffùsus. Glabrous, sts. 10 in. tall, with terete branches: radical lvs obtuse: fls. 2 together and long-peduncled, rose and red, the petals slightly hairy; bracts 2, obovate and mucronate. Greece.

discolor: under D. Sequieri.

disséctus: probably a fimbriate form of a garden species. Dunnéttii: race of D. barbatus.

erythrocòleus. Cespitose, glabrous, sts. 1-fid., 2 in. high: lvs. about 2 in. long, acute: fis. rose, the petals fimbriate to about the middle; bracts 4, about ½ length of calvx. Armenn.—Plants grown under this name may be D. deltordes.

filifòlius: listed hort, name.

fimbriatus. Woody at base, glabrous, sts. simple, 1 ft.: lvs. acute and appressed: fls. rose-color, the petals deeply cut or fimbriate; bracts 4-12, 1/2 length of calyx, straw-colored. Portugal to Tibet.—Forms of D. chinensis and D. plumarius are also grown under this name.

Fischeri: D. chinensis.

frågrans. Cespitose, glabrous, sts. to 1½ ft., with angled branches above: lvs. acuminate: fis. fragrant, rose-white and spotted, petals fimbriate; bracts 6-8, appressed. Caucasus.—Like a small D. plumarius.

Frèynii. Alpine, densely cespitose, blue-green or grayish: lvs. shorter than those of D. glacialis: fis. solitary, bright pink, Herzegovina.

frigidus: snall form of D. sylvestris.

fruticosus. Much like D. Armeria but per. and woody t base: fis. dark red or purple, showy, in loose heads. Grecian Isls.

furcatus. Attractive cespitose glaucous plant with lvs. mostly basal, sts. mostly forked, to 9 in. high: fls. solutary, rose-color, inodorous, about ½ in. across, petals dentate, with reflexed margin. Alps in Italy. Var. Leréschii makes large cushions and light lilac fls.

gallicus. Plant pubescent, at least on radical lvs. (which are chate) and lower part of st., glaucous, to 1 ft. or more: fls. rose to white, fragrant, about 1 in. across, blade fimbriate or cut to 1/3 its depth; calyx-bracts 4, short, appressed. Portugal to France.

gélidus. Cespitose and glabrous, the sts. to 3 or 4 in. high, simple and 4-angled: fls. rose and spotted; calyxbracts 6, acuminate and recurved. E. Eu.

gigantèus: form of D. carthusianorum.

glacialis. Cespitose, glabrous, 3-4 in., the sts. simple, 4-angled, 1-2-fid.; radical lvs. obtuse; fls. ½ in. or more across, inodorous, reddish-purple; petals denticulate and yellowish underneath, contiguous or close together; calyx and 2-4 bracts reddish. Mts., S. Eu.—Other species are likely to be grown under this name.

glaucophýllus: confused name, likely to be applied to a form of D. carthustanorum,

granificus. Sts. 4-7 in., slender, 4-angled, bearing 1-3 fls.: lvs. very narrow, acute: fls. to 1 in. across, petals dentate, purple above but paler underneath, calyx purple. Pyrenees.—D. deltoides, a very different plant, has been grown under this name.

gratianopolitànus (D. casius). Cheddar P. Mat-forming, glaucous: sts. simple or somewhat branched, 3 to 12 in.: lvs. short and narrow: fls. solitary or few on a st., showy,

rose-color, fragrant, petals bearded and toothed. England to Germany and S. France.

Grisebachii: var. of D. viscidus; sometimes applied to condensed forms of D. deltoides.

Hawkianus: D. serotinus.

Heddewigii: see D. chrnensis.

Hoëltzeri. Cespitose and low, with strict radical lvs.: fis. spotted rose or yellowish, more or less fringed, about 1½ in. diam. Turkestan.

hungaricus: D. tatræ.

hébridus: usually applied in the D. barbatus and D. latifolius groups.

imperialis: forms of D. chinensis.

inoddrus: variously applied, often in the D. chinersis

integer: var. of D. strictus.

japónicus. Glabrous, with simple sts. to 20 in.: lvs. about 2 in. long, ovate-lanceolate and acute: fis. in trichotomous fascicles, with contiguous cuneate red petals.

Japan Manchuria.—Variable.

kamtscháticus: unidentified name.

Knáppii. Erect to 16 in., scabrous, more or less glaucous, sts. simple and bearing a compact head at apex: fis. light yellow, not fragrant, ¾ in. across, with prominent acuminate calyx-bracts. Hungary, Jugoslavia.

Kotschvanus. Differs from D. anatolicus in white entire petals and calyx-teeth obtuse. Asia Minor.

laciniatus: var. of D. chinensis.

latifolius. Stiff and erect, 10-16 in., roughish, branched above, green, bearing terminal 1-6-fid. bracted heads: Ivs. short and broad, 2-3 in. long and to ½ in. wide: fls. rose to dark red, single or double. Cultigen; intermediate in character between D. barbatus and D. chinensis or D. plumarius and accounted a hybrid. Vars. atrococcineus and atropurphreus are listed.—Many garden forms of close-headed pinks are referable to D. latifolius.

Lémsii: one of the Neglo pinks, under D. neglectus.

leptopétalus. Glabrous, sts. 2-3-fld., to 15 in.: lvs. long-linear and acuminate: petals yellowish-white above and bluish underneath, entire. Russia, Siberia.

Leréschii: D. furcatus var.

Liboschitzianus. Cespitose, glabrous, sts. to 8 in., 4-angled and 1-fid.: lvs. narrow-acuminate: fis. white or pale rose, the petals bluntly toothed; calyx-bracts very narrow and sharp. Caucasus.

libúrnicus. Glabrous, sts. simple and stiff, to 2 ft. high, more or less 4-angled at least above, terminating in a 2-6-fid. head: fls. rose, spotted, about ¾ in. across, petals dentate; calyx-bracts stiff and long-pointed. S. and E. Eu.

lilácinus: color race of D. plumarius.

longicalýcinus: D. superbus var.

longicaulis. Erect stiff plant to 2 ft., glabrous, simple or branched above and sts. more or less 4-angled: lvs. very narrow: fts. 1 or 2 at summit of st., rose, fragrant, about 1/2 in. long, the bracts very short and broad. S. Eu.—The name has been applied also to a form of D. Caryophyllus.

Lumnitzeri: form of D. plumarius.

marginatus: hort. name, probably for a race of D. chinensis

mexicanus: unidentified hort. name.

micrólepis. Per., dwarf and cespitose: lvs. short, soft: fis. very small, solitary among foliage, rose-color. High mts., Bulgaria.

mirábilis: garden name for a form of D. chinensis.

moesiacus: D. carthusianorum var.

monspessulanus. Sts. terete, branching at top, glabrous: fls. solitary or 2 or 3 near together, inodorous, rose, varying to white (var. álbus) or carmine (var. carmineus), I in. or more across, petals fringed to about the middle, sepals and bracts awn-tipped. Spain to Caucasus.

montanus: D. Seguieri.

monticolus: listed name; perhaps belongs with D. superbus.

multiflòrus: listed name.

Musalise. Dwarf plant of recent introduction, making dense tuft or turf of sharp foliage and bearing small pink fis.

myrtinérvius. Very condensed, 2 in. or less high in tuft, perhaps an alpine form of *D. deltoides:* fls. many but solitary, petals shallowly toothed. Macedonia.—*D. Peristeri* apparently belongs to this group.

nanus semperfiòrens; trade name; probably D. plu-

nardifórmis. Cespitose, 6 or 7 in. high, with stiff spreading lvs.: fls. rose-color, in fascicles. S. E. Eu.

negléctus. Small cespitose plant sometimes regarded as a form of *D. glacial* is but larger: fis. bright crimsonpink with lighter colored eye and long narrow bracts, petals deeply toothed. Mts. S. Eu.—Apparent offshoots of this species, some of them perhaps hybrids, are the Neglopinks, *D. Lemsii*, and such vars as Adoree, Clara, Ida, Mona, Rita, Valerie. Vars. compactus and nanus are listed.

nigricans: race of D. barbatus with dark fis.

nstidus. Green, loosely tusted, sts. to 12 in. tall: fls. 1 or 2 to a st., about 1 in. across, rose-color and spotted. Mts., Cent. Eu.—Rock-garden.

nobilis: form of D. chinensis.

Nocanus. Denselv tufted and very green, sts. to 10 inhigh, forking and bearing 1-5 white small fragrant fls.: lvs. needle-luke. S. Eu. to S. W. Asia.—The plant has been grown as Acanthophyllum spinosum.

ochroleitcus. D chineneis form

orbélicus: form of D. cruentus.

pállens. Glaucous, to 1 ft. or more: fis. rather small, white or pale rose, petals narrow and toothed. Greece, Syria.

Pancícii. Cespitose, glabrous, 1 ft. or more, with slender 4-angled sts.: lvs. rather soft, mostly in basal tuft: fls. rose, several together in a paniculate cyme or head. Balkans.

nelvifórmis. Clusterhead, 2 ft., few-lvd.; fls. purple, in a dense head, petals sharply to othed. Serbia.

Peristèri: see D. myrtinervius.

petræus. Cespitose or mat-forming, glabrous, sts. slender, simple or forked, 6-15 in. tall: lvs. green, sharppointed, 3-nerved: fls. white, about ¾ in. across, fragrant, petals dentate or fimbriate; calyx cylindrical, narrowed at apex, to 1 in. long; bracts 4, about ¼ length of calyx. E. Eu.

picturatus: hort. name.

pinifolius. Cespitose, roughish, st. simple and strict, to 1½ ft.: lvs. awl-like, the radical ones recurved: fls. rose, inodorous, 5-8 in a head, calyx reddish; bracts 4, aristate. S. E. Eu.

plenissimus: very double D. chinensis.

plenissimus: very double D. chinensis.

plumàrius. Cottage P. Mat-forming, glabrous and glaucous, to 1½ ft., the sts. simple or branched above and 2-3-fid.: fls. rose, varying to purple, white and particolored, very fragrant, petals fringed to the middle or less; bracts 4, about ½ length of calyx. Austria to Siberia.—Cult. in various forms, some of them double; a popular strain is var. semperflorens (D. semperflorens). Named vars. of garden pinks may be offshoots of this species or hybrids with D. Caryophyllus and possibly other species; see D. Altwoodii. Vars. álbus, compáctus, nànus and scóticus are offered. The Hortulan pinks are an important group of border plants more or less intermediate between D. plumarus and D. Caryophyllus.

poéticus: a garden name for D. barbatus.

poéticus: a garden name for D. barbatus.

Pontedèræ: P. carthusianorum var.

præcox: uncertain garden name.

Prichardii: border pink of hort. origin in England, but sometimes applied to a form of the D. deltoides group.

procumbens: D. deltoides.

prölifer (Tunica prolifera). Glabrous simple or branching ann. to 2 ft, with inconspicuous little pink fis. in small heads terminating the stiff sts.; calyx and bracts dry. Eu.; nat, in U. S.—A weedy plant of little hort. interest.

punescens. Glandular-pubescent, rather weak, sts. terete and slender, much branched, to 1 ft.: foliage soft: fls. odorless, solitary or twin, long-peduncled, petals rose and spotted above, greenish underneath, calyx villous; bracts 2, spreading, long-pointed. S. E. Eu. punctatus: race of D. chinensis.

pungens: confused name.

pygmæus: D. subacaulis.

pyrenæus: D. deltoides.

pyridicolus: the garden plant under this name may be D. necidus var, Grisebachii.

rèpens: probably D. deltoides, but there is a very dwarf cespitose species of this name in Alaska and Kamtschatka with rose-color or purple fis.

Requiènii. Cespitose, glabrous and glaucous, sts. slender, to 15 in., 4-angled, forked: lvs. short, narrow, strict: fis. purple, the petals dentate, somewhat rhomboid. Pyrenees.

Reuteri: form of D. sulvestris.

Richardii: apparently a form of D. deltoides.

robústus: Hortulan, D. plumarius.

Ródgersii: hort, name.

rdseus: D. barbatus var.

Rôysii: hort. race of undetermined origin and not uniform in cult. unless propagated asexually; showy tufted small pink with large deep rose-colored fis.

runicolus: confused name; perhaps forms of D. sulvestris are usually meant.

salmoneus: color races of D. chinensis.

sanguineus: var. of D. carthusianorum.

saxátilis: indefinite name in cult.

saxicola: form of D. sylvestris.

saxigenus: var. of D. carthusianorum.

scoticus: D. plumarius form.

Seguièri (D. chinensis var. asper). The European extension of D. chinensis, perhaps a distinct species differing in the panicled fis., and wide-spreading callyx-bracts.—Variable; known by several names in cult., as D. caucasicus, discolor, montanus.

semperflorens: one of the Hortulan pinks, under D. nlumarius

serotinus (D. Stawkianus, D. Hawkianus). Clustered or cespitose, to 16 in. or more, glaucous: fls. white, fragrant, petals narrowly fringed. E. Eu.

serpvllifdlius: D. deltoides var.

sinénsis: D. chinensis.

speciosus: form of D. superbus,

spectabilis: garden name; probably D. chinensis or D. plumarius.

spiculifolius (D. acicularis var. spiculifolius). Not cespitose, sts. 10-12 in.: lvs. long-linear and acute: fls. rose to white, the petals palmatifid and barbulate; bracts 4, about ½ length of tube. Russia and Rumania.—The plant sometimes catalogued under this name is D. Noeanus.

spindsus: Acanthophyllum pungens, but the plant grown under that name is D. Nocanus.

spléndidus: garden name, usually D. deltoides.

squarrosus. Cespitose, sts. terete, slender and spreading, glabrous, branched, to 2 ft.: lvs. linear, acute, recurved: fls. rose, few to each st., the petals not close together, pinnately multifid; bracts 4, about ½ length of calyx. Russia, Siberia

Stawkianus: D. serotinus.

stellaris: form of D. chinensis.

Stérnbergii. Cespitose and glaucous, sts. 4-angled, 2-fld., 6-12 in.: lvs. long-linear, spreading: fls. rose and spotted, fragrant, the petals not contiguous; bracts 4, purplish, ½ length of calyx. Portugal, Alps, Switzerland.

strictus. Cespitose and glabrous, sts. to 10 in., strict, slender, 1- or sometimes 2-fld.: fls. small, white, inodorous, petals not contiguous or close together and not fimbriate, oval-rhomboid. S. E. Eu. Var. álbus is listed. Var. grandiflorus is larger-fld.

suaveolens: form of D. plumarius.

sudvis: D. gratianopolitanus or D. plumarius.

subacailis. Low, cespitose, glaucous, with several-headed caudex, sts. simple, 4-angled, 2-fld., 3-4 in.: fls. small, purple, standing above the tufts, the petals not contiguous, entire. Spain, France.—Sometimes called D. pygmæus.

subalpinus: listed name.

subcauléscens: listed name.

subfastigiatus: D. carthusianorum var.

subnegléctus: D. carthusianorum var. pumilus.

Sandermannii. Much like D. structus, but more showy: petals to 1/4 in. broad, entire or nearly so, calyx 3/4 in. long. Greece.

superbissimus: var. of D. chinensis.

superbissimus: var. of D. chinensis.

superbus. Light green glabrous plant with branching sts. to 2 ft. high: lvs. rather soft, flat: fls. pale rose or hlac, very fragrant, mostly to about 1½ in. across, few or many in lax panicle, the petals multifid nearly or quite to base; calyx cylindrical, to 1 in. long; bracts very short. Spain to Norway and Japan. Var. longicalfcinus, with elonated calyx. Var. nanus, a dwarfer form with smaller fls. is offered. Var. speciosus (D. speciosus) is mostly lower than the species, sts. little branched and few-fld., branches divaricate, fls. much larger and more showy. Vars. albus, monticolus, purphreus are listed.

supinus: see D. deltoides.

sylvéstris. Wood P. Cespitose, glabrous, sts. simple or branched, 6-16 in. tall and much exceeding the very narrow basal lvs.: fls. solttary, odorless, rose, to 1 in. across, petals contiguous and dentate; bracts very short and truncate. Spain to E. Eu. Var. purpureus is listed.

tatrs. White-fid. pink, probably a race of D. plumarius; the name D. hungaricus apparently applies to the same plant. Tatra region, S. E. Eu.

tèner. Glabrous, to 5 in. high, the slender sts. 1-fld.: fls. rose, spotted, the petals oblong-cuneate. France.

tenuifòlius: D. carthusianorum var. tergestinus: included in D. sylvestris. trifasciculatus. Clusterhead, to 24 in.: fls. purple, in dense about 3-parted heads, petals deeply dentate. S. E. Eu., S. W. Asia.

tristis. Clusterhead, to 16 in., with soft plane lvs.: fis. purple, in a small head, petals dentate on end. Bulgaria.

tymphrésteus. Small green tufted pink 9 in. or less tall, viscid-pubescent: fls. rose-color, solitary or in a loose head, about ½ in. long. Greece.—Probably not in cult. with us, the plant so named being D. Nocanus.

vaginatus: form of D. carthusianorum.

variegatus: probably D. chinensis. Velenovskvi: form of D. cruentus.

vers(color Glabrous plant with terete paniculately branched st. 10-12 in. high: lvs. narrow-linear, the uppermost scale-like: fls. with contiguous petals red and spotted above and greenish-yellow underneath; calyx-bracts obovate and spreading. Altai Mts., Siberia.

violaceus: listed name.

virgineus: confused name; probably usually applied to D. gratianopolitanus and D. plumarius.

viscidus. Plant cespitose and viscid-pubescent, to 1 ft., the sts. simple: lvs. soft, those on the st. appressed: fls. in fascicles of 3-6, purple and spotted, the petals few-toothed; bracts usually 4. Bulgaria, Greece, Turkey. Var. Grisebachii has fls. 2-3 in the fascicle and bracts 2.

Waldsteinei. Sts. terete, 10-14 in.: lvs. rather soft, spreading: fls. rose, very fragrant, to about 1 in. across; petals not contiguous, obovate, fringed to middle; bracts 4. Pyrenees, Alps.

warleyénsis: listed name, apparently a Clusterhead.

Wimmeri. Allied to D. superbus: sts. terete, to 15 in.: lvs. soft, linear, acute: fls. purple, fragrant, in a lax forked panicle, the petals fimbriate nearly to base; bracts 4, mucronate, short. Switzerland north and east.

Winteri. Recent name for a plant of the border carnation kind, apricot or lemon-yellow, blooming all summer; said to be a hybrid.

zonatus: probably D. plumarius; the true species of this name of Asia Minor is probably not in cult.

DIAPÉNSIA. Diapensiacex. Tufted evergreen plants with crowded mostly opposite entire lys. and solitary bell-shaped fls.; suitable for the rock-garden.

lapponica. To 4 in.: lvs. narrowly spatulate, to 1/2 in. long, obtuse: fis. white, to 3/2 in. across. June-July. Circumpolar, extending southward on mts. of N. Y. and New England. Var. obovata (D. obovata) has lvs. obovate.

obovata: D. lapponica var.

DIAPENSIACEÆ. DIAPENSIA FAMILY. About 6 genera in the north temp. zone of little evergreen shrublets or stemless per. herbs, having simple lvs., bisexual regular fls. with 5-lobed calyx and corolla, 5 stamens, superior 3-celled ovary and capsular frs.; allied to Primulacea. Diapensia, Galax, Pyxidanthera, Schizocodon and Shortia are cult. in rock-gardens and similar places, and employed as ground-cover.

DIÁSCIA. Scrophulariaceæ. S. African low slender herbs of many species ann. and per., with lvs. most y opposite, fls. violet or rose in racemes, 2-lipped but the tube nearly lacking, the lower lip 2-spurred. One is grown in flowergardens and also as a pot-plant. The cultural requirements are simple; easily propagated by seed.

Barberse. Twinspur. Ann., 1 ft.: lvs. ovate, to 1½ in. long, toothed: fis. rosy-pink with yellow spot in throat, ½ in. across, in terminal racemes to 6 in. long.

DICÉNTRA (Bicuculla. Bikukulla). Fu-mariaceæ. Per. herbs with ternately compound lvs., irregular rose, yellow or white fls. in racemes, the corolla heart-shaped or 2-spurred and closed at top, and capsular frs.; cult. in the flower- or wild-garden.

The plants thrive in fertile light soil, in usual exposures.

Propagated by division of crowns or roots.

canadénsis. Squirrel-Corn. To 1 ft., the root with many small tubers: lvs. all basal: fis. greenish-white tinged

with purple, with short rounded spurs, nodding in simple racemes. N. S. to Tenn. and Neb.

chrysantha. Golden-Eardrops. To 5 ft., with leafy sts.: fis. sulfur-yellow, with very short spurs, erect in large panicled racemes. Calif.

Cucullaria. Dutchmans-Breeches. To 10 in.: Ivs. all basal: fls. white tipped with yellow, with widely divergent spurs, nodding in simple racemes. N. S. to N. C. an I Kans.

eximia. To 2 ft.: lvs. all basal: fls. rose or pink, with short rounded spurs, nodding in compound racemes. N. Y.

formòsa. To 1½ ft.: lvs. all basal: fls. rose-purple or rarely white, with short rounded spurs, nodding in compound racemes. B. C. to Calif.

glauca: D. oregana.

ochroleùca. Similar to *D. chrysantha* but with straw-yellow or cream-colored fls. Calif.

oregana (D. glauca). To 1 ft.: lvs. all basal, glaucous: fts. in terminal nodding panicles, cream with the exserted limb rose. Calif., Ore.

parviflòra: catalogue name.

pusiila. To 8 in.: lvs. ternately cut, the ultimate segms. narrowly linear-lanceolate, acute, glaucous: fis. 2-3, on naked scapes, spur not lobed, short, rounded. Japan.

spectábilis (Dielytra spectabilis). BLEEDING-HEART. To 2 ft., with leafy sts.: fls. rosy-red, with short rounded spurs, in simple one-sided racemes. Japan.—An old garden plant. Var. álba has white fis.

uniflòra. To 3 in.: lvs. all basal: fls. solitary, white or pink, the outer petals strongly recurved, spurs resembling rounded sacks. Wash. to Calif.

DICHELOSTEMMA: Brodiza.

DICHÓNDRA. Convolvulacex. A few species of small creeping or prostrate herbs with minute inconspicuous fls., one sometimes grown for ground-cover in greenhouses and frequently a useful substitute for lawn grass in places far south; often a weed in lawns: lvs. cordate-orbicular to reniform, entire: fls. stalked, solitary in the axils, the very small greenish-yellow corolla open, sepals hairy: fr. a 1-2-seeded caps.

carolinensis (D. evolvulacea. D. repens var. carolinensis). Lawn-Leaf. Little silky-hairy to glabrate plant, creeping close to the ground and rooting, per. or persisting: Ivs. ¾ in. or less across, standing 1-3 in. above the ground. Va. to Tex. and Mex., not far from the coast.—The West Indian D. repens, with repand or crenate If.-margins, is said to be intro. in Calif.

evolvulàcea: D. carolinensis.

DICHORISÁNDRA. Commelinaceæ. Perennials from trop. Amer. with sheathing alternate lvs. and irregular blue or purple fls. in racemes or panicles, on erect or ascending simple or branched sts.

Grown under glass, or out-of-doors in warm regions. They require abundant water in the growing season. Propagated by seeds, cuttings, and division.

cærùlea: hort. name.

mosaica. St. spotted: lvs. cross-banded with white longitudinally and along cross-veins, purple undernoath: fis. blue and white, close to foliage. Peru. Var. gigantèa has large fis. and var. undata lacks white cross-veins.

thyrsiflora. To 3 ft. or more, nearly or quite simple: lys. glossy green, not variegated; fis. blue. Brazil.

vittàta: probably Rhao discolor var. vittata.

DICHOTOMOUS: forked in pairs. DICHROSTACHYS: Cailliea.

DICKSÒNIA. Dicksoniacex.Greenhouse tree-ferns with a distinct trunk usually several ft. tall: fronds large, 2-3-pinnate; sori marginal at the tips of veins; mostly in the tropics and subtropics of the southern hemisphere. See Ferns.

antárctica. Trunk to 50 ft., with matted aërial rootlets: fronds to 6 ft. long, 3-pinnate, with lanceolate toothed segms. to 2 in. long. Australia.

cicutària: Dennstaedtia cicutaria.

fibrosa. Trunk to 20 ft., stout, brown, covered with fibrous aerial rootlets: fronds to 8 ft. long, 2-3-pinnate. New Zeal.—A frequent glasshouse fern.

pilosiúscula: Dennstaedtia punctilobula. punctil obula: Dennstaedtia punctilobula. squarròsa. Trunk to 20 ft., slender, black: fronds to 8 ft. long, 2-3-pinnate, stiff and leathery. New Zeal.

DICKSONIÀCEÆ. DICKSONIA FAMILY. Mostly tree-ferns with erect, rarely decumbent, trunks, with hairs but without scales: fronds very large, pinnately divided, usually leathery, in a crown; sori marginal or terminal on the veins. Cibotium and Dicksonia are cult.

DICRANOSTÍGMA. Papaveracex. Herbs from Cent. Asia with woody roots, basal pinnatifid lvs. and alternate st.-lvs., orange or yellow fls., and capsular frs.; one species is grown in rock-gardens.

Franchetianum (Chelidonium Franchetianum). About 1 ft. high, glaucous: fis. orange, 1 in. across: caps. linear, to 3 in. long. China.

DICTAMNUS. Rutacex. One variable species ranging from S. Eu. to N. China, cult. for the ornamental fls. D. albus (D. Fraxinella). DITTANY. FRAXINELLA. GAS-PLANT. BURNING-BUSH. Hardy per. to 3 ft., strong-smelling and long-enduring: lvs. of 9-11 ovate lfts.: fls. white, about 1 in. long, in terminal racemes: fr. a 5-parted caps. Var. caucásicus (D. caucasicus) purpureus has dark fls. and var. rubra rosypurple fls. D. dahuricus is a form of the species.

DICTYOGRAMMA: Conjogramme.

DICTYOSPÉRMA (Linoma). PRINCESS PALMS. Monœcious unarmed feather-lvd. trees of the Mascarene Isls.: lvs. long and gracefully curving, with infl. on the trunk beneath the long lf.-sheaths: fls. in 3's of which the central one is pistillate, spirally disposed on the cord-like branches: fr. oblong to cartridgeshaped, ¾ in. or less long; albumen ruminate; stigma apical. Planted in S. Fla.; see Palm. D. álbum (Areca alba). To 40 or 50 ft.: lvs. 10 ft. long more or less; pinnæ curved or drooping, 2-3 ft. long and 2-3 in. broad, only the midrib very prominent, long-acuminate, green underneath. Var. aureum (Arcca aurea). More slender and smaller and fls. smaller: young plants with orange or yellow petioles and veins. Var. furfuraceum. Petioles and sheaths of young plant tomentose. Var. rubrum (Areca rubra in part). In juvenile stage has very dark green lys. with veins and margins reddish.

DIDISCUS: Trachymene cærulea.

DIDYMAÒTUS. Aizoaceæ. One stemless succulent per. from S. Afr. D. lapidifórmis (Mesembryanthemum lapidiforme). To $1\frac{1}{2}$ in.: lvs. usually 1 pair united at base, to 1 in. long, 1½ in. wide and 1 in. thick, keeled on back, glaucous, grayish-green, brownish or purplish: fls. one on each side of the pair of lys., white or tinged rose with rose stamens, 1½ in. across; petals numerous, linear; stigmas 6.

DIEFFENBÁCHIA. Aracex. Trop. American erect shrubby plants bearing the oblong entire lvs. toward the top of the st., the petiole sheathing, the unisexual fls. borne on an erect spadix about the length of the oblong spathe; grown as foliage subjects in the greenhouse.

Several plants may be put in a large pot until they cease developing good leaves. They may then be topped and the stems cut into 2- or 3-inch pieces, dried for a few days, and then put in boxes of sand where they will throw off shoots which will root and form new plants.

Barraquiniàna: D. victa var.

Railmannii: D. Rommannii.

Bausei. Hybrid between D. picta and D. Weiri (the latter a dwarf kind with yellow spotted lvs.) having yellowish-green lvs. with small white spots and glaucescent

Bowmannii (D. Baumannii). To 3 ft.: lvs. to 16 in. long and 8 in. wide, spotted with white, the petioles deeply channelled: spathes pale green, about 6 in. long. Colombia.

brasiliénsis: D. picta.

costata. To 4 ft.: lvs. to 16 in. long and 1 ft. wide, deep green, paler beneath, the petioles channelled: spathes to 1 ft. long. Colombia, Peru.

Fournièri: hort, name.

imperiàlis. Lvs. to 2 ft. long and 1 ft. wide, shining green spotted with yellow and with whitish midrib, the petioles deeply channelled. Peru.

lénmannii: D. picta var.

Leònii: hort. name.

Lèopoldii: D. Seguine var. liturata.

longispatha. St. thick, to 3½ ft. high: lvs. oblong, to 18 in. long, briefly acuminate: spathes green, to 1 ft. long: berries scarlet. Panama.

magnifica: D. picta var.

magnifica: D. picta var.
nóbilis: D. Seguine var.
picta (D. brasiliensis). To 4 ft.: lvs. shining green, irregularly marked with white and yellow: spathes about 6 in. long. S. Amer. Runs into many forms, some of which are: Var. Barraquiniana having lvs. spotted with white and petioles and midribs almost entirely white; var. Jénmannii with lvs. veined and spotted with white; var. magnifica (D. Rex) has lvs. spotted along veins with yellowishgreen and petioles marked with white.

Réx: D. meta vera magnifica

Réx: D. picta var. magnifica.

Seguine. To 6 ft.: lvs. green often variously spetted, pale green beneath, with thick midribs and petioles striped and dotted with white, not channelled: spathes green or pale green. Trop. Amer., where it is known as 'dumb cane.' Var. irrorata has lvs. to 2½ ft. long. Var. liturata (D. Leopoldi) has an irregular yellowsh stripe along midrib. Var. nobilis (D. nobilis), lvs. dull green spotted (D. Leopotati) has an Irregular venowing stripe along midrib. Var. nobilis (D. nobilis), lvs. dull green spotted brownish-green.

spléndens. Hybrid between D. Leopoldti and D. picta having lvs. spotted with white and channelled petioles.

DIELYTRA: Dicentra spectabilis.

DIERÀMA. Iridaceæ. Two S. African cormous herbs, sometimes grown in S. Calif. or under glass in cold climates. Cult. as for Ixia.

péndula. To 4 ft.: basal lvs. to 2 ft. long and $\frac{1}{2}$ in. broad: fls. white to pale or dark mauve, to 1 in. long, in several slender drooping spikes. Trop. and S. Afr.

pulchérrima (Sparazis pulcherrima). To 4 ft.: lvs. very stiff, to 2 ft. long and 1/2 in. wide: fls. bright purple, 11/2 in. long, with short tube, in slender drooping spikes. Var álba, fls. white.

purpurea: listed as a purple form.

DIERVÍLLA. BUSH-HONEYSUCKLE. Caprifoliaceæ. Three little bushes of E. N. Amer., spreading by means of underground sts. and forming patches: lvs. opposite: fls. small, in spring and summer, yellow sometimes shaded reddish or brownish, borne in small leafless axillary clusters that are sometimes aggregated into terminal cymes, corolla more or less bila-biate: fr. a thin-walled taper-pointed caps. See Weigela.

The bush-honeysuckles are adaptable for holding banks and for colonizing in rear situations and for tall ground-cover. They propagate readily by suckers.

Lonicera (D. trifida). To 4 ft., glabrous or essentially so: lvs. ovate to oval, long-pointed, 2-4 in. long, petioled. Newf. to Sask. and south to N. C., on banks and rocks.

rivulāris. To 6 ft., pubescent: lvs. ovate or narrower, long- or short-pointed, short-petioled: fts. in terminal clusters. N. C., Tenn., Ga., Ala., on damp banks and rocks; hardy in New England.

sessilifòlia. To 4 or 5 ft., glabrous, with 4-angled branch-lets: lvs. nearly or quite sessile, ovate-lanceolate and acuminate: fis. often in crowded terminal clusters. N. C., Tenn., Ga., Ala., on exposed rocky hillsides; hardy N.

trifida: D. Lonicera.

DIETES: see Moræa.

DIFFUSE: loosely branching or spreading.

DIGITÀLIS. FOXGLOVE. Scrophulariacex. Erect herbs with mostly tall and simple fl.-sts. grown in the border for their long racemes of tubular 2-lipped fls., the upper lip shorter than lower, in purple, yellowish or white, in summer: lys, alternate and long and decorative, especially young rosettes, mostly ovate-lanceolate to lanceolate: native from Eu. to Cent. Asia.

Foxgloves are easily grown. The perennial species are propagated by seeds or by division. The common species and cultigens are usually treated as biennials, the seed sown in the spring or summer producing flowering plants the

ambigua (D. grandistora. D. ochroleuca). Yellow F. Per. or bien. to 3 ft., hairy: fis. 2 in. long, yellowish marked with brown, calyx-lobes linear. Eu., W. Asia.

Buxbaumii: hort. name for a yellow-fld. foxglove.

canariénsis: Isoplexis canariensis, but the plant grown under this name is sometimes D. ambigua.

dùbia. Per. to 9 in.: fls. purplish, spotted inside, in few-fld. racenes. Spain, Balearic Isls.

eriostàchya. To 2 ft. or more: lvs. spatulate-lanceolate, acute, tapering to a narrow but winged petiole, serrulate: fls. hairy, probably white or yellowish and with brown netted venations, with pendent broadly ovate lower lip which is much larger than other lobes of corolla. Habitat unknown.

ferruginea. RUSTY F. Per. or bien. to 6 ft.: fls. rusty-red, downy outside, lower lip bearded, middle lobe longer than others, calyx-lobes ovate. S. Eu.

gloxinioldes: D. purpurea var. gloxiniæflora

grandiflora: D. ambigua.

Isabellina: form of D. purpurea with yellow fis.

levights. Per. to 3 ft.: fls. yellow marked with purple, middle lobe of lower lip longer than others, calyx-lobes oblong. S. Eu.

lanata. Grecian F. Per. or bien. to 3 ft.: fis. 1 in. long, nearly white with fine veins, middle lobe of lower lip longer than others, calyx-lobes linear, racemes hairy. Danube than others, calyx region and Greece.

lùtea. STRAW F. Per. to 2 ft.: fls. yellow to white, to in. long, in one-sided racemes, upper lip 2-parted, calyx-lobes lanceolate. Eu.

Lútzii. A group of hybrids with fls. in shades of salmon. maculata: D. purpurea var.

mariana. Per. to 11/4 ft.: lvs. basal, ovate-oblong, very downy: fls. rose, brownish spotted and bearded within. Spain.

minor. To 1 ft., sts. slender: basal lvs. lanceolate, minutely denticulate, usually tomentose, veins prominently raised: fls. rose-pink, small, corolla glabrous with ciliate lobes. Spain.

monstrosa: D. purpurea var.

nervosa. Per.: fis. yellowish, small, in long dense racemes. Cent. Asia.

obscura. WILLOW-LEAVED F. Per., woody at base: lvs. narrowly linear-lanceolate, entire, glabrous: fis. yellow, veined bright red within, corolla-tube very short. Spain.

ochroleùca: D. ambigua.

orientalis. Per to 3 ft.: lvs. lanceolate, pubescent: fls. whitish-cream, all but lower lip finely striped red without and more irregularly so within, upper lobes rounded, to 1 in. long, subtended by lanceolate bracts that are longer than corolla. Levant.—Perhaps not too hardy N.

purpurea. Common F. Bien., sometimes per, to 4 ft.: fls. to 3 in. long, purple more or less spotted, lobes ciliate, middle lobe of lower lip shorter or as long as others: fls. drooping in one-sided racemes to 2 ft. long; calyx-lobes broad-ovate. W. Eu. Hort. vars. are: álba, fls. white; campanulata, upper fls. united into a large bell-shaped bloom; gloxiniseflora (D. gloxinioides) has longer racemes and more open fls. than the type; lilácina is listed; maculata supérba, Leopard F., improved spotted form; monströga, a double peloric form; rôsea has rose fls. and rûbra purple-red. purple-red.

sibírica. Hairy per.: fls. yellowish, middle lobe of lower lip much longer than others, calyx-lobes linear. Siberia.

Thápsii. Per. to 4 ft.: lvs. ovate-lanceolate to oblong: fis. purple with pale throat, dotted red, in lax racemes, middle lobe of lower lip longer than others. Spain.

viridiflora. Bien. to 2½ ft., glandular-pilose: lvs. oblong, dentate: fis. yellowish-green veined red, few in elongate leafy racemes. Greece.

DIGITÀRIA (Syntherisma). Gramineæ. Ann. grasses of wide range, having flat lvs. and spikelets in one-sided racemes borne in whorls or digitately at top of sts. See Grasses.

sanguinālis (S. sanguinale). CRAB-GRASS. Sts. often decumbent, to 3 ft.: lvs. to 6 in. long and ½ in. wide: racemes to 6 in. long, very narrow, 3-10 together. Eu., but widely nat.—Weedy grass but sometimes planted for ornament

DIGITATE: hand-like; compound with the members arising from one point, as the leaflets of horse-chestnut. See Palmate.

DIHOLCOS: Astragalus bisulcatus. DILL: Anethum graneolens.

DILLÈNIA. Dilleniacex. Warm-country trees. Asia to Australia, one intro. in southernmost parts of U. S.: lvs. alternate, large and strongly pinnately veined: fis. mostly large and showy, white or yellow, solitary or in clusters, the parts 5 or in multiples, the calyx enlarging and inclosing the fleshy fr.

Indica (D. speciosa). To 40 ft., evergreen or losing its foliage in the dry season: lvs. oblong, thick, to 12 in., serrate, borne at ends of branches: fls. white, 6 in. or more across, with a mass of yellow stamens and a rayed stigma: fr. size of fist, acid, edible. Trop. Asia.

speciòsa: D. indica.

DILLENIÀCEÆ. DILLENIA FAMILY. Trees, shrubs or rarely herbs of about a dozen genera, some having medicinal properties but only Actinidia, Candollea, Dillenia, and Hibbertia known in cult. in the U. S. outside botanic gardens. The family is characterized by mostly alternate lvs., yellow, white or rarely red usually bisexual fls. having commonly 5 sepals and petals, numerous stamens, ovary 1 or more carpels.

DILLWÝNIA. Leguminosæ. Heath-like shrubs, mostly of small size, native in Australia and adapted to Calif.: lvs. scattered or alternate, narrow-linear or needle-like: fls. papilionaceous, yellow or orange-red, prevailingly in small axillary or terminal racemes or corymbs or sometimes solitary: pod ovate or broader.

Preissii. To 5 ft. with long erect branches: lvs. to ¾ in. long, stiff: fls. about 3 or less in the axils, standard somewhat exceeding calyx.

DIMORPHANTHUS: Aralia.

DIMORPHOTHÈCA. CAPE-MARIGOLD. Compositæ. S. African herbaceous or subshrubby annuals and perennials with white, purple, yellow or orange, solitary terminal heads of ray- and disk-fls. In Calendula the ray achenes are incurved, the lvs. entire or minutely toothed; in Dimorphotheca the ray achenes are straight, the lvs. conspicuously toothed.

Cape-marigolds are grown in the flower-garden and sometimes in the greenhouse and bedded out. They make a good display in warm sunny situations, requiring a long season for best results. Propagated by seeds and the perennial species by cuttings.

annua (Calendula pluvialis). Ann., rough-hairy: lvs. oblong: rays white or yellowish above, purplish below. Var. ligulosa (Calendula Pongei). Double, the rays white above, yellow or violet beneath. Var. ringens (D. ringens). Fls. pure white with blue ring around the center.

aurantiaca (Calendula Traque). Per. blooming as an ann., often shrubby: lvs. linear-oblong, to 3 in. long and ½ in. wide, margins entire: rays orange-yellow.

calendulàcea. Ann., glandular-pubescent: lvs. oblong, wavy-toothed: rays orange-yellow.

chrysanthemifòlia. Shrubby per. to 2½ ft.: lvs. obovate-oblong, to 3 in. long and 1 in. wide, incised or toothed, oc-casionally lobed: rays yellow, heads to 3 in. across.

cuneata. Much branched shrub, sticky-glandular: lvs. cuneate to lanceolate, to 1 in. long, toothed: rays yellow, heads about 2 in. across.

Ecklonis. Per. or subshrub to 2 ft.: lvs. lanceolate or linear-lanceolate: rays white above, purplish beneath.

hýbrida (Calendula hybrida). Hybrids between D. annua and D. aurantiaca with fis. varying from white to red, yellow and orange.

pluviàlis: D. annua.

ringens: D. annua var.

spectabilis. Per. to 1½ ft.: lvs. lanceolate-elliptic, to 2½ in. long, acute, scabrous: heads about 1 in. across, ray-fis. bright purple, 3-toothed, disk-fis. purple.

DINEMA, represented by the single species D. polybulbon, is now referred to Epidendrum.

DINTERÁNTHUS. Aizoaceæ. S. African stemless succulents of the Mesembryanthemum association, having short thick lvs. united halfway or more and large yellow solitary fls.; petals numerous; stigmas 7–9.

Mårgaretiæ: Lapidaria Margaretiæ.
microspermus (M. microspermum). Lvs. united to
\$\foatie{t}\$ their length, 1 in. long and broad and \$\foatie{x}\$ in. thick, reddish with green dots: fis. yellow tipped with reddish, 1\foatie{x}\$ in.

Pole-Evansii (M. and Rimaria Pole-Evansii). Plant-body to 1% in. wide, the fissure about ½ in. deep, grayish: fis. with outer petals pink and inner pale yellow, 1½ in. across.

puberulus (D. punctatus). Plant to 1½ in., the pair of lvs. united ½ to ½ their length and the tips diverging: lvs. to ¾ in. long and broad and ½ in. thick, grayish-brown dotted with dark green, velvety: fls. yellow, reddish outside.

punctatus: D. puberulus.

DIOCLÈA. Leguminosæ. Twining vines with lvs. of 3 lfts. and papilionaceous blue, red or white fls. in clusters or racemes; sometimes planted in warm regions. Propagated by seeds, cuttings, or suckers.

glycinoides. Fls. scarlet, 1 in. long. Argentina.—The botanical position of the plant grown under this name is much in doubt, and it may belong to another genus.

DIŒCIOUS: staminate and pistillate flowers on dif-

DION (*Dioon*). Cycadacex. Mexican palmlike or tree-fern-like plants with stiff pinnate lvs. and fls. borne in cones. For cult. and uses see Cycas, from which it differs in technical floral and fr. characters.

Dohènii. A plant not fully described and yet little known: Ifts. broadest at base, very stiffly sharp-pointed, not toothed, glabrous, margins recurving, parallel side nerves about 12 and prominent. Erroneously reported from Guatemala.

edûle. Trunk to 6 ft. high, very stocky: lvs. 3-5 ft. long; lfts. entire in adult plants but toothed at tip on young ones, side nerves 12 or less, sharp-pointed. Hot open situations.

spinulosum. Trunk to 50 ft. high, more slender: lvs. 4-6 ft. long; lfts. long, with separate slender spiny teeth on each margin, the parallel side veins 18 or more. Rain forcests.

DIONÈA. Droseraceæ. One insectivorous per. of restricted range in N. C. and S. C., sometimes grown as an oddity or for botanical demonstration. The plant thrives in sunshine in a humid atmosphere. It should be potted in sphagnum or silver-sand and black silt and the pots set in about 1 in. of water. Propagated by seed under a bell-jar. D. muscípula. Venus Fly-Trap. Lvs. in basal rosettes, having flat petioles and round 2-lobed blades which are fringed with sensitive hairs, closing together when touched: fls. white, in umbels terminating scapes about 1 ft. high.

DIOON: Dion.

DIOSCORÈA. YAM. Dioscoreaceæ. Herbaceous twining vines or perhaps more or less woody, in both eastern and western hemispheres and mostly of warm regions, with tuberous roots and often aërial tubers, simple or compound broad lvs. and small dioccious fis. in spikes or racemes.

Several species are cultivated in the tropics for the edible tubers, and a few in the North for ornament and

interest: Yams are of easy cultivation and may be planted at any time of year where hardy. Propagated by seeds, tubers or cuttings. The word yam is sometimes applied to certain varieties of sweet potato.

alata. Tubers to 8 ft. long: sts. 4-winged or -angled, often with small axillary tubers: lvs. opposite, ovate to oblong and deeply heart-shaped at base. India to Malaya; not hardy N.

Bathas (D. divaricata). Chinese Y. Cinnamon-Vine. Tubers to 3 ft. long, deep in ground: sts. tall-climbing, slightly angled, bearing small axillary tubers: lvs. opposite, ovate, strongly broadened or angled at base. Chine; hardy N., remaining for years, the tops dying to the ground.

bulbiffera. AIR Portato. With small or no root-tubers: sts. cylindrical, bearing axillary angular tubers to 1 ft. long: Ivs. alternate, ovate, heart-shaped at base. Trop. Asia, Philippines; not hardy N.

cayenénsis. YELLOW or ATTOTO Y. St. angled or cylindrical, prickly toward base: lvs. mostly opposite, ovate, deeply heart-shaped at base. W. Indies to Brazil; not hardy.

díscolo: Root tuberous: lvs. ovate, heart-shaped at base, purplish beneath, white along midrib. S. Amer.—Grown as a greenhouse foliage plant.

divericate: D Ratatas

hirticaùlis. Plant with weak pubescent st. to 10 ft. long: lvs. pubescent beneath, alternate, broadly ovate: staminate fls. solitary, pistillate fls. in racemes, with 1-4 frs. developing from each infl. Swamps of Ga. and S. C.

macroura. Lvs. alternate, orbicular, heart-shaped at base, wavy-margined. Trop. Afr.

oppositifòlia. Lvs. opposite, lanceolate to ovate, not heart-shaped at base. India, E. Indies.

trifida. Cush-Cush. Yampee. Tubers small: sts. angled or winged: lvs. 3-5-lobed to middle or lower. S. Amer.; not hardy.

villôsa. Wild Yam. Colic-Root. Rootstock woody, to ¾ in. thick: lvs. ovate, heart-shaped at base. R. I. to Fla. and Tex.

DIOSCOREACEÆ. YAM FAMILY. Ten genera of twining herbaceous or somewhat woody vines with woody or tuberous roots, widely distributed, characterized by monœcious or diœcious fls. having 6 perianth-segms. in 2 series, 6 or 3 stamens, typically 3-celled ovary, 3 styles, and capsular or baccate fr. Only Dioscorea, Rajania, Tamus and Testudinaria are in general cult.

DIÓSMA. Rutacex. Heath-like shrubs native in S. Afr., with simple linear lvs., small white or red fls., and fr. of 5 carpels; cult. out-of-doors in the S. and under glass for ornament and use in floral decorations.

Soil for diosmas should be similar to that for heaths, fibrous loam and leaf-mold with sharp sand added. Plants should be cut back after flowering to induce bushy growth. Propagated by cuttings of young wood.

álba: Coleonema album.

capitata: Audouinia capitata.

ericoides. Buchu. To 2 ft., with many branches, fragrant. fis. white and borne in great profusion.

pulchélla: Barosma pulchella, púlchra: Coleonema pulchrum, purpùrea: Agathosma villosa. Reèvesii: listed name.

DIOSPYROS. Persimmon. Ebenaceæ. Widely distributed trees and shrubs, largely Asian, with alternate simple lvs., unisexual or imperfect fls. in cymes or the pistillate solitary, and fr. a juicy edible berry with the enlarged calyx at base. D. Kaki and D. virginiana are grown for the edible fr., and others for ornament and interest.

Persimmons are not hardy North with the exception of D. virginiana which will stand in parts of New England. They succeed in most soils. Propagated by seeds, cuttings, and layers. For culture of D. Kaki see Persimmon. D. Ebenaster, the black sapote, thrives only in the tropics or perhaps will withstand two or three degrees of frost. Propagated by seeds and shield-budding. D. Lotus stands perhaps to north-central regions. The other species are tropical or of mild climates.

Cargillia. Small tree: lvs. oval, to 3 in. long, yellowish beneath: fr. black, ½ in. long. Australia.

chinénsis: D. Kaki.

Ebenáster. Black Sapote. Tree to 60 ft.: lvs. oval or oblong, to 8 in. long, shining: fs. small, white: fr. olivegreen, to 5 in. long, with chocolate-brown flesh. Mex., W. Indies.

Ébenum. Large tree with smooth branchlets: lvs. elliptic, to 4 in. long, thick: staminate fis. fascicled, pistillate solitary, corolla tubular: fr. ¾ in. diam. India.—Source of the ebony of commerce.

iapónica: D. Lotus.

Káki (D. chinensis). Kaki. Japanese P. Tree to 40 ft.: lvs. ovate or obovate, to 7 in. long, shining above, pubescent beneath: fls. yellowish-white, about ½ in. long fr. orange or reddish, to 3 in. across, with orange flesh. Japan, China, where it is much cult.

Lotus (D. japonica). Date-Plum. Tree to 45 ft.: lvs. oval or oblong, to 5 in. long, pubescent: fls. reddish or greenish, to ½ in. long: fr. yellow turning black, ½ in. across. W. Asia to Japan.

montans. Tree: lvs. ovate or oblong, to 4 in. long: fls. white, 1/4 in. long: fr. reddish-brown, 11/4 in. across. Trop. Asia.

virginiana. Common P. Tree to 50 ft. or more: lvs. ovate, to 6 in. long, shining above: fls. to 1/2 in. long: fr. yellow or orange, to 1/2 in. across. Conn. to Fla. and Tex., in woods and fields.

DIOSTEA: Baillonia juncea.

DIÒTIS. Compositæ. One per less than 1 ft. high, growing along the European coast and useful in rock-gardens. Propagated by seeds or cuttings. D. candidíssima. Cotton-WEED. White-tomentose: lvs. alternate, oblong. ½ in. long: heads ¼ in. across, in dense terminal clusters, of disk-fls. only. Aug.-Sept.

DIPÉLTA. Caprifoliaceæ. Chinese deciduous shrubs allied to Diervilla and Weigela, with opposite lvs., pinkish or purple tubular-campanulate fls. solitary or in racemes, and fr. a caps. inclosed by large showy bracts. They are hardy in the N. and thrive in any good soil. Propagated by seeds in spring and by cuttings of green and hard wood.

floribunda. To 16 ft.: lvs. ovate to oval-lanceolate, to 4 in. long, enture: fls. pink with orange-yellow throat, fragrant, 1 in. long, the corolla slender at base, May: fr.-bract shield-like, to 1 in. across.

ventricosa. To 20 ft : lvs. elliptic or narrower, to 5 in. long, mostly finely denticulate: fis. rose with orange throat, drooping, the corolla swollen at base: fr.-bract cordate, attached at base.

DIPHYLLÈIA. Berberidaceæ. Two per. herbs native in E. N. Amer. and Japan, the former transferred to wild-gardens: lvs. large, peltate, 1 radical and 2 smaller cauline lvs.: fls. white, in a terminal cyme: fr. a berry.

cymòsa. Umbrella-Leaf. To 2 ft.: basal lf. to 2 ft. across, deeply 2-lobed, with many toothed lobes: berries blue, about 1/2 in. long. Va. to Ga. and Tenn., in wet places in mts.

DIPLACHNE: Leptochloa fascicularis.

DIPLACUS: Mimulus.

DIPLADÈNIA. Climbing A pocynacex. shrubs, perhaps at first erect, with opposite lys., large funnelform fls. in terminal or axillary racemes, white or rose corolla with 2 scales at base inside, and fr. of 2 spreading follicles; native in trop. S. Amer., grown in greenhouses, and out-of-doors in the S. D. splendens and D. boliviensis are the usual species in cult; other names are likely to represent hort. derivatives.

Dipladenias may be grown under heat with good drainage, in a soil composed of fibry peat, sand and charcoal. Propagated by cuttings over bottom heat.

amábilis. Fls. rosy-crimson. amcena. Fls. pink, suffused with rose. boliviénsis. Lvs. oblong, to 3½ in. long: fis. white, the throat yellow inside, 1½ in. across, 3 or 4 together. Bolivia. Brearleyana. Fls. pink, changing to crimson.

hybrida. Fls. bright crimson-red.

insignis. Fls. rosy-purple. profusa. Fls. bright rose.

rosea. Fis. pink with purple eye, to 4 in. across.

splendens. Lvs oval, to 8 in. long, heart-shaped at
base: fis. white suffused with rose, 4 to 6 together. Brazil.

DIPLARRHENA. Iridacee. Tender herbs from Australia and Tasmania, with short rhizomes, mostly basal narrow stiff lys. and fugacious fls. 1 or more in a stiff terminal spathe; of the Belamcanda and Sisyrinchium group.

Moræa. To 2 ft.: lvs. to 11/2 ft. long and 1/2 in. wide: fls. whitish, 2-3 in spathes 2 in. long.

DIPLÀZIUM. Polypodiaceæ. Ferns closely resembling Asplenium and requiring the same general treatment, grown under glass, differing in the arrangement of the sori; mostly in the warmer zones. See Ferns.

lánceum (Asplenium lanceum). Fronds simple, lanceolate, to 9 in. long and 1 in. wide, usually entire. India, China, Japan.

DIPLOCŸATHA. Asclepiadaceæ. One African succulent leafless per. D. ciliàta (Stapelia ciliata). Sts. decumbent, 4-angled, to 2½ in, long: fls. pale vellowish dotted with red, rough inside, 3 in. across, solitary near base or middle of st.

DIPLOGLÓTTIS. Sapindacex. One tall Australian tree, sometimes planted in S. Calif. D. Cúnninghamii (Cupania Cunninghamii). Lvs. pinnate, of 8-12 oblong or ovate-lanceolate lfts. to 1 ft. long, pubescent beneath: fls. greenish, in large panicles: fr. a tomentose caps. 1/2 in. across, the seed inclosed in a pulpy aril from which jam is made in Australia.

DIPLOPAPPUS: see Aster filifolius and fruticosus.

DIPLOSÒMA. Aizoaccæ. Succulent stemless deciduous perennials of S. Afr., allied to Mesembryanthemum: lvs. of 1 pair obliquely united at base, soft and pulpy: fls. solitary and terminal; petals numerous; stigmas 7, filiform.

retrovérsum (M. retroversum). Lvs. to 1 in. long, $\frac{1}{3}$ in. broad and $\frac{1}{6}$ in. thick, united nearly halfway, smooth, with few pellucid dots: fls. rosy-purple, $\frac{1}{2}$ in. across.

DIPLOTÁXIS. ROCKET. Cruciferæ. score of mustard-like erect ann., bien. or per. herbs of Eu, and the Medit, region, two of them sometimes raised for ornament: lvs. pinnatifid or lobed: fls. yellow, white, rose or lilac, in terminal racemes: pod or silique elongated with short beak, erect or spreading.

acris (Moricanda hesperidiflora). To 7 in.: lvs. oblong to obovate, obtuse, dentate: fls. lilac-pink to white, on ascending pedicels: pods erect.

erucoides. Ann, to 18 in., branching from base: lower lvs. lyrate: fls. white, veined rose or lilac. In cult. fields, Eu., coming quickly to bloom.

DIPLOTHEMIUM: see Polyandrococos caudescens.

DIPSACEÆ. TEASEL FAMILY. Old World herbs of about 7 genera, having mostly opposite lvs., small bisexual fls. in dense involucrate heads or spikes, like composites, with gamopetalous 2-5-lobed corolla, 2-4 stamens, inferior 1-celled ovary, and fr. an achene, and the general looks of Compositæ. A few genera are cult. for ornament or commercial purposes, as Cephalaria, Dipsacus, Knautia, Morina, Pterocephalus, Scabiosa, Succisa.

DÍPSACUS. Teasel. Dipsacex. Bien prickly or hairy coarse tall herbs with opposite entire or pinnately cut lvs. and 4-lobed fls. in terminal heads or spikes subtended by spiny involucral bracts; plants of thistle-like aspect; native in Eu., Asia, N. Afr. A few species are grown in the garden and D. fullonum for raising the nap on woollen cloth.

asper. To 6 ft.: lower lvs. pinnatifid, rough and hairy: fls. white. Himalayas.

azureus: listed name of blue-fid. hort. form of D.

chinénsis. To 6 ft.: lvs. pinnately cut into about 8 pairs of coarsely toothed bristly lobes: heads globose, to 2 in. across, the involucral bracts shorter than head and recurved, stamens long-exserted. China.

fullonum. Fullers T. To 6 ft.: lvs. lanceolate or oblong, to 1 ft. long, entire or toothed, sessile: fls. pale lilac, in cylindric heads to 4 in. long, the involucral bracts shorter than head and becoming reflexed, bracts of receptacle with hooked tips and the dry head employed by fullers. Eu.; grown as a special crop in U. S., and somewhat escaped.

inérmis. To 6 ft, prickly: lvs. pinnatifid: fls. white or yellowish, in nearly globose heads. Himalayas.

laciniatus. To 3 ft.: lvs. pinnatifid or bipinnatifid, ciliate: fls. white or pale pink, in oval heads to 3 in. long, exceeded or equalled by the involucial bracts. Eu., W. Asia.

pilòsus. To 4 ft : lvs. oblong, entire or toothed, petioled: fls. yellowish-white, in globose heads to 1 in. across, the involucral bracts equalling those of receptacle and shorter than head, bristly. Fu.

sylvéstris. Common T. Differs from D. fullonum in the involucral bracts as long as or exceeding head and curved upward. Eu., Asia; extensively nat. in E. N. Amer.

DIPTERÒNIA. Aceraceæ. Two Chinese deciduous trees with odd-pinnate opposite lvs. and imperfectly monocious little fls. in large terminal panieles: fr. winged all around. D. sinénsis, adapted to southern states and Calif., is 30 ft. or more: lfts. 4-6 pairs, narrow-ovate to oblong, serrate: fls. whitish, very small: samara about 1 in. across.

DÍRCA. LEATHERWOOD. Thymelæaceæ. Two deciduous bushes native in the U. S., with tough flexible branches and yellowish funnelform declined or pendent short-stalked bisexual fls. in advance of the simple alternate lvs.: fr. a small red or greenish drupe. D. palústris, N. B. to Mo. and Fla. in damp or fertile woods and copses, is a neat shrub to 6 ft.: lvs. elliptic to obovate, 2–3 in. long, entire.

DISA. Orchidacex. Terrestrial African orchids with the habit of Habenaria, with tuberous undivided rootstocks and leafy sts., the fls. with helmet-shaped dorsal sepal, commonly small petals and lip. Require moist situations in the greenhouse; for cult. see Orchids.

grandifldra: D. uniflora.

Luna. Hybrid between D. racemosa and D. Veitchii.

racemòsa. To 30 in. high, leafy toward the base: racemes laxly about 4-9-fid.; fis. rose-red with purple lines or veins, large, about 1½ in. across. S. Afr.

unifora (D. grandsfora). To 2 ft. high with leafy sts.: racemes lavly 1-3-fld.; fls. the largest of the genus, to about 4 in. across; dorsal sepal red without, lighter within, lined with deeper color, with a short straight spur; lateral sepals scarlet or carmine. Jan.-Mar. S. Afr.

Veitchii. Hybrid between D. racemosa and D. uniflora. Fls. rose-hlac, about $2\frac{1}{2}$ in. across.

DISANTHUS. Hamamelidaceæ. Japanese genus containing a single species. D. cercidifòlius. Shrub to 24 ft., twigs with conspicuous lenticels: lvs. orbicular-ovate, to 4 in. across, alternate, glabrous, entire, palmately 5–7-nerved, becoming crimson-red in autumn: fls. dark purple, to $\frac{5}{8}$ in. across, perfect, calyx pubescent with recurved lobes.

DISCARIA. Rhamnaceæ. Mostly S. American spiny shrubs, but one kind in Australia and another in New Zeal., with small opposite or clustered lvs. or sometimes lacking, axillary fls. and fr. a leathery drupe or caps.; sometimes grown for ornament.

serratifolia. To 12 ft., with pendulous branches, spines to 1 in. long; lvs. to 1 in. long, narrow-oblong; fls. greenish-white, many, ½ in. across, fragrant. Chile, Patagonia.

Toumatou. To 15 ft, divaricately much branched, spines 2 in. long: lvs. to ¾ in. long, linear-obovate: fis. many, greenish-white, ½ in. across. New Zeal.; grown in S. Calif.

DISCOCÁCTUS. Cactaceæ. Low plants, globlose or flattened endwise, with many tubercled ribs, spines clustered at the areoles and usually curved: fls. in a small head from the center of the plant, nocturnal, with a tube, white or pinkish: fr. naked. E. S. Amer. Differs from Melocactus in its night-blooming habit and flower-limb of many rather than few segms.; not to be confused with the very different genus Disocactus. See Cacti.

altèolens (D. tricornis). Solitary, st. wider than tall, to 4 in. diam.; ribs 9-10; radial spines 5-6; central spine usually absent: fis. white. Brazil.

Bésleri: D. placentiformis.

placentiformis (D. and Melocactus Beslert). Plant depressed, broader than high, blue-green; ribs broad and low, 10-14; radial spines 6 or 7; central usually wanting: fis, somewhat elongated, rose-color. Brazil.—Long in cult, but apparently seldom seen.

tricornis: D. alteolens.

DISK, DISC: a more or less fleshy or elevated development of the receptacle about the pistil; also the receptacle in the head of Composite; a flattened extremity, as on tendrils of Virginia creeper.

DISK-FLOWERS: the tubular flowers in the center of heads of Composite, as distinguished from the ray-flowers.

DISOCÁCTUS. Cactacex. Spincless epiphytic plants with terete st. and flattened often more or less leaf-like branches, of bushy habit: fls. diurnal, near tips of branches, the tube shorter than limb and segms. few. Two species in Cent. Amer.; not to be confounded with Discocactus. See Cacti.

biformis (Cereus and Phyllocactus biformis. Epiphyllum biforme). Becoming pendulous, plant 8 in. or more long; branches 1/2-3/4 in. broad and 3 in. long, serrate: fls. purplered, about 1/2 in. long. Honduras, Guatemala.

DISPHYMA. Aizoaceæ. Segregate from Mesembryanthemum (which see for cult.): sts. prostrate: lvs. half-cylindrical, slightly united at base, punctate: fls. solitary or 2-3; stigmas and fr.-cells 5, with 2-lobed tubercle at opening of each cell.

australe (M. australe). Per., rooting at joints: lvs. opposite, oblong, flattened or 3-angled, mostly obtuse: fis. reddish, 1 in. across. Australia, New Zeal., Pacific Isls.

crassifolium (M. crassifolium). Lvs. to 1½ in. long and ½ in. wide: fis. rose, 1½ in. across, on long pedicels. S. Afr.

DÍSPORUM (*Prosartes*). FAIRY BELLS. *Liliaceæ*. Per. woods herbs with slender rhizomes, alternate lvs., white or greenish-yellow drooping fls. solitary or in few-fld. umbels, and fr. a berry; sometimes planted in the wild-garden.

Hookerl. To 2 ft.: lvs. ovate, to 3 in. long, cordate at base: fls. green, 1/2 in. long: berries scarlet. Calif.

lanuginosum. To 2½ ft.: lvs. to 4½ in. long and 2 in. wide: fis. greenish, ¼ in. long: berries red. Ont. to Ga. and Tenn.

maculatum. To 2 ft.: lvs. ovate-lanceolate, to 2 in. long: fis. yellowish dotted with black, ¾ in. long. N. C. to Ga. and Ala.

oreganum. To 2 ft.: lvs. to 3½ in. long and 2 in. wide, cordate at base: fis. creamy-white, ½ in. long. B.C. to Ida. and Ore.

Smithii. To 3 ft.: lvs. ovate or ovate-lanceolate, to 4% in. long: fls. whitish, to 1 in. long: berries yellow. B. C. to Calif.

trachycarpum. To 2 ft.: lvs. ovate to ovate-lanceolate, to 31/2 in. long, briefly acuminate: fls. yellowish, to 3/2 in. long. Ariz. to New Mex., north to B. C. and Man.

DISSECTED: divided into many slender segments. DISTEGIA: Lonicera involucrata.

DÍSTICTIS. Bignoniacex. Trop. American woody vines with lvs. of 2-3 entire lfts. and often a terminal tendril, purple or pink funnelform fls. in terminal racemes or panicles, and oblong smooth frs.; one species grown in S. Calif. cinèrea: D. lactiflora.

lactifiora (D. cinerea). Lits. ovate or oblong, to 2½ in. long, pubescent: fis. purple, to 3½ in. long and limb 2½ in. across, tomentose outside: fr. to 3½ in. long. Mex.

DISTYLIUM. Hamamelidacex. few evergreen trees and shrubs native in Asia, diœcious, monœcious or polygamous, with alternate lvs., fls. without petals but with small bracts, borne in axillary racemes; hardy only in warm regions. Propagated by seeds and by lavers.

racemòsum. To 80 ft., shrubby in cult.: Ivs. elliptic, to 3 in. long, entire, dark green and shining above, sometimes with irregular margins: fis. with red anthers, in racemes 2-3 in. long. Japan. Var. variegàtum has lvs. bordered or splashed yellowish-white.

DITCH-MOSS: Anacharis canadensis.

DITREMEXA: Cassia.

DITTANY: Dictamnus albus. Crete: Origanum Dictamnus. Maryland: Cunila origanoides.

DIVIDED: separated to the base. DIVI-DIVI: Casalpinia corraria.

DIZYGOTHÈCA. FALSE ARALIA. Araliacex. Shrubs or small trees, probably native in the Pacific Isls., with alternate digitately compound lvs., small fis. in umbels, and berry-like frs. The species or names are not well understood.

Tender foliage plants grown in the greenhouse in the Tender foliage plants grown in the greenhouse in the juvenile state as pot specimens and seldom coming to flower. A good soil is one composed of equal parts sandy loam and peat or leaf-mold. For propagation see Polyscas. elegantissima (Aralia elegantissima). Lvs. of 7-11 thread-like drooping lfts.; petuoles mottled with white. Kerchoveana (Aralia Kerchoveana). Lvs. of 7-11 prominently notched lfts. about ½ in. wide; petuoles mottled. Veitchii (Aralia Veitchii). Lvs. of 9-11 toothed or wavymargined lfts. about ½ in. wide, reddish beneath. Var. gracillima has very narrow lfts. with white midribs.

DOCK: Rumex. Prairie: Silphium terebinthaceum. DOCKMACKIE: Viburnum acerifolium.

DOCYNIA. Rosacex. A few partially or wholly evergreen small trees of farther Asia allied to apples and pears, sometimes planted for ornament and interest in the warmer parts of the U. S., the fruits more or less employed in other countries in cooking: the genus belongs with the Cydonia or quince group bearing several to many seeds in each carpel: lvs. simple sometimes shallowly lobed: fls. white, in small umbels, appearing before the lvs. or with them. the calyx and pedicels tomentose.

Delavalyi (Pyrus Delavayı). Evergreen, to 30 ft.: lvs. ovate-lanceolate, entire, to 4 in. long, tomentose underneath: fr. ovoid, about 1 in. long. China.

docynioldes: D. rufifolia.

ruffòlia (D. docynioides). Deciduous or only partially evergreen: lvs. elliptic or broad-lanceolate, often serrate toward apex, to 3 in. long, thinly pubescent becoming glabrous underneath: fr. nearly globose, about 1 in. diam. China.

DODECATHEON. SHOOTING-STAR. AMERI-CAN COWSLIP. Primulaceæ. N. American small per. herbs, of woods, prairies and mts., with basal lvs., nodding cyclamen-like fls. borne in umbels on scapes, the corolla-lobes reflexed, the long slender anthers connivent into a cone.

Sometimes planted, and grown in well-drained soil in a shady place; useful in the wild-garden and some species in the rock-garden. Propagated by division and seeds.

The plants of this genus have received various specific interpretations, from the consideration of all forms as variants of the single species D. Meadia, to the view that all variants merit specific rank. Below are given the binominals and their varieties as listed in the trade.

alpinum. Lvs. to 4 in. long: fls. purple, the whitish base having yellow zone and purple band; stamens deep purple. Mts., Calif., Ore.

campéstre. Lvs. to 2 in. long: fls. pink with white base and blue center; anthers pink with dark purple base. Wash.

Clèvelandii. Lvs. to 2½ in. long: fls. purple with yellow base, varying to white; filaments of stamens purple, anthers yellow. S. Calif.

Colrigo: hort, name of unknown botanical status.

conjugens. Glabrous plant to 10 in.: lvs. to 5 in. long: fls. large, deep purple varying to rose or white. Ore. to Mont.

Differs from D. vulgare in its slightly Cheickii cusickii. Differs from D. vulgare in its signtly smaller habit and glandular-puberulent foliage and scapes: fis. usually deep rose to lavender. B. C. to Alta., south to Wash. and Mont. Var. álbum has white fis.

dentatum (D. Meadia var. lattlobum). Lvs. to 4 in. long, dentate: fls. white with 2 purple spots at base of each petal; anthers brownsh-red with yellow filaments. Ore. to Utah.

frigidum. To 1 ft.: lvs. oblong-obovate to ovate, entinor dentate: fis. violet, corolla-lobes oblong-linear. Bering Strait to Rocky and Sierra Mts.

Héndersonii. Similar to D. Clevelandii but anthers deep purple. Calif. to Wash.

Hügeri, Lys. to 1 ft. long: fls. white or sometimes tinged purple. Md. to Ga. and Ala.

integrifòlium: D. Meadia.

Jéffreyi. Lvs. to 1 ft. or more long, oblong-lanceolate, crenate: fls. deep red-purple; filaments and anthers purple. Calif. to Ida. and B. C. Var. rédolens has odorous foliage and fls. not so closely reflexed.

latifòlium. To 1 ft.: lvs. broadly elliptic to obovate, entire: fls. dark purple with yellow center, filaments black-ish-purple: caps. circumscissile. N. W. Amer.

latflobum. Lvs. to 10 in. long: fls. yellowish-white; filaments very short, anthers purple. Wash., Ore.

Mèadia (D. integrifolium). Lvs. to 6 in. long: fls. rose, white at base; filaments reddish-yellow, anthers purple. Pa. to Man. and Tex. Var. álbum, fls. white; var. élegans is shorter with darker fls.; var. spléndidum has crimson fls. with a yellow circle; var. supérbum is an improved form.

multiflorum. Lvs. to 8 in. long: fls. bluish-violet, numerous. Colo., Wyo.

patulum. Lvs. to 1½ in. long: fls. white or pinkish with purple base; filaments and anthers purple. Calif.

paucifidrum: D. vulgare.

poéticum. Lvs. to 41/2 in. long: fls. rose-pink with yellow circle at base, then a narrow crimson band and a broad yellow band. Ore.

praténse: listed name.

puberuléntum: D. puberulum.

puberulum (D. puberulentum). Lvs. spatulate, to 314 in. long, glabrous: fis. purple with yellowish throat. Ida.—By some D. Cusickii is not considered distinct from this plant.

radicatum. Lvs. to 5 in. long: fis. rose or reddish; anthers purple. Kans. to N. Mex.

salinum. Lvs. to 13/4 in. long: fis. lilac with yellowish throat, anthers purple. Sask. to Ida. and Utah.

Stånfieldia. To 1½ ft.: lvs. spatulate, to 5 in. long, margins wavy: fls. rose-purple, corolla-lobes to ¾ in. long, showy. Tex.

tetrándrum. Lvs. to 1 ft. long: fis. purplish with yellow ring near base; anthers dark purple. Wash., Ore.

viscidum (D. conjugens var. viscidum). Differs from D. conjugens chiefly in its foliage and scape glandular-puberulent. Wash.

vulgare (D. pauciflorum). To 18 in.: lvs. spatulate-oblanceolate, to 4 in. long, narrowed into winged petiole, usually entire: fis. purple with dark wavy line in throat, anthers purple with yellow filaments. B. C. to Colo.

DODONAA. Sapindacex (or Dodonxacex). Small trees and shrubs with alternate simple or sometimes compound lvs.: fls. small, polygamous or diocious: frs. capsular, winged. Sometimes planted for ornament in warm regions. Some species carry medicinal properties, and most of them have resinous sticky excretions. They are native of trop, and semitrop, regions in both hemispheres.

attenuata. Viscid shrub, somewhat like narrow-lvd. D. viscosa, but lvs. linear-cuneate or long and linear, only slightly sinuate-to othed, to 2½ in. long: fls. in short simple racemes. Australia.

cuneata. Hor-Bush. Shrub, usually viscid: lvs. obovate or cuneate, to 1 in. long: fis. in terminal racemes or axillary clusters. Australia.

madagascariénsis. Tree to 14 ft.: lvs. of about 12 pairs of linear-lanceolate lfts. to 1½ in. long. Madagascar.

ptarmicæfòlia. Tall shrub, sometimes viscid, young branches angled: lvs. linear-lanceolate and acuminate, to 3 m. long and in some cases more, serrate or entire: fis. in terminal racemes or panicles. W. Australia.

spatulata: considered to be one of the forms of D. viscosa. Thunbergiana. Shrub to 10 ft., glabrous: lvs. lanceolate to linear-lanceolate, to 2½ in. long; fls. in dense racemes.

viscôsa. Shrub to 15 ft., viscid: lvs. obovate-oblong to lanceolate, to 4 in. long: fls. in short racemes. Widely distributed in Fla. and W. Indies; a variable species.

DOELLINGERIA: Aster umbellatus.

DOGBANE: A pocunum.

DOGS-TAIL, CRESTED: Cynosurus cristatus.

DOGWOOD: Cornus. Poison: Rhus Vernix.

DOLICHÁNDRA. Bignoniacex. One Brazilian climbing shrub, suitable for greenhouse cult. D. cynancholdes (Macfadyena cynan-choldes). Lvs. of 2 oblong entire lfts. to 2 in. long and a 3-parted terminal tendril: fls. red, tubular, to $2\frac{1}{2}$ in. long, stamens long-exserted, calyx split and spathe-like: caps. linear, to 4 in.

DOLICHOLUS: Rhunchosia.

DÓLICHOS. Leguminosæ. Mostly twining herbs or subshrubs with trifoliolate lvs., papilionaceous fls. solitary or clustered in the axils, and flattened beaked pods; native in the tropics where several species are grown for human food, as forage and green-manure crops, but in N. Amer. cult. chiefly for ornament. Seeds should be sown in spring where the plants are to stand.

biflorus. Ann. twiner: lfts. 1–2 in. long: fls. yellow: pods to 2 in. long, with gray seeds. India.

gigantèus: D. Lablab var.

Hôsei. Sarawak Bean. Forming mats to 6 in. thick: lfts. to 1½ in. long and ¾ in. broad: pods ¼ in. across. Borneo.—Grown far S. as cover-crop and propagated by

japónicus: Pueraria Thunbergiana.

Láblab (D. soudanensis). Hyacinth Bean. Bonavist.

Lablab Per but grown as ann.: lits. to 6 in. long and very broad: fis. purple or white: pods to 2½ in. long, with black or white seeds. Probably Old World but widely spread in tropics, and common in cult. Var. gigantèus is a large form with white fis. The hort, form Darkness has violet-purple fls. and black seeds and Daylight white fls. and white seeds.

lignòsus. Per., evergreen: líts. to 1½ in. long, triangular-ovate: fls. rose-purple or white in var. álba: pods to 1 in. long, with black seeds. Probably Asia.

sesquipedalis: Vigna sesquipedalis.

soudanénsis: D. Lablab.

violaceus: Phascolus violaceus.

DOLICHOTHÈLE. Cactucex. Three small globose and more or less cespitose Texan-Mexican cacti segregated from Mammillaria, soft in texture and juice not milky, tubercles long: fls. in axils of old tubercles, large, tube funnelform, yellow. See Cacti.

longimámma (Mammillaria longimamma, M. globosa. M. melaleuca). Solitary or cespitose, to 4 in. high; tubercles 2 in. long, cylindrical, obtuse; spines puberulent, the

radials 6-12 and centrals 1-3; fis. 2 in, long more or less. Cent. Mex.

spherica (Mammillaria spherica). Depressed plant growing in masses that may be 8 in. across; tubercles 1/2 in. long, more or less; spines glabrous, the radials 12-15 and central 1: fls. about 2/2 in. across when wide open. S. Tex.,

uberiformis (Mammillaria uberiformis). Similar to D. longimamma from which it differs in its conical acute tuber-Mos.—Said to be less florierous than D. longinamma and by some considered a variety of that species.

DOMBÈYA (Assonia. Astrapæa). Sterculiaceæ. African shrubs or small trees with alternate palmately-veined lvs., showy fls. in cymes or heads, and capsular fr.; ornamental subjects in the tropics and semi-tropics and sometimes grown in the greenhouse. Propagated by seeds. or by cuttings over heat.

acutángula. Small tree or shrub: lvs. crowded at ends of branches, palmately 3-5-lobed: fls. white or reddish, ½ in. long, in 2-parted cymes. Mauritius, Bourbon.

calantha. To 12 ft.: lvs. 3-5-lobed, toothed, tomentose beneath: fls. rose, 1½ in. across. Cent. Afr.

Cayeuxii. Hybrid between D. Mastersii and D. Wallichu: fls. pink, in drooping many-fld. umbels.

Mastersii. To 5 ft.: lvs. toothed, densely tomentose beneath: fls. white, fragrant, in many-fld. umbels. Trop.

nairobénsis. To 6 ft.: lvs. wavy-margined, densely white-tomentose beneath: fls. pink, in umbels. Nairobi.

natalénsis. Shrub or small tree: lvs. poplar-like, toothed, becoming glabrous beneath; fls. white, fragrant, in umbels. Natal

punctata. To 10 ft.: lvs. toothed or angled, tomentose beneath: fls. pink, in umbels. Mauritius, Bourbon.

spectabilis. To 10 ft.: lvs wavy-margined, densely white- or rusty-tomentose beneath: fis. white, in umbels. Madagascar, trop. Afr.

Wallichii. To 30 ft.: lvs. toothed, densely tomentose beneath: fls. scarlet or pink, in many-fld. very large dense hanging heads. Madagascar, E. Afr.—Commonly planted in warm countries.

DOÒDIA. Polypodiacex. Dwarf dense ferns suitable for window-boxes and protected ferneries, with stiff pinnate or pinnatifid fronds; sori in rows parallel to midrib; native Ceylon to New Zeal.

They are to be protected from strong sunlight, and require an intermediate or cool atmosphere; propagated by spores and sometimes by division. Mostly grown under glass, often under benches. See Ferns.

dspera. HACKSAW-FERN. Fronds pinnatifid, to 11/2 ft. long and 4 in. wide, very rough, segms. to 3 in. long. Australia.

caudata. Fronds pinnatifid or pinnate at base, to 1 ft. long and 2 in. wide, slightly rough, segms. to 1½ in. long. New Zeal., Australia.—Some of the material cult. as D. aspera belongs here.

DÓRITIS. Orchidaceæ. One epiphytic Phalænopsis-like orchid native in Burma, Cochin-China and Siam. D. pulchérrima (Phalænopsis Esmeralda). To 2 ft. high: lvs. to 8 in. long: infl. racemose (rarely paniculate), loosely 3-manyfld.; fls. to 11/4 in. across, varying from amethyst-purple to almost white, lip from deep purple to orange-red. Oct.—Jan., July.

DORÓNICUM. LEOPARDS-BANE. Compositæ. Herbaceous perennials: basal lvs. long-petioled, st.-lvs. alternate, often clasping: heads yellow, long-stalked, with one row of ray-fis., showy in spring and summer; pappus of hairs. Native in Eu. and temp. Asia.

Doronicums thrive under the average garden conditions, and are frequent in borders. Increased either by seeds or divisions.

austriacum. To 4 ft., hairy: lvs. toothed, ovate, cordate at base: heads several. Eu.

caucásicum. To 2 ft., somewhat hairy: lvs. coarsely

toothed, ovate, cordate at base: heads solitary. Sicily to Asia Minor. Var. magnificum is a more robust form with somewhat larger heads.

Clusii (Arnica Clusii). To 2 ft.: lvs. ovate or oblong, toothed, not cordate at base: heads solitary. S. Eu.

Columna: D. cordifolium.

cordifolium (D. Columnæ). To 5 in., glabrous: lvs. cordate-ovate to ovate-lanceolate, toothed or lobed: heads solitary. S. E. Eu. and W. Asia.

excélsum: D. plantagineum.

macrophfilum. To several ft.: lvs. cordate-ovate, coarsely toothed: heads in corymbs. Caucasus, Persia.

magnificum: probably D. caucasicum var.

Pardalianches. To 4 ft., harry, roots tuberous: lvs. toothed, ovate to oblong, cordate at base: heads 1-5. Eu.

plantagineum (D. excelsum). To 5 ft., roots tuberous: lvs. toothed, ovate to oblong: heads 2-4 in. across, solitary. Eu. Var. giganteum is listed as a more robust form with larger heads.

platanoides: listed name.

DOROTHEÁNTHUS. Aizoaceæ. One of the Mesembryanthemum segregates: S. African herbs: lvs. linear or spatulate, with crystalline papillæ.

bellidiformis (D. criniflorus. M. bellidiforme. M. criniflorum). Small branched ann.: lvs. obovate, to 3 in. long and ¼ in. wide: fis. solitary, pink, red or white with pink stamens.

criniflòrus; D. bellidiformis.

gramíneus (M. lineare. M. pyropeum. M. tricolor). Low densely-fld. clump to 8 in. across: lvs. opposite, more or less fleshy, linear, to 3 in. long: fls. solitary, to 1½ in. across, light pink, rose, white, red, sometimes blue- or red-centered.

DORSAL: back; relating to the back or outer surface of a part or organ.

DORSTÈNIA. Moracex. Trop. herbs with basal lvs. and unisexual fls. imbedded in the flat dilated receptacle (something like a fig opened out); grown under glass for botanical study as an example in morphology of the receptacle or torus. Propagated by division or seeds.

Contrajerva. Lvs. to 8 in. long and as broad, deeply lobed or entire, the petioles to 10 in. long; receptacles about 1 in. long and broad, peltate. Trop. Amer.

DORYALIS: Dovualis.

DORYÁNTHES. SPEAR-LILY. Amaryllidaceæ. Very large succulent plants native in the deserts of Australia, with lvs. in basal rosettes and large red fls. in panicles or heads, the perianth-segms. nearly distinct; occasionally cult. in the S. and Calif. Propagated slowly by suckers.

excélsa. To 18 ft.: lvs. many, sword-shaped, to 4 ft. long; fls. to 4 in. long, in globular heads to 1 ft. across, with green bracts.

Páimeri. To 10 ft.: lvs. sword-shaped, to 6 ft. long and 4 in. broad: fts. 2½ in. long, whitish inside, the heads or spikes in panicles to 3 ft. long, the bracts colored.—Perhaps a var. of D. excelsa.

DORÝCNIUM. Leguminosæ. Herbs or subshrubs from Medit. region and the Canary Isls., somewhat clover-like, with lvs. of 3 or 5 lfts., papilionaceous fls. in heads, and small cylindrical pods. Of easy cult. for ornament. Propagated by seeds or division.

herbaceum. To 2 ft., herbaceous: fls. white marked with dark purple, ½ in. across. May-July. S. Eu.

hirsutum. To 2 ft., shrubby, whole plant white-hairy: fis. white, in heads to 1½ in. across. July-Sept. S. Eu. rectum. To 2 ft., shrubby: fis rose-colored in heads to

réctum. To 2 ft., shrubby: fis. rose-colored, in heads to ¾ in. across. July-Oct. S. Eu.

suffruticosum. To 2 ft., much branched, shrubby, gray-green: fls. white, marked with dark blue, in heads 1/2 in. across. Apr.-June. S. Eu.

DORYÓPTERIS. Polypodiaceæ. Small trop. American ferns with lobed or entire attractive

fronds, the sori confluent in a marginal line; something like Pteris and requiring similar handling. See Ferns.

paimàta. Fronds to 9 in. long and wide, palmately divided into 5 or more triangular lobes, stalks black. W. Indies to Brazil.

possínia. Orchidaceæ. One terrestrial species native in Borneo and Malaya, suitable for a warm greenhouse. D. marmorata (Cheirostylis marmorata). To about 14 in. tall, lvs. clustered near the base, to 3¾ in. long, dark green veined with lighter green or yellow: fls. numerous, racemose, about ½ in. across, pink with white lip.

DOUBLE: said of flowers that have more than the usual or normal number of floral envelopes, particularly of petals; full; plenus.

DOUGLÁSIA. Primulaceæ. Tufted per. herbs with lvs. in rosettes and yellow or rose fls. in 1–7-fld. umbels terminating the scape; grown in the rock-garden. Cult. as for Androsace.

dentàta. Sts. prostrate, bearing rosettes of oblong pulescent lvs. ½ in. long: fls. violet, in 2-6-fld. umbels. Wash.

lævigata. Lvs. imbricated, oblong-lanceolate, ¼ in. long: fls. bright red, long-tubed, in 2-4-fld. umbels. Wash.,

montana. Lvs. to 1/3 in. long, ciliate on margins: fls. purple or lilac, 1/4 in. long. Mts., Mont., Wyo., Ore.

nivalis. To 4 in : lvs. linear, to ½ in. long, thick, pubescent: fls. pink, ¼ in. long. Mts., B. C. to Wash.

Vitaliàna (Androsace and Gregoria Vitaliana). Sts. prostrate, tipped by rosettes of small linear hairy lvs.: fis yellow, long-tubed, nearly sessile, solitary or 1-2. Alps, Pyrenees. Var. praetutiàna is a cult. variation.

DOVE-FLOWER: Peristeria elata. -Tree; Davidia.

povyalis (sometimes but not originally spelled *Doryalis*). Flacourtiacex. Diœcious shrubs or small trees, with or without axillary spines, having alternate simple lvs., fls. unisexual, small and inconspicuous, and fr. an edible berry; native in Afr. and Ceylon.

The plants are suitable for subtropical climates, the umkokolo withstanding drought and lower temperatures than the kitambilia. To insure fruit both staminate and pistillate plants must be provided. Propagated by seeds, layering and shield-budding.

caffra (Aberia caffra). Kei-Apple. Umkokolo. To 20 ft., with long stiff thorns: lvs. to 2 in. long, often in clusters at base of thorns: fls. greenish: fr. 1 in. diam., yellow, acid, used for pickles and preserves. S. Afr.

hebecárpa (Aberia Gardneri). KITAMBILLA. CEYLON-GOOBEBERRY. To 20 ft., much branched: lvs. to 4 in. long: fr. maro on-purple, 1 in. across, edible. India and Ceylon.

DOWNÍNGIA. Lobeliaceæ. Small annuals from W. N. and S. Amer., on low plains and in valleys, with alternate entire lvs., blue, yellow or white 2-lipped fls. borne in the axils of lvs. or bracts, and fr. a linear caps.; sometimes grown in the flower-garden. Propagated by seeds.

élegans (Clintonia elegans). To 7 in.: lvs. oblong to oblong-lanceolate, to 34 in. long: fls. light blue with white throat marked with green or yellow, the stamen-column long-exserted. Wash. to Calif.

pulchélla (Clintonia pulchella). To 10 in.: lvs. oblongovate, ½ in. long: fls. deep blue with white center of lower lip marked with yellow and purple, stamen-column scarcely exserted. Ore. to Calif.

DOWNY: covered with very short and weak soft hairs.

DOXÁNTHA. Bignoniaceæ. Trop. American woody vines of 2 species, with lvs. of 2 lfts. and a terminal 3-parted claw-like tendril, funnelform 5-lobed fls. solitary or few together, and linear leathery frs. Grown out-of-doors in the S. where it will stand a few degrees of frost,

and also in the greenhouse. Propagated by cuttings under glass.

capreolata: Bignonia cupreolata.

Unguis-cati (Bignonia Unguis-cati and Tweediana. Batocydia Unguis). CARS-CLAW. Lits. ovate to lanceolate, 2 in. long: fls. bright yellow, to 3 in. long and 4 in. across: frs. 1 ft. or more long. W. Indies to Argentina.

DRABA. Cruciferæ. Many little plants, ann., bien., per., mostly in north temp. and cold regions and in mts., a good number of them adaptable to alpine- and rock-gardens and cool borders: lvs. simple and small, the basal ones commonly forming a rosette, the sts. sometimes devoid of foliage, often with very deep tap-root: fls. small and dainty, white, yellow, rose or purplish, in terminal racemes: fr. a small pod or silicle, often globular or orbicular. The species are variable and difficult of determination.

Propagation is by seed sown a season in advance of blooming in the case of the biennials and perennials, and by division of the tufts.

Ádamsii: D. alpina var.

aizoldes. Per., tufted, to 4 in.: lvs. in basal rosettes, linear, to ½ in. long and ½ in. wide, acute, ciliate: fls. yellowish, on glabrous scape, in many-fld. racemes, stamens equalling the petals: pods compressed. Mts. of Medit. region.

Aizofn (D. lasiocarpa). To 8 in.: lvs. very numerous, in dense rosettes, hnear-lanceolate, pectinate-ciliate, to 34 in. long and 34 in. wide: fls. sulfur-yellow, on glabrous scape, in many-fld. racemes, stamens shorter than petals: pods compressed. Eu.—Variable.

állica: catalogue name for white-fld. form on slender scapes to 4 in. high; probably error for D. altaica.

alpina. Cespitose per. with simple erect hairy scapes 1-8 in. tall in fr.: lvs basal, lance-elliptic, entire or essentially so, pubescent, thin, not fleshy: fis. yellow, in close clusters, petals 2-3 times as long as senals: pods compressed. Subarctic regions, circumpolar. Var. Adamsii (D. Adamsii), plants pilose and densely hispid. Var. glacialis (D. glaccalis), lvs oblong-lanceolate, slightly fleshy and keeled, sepals hispid. Siberia.

altaica. Much branched cespitose per. to 3 in.: lvs. in basal rosettes, lmear-lanceolate, to nearly ½ in. long, acute, apex 1-2-toothed, pilose, ciliate, st-lvs. sessile, entire: fls. white, in compact capitate racemes on hirsute leafy scapes: pods ovate, acute. Cent. Asia.

andina: Stenodraba colchaquensis, although plants so listed in trade are probably A. oligosperma var. andina.

androsacea: D. lactea.

arábisans. Per, diffuse, 8-20 in. tall with many erect sts.: lvs. narrow, to 1½ in. long in basal cluster, smaller and scattered on sts, toothed: fis. white, in corymbose racemes, on glabrous to minutely stellate-pilose scapes: pods long-acumnate. Newf. to Ont. and N. Y.

armata: D. longrostra.

athòa. To 4 or 5 in. high: lvs. broad-linear, to ¾ in. long, obtuse, chiate: fis. yellow, in 8-20-fid. lax racemes. S. E. Eu.

aurea. Bien. or per., pubescent: lvs. oblanceolate to lanceolate, to 2 in. long, entire or sparingly serrate: fls. yellow to nearly white, in 15-30-fld. racemes. Arctic to Ariz., in several forms.

austriaca (D. stellata. D. Johannis). Per., cespitose, to 4 in.: basal lvs. narrowly obovate, obtusish, entire or toothed at apex: fls. milk-white, on leafy stalks: persistent style on pod nearly 1/8 in. long. Eu.

Bertolonii: D. longirostra var. erioscapa.

borealis. Cespitose, to 12 in., simple or somewhat branched: lvs. pubescent-stellate, ovate to oblong-ovate, to 1 in. long, with 1 or 2 teeth: fls. white, in dense corymbose racemes on densely pilose scapes, the hairs not stellate. Arctic, Canada, Siberia.

bruniifòlia. Per., tufted, to 4 in.: lvs. linear and obtuse, about ¼ in. long, in rosettes: fis. attractive orange, in lax racemes, stamens shorter than petals, scape short-pilose. Medit. region, in mts.

cæruleomontàna. Tufted per. to 6 in.: lvs. all basal or in terminal rosettes, linear to linear-spatulate, to $\frac{1}{2}$ in. long, cuspidate, keeled beneath, sparsely pubescent and hispid ciliate: fls. yellow, the petals to $\frac{1}{2}$ in. long, in loose racemes, on scapes glabrous above and hispid toward base. E. Wash. Var. Piperi has pods densely white puberulent; may not now be in cult.

carinthiaca. Cespitose, forming many rosettes, to 6 in.: basal lvs. lanceolate, to ½ in. long, usually entire or 1-toothed at acute apex, pilose, ciliate, st.-lvs. shorter, ovate to oblong: fis. white, in loose corymbose racemes, petals to ½ in. long, scapes glabrescent above and briefly pilose toward base: pods oblong-elliptic. Cent. Eu.

cascadénsis. Per. to 8 in., soft white-pubescent throughout, sts. leafy: rosette lvs. oblanceolate, to ¾ in. long, remotely dentate; st.-lvs. lanceolate to ovate-lanceolate, to ¾ in. long: fis. pale yellow, to ¼ in. across, in dense capitate racemes which become loose at fr. maturity: pods linear-oblong, to ¼ in. long. Wash.

columbiana: D. prealter.

cuspidata. Per., densely tufted, to 4 in.: lvs. linear and obtusish, to ½ in. long: fis. purplish, in lax racemes: pods somewhat inflated. Medit. region, in mts.—Plants grown under this name may be D. longwostra, D. rupestris or D. axondes.

Dedeana. Densely cespitose, scape to 2 in. high: lvs. oblong-linear, obtuse, in rosettes, ciliate, about ¼ in. long: fix white, rarely pale sulfur-yellow, 3-10 in a raceme. Spain.

densifolia. Tufted per. to 23½ in.: lvs. dense, in basal rosette, linear to narrowly spatulate, to ½ in. long or less, obtuse, margin long-pectinate-chiate: fis. yellow, in lax racemes, scape villous. Utah to Calif. north to Mont. and B. C.—Allied to D. oligosperma.

dicranioldes: D. rigida.

diversifòlia. One of the many forms of D. bruniifolia, from Armenia, the lvs. in rosettes rather broad and deflexed, those on offsets narrow and erect.

dùbia. Many-stemmed, small, cespitose, obovate or oblong basal lvs. closely rosulate, sts. to 4 in.: fls. white, in lax racemes. Cent. Eu.

fladnizénsis. Per., cespitose and cushion-like, 2-3 in. high: lvs basal, oblong, obtusish, mostly entire, to ½ in. long or more, st.-lvs. entire or remotely dentate: fls. greenish-white. Arctic regions, and south in Eu. and Amer. in mts—Under this name forms of D. hurta, D. lactea and D. Kotschyi are sometimes grown.

frigida: name applied to different Drabas; perhaps $D.\ dubia$ is meant.

gigas: Arabis carduchorum.

glacialis: D. alpina var.

globosa. To ½ in. high, perhaps more in cult.: lvs. in subspherical rosettes, oblong, to ½ in. long and ½ in. wide, obtuse, incurved, briefly pectinate-ciliate, pilose: fis. yellow, in lax racemes, scape and sepals glabrous. Wyo. to Utah and Nev.—Closely allied to D. densifolia and D. oligosperma. Var. spherula (D. Paysonii) has scape and sepals sparsely pilose. Ore.

Háynaldii. To 2½ in. high: lvs. in basal rosettes, narrowly linear, about ¼ in. long, acute, briefly and finely ciliate but not pectinate-ciliate: fls. yellow, in corymbiform racemes on glabrous scapes: pods inflated at base. Cent. and E. Eu.—Occasionally confused with D. Aizoon.

hirta. Per. to 10 in., hairy: basal lvs. narrow-lanceolate, sometimes toothed at apex, to \$\frac{3}{4}\$ in. long, minutely stellate, remotely ciliate: fis. milk-white, in corymbose racemes on glabrous to minutely stellate-pilose scapes: pods abruptly acute. Subarctic Eurasia.—Alhed to D. arabisans.

hispánica. Densely cespitose, to 2 in. or somewhat more: lvs. in rosettes, linear, to ½ in. long and ½ in. wide, acutish, chlate: fis. yellow, in 6-15-fid. racemes, scape hairy: pods more or less inflated at base, pilose. Spain, in several forms.—Plants in the trade are likely to be D. Atcoon.

Hoppeana (D. Zahlbruckner). Densely cospitose per. to 1½ in. high: lvs. linear and mucronate, ciliate, about ½ in. long: fls. few in a head, yellow. Alps.—Differs from D. arzoides in style short, thick and erect, not elongate, slender and subcurved.

hyperbòrea. Bien. to 10 in., hairy, short branched, sts. decumbent: basal lvs. oblanceolate, to 4 in. long including the broad winged petiole, st.-lvs. to 1 in. long, all coarsely toothed: fls. yellow, in broad corymbs: pods broadly elliptic, to 34 in. long. Alaska.

incana. Bien to 1 ft. high, gray-pubescent: lvs. lanceolate and obtusish, entire or sparsely dentate, to 1 in. long, the basal ones in rosettes: fis. white, sepals often purplish. Far north in Amer. and Eurasia.

incerta (D. oligosperma var. pilosa). Tufted per. to 5 in. high: lvs. all basal, linear-oblanceolate, to ½ in. long, stellate-hairy, ciliate: fls. yellow, to ½ in. across, 3-14 on stout pedicels in loose racemes: pods flat, broadly lanceolate, to ½ in. long with small but distinct beak. Mts. of B. C. to Wyo. and Ore.

Johánnis: D. austriaca.

Kôtschyi. Per. 1-4 in. high, with decumbent and rooting sts.: basal lvs. oblance olate or elliptic, to ½ in. long, entire or with few teeth, hairy; st.-lvs. 1-3, incised-dentate: fis.

white, with small stigms not apparent in fr. Mts., middle Eu.—Forms of D. azzoides are grown under this name.

lactea (D. androsacea). Loosely cespitose per., with slender offsets: lvs. very narrow, acute, entire or nearly so, harry: fls. white, with broad stigma on persistent style of pod. Arctic regions.

lasiocárpa: D. Aizoon.

láxa: D. norvegica.

Lémmonii. Tufted, to 2½ in.: lvs. obovate to oblongobovate, to ½ in. long, fleshy, obtuse, ciliate, pilose: fls. yellow, in somewhat elongate corymbose racemes on pilose scape, petals 2-3 times longer than sepals. W. Nev. to Calif. and Ore.

Loiseleuri. Densely cespitose, to nearly 2 in. high: lvs. broadly linear, to ½ in. long and ½ in. wide, obtuse, margins setose-ciliate: fis. yellow, in corymbose racemes, scape densely hispid to pilose: pods compressed, scabrous. W. Medit. region.

lonchocarpa. Densely cespitose per. 3-5 in. high: basal lvs. spatulate, ¼ in. or less long, stellate: fis. white, on leafy st.: pods linear. Mts., N. W. Amer., and subarctic.

longifostra (D. armata). Much like D. aizoides but smaller, to 1½ in. high in bloom, lvs. shorter, about ½ in. long: fis. yellowish, mostly 3-6 in a compressed corymbose raceme. S. Eu, in many forms. Var. erioscapa (D. Bertolom) has lvs. a little larger and scape pilose. Mts., S. Eu.

Nélsonii. A form of D. densifolia having a glabrous or sparsely villous scape.

nivalis. Many-stemmed densely cespitose per. about 3 in.: lvs. ¼ in. or less long, narrow-obovate to lingulate, entire or with 1 or 2 teeth: fls. white, in dense racemes, on short-pilose scape: pods oblong to elliptic, persistent style less than ¼ in long. Arctic and subarctic regions, south to mts. in Utah—Allied to D. lonchocarpa.

norvégica (D. laxa. D. scandinavica). Per to 6 or 8 in.: lower lvs. oblong-lanceolate, acute, entire or few-toothed at apex, pilose, not stellate, ciliate on margin, to 2 in. long: fls white, on leafy st.: pods in open raceme. Subarctic.—Similar to D. altaica.

novolýmpica. Densely cespitose per. with very narrow thick white-ciliate lvs. nearly ¼ in. long: fis. yellow. Olympic Mts., Wash.

oligospérma. Laxly cespitose, to 4 in. tall: basal lvs. linear, to ½ in. long and ½ in. wide, acute, rigid, briefly pilose, clinte but not pectinate-clinte: fls. yellow, in lax racemes on briefly pilose scape, petals scarcely longer than sepals. B. C. to Alaska and eastward in Rocky Mts.—Closely allied to D. globosa and D. densifolia. Var. andina is a smaller more densely compact plant with glabrous or glabrescent scape to 1 in. high. Utah to Calif. north to Mont. and B. C. Var. pilosa is D. incerta.

olympica. Per, cespitose and cushion-like, 2-4 in.: lvs. linear and obtusish, lightly ciliate, 14 in. long: fis. orange, rather large, in compact racemes, stamens shorter than petals, scape villous. Medit. region.—Plants grown under this name may be D. brumifolia.

Paysonii: D. globosa var. sphærula.

polytricha. Per. to 2 in., rosettes dense, many, hairy: lvs. linear-lanceolate, to ½ in. long, densely imbricated, white-hairy: fls. yellow, 4-10 in racemes: pods ovate, inflated, to ½ in. long, on pedicels to ½ in. long. Caucasus.

prefilter (D. columbiana). Per. with simple sts. to about 8 in.: basal lvs. many, oblance olate, ciliate, ½ in. or so long, entire or denticulate: fls. white. B. C. and Yukon.

pyrendica: Petrocallis pyrenaica.

ramosissima. Per., branched, to 18 in. high: lower lvs. oblanceolate, dentate, to 2 in. long, st.-lvs. smaller, oblong, dentate: fis. white, in racemes. S. E. U. S.

rènens: D. sibirica.

rigida (D. dicranioides). Cespitose per., with many scapes to 3 in. high: lvs. broad-linear or elliptic, rigid and shining, stiffly cliate, about 4 in. long, obtuse: fis. yellow, in large clusters. S. Eu.—Differs from D. brumifolia in ovary with 32-36 ovules and not 4-10.

ruáxes. Cespitose per. with sts. to 2 in. long and pilose: lvs. all basal, oblanceolate to suborbicular, thick, about ¼ in. long, densely white-hairy: fls. bright yellow. Alpine, Wash, and B. C.

rupéstris. Per., forming tufts 1 in. or so broad, with very sender sts. with a single if. or none, somewhat hairy but not ciliate: Ivs. nembranaceous, linear-lanceolate, entire or toothed at apex: fls. small, white. N. Eu.—Plants cult. under this name are sometimes D. borealis, D. hirta, or D. norvegica.

scandinàvica: D. norvegica, but plants so named may be forms of D. hirta.

sibfrica (D. repens). Plant soft, green, the slender sts. more or less prostrate and sometimes 12 in. long: lvs. scarcely in rosettes, oblong-lanceolate, acute, entire, somewhat hairy: fls. yellow, on ascending sts. Siberia, Caucasus.

stellata: D. austriaca.

subamplexicaulis. Much like D. hirta, but plant smaller; tufts much congested, less than 1 in. across: basal lvs. very crowded, the cauline ones oblong or oblong-ovate, the broad base sessile or somewhat clasping: fls. small, white. Siberia, Turkestan

tomentosa. Per., sts. weak and erect, $2-3\frac{1}{2}$ in., pilose: lvs. mostly basal and crowded, elliptic or obovate, obtuse, entire, $\frac{1}{2}$ in. long, densely tomentose: fls. white or nearly so, in racemes on leafy sts: pods rounded at apex. Cent. Eu.—Plants so named in cult. may be D. borealis.

vérna. Whitilow-Grass. Ann. 2-3 in. high, mostly in winter and blooming in spring: fis. small, white, the petals 2-cleft. Eu.; nat. in N. Amer.-Very variable; by some authors separated in the genus Erophila.

Zahlbrückneri; D. Hoppeana.

DRACÈNA. DRACENA. Liliaceæ. Trees and shrubs grown in the greenhouse, and out-of-doors in the S., for the handsome often varicolored foliage; fls. rather small, in small clusters, borne in panieles. For cult. see Cordyline, to which most of the so-called dracenas belong and from which the genus differs in technical carpellary and floral characters.

amábilis: Cordyline amabilis.

austràlis: Cordyline australis.

Baptistii: a form of Cordyline terminalis.

Bruantii: a form of Cordyline rubra.

 ${\tt concinna.}\ {\tt To}\ {\tt 6}\ {\tt ft.:}$ lvs. oblance olate, the margins purple. Madagascar.

dereménsis. To 15 ft.: lvs. to 2 ft. long and 2 in. broad: fls. dark red outside and white inside. Trop. Afr. Var. álba is listed. Var. Wárneckii is mostly grown.

Doucètii: a form of Cordyline australis.

Draco. Dragon-Tree. To 60 ft: lvs. to 2 ft. long and 1¾ in. across, glaucous: fls greenish: berries orange. Canary Isls.—Planted in Calif.

ensifòlia: Dianella ensifolia.

fragrans. To 20 ft.: lvs. to 3 ft. long and 4 in. across: fls. yellowish, fragrant. Upper Gumea. Var. Lindenii has creamy-white bands on lvs. and var. Massangeana a broad yellow stripe down center. Var. canariénsis is a hort.

Godseffàna. Lvs. to 5 in. long and 2½ in. or less across, irregularly spotted with white: fls. greenish-yellow. Upper Guinea.

Goldieana. Lvs. to 9 in. long and 5 in. across, with cross bars of gray and bright green; fis. white, in dense heads. Upper Guinea.

grácilis: an unidentified hort. name.

Haagei: probably Cordyline Haageana.

Hookeriana. To 6 ft. or more: lvs. ensiform, to 2½ ft. long and 2 in. across, margins white-pellucid, somewhat ribbed beneath: fls. greenish, to 1 in. long: berries orange. S. Afr. Var. latifòlia has lvs. to 3½ in. across and var. variegata lvs. more or less white striped.

hýbrida: hort. form of Cordyline terminalis.

imperialis: form of Cordyline terminalis.

indivisa: Cordyline indivisa.

Kélleri: hort. form of D. Godseffiana.

Knérkii: form of D. fragrans with glossy light green lvs.

Lindenii: D. fragrans var.

Lôngii: hort. name.

major: hort. name.

Mandeana (Mandaiana?): a trade name.

marginata: Cordyline marginata.

Massangeana: D. fragrans var.

Mazelii: hort. name.

Rothiana: a garden form of D. fragrans.

rubra: Cordyline rubra.

Sanderians. Lvs. to 9 in. long and 11/4 in. across, with broad margins of white. Cameroons.

stricta: Cordyline stricta.

terminalis: Cordyline terminalis.

tricolor: Cordyline terminalis.

Veltchii: Cordyline australis var.

Victòria: garden form of D. fragrans.

Wárneckii: D. deremensis var.

Youngii: form of Cordyline terminalis.

DRACENA: Dracæna, Cordyline.

DRACOCÉPHALUM. DRAGONHEAD. Labiatæ. Hardy ann. or per. herbs, mostly erect, with entire, toothed or deeply cut lvs. and purple, blue or seldom white 2-lipped fls. in whorls axillary or in terminal spikes. Sometimes grown in borders and flower-gardens.

Dragonheads prefer a rather moist partially shady position and moderately rich sandy loam. Propagated by seeds or by division.

alpinum: probably D. nutans var.

argunénse: D. Ruyschiana.

austriacum. Per. to 1½ ft., somewhat hairy: lvs. cleft into 3-5 very narrow revolute lobes: fls. blue, 1½ in. long. Eu., Caucasus.

botryoides. Per. to 6 in., soft-pubescent: lvs. small, 1/2 in. across, round-ovate, deeply 5-7-lobed: corolla pubescent, in whorls that are aggregated into a head. Caucasus.

bullatum. Per. to 10 in., hairy: lvs. cordate-ovate or -elliptic, crenate, to 2 in. long and nearly as broad: fis. bright blue, lower lobe somewhat darker. China.

canariénse: Cedronella canariensis.

Forrestii. Per. to 1½ ft., leafy: lvs. pinnatisect with 2 or 3 pars of lobes, or 3-parted, the segms. ¾ in. long, revolute, white-hairy underneath: fls. blue-purple, in whorls. China.

fruticulòsum. Per. to 3 ft. or more, glabrous: lvs. lanceolate to ovate-lanceolate, to 3½ in. long, sharply serrate, base subcordate, petioled: fis. bright violet-blue, to 1½ in. long, in whorls. Siberia.

gigantèum: hort. name of red-fld. form, probably a Physostegia.

grandiflorum. Per. to 1 ft.: lvs. oblong or ovate, basal lvs. notched at base: fls. blue, hairy, 2 in. long, in spikes to 3 in. long. June-July. Siberia.

Hemsleyanum. Per. to 20 in., tufted: lvs. oblong to lanceolate-oblong, to 2 in. long, obtuse, entire, sessile, glandular-pitted beneath: fls. purplish-blue, to 1½ in. long, in 3-7-fld. cymes forming a lax infl. to 8 in. long. Thet

heterophyllum. Per. to 15 in. high, sts. decumbent or ascending, forming clump to 2 ft. across: lvs. oblong-ovate, to 2 in. long, short-petioled, cordate, rough-scabrous: fis. white, to 1½ in. long, in leafy racemes, corolla pubescent. China, Turkestan.

Isabéllæ. Per. to 2 ft.: lvs. deeply divided into 5-7 linear entire segms. to 1 in. long: fts. purple-blue, to 2 in. long, hairy, in spikes to 4 in. long. China.

japónicum: D. Ruyschiana var.

Moldávica (Moldavica suaveolens). Ann. to 2 ft.: lvs. lanceolate, to 1½ in. long, toothed: fls. blue or white, 1 in. or less long, in long leafy racemes. July-Aug. Eu., N. Asia.

mitans. Per. to 1 ft.: lvs. ovate or oblong, to 2 in. long, coarsely toothed: fls. bright blue, ½ in. long, sometimes drooping, in spikes to 6 in. long. Cent. Asia. Var. alphum is listed as a dwarf form.

parviflorum (Moldavica parviflora). Ann. or bien. to 2½ ft.: lvs. lanceolate to ovate, to 3 in. long, toothed: fis. light blue, scarcely longer than calyx, in short dense spikes. N. Amer.

peregrinum. Decumbent, branches ascending: lvs. lanceolate, entire or with few teeth: fis. blue, in racemes to 1½ ft. long. July. Siberia.

Rûprechtii. To 18 in., much branched: lvs. oblongelliptic to linear-oblong, obtuse, pinnately lobed, lobes linear, entire to coarsely toothed: fis. bluish-purple, to 1¾ in. long, in short and usually dense spikes. E. Turkestan.

Ruyschiana (D. argunense). Per. to 2 ft.: lvs. linear-lanceolate, to 2 in. long, entire: ffs. blue or bluish and in var. japonicum white shaded with blue, 1 in. long, hairy, in short spikes. Siberia.

speciòsum. Per to 1½ ft.: lvs. orbicular, to 4 in. long, wavy-toothed, pubescent beneath and wrinkled: fis. purplish to deep purple, 1 in. long, hairy, in dense heads. June-July. Himalayas.

tangùticum. To 2 ft.: lvs. pinnatisect into 2-3 pairs of long-linear lobes: fls. blue, 1 in. long, in interrupted spikes. Mongolia.

thymiflorum. Ann., lightly pubescent, sts. erect and simple, to 18 in.: lvs. orbicular-ovate, cordate, serrate or entire: fls. light purplish, in many-fld. whorls forming a long raceme. Eu., Asia.

virginianum: Physostegia virginiana.

Wflsonii (Nepeta Wilsonii). Per. to 2½ ft., hairy: lvs. oblong-lanceolate, to 2 in. long, wrinkled: fis. dark blue, 1 in. long, in distant clusters. China.

DRACOPHILUS. Aizoaceæ. Tufted very succulent plants of the S. African Mesembryanthemum group: lvs. many, united at base, 3-angled, bluish-green: fls. terminal, white or rose; stigmas 8-11.

rhèolens (M. rheolens). Lvs. to 1½ in. long and ½ in. wide, entire, with rhubarb-like odor: fis. solitary, lilac-rose, 1¼ in. across, short-stalked.

DRACOPIS: Rudbeckia amplexicaulis.

DRACUNCULUS. Araceæ. Tuberous herbs native in the Medit. region, bearing pedately dissected lvs. and unisexual fls. on spadices surrounded by spathes; of very offensive odor when in bloom and grown only as a curiosity in the greenhouse or in the open far S.

canariénsis. To 18 in.: lvs. palmately lobed, longpetioled: spathe tubular, to 12 in. tall, spadix more than twice as long as tube. Canary Isls.

vulgăris (Arum Dracunculus). Lvs. of 13-15 segms. from a bow-shaped base, the petioles about 1 ft. long; spathes with purple limb to 1 ft. long, the tube striped purple.

DRAGONHEAD: Dracocephalum. False: Physostegia.

DRAGON-ROOT: Arisæma Dracontium.

DRAGON-TREE: Dracena Drace.

DRÎMIA. Liliaceæ. Bulbous African herbs with whitish or reddish-white fls. in racemes, the corolla-tube campanulate and segms. reflexed.

haworthioldes. Lvs. after the fls., lanceolate, to 3 in. long, thin: fls. greenish-white, 1/4 in. long, in loose racemes to 3 in. long on stalk to 1 ft., the segms. 3 times as long as tube.

DRIMYS (*Drymis* is a later spelling). *Magnoliaceæ*. About a dozen aromatic glabrous trees and shrubs in the southern hemisphere: lvs. alternate, bearing pellucid dots: fls. small in ours, solitary or fascicled; petals spreading, 5 or more: fr. of 1 or more indehiscent berries.

axillàris. To 25 ft. or more, with black bark: lvs. narrow-ovate to oblong, to 5 in. long, obtuse, mostly coriaceous, greenish-yellow, the petals linear. New Zeal.; intro. in Calif.

lanceolata. Shrub or small tree to 10 ft., rarely to 30 ft.: lvs. linear-lanceolate, acute: fls. brown, often umsexual, in terminal umbels. Australia and Tasmania.

Winteri. To 50 ft., evergreen: lvs. elliptic or lanceolate, leathery, entire, aromatic, acuminate: fis. cream-colored, 1 in. or more across, fragrant. S. Amer.

DROPWORT: Filipendula hexapetala.

DROSÁNTHEMUM. Aizoaceæ. Segregate from Mesembryanthemum: per., sometimes woody at base, branching and spreading or diffuse, the sts. hispid or rough with small pustules: lvs. small, cylindric or somewhat angled, glistening: fls. solitary, white, rose, violet or reddish; stigmas 4-6. S. Afr. For cult. see Mesembryanthemum.

autumnèle. Shrubby, 1½ ft. high and thick: lvs. ¼ in. long and ¼ in. thick, spreading: fls. ¾ in. across.

cándens (M. candens). Sts. or branches to 2 ft, or more, rooting, very slender: lvs. to $\frac{1}{2}$ in. long: fis. small, violet or pinkish, terminating short lateral leafy branches.

floribundum (M. floribundum). Branches short, somewhat decumbent: lvs. to about 1 in. or less, obtuse: fls. rose, ¼ in. across, on peduncles 1 in. or more long.

Framesii. To 3 in., compact: lvs. ½ in. long and ¼ in. broad, erect and spreading: fis. white, yellow or pink, 1 in. across. Var. prostratum is listed.

hispidum (M. hispidum). To 2 ft., much branched: lvs. to 1 in. long and $\frac{1}{2}$ in. broad, spreading: fis. purple, 1 in. across.

Luederstzii (M. Luederstzii). To 6 in., shrubby: lvs. lanceolate, spreading, ½ in. long and ½ in. thick: fis. ½ in. long.

papaveracium: listed name.

parvifolium (M. parvifolium). To 8 in., shrubby, with many reddish branches: lvs. 3-angled, to ½ in. long and ¼ in. wide, papillose: fls. purple-red, ½ in. across.

The wide, papinose: is. purple-red, ½ in. across.

Schoenlandianum (M. Schoenlandianum). To 6 in., shrubby: lvs. club-shaped, spreading, ½ in. long and ½ in. wide, densely papillose: fls. pale yellow, ½ in. long.

speciosum (M. speciosum). To 2 ft., shrubby: lvs. ½ in. long and ½ in. wide, spreading or curved upward: fls. orange-red, green at base, 2 in. and more across.

subcompréssum (M. subcompressum). To 2 ft., shrubby: lvs. to 1 in. long and 1/6 in. wide, spreading: fis. purple-red, 1/2 in. across.

uncinéllum: probably Ruschia uncinella.

DRÓSERA. SUNDEW. Droseraceæ. tivorous usually per. herbs with basal lvs. covered with glandular hairs, and small white, pink or red fls. in a one-sided raceme terminating the scape; occasionally grown for botanical study and sometimes in rock-gardens; native in moist or swampy places, and transplanted.

The sundews are planted under glass in pots containing muddy loam and sphagnum. They require abundant moisture and sunlight. Propagated by seeds, division of shoots and root-cuttings.

filiformis. Lvs. linear and thread-like, to 8 in. long, with purple hairs: fis. bright purple or rarely white, on scapes to 2 ft. high. Mass. to Fla. and Miss.

intermèdia. Lvs. spatulate, to 2½ in. long, petiolate, usually red and covered with glandular hairs: fis. white, on many-fid. scapes. E. N. Amer., Cuba, Eu.

longifòlia. Lvs. with long petioles and spatulate hairy blades to 1½ in. long: fls. white, on scapes to 1 ft. high. N. Amer., N. Eu., Asia.

rotundifòlia. Lvs. with flat petiole and round hairy blades to $1\frac{1}{2}$ in. long: fls. white to red, on scapes to 10 in. high. N. Amer., Eu., Asia.

DROSERACEÆ. SUNDEW FAMILY. widely distributed genera of herbs with lvs. in basal rosettes which are glandular-hairy and insectivorous, bisexual fls. having 4-5 sepals, 5 petals, 4-20 stamens, superior 1-celled ovary, and capsular frs. Dionæa and Drosera are sparingly cult.

DRUPE: a fleshy 1-seeded indehiscent fruit, with seed inclosed in a stony endocarp; stone-fruit, as peach, cherry.

DRUPELET: one element in a fruit made up of aggregate little drupes, as in the raspberry.

DRYÁNDRA. Proteaceæ. Shrubs of extratrop. W. Australia, two or more intro. in Calif .: lvs. alternate, mostly sinuate or pinnatifid and sometimes pinnate, often prickly-toothed: fls. in dense heads, mostly yellow, the head sitting in an involucre of scale-like bracts and attended by foliage lvs.: fr. a caps., usually hairy.

floribunda. Bush to 8 ft.: lvs. nearly or quite sessile, cuneate or obovate, undulate and prickly, mostly less than 1 or 2 in. long; ft.-heads small, terminal, involucre not ½ in. long; fls. nearly 1 in. long, silky.

formosa. Erect shrub to 15 ft: lvs. to 8 in. long, divided to midrib: fl.-heads large, terminal, involucre to 1½ in. diam.; fls. to 1½ in. long, more or less silky.

DRYAS. Rosaceæ. Evergreen creeping plants somewhat shrubby at base, with alternate lvs., white or yellowish solitary showy fls., and fr. an achene with feathery style or tail; native in high northern parts of northern hemisphere and on mts., suitable for rock-gardens; they make a rather close ground-cover and send up peduncles a few inches high. Propagated by cuttings, division, or seed.

Drúmmondii. Lvs. oblong, to 1½ in. long, white-tomentose beneath: fls. yellowish, about ¾ in. across, nodding: fruising styles to 1½ in. long. N. N. Amer.

integrifòlia. Lvs. ovate-lanceolate, usually with revolute margins: fis. white, to $\frac{3}{4}$ in. across, sepals usually linear-lanceolate. N. N. Amer.

japónica: listed name of unknown botanical standing.

lanata: D octonetala var.

octopétala. Lvs. elliptic or oblong, to 1 in. long, white-tomentose beneath: fis. white, 1-1½ in. across, erect: fruiting styles 1 in. long. N. N. Amer., N. Eu., N. Asia. Var. lanàta (D. lanata), lvs. white-woolly. Var. minor is listed as a very dwarf form. Var. vestita (D. vestita), lvs. gray-downy. Var. integrifòlia is D. integrifolia.

Suendermannii. Hybrid between D. octopetala (stami nate) and D. Drummondii: fls. yellowish in bud, white in full bloom and nodding.

vestita: D. octopetala var.

DRYMIS: Drimus.

DRYMOCALLIS: Potentilla.

DRYMÓPHILA. Liliacex. A genus of about 2 species in Australia and Tasmania, having a bulbous rootstock which produces simple slender erect sts. which are leafy on the upper portion only: perianth of 6 equal spreading segms., as many stamens and a 3-celled multi-ovulate ovary supporting 3 slender recurved styles: fr. a berry.

cyanocárpa. To 2 ft.: lvs. lanceolate, alternate, to 3 in. long: fls. white, to ½ in. across, few or solutary in the upper axis: fr. globose-oblong, blue or rarely white —A woodland plant growing in well-drained soils high in organic matter; propagated by offsets or seed and blossoming in late spring or early summer.

DRYMOPHLŒUS: D. Normanbyi is Normanbya Normanby. The genus Drymophlœus is retained for other species, but is not known to be represented in the U.S.

DRYNARIA: Polypodium.

DRYÓPTERIS (Lastrea. Nephrodium. Thelypteris. Aspidium in part). Wood-Fern. Shield-Fern. Polypodiaceæ. Both temp. and trop. ferns with compound foliage; sori borne on veins with or without indusia. Many of them are woodsy plants native in the U. S. and Canada and are sometimes transferred to grounds. The greenhouse species require no special treatment. See Ferns.

acrosticholdes: Polystichum acrostichoides.

aculeata: Polystichum aculeatum.

argita. Fronds 1-3 and even 5 ft. long, 2-pinnate with the pinnæ sessile, oblong-lanceolate, and with the pinnules spinulose toothed: indusia firm, strongly convex, with deep narrow sinuses and glandulose margins. W. N. Amer., Wash. to S. Calif.

Boottii (Aspudium Boottii). Fronds to 2½ ft. long and 5 in. wide, 2-3-pinnate, pinnules finely toothed. N. S. to Minn and Va; probably a hybrid between D. cristata and D. spinulosa var. intermedia.

chrysóloba. Fronds to 9 in. long and 4 in. wide, 2-pinnate, pinnules entire. Brazil, Colombia.

Clintoniàna: D. cristata var.

cristata (Aspidium cristatum). Fronds to 2½ ft. long and 6 in. wide, 2-pinnatifid, pinnules finely toothed. Newf. to Va. and Ark., Eu., Asia. Var. Clintoniana (D. Clintonuana) has broader lvs.

decomposita. Fronds to 1½ ft. long and 1 ft. wide, 2-3-pinnate, pinnules to othed, pubescent. New Zeal., Australia.

dentata (D. mollis. D. parasitica. Aspidium violescens). DOWNY W. Fronds to 3 ft. long and 1 ft. wide, 1-pinnate, the segms. pinnatifid and entire, hairy. Tropics.

dilatata: D. spinulosa var.

Dryopteris: D. Linnxana.

erythrosora. Fronds to 1½ ft. long and half as wide, 2-pinnate, segms. pinnatifid, toothed: fruit-dots red when young. China, Japan.—Some of the material cult. as D. chrysoloba belongs here.

Filix-más (Aspidium Filix-mas). MALE-FERN. Fronds growing in crowns, nearly evergreen, to 4 ft. long and 1 ft. wide, 2-pinnate, segms. toothed or cut. N. Amer., Eu.—There are crisped, crested, forked, dwarf forms.

fragrans. Fronds ¼-1 ft. long, glandular-aromatic, narrowly lanceolate, with the pinnæ pinnately parted, and nearly covered beneath with large thin imbricated indusia. Lab. to Alaska, Greenland, Finland, Siberia.

Goldiana (Aspidium Goldianum). GOLDIE'S-FERN. Fronds in large crowns, to 4 ft. long and 1½ ft. wide, 2-

pinnate, pinnæ toothed, dark green above. N. B. to N. C. and Tenn.

hexagonóptera (Polypodium hexagonopterum. Phegopteris hexagonoptera). Broad Beech-Fern. Fronds triangular, to 15 in. long and broad, 1-pinnate into pinnatifid wavy-toothed pinnæ: sori without indusia. Que. to Fla. and Tex.

hirtipes. Fronds stiff, to 3 ft. long and 16 in. wide, 1-pinnate into segms. cut one-third to midrib, stipes black-scaly. India.

intermèdia: D. spinulosa var.

Linneana (Phegopteris and Polypodium Dryopteris). OAK-FERN. Fronds triangular, to 11 in. each way, 2-pinnate, segms. entire or wavy-toothed: sori without indusia. N. N. Amer., Eu., Asia.

marginalis (Aspidium marginale). MARGINAL S. Lvs. in crowns, to 2½ ft. long, 2-pinnate, segms. entire or lobed. N. S. to Ga. and Kans.

móllis: D. dentata.

nevadensis (D. oregana). Fronds 1½-3 ft. long and 4-6 in. wide, lanceolate, with the pinnæ linear-lanceolate from a broad base, deeply pinnatilid, and the lower ones distant and greatly reduced. B. C. to Nev. and Calif.

normalis (Aspidium patens in part). Rootstock horizontal, slender, with the fronds usually in 2 ranks and with the scales linear, chatch, hairy: fronds 2-3 ft. long, bininatifid, somewhat pubescent beneath on the midribs. S. C. to Fla. and Tex., Bermuda, Bahamas, W. Indies.

noveboracénsis (Aspudium noveboracense). New-York-Fern. Fronds pale green, to 2 ft. long and 7 in. wide, I-pinnate, pinnæ deeply pinnatifid. Newf. to Ga. and Ark.

oregana: D. nevadensis.

oreópteris (Polystichum montanum). Mountain W. Fronds to 3 ft. long and 8 in. wide, 1-2-pinnate, pinnules nearly entire. Wash. to Alaska, Eu., Japan.

parasítica: D. dentata.

patens (Aspudium patens). Rootstock erect, stout, with the fronds clustered and with the scales ovate, glabrous: fronds 2-4 ft. long, bipinnatifid, with the pinna linear-acuminate and the ultimate segms. acutish. W. Indies Mex. to Argentina and Paraguay.

pennigera (Polypodium pennigerum). Fronds to 5 ft. long and $1\frac{1}{2}$ ft. wide, 1-pinnate into deeply cut nearly entire segms. New Zeal., Polynesia.

Phegopteris (Polypodium Phegopteris. Phegopteris polypodioides). Long or Narrow Beech-Fern. Fronds triangular, to 9 in. long and 8 in. wide, 1-pinnate into deeply pinnatifid nearly entire segms.: sori without indusia. N. N. Amer., Eu, Asia.

rígida (Aspidium rigidum). Fronds to 2 ft. long and 1 ft. wide, 2-pinnate, segms. to othed or cut. Eu.

Robertiana (Phegopteris Robertiana). Northern Oak-Fern, Scented Oak-Fern, Limestone Polypody. Stipes and fronds minutely glandular beneath, fronds to 8 in. long and 7 in. wide, 2-3-pinnatifid: sori without indusia. N. N. Amer, Eu.

setigera. Rootstock stout, with dark brown scales: fronds dark green, 3-6 ft. long, tripinnatifid, white-hairy beneath. Established in Fla. and S. Amer., native in Asia.

spinulosa (Aspudum spinulosum). Spinulose W. Fronds to 1½ ft. long and 9 in. wide, 2-pinnatifid into deeply out segms. N. Amer., Eu., Asia. Var intermèdia (D. intermèdia) has indusia with marginal glands. Var. dilatàta has 3-pinnate lvs.

Thelypteris (Aspidium Thelypteris. Thelypteris palusris). Marsh-Fern. Rootstock creeping: fronds to 2½ ft. long and 6 in. wide, 1-pinnate into deeply pinnatifid segms., margins revolute. N. Amer., Eu., Asia.

uliginosa. Sometimes used as the name for the American plants previously identified as D. setigera; that name is then restricted to a species of trop. Asia.

viridéscens. Gloss W. Fronds to 2 ft. long, 3-pinnate, segms. toothed, stalks shining. Japan.

DUCHÉSNEA. Indian- or Mock-Strawberr. Rosaceæ. Asian per. herbs with trailing often rooting branches, long-stalked 3-parted lvs., yellow solitary fls., and fr. composed of achenes borne on a dryish receptacle; used as ground-cover and for hanging baskets.

indica (Fragaria indica). Lits. ovate, coarsely toothed:
fis. ½-1 in. across: fr. red, surrounded by large persistent calyx. India; nat. in N. Amer.—Looks like a strawberry.

DUCKWEED: Lemna.

DUCKWHEAT: Fagopyrum tataricum.

DUDLEYA: Echeveria.

DUGALDIA: Helenium Hoopesii.

DUGGÈNA. Rubiaceæ. Shrubs or small trees with opposite lvs., small salverform fls. in terminal spikes, racemes or panicles, and berry-like frs.; one species intro. in S. Calif.

hirsuta (D. spicata). To 10 ft.: lvs. ovate to lanceolate, to 7 in. long, pubescent or becoming glabrous: fls. white, ½ in. long, in spike-like panicles to 16 in. long; fr. white or blue. W. Indies, N. S. Amer.

spicata: D. hirsuta.

DURÁNTA. Verbenaceæ. Shrubs and trees with opposite or whorled lvs., small fls. in terminal racemes, and drupe-like frs.; one species (D. repens) is commonly planted in warm regions and sometimes under glass. Propagated by seeds and cuttings in spring.

Loréntzii. Shrub to 10 ft. with drooping branches: lvs ovate, small and leathery, toothed toward apex: fis. white. Argentina.

Plumièri: D. repens.

rèpens (D. Plumieri). Pigeon-Berry. Sky-Flower. Shrub or tree to 18 ft., sometimes spiny and often with drooping or trailing branches: lvs. ovate to obovate, to 4 in. long, entire or coarsely toothed: fts. lilac, to ½ in across: fr. yellow, to ½ in. across. Fla. to Brazil. Var. álba has white fts. and variegata variegated lvs.

stenostachya. Shrub to 15 ft.: lvs. oblong-lanceolate, to 8 in. long, entire or toothed: fls. hlac, 3½ in. across: fr. yellow, ½ in. across. Brazil.

DURIAN: Durio.

DÙRIO. Bombacacex. Malayan trees with entire leathery lvs., fls. in cymes, and large spiny frs.

The durian is grown sparingly in the western tropics, not being hardy in continental United States. It does best in deep rich soil with plenty of moisture. Propagated by seeds, and superior strains by budding on seedling stocks.

zibethlaus. Durian. To 80 ft.: lvs. obovate-oblong, to 7 in. long; fls. whitish: fr. oval, to 8 in. long, with custard-like pulp of disagreeable odor.

DURRA: Sorghum vulgare var. Durra.

DUSTY MILLER: Artemisia Stelleriana, Centaurea Cineraria and gymnocarpa, Lychnis Coronaria, Senecio Cineraria and leucostachys.

DUTCHMANS-BREECHES: Dicentra Cucullaria. DUTCHMANS-PIPE: Aristolochia durior.

DUVÀLIA. Asclepiadaceæ. Succulent little leafless herbs in Afr., one or more intro. in Calif. and perhaps elsewhere: sts. thick and angled, teeth tipped: fls. near base or middle of young sts., mostly in small clusters, corolla rotate and deeply 5-lobed; corona double.

angustfloba. Tufted, sts. to 1 in. long, subglobose or oblong: fls. 5-20, dark chocolate-color, 1 in. across; corona white. S. Afr.

Corderòyi (Stapelia Corderoyı). Sts. 1¼ in. or less long from one crown, oblong or nearly globose, tinged purple in sun: fls 2-4, olive-green with darker tips and bearing purple hairs toward base, to 2 in. diam.; outer corona brick-red, inner one buff. S. Afr.

hirtélia. Sts. to 3 in. long, subglobose or oblong: fls. 1-5, dark chocolate, 1 in. across; outer corona brownishred, inner yellow. S. Afr. Var. obscura (D. obscura) has a taller annulus, rarely pubescent: outer corona speckled or ringed dull yellow.

obscura: D. hirtella var.

polita. Sts. decumbent, to 2½ in. long: fls 3-4, green outside, purplish-brown inside, 1¼ in. across, shining; outer corona chocolate-red, inner orange-red. Trop. and S. Afr.

pubéscens. Sts. decumbent, to 2 in. long: fls. 2-4, dark chocolate, 1 in. across, densely pubescent inside; outer corona reddish-brown. S. Afr.

radiats. Sts. to 2 in. long and 34 in. thick, oblong or globose, remotely 4-5-angled: fls. dark reddish-brown. S. Afr.—Coronas as in D. hirtella var. obscura and by some authors the two are not considered entirely distinct.

reclinata. Sts. to 6 in. or more, angles obscure and tubercled: fis. dark chocolate, to 1½ in. across, rim of annulus greenish; coronas somewhat orange-colored. S. Afr.

DÝCKIA. Bromeliaceæ. Stemless succulent or thick herbs with stiff spiny-margined lvs. in basal rosettes and yellow or orange fls. in racemes or panicles; native in S. Amer. and occasionally planted in Fla. or Calif. Cult. as for Bromeliaceæ.

frigida (D. regalis). Lvs. to 2 ft. long and 2 in. wide: fls. yellow with green base, ¾ in. long, the infl. to 1 ft. Brazil.

rariflora. Lvs. to 6 in. long and 1/2 in. wide: fis. orange, 1/2 in. long, the infl. to 11/2 ft. Brazil.

regalis: D. frigida.

sulphurea. Lvs. to 8 in. long and ¾ in. wide: fis. yellow, ¼ in. long, the infl. to 1 ft. high. Brazil.

DYERS-GREENWEED: Genista tinctoria.

DYPSIS: see Chrysalidocarpus madagascariensis.

DYSCHORÍSTE (Calophanes). A canthaceæ. Per. Ruellia-like herbs widely distributed in warm regions: lvs. opposite, entire: fls. irregular, bracted. in cymes.

linearis. To 1½ ft.: lvs. linear to spatulate, to 2½ in. long: fts. violet spotted with purple, 1 in. long. Tex. to N. Mex.—Sometimes transferred to grounds.

DYSÓXYLUM. Meliaceæ. Large trees of which one has been intro. into Calif. for ornament, native from trop. Asia to New Zeal.: lvs. alternate, pinnate: fls. in loose axillary panicles: fr. a leathery caps.

spectabile. To 50 ft.: lvs. of 3-4 pairs of ovate-oblong entire lfts. to 7 in. long: fls. waxy-white, 11/2 in. across, in drooping panicles to 11/2 ft. long: caps. 1 in. long. New Zeal.

EARLEOCASSIA: Cassia Roemeriana.

EBENACEÆ. EBONY FAMILY. Trees or shrubs of some 6 genera in warm and temp. regions of both hemispheres, with very hard wood, alternate entire lvs., regular unisexual or bisexual gamopetalous fls. having prominent 3–7-lobed calyx and corolla, 2–3 times as many stamens as corolla-lobes, superior ovary with 2–8 styles, and fr. a berry. Diospyros is grown for the edible frs. of some species and for the ornamental character of others, and Maba and Royena for ornament.

EBENÓPSIS (Siderocarpus of American authors). Leguminosæ. Spiny trees or shrubs of subtrop. regions in New World, having 2-pinnate lvs., fls. in oblong or cylindrical spikes, and turgid curved hard woody pods with valves tardily dehiscent. Propagated by seeds.

flexicallis (Pithecellobium flexicaule. Siderocarpus and Zygia flexicaulis). Texas Ebony. Tree to 50 ft. or shrub about 20 ft. high, twigs with stipular spines to ½ in. long: lfts. 3-5 pairs, oblong to obovate, to ½ in. long, obtuse, glabrous: fls. yellow, about ½ in. long, fragrant, in dense slender spikes about 1½ in. long: pods 4-6 in. long. S. Tex. to Yucstan.

ÉBENUS. Leguminosæ. About a score of herbs or subshrubs of E. Medit. region and W. Asia, one of which is intro. in Calif.: lvs. simple, digitate, or odd-pinnate: fls. papilionaceous, in colored clover-like heads: pod small and included in the calyx, seeds 1 or 2. E. crética is somewhat shrubby, to 2 ft.: lfts. 3 or more, narrowly oblong: heads more or less cylindrical, red or purplish. Crete. See Maba.

EBERLÁNZIA. Aizoaceæ. Shrubs with woody roots and erect sts.: lvs. 3-angled, united at base, blue-green with dark spots: fls. red, in branched infl. Native in S. Afr. and a separate from Mesembryanthemum.

spinosa (M. spinosum). To 2 ft., the branches tipped with thorns: lvs. to 1 in. long and 1/6 in. wide: fls. deep rose, 1 in. across

EBONY FAMILY: Ebenaceæ. Mountain: Bauhinia variegata. Texas: Ebenopsis flexicaulis.

EBRACTÈOLA. Aizoaceæ. Dwarf succulents with thick roots, 3-angled or cylindrical lvs., and solitary terminal short-stalked red or white fls.; stigmas 5. S. African, separated from Mesembryanthemum.

Derenbergiana (M. Derenbergianum). To 3 in., forming clumps: lvs. 3-angled, to 1½ in. long and ½ in. thick, light bluish-green: fls. rose, shining, 1 in. across.

môntis-môltkei (M. montis-moltkei). Plant forming clumps, with rosettes of 4-8 lvs.: lvs. 3-angled, to 1 in. long and ½ in. thick, united at base, bluish-green with pellucid dots: fls. bright rose-violet, ½ in. long. Var. álba is listed.

Vállis-pàcis: listed name.

ECBÁLLIUM. Cucurbitaceæ. One monoccious per.-rooted herb of the Medit. region, more or less trailing or prostrate but without tendrils, planted sometimes for the interest of its odd frs., usually treated as an ann.: fls. yellow, pistillate solitary, staminate racemose. It grows readily from seeds. E. Elatèrium (Momordica Elaterium). Squirting-Cucumber. Hairy-pubescent and grayish: lvs. triangular-ovate, to 4 in. long,

angled or obscurely lobed: fr. oblong, to 2 in. long, rough-hairy, squirting the seeds when detached, if ripe.

ECCREMOCÁRPUS (Calampelis). GLORY-FLOWER. Bignoniaceæ. Climbing shrubs from Peru and Chile with pinnate lvs. terminated by a branching tendril, tubular yellow, orange or scarlet fls. in terminal racemes, and fr. an ovoid caps.; grown as an ann. in the N. and per. where it is hardy.

scaber. Woody, climbing to 12 ft. but sometimes treated as an herb and blooming first year from seed: lvs. 2-pinnate into ovate entire or toothed lfts. to 1½ in. long; fts. orangered, 1 in. long, in racemes to 6 in. long, with small lobes: fr. 1½ in. long. Chile. Var. aureus has golden-yellow fts, carmineus carmine-red, and coccineus scarlet.

ECHEVÈRIA. Crassulaceæ. American succulents with broad lvs. in rosettes and fls. in spikes, racemes or panicles, the corolla with short tube that little if at all exceeds the calyx. By some authors the genus is included in Cotyledon; as considered here the genus includes Courantia, Dudleya, Oliveranthus, Stylophyllum and Urbinia. For cult. see Sempervivum and Succulents; grown in pots and frequently planted out. The plants have the habit of Sempervivums.

Abramsii (Dudleya Abramsii). Flowering sts. to ½ ft.: basal lvs. in dense rosettes, linear-ovate, to 1 in long, somewhat glaucous: fls. yellow with reddish stripes. Calif.

acutifòlia. Sts. short: lvs. rhomboid, concave: fis. red tinged with yellow, in a narrow erect panicle. Mex.

agavoides (Urbinia and Cotyledon agavoides). St. or caudex very short and thick: Ivs. thick and rigid, densely imbricated, ovate, to 2 in. long, spine-tipped: corolla conshaped, reddish with yellow tips. Mex.

albiflora (Dudleya albiflora). Caudex 8-12 in. diam., with 25 or more rosettes crowning the short sts.: lvs. linear-lanceolate, $1\frac{1}{2}-2$ in. long, thick, flat, becoming purplish: fls. white. Lower Calif.

alpina. Plant small, stemless, cespitose, floral shoots to 5 in. lvs. glaucous, oblong-spatulate, to 3 in. long, truncate and mucronate at apex: fls. 10 or more, reddish-orange, in a simple raceme. Mex.

amadorana (Dudleya giyantea). Stemless or nearly so, with basal lvs. very glaucous, oblanceolate, 2-3 in. long: fl.-st. 1 in. long, with the infl. paniculate; fls. deep red. Amador Co., Calif.

ameth fstina: Graptopetalum amethystinum.

amæna (E. pusılla). Nearly stemless, with numerous offshoots: lvs. spatulate-lanceolate, $\frac{3}{4}$ in. long: fis. 1-8, coral-red, the flowering branches to 8 in. long. Mex.

atropurpurea (E. sanguinea). To 8 in.: lvs. in dense rosette at top of st, obovate, to 4½ in. long, glaucous, dark purple above: fis. bright red, ½ in. long, on branches 1 ft. long. Mex.

atrosanguinea: probably meant for atropurpurea.

attenuata (Stylophyllum attenuatum. S. Orcuttii). Lvs. linear, terete, to 4 in. long: fis. yellowish tinged with green and red, ½ in. long, in one-sided racemes. Lower Calif. and isls.

austràlis. To 2 ft.: lvs. at top of branches, broadly spatulate, to 3 in. long, glaucous: fls. bright red, ½ in. long. Costa Rica.

Bàileyi: listed name.

bifurcata. Sts. short: basal lvs. lanceolate, to 3 in. long and ½ in. wide: fls. yellow, bright red above, ½ in. long, in one-sided racemes to 5 in. long forming a two-branched infl. Mex.

Bradburyana: listed name.

Brittonii: Sedum obtusatum.

cæspitôsa (Cotyledon cæspitosa and californica. Dudleya cæspitosa. E. linguaformis). Green or glaucous: fl.-sts. slender, 4-12 in. high: basal Ivs. obovate-oblong, ½-1½ in. long: fls. yellow, about ½ in. long. Calif.

cándicans: listed name.

carnícolor. Stemless: lvs. in dense rosettes, oblance olate-

spatulate, 2 in. long, glaucous tinged red: fls. 6-12, bright red, ½ in. long. Mex.

clavata. Hybrid with Pachyphytum bracteosum as one parent: see Pachyperia clavata.

clavifòlia. Hybrid: lvs. gray-green with reddish margins: fis. carmine, numerous.

claviformis: listed as a small very green plant with horzontal fl-sts.

coccinea. To 2 ft., gray-pubescent: lvs. oblanceolate, to 4 in. long: fis. red, in 15-25-fid. spikes. Mex.

compacta (Duilleya compacta). Bright green: fl.-sts. 4-12 in. high: basal lvs. oblong-lanceolate, stiff and very fleshy, to 2½ in. long: fls. bright lemon-yellow, ½ in. long. S. Calif.

Cooperi: presumably Adromischus Cooperi.

Corderdyi (Urbinia Corderoyi). Stemless: lvs. in dense rosettes, to 3 in. long, very thick: fls. 15-20, red with yellow tips, ¾ in. long. N. Mex.

crenulata. Sts. long: basal lvs. obovate, to 1 ft. long and 6 in. wide, st.-lvs. with wavy purplish-red margins: fls. yellowish-red, ½ in. long. Mex.

crispa. Hybrid: lvs. with deeply crenulated red or pink

cuspidata. Stemless: lvs. in dense rosettes, obovate, to 2½ in. long, very glaucous tinged with red: fls. purplish with yellowish tips, ½ in. long, the fl.-st. to 8 in. Mex.

cymòsa (Dudleya and Cotyledon cymosa). Stemless: fl.sts. to 14 in.: basal lvs. in dense rosettes, oblong-lanceolate, to 5 in. long: fls. pale yellow, ½ in. long. Calif.

densiflora (Stylophyllum densiflorum. Cotyledon nudicaulis and densiflora. E. nudicaulis). Making dense clumps, very glaucous: lvs. many, nearly terete, to 4 in. or more long: fls. white or pinkish, about 1/4 in. long, in cymes. S. Calif.

Dérenbergii. Lvs. in rosettes, spatulate, to 1½ in. long and 1 in. wide, grayish-white with red margins and sharp tip: fls. reddish-yellow or cinnabar-red, ½ in. long, the fl.-st. to 2½ in. Mex.

Desmetiàna: E. Peacockii.

edùlis (Stylophyllum edule). To 1½ ft.: lvs. linear, nearly terete, flat and broad at base: fls. yellowish, ¼ in. long, in panicles. S. Calif.

élegans. Stemless: lvs. in compact rosettes, to 2 in. long, glaucous, very succulent with translucent margins: fis. 5-7, pinkish with yellow tips, fi.-branches to 8 in. long. Mex.

exímia: listed name.

expatriàta. To 4 in.: lvs. in dense rosettes, oblanceolate, 1 in. long, glaucous: fls. pinkish. Described from cult. material. Mex.

farinosa (Cotyledon and Dudleya farinosa). Sts. low, rootstock short: basal lvs. tongue-shaped, flat and white-mealy, st.-lvs. sagittate: fls. lemon-yellow, on slender pedicels in rather open cymes. Coasts, Calif.

fimbriata. Sts. to 10 in.: lvs. in loose rosettes, oblanceolate, 5 in. long, with nearly transparent fimbriated margins: fis. pink outside, yellow inside, ½ in. long, in one-sided racemes. Mex.

flammea: form of E. gibbiflora with highly colored foliage.

Funkii: a name of uncertain botanical application.

gibbiflora (Cotyledon gibbiflora. E. grandifolia). To 2 ft.: lvs. obovate-spatulate, to 7 in. long, becoming pinkish: fls. red. Mex. Var. metállica has glaucous-purple foliage with metallic luster.

gibbdsa var. víride: listed name of no botanical standing. gigantèa. Subshrub with thick st.: lvs. in thick rosettes, to 10 in. long and 6 in. wide, reddish: fls. red. Mex.

glauca (E. secunda var. glauca). Lvs. nearly orbicular, 3/4 in. across, pale and glaucous, with purple point: fis. pinkish outside, yellow inside, the flowering branches reddish. Mex. Var. major is listed; also var. metállica but this may be referable to E. gibbiflora.

globbsa. Nearly stemless: lvs. in dense rosettes, spatulate, to 3 in. long, pale: fis reddish and yellowish, the flowering branches weak. Origin unknown. Vars. cristata and gigantea are listed.

Goldmanii. To 8 in., sts. often prostrate and rooting at nodes: lvs. linear-oblong, 2 in. long, pale green with purple margins. Mex.

grácilis. To 8 in., often decumbent from base: lvs. subrosulate to scattered, green with red tips, obovate-oblong, 1 in. long: lowermost pedicels often 2-fid.; fis. bright scarlet. Mex.

grandiflòra: E. lanceolata var. aloides.

grandifòlia: E. gibbiflora.

Greenei (Dudleya Greenei). To 16 in., more or less

glaucous: lvs. numerous, oblanceolate, to 4 in. long and 1/4 in. wide; fis. yellow. Santa Cruz and isls., Calif.

guatemalénsis. To 1 ft., branching at base: lvs. to 1½ in. long and ¾ in. wide: fis. borne singly, pinkish below, yellowish above. Guatemala.

Haageana: listed name.

Hállii: Sedum obtusatum.

Hármsii (Cotyledon and Oliveranthus elegans). To 20 in., much branched: lvs. near ends of branches, obovate: fis. bright red tipped with yellow, 1 in. long, solitary or twin at ends of branches in summer. Mex.; hardy out-of-doors as far north as Washington, D. C.

heterosépaia (E. mrduflora). Stemless: basal lvs. forming a dense rosette, obovate, somewhat acuminate, to 11/4 in. long: fl.-sts. to 10 in., with fls. in racemes or spikes.

Hôveyi (Cotyledon Hoveyi). Nearly stemless, but fls. on an elongated peduncle or scape: lvs. long-spatulate forming a basal rosette, margined: fls. 6-12, racemose, pinkish. Origin unknown; perhaps a cultigen.

imbricata. Hybrid between E. glauca and E. gibbiflora var. metallica: rosettes saucer-like, lvs. gray or nearly white.

ingens (Dudleya ingens). Sts. to 1 ft. high, bearing at top a rosette of lvs. to 10 in. long and 1½ in. wide: fls. yellow, in open panicles. Lower Calif.

kewénsis: listed name.

lanceolata (Cotyledon and Dudleya lanceolata). Usually somewhat glaucous: fl.-sts. to 2 ft: basal Ivs. narrowly lanceolate and long-acuminate, to 6 in. long, st.-lvs. cordate or sagitatte: fls. reddish-orange, about ½ in. long. S. Calif. Var. aloides (E. and Dudleya grandisfora) is scarcely to quite glaucous with corolla green-yellow. Var. larida (E., Cotyledon and Dudleya lurida, E. Monicæ) is not glaucous with corolla reddish.

láxa (Cotyledon and Dudleya laxa). Glaucous or yellow-ish-green: fl-sts, to 2 ft.: lvs. ovate to lanceolate, acute, to about 3 in. long: fls. yellow, deeply parted, ½ m. long, in lax cymes. S. and Cent. Calif.

leucótricha. Much branched: lvs. lanceolate, thick, covered with white hairs: fis. cinnabar-red. Mex.

Lingettòlii: listed name.

linguæfðlia. To 1 ft.: lvs. thick and fleshy, nearly cylindrical at base: fls. cream-color, the flowering branches long and drooping. Mex.

linguafórmis: E. caspitosa.

Lozànii. Stemless: lvs. in dense rosettes, lanceolate, 4 in. long, those in center copper-colored: fls. pale copper-color, the fl-sts. to 1½ ft. long. Mex.

lùrida: E. lanceolata var.

macrántha: listed name.

macrophylla: a name of doubtful botanical status.

maculata. Stemless: lvs. lanceolate, 4 in. long, somewhat mottled: fis. lemon-yellow, in panicles, flowering branches to 3 ft. long. Mex.

Máxonii. Sts. to 2½ ft., becoming decumbent: lvs. spatulate, to 4 in. long, margins purplish: fis. salmon-pink, in racemes on peduncles to 1 ft. long. Mex.

McCabei: listed name.

metállica: E. gibbiflora var.

mexicana: listed name.

micrócalyx (E. Purpusii). Sts. 4 in. or more: lvs. spatuate, 1 in. long and ½ in. wide, thick: fis. yellowish-pink, ½ in. long. Mex.

minor: E. nevadensis.

Mônicæ: E. lanceolata var. lurida.

montana. Lvs. in dense rosette at top of st., orbicular or obovate, 2 in. long: fis. $\frac{1}{2}$ in. long, in racemes on fists. 1 ft. long. Mex.

multicaulis. To 3 ft.: lvs. to 8 in. long and ¾ in. wide: ft.-branches rose-colored. Mex.

nevadensis (Cotyledon and Dudleya nevadensis. E. minor). Stemless: fl.-sts. to 8 in.: basal lvs. obovate, to 4 in. long: fls. yellow tinged with red, to ½ in. long, in compound cymes to 3 m. across. Calif.

nivalis, nívula: listed names.

nóbilis: advertised as a prolific purplish form.

nodulosa. Sts. 1-2 ft. long, crowned by a dense rosette of obovate-spatulate lvs. 2-3 in. long, slightly glaucous, with the margins reddish: fls. fex, in a short raceme, straw-colored tinged with red. Mex.

nida. Sts. to 4 in , with lvs. scattered towards the apex, obovate-spatulate, 2 in. long, slightly glaucous: fls. in a simple or slightly compound raceme, pink below, yellowish above. Mex.

nudicaulis: E. densiflora.

Órpetii. Said to be a hybrid with large rosettes: outer lvs. rosy, inner lvs. green: see Pachyveria Orpetii.

ovaliformis: catalogue name.

ovifórmis: listed name.

Pálmeri (E. Rosei). Stemless: lvs. rhomboid or oblanceolate, to 8 in. long and 4 in. wide, margins reddish: fls. reddish-yellow, 34 in. long, in panicles to 8 in. long. Mex.

Pèacockii (E. Desmetsana). Stemless: lvs. obovatespatulate, to 3 in. long, white-glaucous, reddish toward top: fls. bright red, the fl.-sts. 1 ft. long. Mex.

perbélla: listed name.

pinetòrum. Stemless: lvs. in dense rosettes, oblanceolate, to 1½ in. long and ½ in. wide, margins tinged red: fls. ½ in. long, the infl. to 10 in. long. Mex.

Pittièri. To 6 in., bearing rosette at top of st.: lvs. oblanceolate, 3 in. long: fls. rose, ½ in. long, in dense spikes 2 in. long on sts. 8 in. long. Guatemala.

Plattiana (Cotyledon and Dudleya Plattiana). Stemless: lvs. oblanceolate, to 4 in. long, somewhat glaucous: fis. in a rather short flat-topped panicle, reddish. Calif.

plicata: listed name.

Pringlei. Sts. decumbent, 1 ft. long, pubescent: lvs. oblanceolate, to 4 in. long: fis. scarlet. Mex.

pubéscens. To 2 ft., velvety-pubescent: lvs. obovate or spatulate, to 3 in. long: fls. bright red, ½ in. long, in manyfld. spikes. Mex. Var. recurvata is listed.

pulvinata. Velvety-pubescent throughout: sts. to 5 in. long with lvs. clustered in a rosette at top, 1 in. long, rounded at apex and apiculate: fls. scarlet, in a leafy raceme. Mex.

pulverulenta (Cotyledon and Dudleya pulverulenta). Mealy all over: fl.-sts. to 2½ ft.; lvs. broadly spatulate, to 3½ in. long, those on st. broadly ovate and clasping: fls. red, above ½ in. long, in racemes. S. Calif.

pumila. Stemless, stoloniferous: lvs. in dense rosettes, to 1½ in. long and ½ in. wide, glaucous: fis. red, upper half yellow. Mex.

Párpusii (Cotyledon and Dudleya Purpusu). Tufted, pale green: fl-sts. to 8 in.: basal lvs. rhombic, to 3 in. long: fls lemon-yellow, ½ in. long, in cymes to 3 in. across. Calif.—Plants under this name, in another application, are to be referred to E. microcalyx.

Purpusòrum (Urbinia Purpusii). Stemless: basal lvs. gray-green, mottled with brown, broadly ovate, pointed, to 1½ in. long: fls. pinkish outside, yellowish within and at tip. Mex.

pusílla: E. amæna.

racembsa. Stemless, with basal lvs. numerous, in a dense rosette, deep purple, to 2 in. long: fl.-branches to 1 ft.; fls. 20-40 in a simple raceme, corolla yellowish, 1/2 in. long, sepals ascending. Mex.

retûsa. Nearly stemless: lvs. in dense rosettes, obovate or spatulate, 3 in. long: fls. bright red, ½ in. long, in compact panicles on sts. 8 in. long. Mex.

rosea (Courantia rosea). Sts. to 1 ft., branching: lvs. near tops of branches, oblanceolate-spatulate, 3 in. long, edges tinged reddish: fls. pale yellow with lobes of calyx rose, in dense spikes on leafy branches 4 in. long. Mex.

ròsea-grándis: listed name.

Ròsei: E. Palmeri.

rubélla: listed name.

rubromargināta. Stemless or nearly so: lvs. oblanceolate, to 5 in. long, stiff, glaucous, with a red slightly wavy margin: fls. pale rose, fl.-sts. to 4 ft. high. Mex.

Rúnyonii. Sts. short or none: lvs. in rosettes, spatulatecuneate, to 3 in. long, very glaucous: fls. in bifid racemes, corolla pink to scarlet, to ¾ in. long. Mex.

sanguinea: E. atropurpurea.

saxòsa (Dudleya saxosa). Pale green or somewhat glaucous: basal lvs. numerous, narrowly lanceolate, semi-terete, to 4 in. long: fi.-branches to 14 in. long with fis. in cymes, calyx-lobes red, corolla yellow, becoming reddish. Calif., Ariz.

scaphýlla. Hybrid between E. agavoides and E. linguæ-folia.

Scheèri. Caulescent, to 2 ft., more or less glaucous: rosette-lvs. to 8 in. long: fis. terminal in a few-branched panicle, corolla red or tinged with yellow. Mex.

Scheideckeri. Hybrid between Pachypytum bracteosum and E. secunda: fis. orange-red tipped with yellow: see Pachyveria Scheideckeri.

scopulòrum. Sts. short, topped by rosette: lvs. obovate, to 3 in. long: fls. dark red, 1/3 in. long, the red flowering sts. to 8 in. long. Mex.

secunda (Cotyledon secunda). Lvs. obovate, with very short sharp point, glaucous-blue, reddish at margins: fis. reddish, on scapes to 15 in. tall. Mex.

septentrionalis (Cotyledon and Dudleya septentrionalis).

White-powdery: fl.-sts. about 3 in. long: lvs. in compact rosettes, ovate, 1 in. broad: fls. pale yellowish-green, short and broad, in a very compact cyme. N. Calif.

Sétchellii (Dudleya Setchellu). Fl.-sts. numerous, from a short thick caudex, to 1 ft.: rosette-lvs. lanceolate to linear-lanceolate, very glaucous: fis. in a narrow panicle, corolla pale yellow. Calif.—Possibly only a var. of E.

setòsa. Stemless: lvs. in a nearly globular rosette, 2 in. long, hairy: fls. 8-12, red tipped with yellow. Mex.

Shéldonii (Dudleya Sheldonii). Stemless: fl.-sts. to 10 in.: lvs. lanceolate to ovate-lanceolate, to 2 in. long: fls. yellow, ¼ in. long, in compact panicles. Calif.

símulans. Similar to E. elegans but with flatter rosettes and narrower corolla. Mex.

Spricei. To 1 ft.: lvs. in dense rosettes, lanceolate, ½ in. long: fis. red, ½ in. long, in 10-12-fid. loose racemes about 6 in. long. Ecuador.

stolonifera. Short-stemmed, stoloniferous: lvs. in dense rosettes, obovate or spatulate, $2\frac{1}{2}$ in. long: fis. 4-6, yellowish Mor

strictiflora. Stemless: basal lvs. spatulate-lanceolate, to 4 in. long, acuminate, pale green and slightly glaucous, the upper part with bright red margins: fl.-branches to 16 in. long, either simple or two-forked, fls. scarlet. Tex.,

subrigida. Stemless: lvs. in dense rosettes, ovate, very glaucous, tinged purple, margin of young lvs. scarlet: fis. red, to ¾ in. long, in panicles to 2 ft. long. Mex.

tolucénsis. Acaulescent or in age shortly caulescent: living in rather open rosettes, usually ascending, glaucous, oblanceolate, to 2½ in. long: fis. 7-12 in a raceme. Mex.

túrgida. Stemless: lvs. in dense rosettes, turgid, spatulero-oblong, grayish-green tinged red: fls. rose, ½ in. long, in one-sided racemes on sts. 4 in. long. Mex.

venezuelénsis. To 4 in.: lvs. in rosette at top of st., oblanceolate, 3 in. long, slightly glaucous: fis. pinkish, in many-fid. racemes to 1 ft. long. Venezuela.

villòsa: of uncertain botanical status.

virens (Stylophyllum virens). Caudex elongated, branched and sprawling, crowned by dense rosettes of very fleshy oblong-linear lvs., 3½ in. long: fl.-sts. to 8 in., fls. reddish-yellow. Isls. off S. Calif.

víridens, víridis: listed names.

viridiflora: E. heterosepala.

Walpoleana. Nearly stemless: lvs. in dense rosettes, to 3 in. long and 1 in. wide, tinged with deep red: fis. orange, ½ in. long, in a two-branched infl. on sts. 1 ft. high. Mex.

Weinbergii: Graptopetalum paraquayense.

Weingartii. Hybrid.

Whitel. Sts. to 4 in. topped by dense rosette: lvs. spatulate, to 2 in. long, margins purplish: fis. red, ½ in. long, in racemes 4 in. long on red sts. to 1 ft. long. Bolivia.

ECHIDNÓPSIS. Asclepiadacex. Leafless succulent plants of trop. Afr. and Arabia allied to Stapelia, the stout branching sts. tubercled: fis. fleshy, 5-lobed, yellow or purple-brown, small, in fascicles or sometimes solitary.

cereiformis. Sts. ½ in. thick, 8-angled: fls. in clusters near tips of sts., bright yellow, ½ in. across. Nile Land. Var. brúnnes, fls. yellowish- to purple-brown, sts. 6-10-angled. Var. obscůra, fls. dark yellowish-brown, sts. 6-10-angled.

cylindrica. Similar to E. cereiformis but with longer branches and larger fls. Nile Land.

Dammanniana. Sts. to 34 in. thick, grayish-green or purplish-green, 8-10-angled: fis. 2-5 together or solitary, corolla dark purple-brown, to 1/3 in. across. Nile Land.

ECHINACEA (Brauneria). Coneflower. Compositæ. N. American coarse herbaceous perennials with thick black roots of pungent taste and alternate simple lvs.: heads large and showy, solitary and terminal, ray-fls. purple or rose or yellow, disk-fls. green or purple, becoming conical; pappus a short crown.

The coneflowers are easily cultivated in the border or wild-garden. Propagated by division but this should not be practiced too frequently; also by seed.

angustifolia. To 2 ft., hairy: lvs. lanceolate or linearlanceolate, to 8 in. long, entire: heads light purple, rays about 1 in. long, spreading, the fruiting disk often 1 in. high. Sask. to Tex.

pállida (Rudbeckia pallida). To 3 ft., hairy: lvs. linear-

lance olate, to 8 in. long, entire: heads rose-purple to nearly white, rays to 3 in. long, drooping. Ill. to Tex. Var. álba with pure white rays is listed.

purpurea (Rudbeckia purpurea). Purpue C. To 5 ft.: lvs. ovate or ovate-lanceolate, to 8 in. long, usually toothed: heads purple varying to white, rays to 3 in. long, spreading or drooping. Pa. to Ga. and La. Var. grandiflora is said to have larger heads.

ECHINOCÁCTUS. Cactaceæ. More than 1,000 names have been applied in this genus, but it is now restricted to a few species: plants thick, sometimes very large, many- or several-ribbed, cylindric, the large areoles very spiny: fls. on the crown, yellow or pink, often immersed in wool; axils of scales on ovary and fr. woolly: fr. white-woolly. S. W. U. S. and Mex. See Cacti.

Various kinds of echinocacti and closely related genera are favorites for pot and tub culture and for plunging in the open in summer. They are propagated by seeds as they do not branch nor readily produce offsets. Seeds are sown in late spring or early summer. Under glass they may require pollination to produce seeds. In winter, the plants may be placed in a light dry greenhouse and kept fairly dormant; in spring and summer water may be supplied liberally to establish plants.

acanthòdes: Ferocactus acanthodes.
acutíssimus: Chilenia acutissima.
alamosànus: Ferocactus alamosanus.
albàtus: Stenocactus albatus.
anfactudsus: Stenocactus onfractuosus.
Anistisii: Gymnocalycium Anistisii.
ápricus: Notocactus apricus.
árrigens: Stenocactus arrigens.

aureicentrus: probably Parodia aureicentra.

aureispinus: listed name, perhaps Parodia aureispina.

Beguinii: Neolloydia Beguinii. bicolor: Thelocactus bicolor.

Astèrias: Astrophytum Asterias.

Bodenbenderianus: Gymnocalycium Bodenbenderianum.

brevihamatus: Ancistrocactus bremhamatus.

californicus: Ferocactus californicus.

calochlòrus. Depressed-globose, 1½ in. high and 2¼ in. diam., shining bright green, slightly proliferous; ribs 11 and tubercled, areoles slightly woolly; radial spines 9 and ½ in. long: fis. pale rose with darker marks, 2 in. long. Argentina.

capricórnis: Astrophytum capricorne. cataphráctus: Frailea cataphracta. centetèrius: Purrhocactus mammillarioides.

ceratistes: Eriosyce ceratistes.
chilénsis: Chilenia chilensis.

chrysacanthion: Parodia chrysacanthion.

chrysacánthus: Ferocactus chrysacanthus. columbiànus: Frailea columbiana. concinnus: Notocactus concinnus. conoideus: Neolloydra conoidea. conothèlos: Thelocactus conothelos. contonogònus: Stenocactus cortonogonus.

cornigerus: Ferocactus latispinus.
crassihamatus: Ferocactus crassihamatus.

crispatus: Stenocactus crispatus.

cupreatus: a name of doubtful botanical standing as it was described without fis. or fr.

curvispinus: Pyrrhocactus curvispinus. cylindraceus: Ferocactus acanthodes. Damsii: Gymnocalycium Damsii.

Davisii: listed name; see Hamatocactus hamatacanthus.

Delaètii: Gymnocalycium Schickendantzii var. denudâtus: Gymnocalycium denudatum. disciformis: Strombocactus disciformis. ebenacânthus: Neoporteria fusca. Éhrenbergii: Thelocactus Ehrenbergii. electracânthus: Ferocactus melocactiformis. elephântidens: Coryphantha elephantidens. Émoryi: probably Bergerocactus Emoryi.

énsifer: Stenocactus arrigens. excúlptus: Chilenia subgibbosa.

Fiedlerianus. Forming clumps, depressed-globose and woolly at apex; ribs 13 and tubercled, areoles depressed; spines 4-7 and 1 m. long: fis. yellow, greenish outside. Chile.

flavóvirens: Ferocactus flavovirens. floricomus: Notocactus floricomus.

Fordii: Ferocactus Fordis.

Froehlichianus: Pyrrhocactus Froehlichianus.

fúscus: Neoporteria fusca.

gibbòsus: Gymnocalycium gibbosum. Gielsdorfiànus: Thelocactus Gielsdorfianus.

gladiatus: Stenocactus gladiatus. glaucéscens: Ferocactus glaucescens. Graèssneri: Notocactus Graessneri.

grándis. To 7 ft. tall and half as wide, very woolly on top; ribs usually more than 40, narrow; spines subulate, yellow to reddish; radials 5-6, to 1½ in. long; central 1, to 2 in. long, straight: fis. yellow, to 2 in. long, outer segms. ciliate and acute, inner ones obtuse and serrate. Mex.

Gróssei: Notocactus Grossei.

Grusonii (Ferocactus Grusonu). A few in. to 4 ft. or more high, to 2½ ft. diam., light green; ribs 21-37; spines goldenyellow when young but becoming whitish, the radials 8-10; fts. yellow, brownish outside, imbedded in a felt-like cushion, opening in sunlight. Cent. Mex.

guayennénsis: Chilenia subgibbosa. Haageanus: see Astrophytum ornatum,

hamatacánthus: Hamatocactus hamatacanthus.

Háselbergii: Notocactus Haselbergii.

helóphorus: an imperfectly described species, perhaps the same as E. ingens.

Héttrichii. Solitary, cylindrical, to 5½ ft. high and 2 ft. diam.; ribs 12-24; radial spines 17-19, to 1½ in. long, spreading, reddish-brown, ringed; centrals 4, to 2¼ in. long, one hooked; fls. reddish-brown, to 2½ in. long. Ariz.

heteracánthus: Stenocactus heteracanthus, heterochròmus: Thelocactus Pottsii. hexædróphorus: Thelocactus hexædrophorus.

horizonthalònius. Not large, globular or short-cylindric, to 10 in. high, glaucous; ribs commonly 8; spines 6-9 and to 1½ in. long and reddish or blackish at base, central 1: fis. pale rose or pink, 2 in. or more long and of greater breadth when expanded. W. Tex. to Ariz. and Mex.

Hôssei: Gymnocalycium Hossei.
hùmilis: doubtful name in the lists.

ingens. To 5 ft. high and 4 ft. diam., more or less short-oblong, somewhat glaucous and purphish, woolly at top; ribs 8; spines brown, 8 radial, 1 central: fis. 34 in. long and somewhat broader, yellow. Mex. Var. grandis is E. grandis and var. Palmeri is E. Palmeri.

intertéxtus: Echinomastus intertextus. intórtus: see Melocactus intortus. islayénsis: Parodia islayensis. Iónnsonii: Echinomastus Johnsonii.

Knèbelii: listed name, perhaps Mammillaria Knebeliana.

Knuthiànus: Thelocactus Knuthianus. korethroides: Eriosyce korethroides. Kraûsei: Echinomastus Krausei. Kurtziànus: Gymnocalycium Kurtzianus

Kurtzianus: Gymnocalycium Kurtzianum.

Leennus: Gymnocalycium Leeanum. Lecôntei: see Ferocactus acanthodes. Lemàirei: Melocactus Lemairei. Léninghausii: Notocactus Leninghausii.

leptánthus (Gymnocalycium leptanthus). Subglobose; ribs 8-10, low and broad, rounded; radial spines 6-9; centrals 1-3: fls. funnelform. Argentina.

leucacánthus: Thelocactus leucacanthus.
leuc6trichus: Arequipa leucotricha.
Llóydii: see Stenocactus Lloydii.

longihamàtus: Hamatocactus hamatacanthus.

lophophoroides: listed name.
lophothèle: Thelocactus lophothèle.
loricatus: Gymnocalycium Spegazzinii.

Maassii: Parodia Maassii.

Macdowellii: Echinomastus Macdowellii. macrodiscus: Ferocactus macrodiscus.

mammillarioides: Pyrrhocactus mammillarioides. mammulòsus: Notocactus mammulosus.

Mandrágora: Thelocactus Mandragora.

Mathanonii: Ferocactus crassihamatus. mazanénsis: Gumnocalucium mazanense megalothèlos: Gumnocalucium megalothelos. megarhizus: Ancistrocactus megarhizus. melocactiformis: Ferocactus melocactiformis. microspérmus: Parodia microsperma. Mihanovichii: Gumnocalucium Mihanovichii.

minfigenting. Rehutra minuscula Moèlleri: listed name.

Monvillei: Gumnocalucium Monvillei. Martii Gumnacalucium Martii

multicostàtus: Stenocactus multicostatus. multifldrus: Gumnocalucium multiflorum. muricatus: Notocactus muricutus. myriostigma: Astrophytum myriostigma. Netrelianus: Gymnocalycium Netrelianum.

nídulans: Thelocactus nidulans. Nidus: Neoporteria Nidus.

nigriareolatus: see Gumnocalucium nigriareolatum.

nigricans: Neoporteria nigricans. nivosus: Parodia nivosa. nahilis. Ferocactus nobilis obrepándus: Echinopsis obrepanda. occúltus: Neoporteria occulta. Órcuttii: Ferocactus Orcuttii. ornatus: Astrophytum ornatum. Ottonis: Notocactus Ottonis.

Ourselianus: Gymnocalycium multiflorum.

Pálmeri. To 6 ft. high and 8 in. thick; ribs 12-26; radial spines 5-8; central spines 4 and to 3 in. long, yellow at tips: fis. yellow, small. Mex.

pampeanus: Notocactus pampeanus. peninsulæ: Ferocactus peninsulæ. peruvianus: Oroya peruviana. Pfeifferi: Ferocactus glaucescens. Pflánzii: Gymnocalycium Pflanzii. phyllacanthus: Stenocactus phyllacanthus, phymatothèle: Thelocactus phymatothele. nildsus: Ferocactus Stainesii.

platénsis: Gumnocalucium platense. polyancistrus: Sclerocactus polyancistrus.

polycéphalus. Rather small, at length forming clumps, body globular or short-cylindric and sometimes 2 ft. tall; ribs 13-21; spines many and covering the plant, radials 7-15, centrals 4: fls. yellow, 2 in. or more long. Utah, Nev., Ariz., Calif., Mex.

porréctus: Thelocactus porrectus.

Poselgerianus: Coruphantha Poselgeriana.

Pôttsii: Thelocactus Pottsii. Pringlei: Ferocactus Pringlei. pulchéllus: Echinocereus pulchellus. pulchérrimus: Frailea pulcherrima. pùmilus: Frailea pumila.

pygmæus: Frailea pygmæa.

Quehliànus: Gymnocalycium Quehlianum. rafaelénsis: Ferocactus rafaelensis.

rectispinus: Ferocactus rectispinus. recúrvus: Ferocactus nobilis.

rhodanthèrus: Gymnocalycium mazanense. rinconénsis: Thelocactus rinconensis.

Ritteri: Aztekium Ritteri. robústus: Ferocactus robustus. Roseanus: Thelocactus Roseanus. Saglidnis: Gymnocalycium Saglione.

salmoneus: trade name, perhaps E. Salmianus which is Melocactus macrocanthus.

saltillénsis: Coruphantha Poselaeriana.

Sandillon: Eriosyce ceratistes.

sanguinifiorus. To 3 in. high and thick, simple or branched; ribs 10-12, are cles to 2 in. long and white woolly; spines all radial, 7-9, ½ in. long, whitish or pale brown: spines all radial, 7-9, ½ in. I fls. red, 2 in. long. Argentina.

Sauèri: Thelocactus Saueri. Saussièri: Thelocactus Saussieri. Scheeri: Ancistrocactus Scheeri.

Schickendántzii: Gymnocalycium Schickendantzii.

Schilinzkvanus: Frailea Schilinzkvana. Schumannianus: Notocactus Schumannianus.

Schwebsianus: Parodia Schwebsiana.

scòna: Notocactus scona.

Séllowii: Malacocarpus Sellowii. senilis: Neoporteria Nidus. setispinus: Hamatocactus setispinus. Simpsonii: Pedrocactus Simpsonii.

Smithii. Globose or cylindrical, 3 in. across; ribs 21 and strongly tubercled; radial spines 20-27 and ½ in. long; central spines 4, white with darker tips: fis. reddish, 1½ in. long. Mex.

Soehrénsii: Pyrrhocactus tuberisulcatus. spherocéphalus: Stenocactus arrigens. spinifldrus: Acanthocalycium spiniflorum.

Stainesii: Ferocactus Stainesii. Steinmannii: Lobivia Steinmannii. stellatus: see Gunnocalucium stellatum. Strausianus: Purrhocactus Strausianus. Stückertii: Gymnocalycium Stuckertii.

Stûemeri: Parodia Stuemeri.

submammuldsus. Notocactus submammulosus

Sutterianus: Gumnocalucium Sutterianum.

tabulàris: Notocactus tabularis.

tephracánthus: Malacocarpus Sellowii. tetráxiphus: Stenocactus heteracanthus.

texénsis: Homalocephala texensis.

Townsendianus; see Ferocactus Townsendianus,

Trolliètii: Echinomastus unquispinus. tuberisulcatus: Purrhocactus tuberisulcatus. tuléncie. Thelocactus tuleusus turbinifórmis: Strombocactus disciformis.

umadeave: Pyrrhocactus umadeave. uncinatus: Hamatocactus uncinatus. unguispinus: Echinomastus unguispinus,

Urselianus. Described as depressed-globose, ribs 7-9. broadly rounded, dark green, spines 7-9: fis. white. Hort.

Valdeziànus: Thelocactus Valdezianus. Vaupelianus: Stenocactus Vaupelianus. Velendwskyi: see Gumnocalucium Velenowskii.

violaciflorus: Stenocactus violaciflorus. viridéscens: Ferocactus mridescens. viridiflorus: Echinocereus viridiflorus.

Visnaga. Large, to 10 ft. high and 3 ft. or more diam., glaucous-green, tawny-woolly on top; ribs 15-40; spines 4 and all radial: fls. yellow, about 3 in. long. Mex.

Vorwerckianus: Malacocarpus Vorwerckianus. Wagnerianus: Thelocactus Wagnerianus,

Whipplei: Sclerocactus Whipplei. Williamsii: Lophophora Williamsii. Wislizenii: Ferocactus Wislizenii.

xeranthemoides (E. polycephalus var.). Similar to E. polycephalus from which it differs primarily in its more numerous spines, with the lower central of each areole being broad, flattened and not curved. Tex. to Calif. and Mex.

xiphacánthus: Stenocactus arrigens.

zacatecasénsis: see Stenocactus zacatecasensis.

ECHINOCÈREUS. Cactaceæ. Sts. solitary or cespitose and forming large clumps, erect or prostrate, always low, sometimes pendent, globular to cylindric, mostly spiny or bristly, ovary and fr. spiny: fls. diurnal but not always closing at night, bell-shaped to funnelform, scarlet, purple, yellow. About 60 species in W. U. S. and Mex. See Cacti.

The echinocerei are more or less grown in collections but are not generally useful for greenhouse conditions although the bloom is showy. The plants are likely not to last many years, and they may be renewed from the wild or from the stock of regular dealers.

acifer (Cereus acifer). Sts. clustered, 6-8 in. high and to 2 in. diam., glossy-green; ribs prevailingly 10; radial spines 5-10; centrals mostly 4: fis. scarlet, 2 in. and more long. Mex.

adústus (E. pectinatus var. adustus). Simple, to 2 in. high; ribs 13-15; radial spines 16-20; central spine 1 or none: fis. purplish, 1½ in. long. Mex.

aggregatus: E. coccineus.

amchus (Echinopsis amena). Sts. obconical, to 3 in. diam.; ribs 10-14, prominent, bright green, are oles usually 7-spined, latter to ½ in. long: fls. bright pink. Mex.

angústiceps. Cespitose, sts. to 3½ in. long and 1½ in. diam., many; ribs 7-8, prominent; spines acicular, radials 7-9, white to yellow, central 1, brown: fls. yellow with orange-red center, 1½ in. long; fr. green. Tex.

arizonicus. Tufted, sts. from common root, unequal; ribs 10, deeply tuberculate, areoles white-woolly; radial spines 10, white, unequal; centrals 1-4, purplish, to 1 in. long: fis. crimson. Ariz.

armatus: listed name.

Baileyi. Cylindric, about 4 in. high; ribs 15; radials about 16 and first white then brownish or yellowish, no centrals: fls. about 2½ in. broad, light purple inside and segms. crose or toothed. Okla.

Barthelowanus. Sts. clustered, cylindric, to 8 in. long and 2 in. diam.; ribs about 10; spines numerous and to 3 in. long: fls. ½ in. or less long. Lower Calif.

Berlandièri: E. Blanckii.

Blanckii (Cercus Blanckii. E. and Cercus Berlandieri). Prostrate and branching from the base making a colony of Frostrate and obtaining from the base making a colony of erect or ascending sts. to 6 in. long and 1 in. diam.; ribs 5-7; radial spines 6-8; central 1: fls. purple, to 3 in. and more long. S. Tex., Mex.

Bónkeræ. A recent species similar to *E. Engelmannii* but with more ribs, shorter spines and deep purple fls.

Brandegeei. Sts. clustered, to 3 ft. or more long and 2 in. diam; ribs strongly tubercled; radial spines 12; central spines commonly 4 and to 3 in. long: fls. purplish, 2 in. long. Lower Calif.

Bristolii. Sts. cylindrical, to 8 in. tall or more and 2 in. dam., light green; ribs 15-16, tubercled; spines curved; radials about 20, white; centrals 3, white with red tips: fls. violet-pink: fr. red, spiny. Mex.

cæspitdsus: E. Reichenbachii.

castàneus: referable to E. Reichenbachii.

chloránthus (Cereus chloranthus). Usually simple, sts. cylindric to 6 in. long and 2-3 in. diam., very spiny; ribs about 13; radials several; centrals 3 or 4: fls. yellowishgreen, ¾ in. long. W. Tex., New Mex. and Mex.

cineráscens (Cereus cinerascens). Making patches 2-4 ft. across, sts. ascending 1 ft.; rbs about 12; spines pale or white; radials about 10; centrals 3 or 4; fls. about 3 in. long, purple inside, tube with white wool. Mex.

coccineus (E. aggregatus. E. phæniceus. Cereus coccineus. C. phæniceus. C. Roemeri. C. aggregatus). Mostly densely cespitose, forming mounds, sts. 6–8 in. high, 1–2 in. diam.; ribs 8–11; radials 8–12 and needle-like and commonly white; centrals several and straight and terete: fls. 2 in. or more long, crimson. Colo., Utah, New Mex., Ariz.

conglomeratus (Cereus conglomeratus). In large clumps. sts. 4-8 in. long and often partly in the ground; ribs 11-13; radials needle-like; centrals several; fls. 2 in. or more long, purplish. Mex.

conoldeus (Cereus conoideus).' Cespitose; like E. coccineus but central spines somewhat curved and more or less angled. W. Tex., Mex.

ctenoides (Cereus ctenoides). Sts. cylindric, to 16 in. long and 3-4 in. diam.; ribs 15-17; radial spines to 20 and not spreading; centrals 8-10: fls. 3-4 in. long, wide-expanding, bright or reddish-yellow. S. Tex., Mex.

dasyacanthus (Cercus dasyacanthus). Sts. cylindric, 4-12 in. high, very spiny; rbs 15-20; radials 16-24 and pinkish at first; centrals 3-8: fls. to 4 in. long, yellow. W. Tex., New Mex, Mex.

Delactii. Clustered, to 8 in. high, covered by long white curling hairs; ribs indistinct, are oles with many long white hairs and few bristles: fls. pink. Mex.

dubius (Cereus dubius). Somewhat cespitose, sts. to 8 in. long. soft, pale green, white-spined; ribs 7-9; radials 5-8; centrals 1-4; fls. 2½ in. or more long, pale purple. S. W. Tex.
